<td>Jazelle extension implemented, with clearing of JOSCR CV on exception entry.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

**State1, bits [7:4]**

T32 instruction set support. Defined values are:

<table>
<thead>
<tr>
<th>State1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>T32 instruction set not implemented.</td>
</tr>
</tbody>
</table>
| 0b0001 | T32 encodings before the introduction of Thumb-2 technology implemented:  
• All instructions are 16-bit.  
• A BL or BLX is a pair of 16-bit instructions.  
• 32-bit instructions other than BL and BLX cannot be encoded. |
| 0b0011 | T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions. |

All other values are reserved.

In Armv8-A the only permitted value is 0b0011.

**State0, bits [3:0]**

A32 instruction set support. Defined values are:

<table>
<thead>
<tr>
<th>State0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>A32 instruction set not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>A32 instruction set implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

**Accessing the ID_PFR0_EL1**

Accesses to this register use the following encodings:

\[
\text{MRS } <Xt>, \text{ ID_PFR0_EL1}
\]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);

    return ID_PFR0_EL1;
elsif PSTATE.EL == EL3 then
    return ID_PFR0_EL1;
ID_PFR1_EL1, AArch32 Processor Feature Register 1

The ID_PFR1_EL1 characteristics are:

**Purpose**

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers.

**Configuration**

AArch64 System register ID_PFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_PFR1_EL1 are UNKNOWN.

**Attributes**

ID_PFR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_PFR1_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| GIC | Virt_frac | Sec_frac | GenTimer | Virtualization | MProgMod | Security | ProgMod |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

Reserved, RES0.

**GIC, bits [31:28]**

System register GIC CPU interface. Defined values are:

<table>
<thead>
<tr>
<th>GIC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>GIC CPU interface system registers not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.</td>
</tr>
<tr>
<td>0b0011</td>
<td>System register interface to version 4.1 of the GIC CPU interface is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Virt_frac, bits [27:24]**

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for features from the ARMv7 Virtualization Extensions. Defined values are:
### Virt_frac

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
</tr>
<tr>
<td>0b0001</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 when EL2 is implemented.
- 0b0001 when EL2 is not implemented.

This field is only valid when the value of ID_PFR1_EL1.Virtualization is 0, otherwise it holds the value 0b0000.

**Note**

The ID_ISAR registers do not identify whether the instructions added by the ARMv7 Virtualization Extensions are implemented.

### Sec_frac, bits [23:20]

Security fractional field. When the Security field is 0b0000, determines the support for features from the ARMv7 Security Extensions. Defined values are:

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
</tr>
<tr>
<td>0b0001</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>0b0010</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 when EL3 is implemented.
- 0b0001 or 0b0010 when EL3 is not implemented.

This field is only valid when the value of ID_PFR1_EL1.Security is 0, otherwise it holds the value 0b0000.

### GenTimer, bits [19:16]

Generic Timer support. Defined values are:

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
</tr>
<tr>
<td>0b0001</td>
</tr>
<tr>
<td>0b0010</td>
</tr>
</tbody>
</table>

All other values are reserved.

ARMv8.6-ECV implements the functionality identified by the value 0b0010.

In Armv8.0, Armv8.1, Armv8.2, Armv8.3, Armv8.4, and Armv8.5, the only permitted value is 0b0001.
From Armv8.6, the only permitted value is 0b0010.

**Virtualization, bits [15:12]**

Virtualization support. Defined values are:

<table>
<thead>
<tr>
<th>Virtualization</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL2, Hyp mode, and the HVC instruction not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0b0001 implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

**Note**

The ID_ISARs do not identify whether the HVC instruction is implemented.

**MProgMod, bits [11:8]**

M profile programmers’ model support. Defined values are:

<table>
<thead>
<tr>
<th>MProgMod</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for two-stack programmers’ model</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

**Security, bits [7:4]**

Security support. Defined values are:

<table>
<thead>
<tr>
<th>Security</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL3, Monitor mode, and the SMC instruction not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0b0001 implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the ability to set the NSACR.RFR bit. Not permitted in Armv8 as the NSACR.RFR bit is RES0.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 when EL3 is not implemented.
- 0b0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.
ProgMod, bits [3:0]

Support for the standard programmers' model for Armv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

<table>
<thead>
<tr>
<th>ProgMod</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32 then this field has the value 0b0000.

Accessing the ID_PFR1_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID_PFR1_EL1

```
<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

    else
      return ID_PFR1_EL1;
  else
    if PSTATE.EL == EL2 then
      return ID_PFR1_EL1;
    else
      if PSTATE.EL == EL3 then
        return ID_PFR1_EL1;
```
The ID_PFR2_EL1 characteristics are:

**Purpose**

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1 and ID_PFR1_EL1.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers.

**Configuration**

AArch64 System register ID_PFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_PFR2_EL1 are UNKNOWN.

**Attributes**

ID_PFR2_EL1 is a 64-bit register.

**Field descriptions**

The ID_PFR2_EL1 bit assignments are:

IFSR32_EL2, Instruction Fault Status Register (EL2)

The IFSR32_EL2 characteristics are:

**Purpose**

Allows access to the AArch32 IFSR register from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Configuration**

AArch64 System register IFSR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register IFSR[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to IFSR32_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

**Attributes**

IFSR32_EL2 is a 64-bit register.

**Field descriptions**

The IFSR32_EL2 bit assignments are:

**When TTBCR.EAE == 0:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

**Bits [63:17]**

Reserved, RES0.

**FnV, bit [16]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IFAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>IFAR is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

This field resets to an architecturally UNKNOWN value.

**Bits [15:13]**

Reserved, RES0.
External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

This field resets to an architecturally UNKNOWN value.

Reserved, RES0.

This field is bit[4] of FS[4:0].

<table>

<td>When RAS is not implemented</td>
</tr>
</tbody>
</table>

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The FS field is split as follows:

- FS[4] is IFSR32_EL2[10].
- FS[3:0] is IFSR32_EL2[3:0].

This field resets to an architecturally UNKNOWN value.

On taking a Data Abort exception, this bit is set as follows:
### LPAE

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Using the Short-descriptor translation table formats.</td>
</tr>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table formats.</td>
</tr>
</tbody>
</table>

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

This field resets to an architecturally **UNKNOWN** value.

### Bits [8:4]

Reserved, RES0.

### FS[3:0], bits [3:0]

This field is bits[3:0] of FS[4:0].

</tbody>
</table>

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

This field resets to an architecturally **UNKNOWN** value.

### Bits [15:13]

Reserved, RES0.

### ExT, bit [12]

External abort type. This bit can be used to provide an **IMPLEMENTATION DEFINED** classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

This field resets to an architecturally **UNKNOWN** value.

### Bits [11:10]

Reserved, RES0.
LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Using the Short-descriptor translation table formats.</td>
</tr>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table formats.</td>
</tr>
</tbody>
</table>

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

This field resets to an architecturally **UNKNOWN** value.

**Bits [8:6]**

Reserved, RES0.

**STATUS, bits [5:0]**

Fault status bits. Possible values of this field are:

<table>
<thead>
<tr>
<th>STATUS</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Address size fault in translation table base register.</td>
<td></td>
</tr>
<tr>
<td>0b000001</td>
<td>Address size fault, level 1.</td>
<td></td>
</tr>
<tr>
<td>0b000010</td>
<td>Address size fault, level 2.</td>
<td></td>
</tr>
<tr>
<td>0b000011</td>
<td>Address size fault, level 3.</td>

<tr>
<td>0b011111</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 3.</td>
<td>When RAS is not implemented</td>
</tr>
<tr>
<td>0b100001</td>
<td>PC alignment fault.</td>
<td></td>
</tr>
<tr>
<td>0b100010</td>
<td>Debug exception.</td>
<td></td>
</tr>
<tr>
<td>0b110000</td>
<td>TLB conflict abort.</td>
<td></td>
</tr>
</tbody>
</table>

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011101, 0b011110, and 0b011111, are reserved.

For more information about the lookup level associated with a fault, see ‘The level associated with MMU faults on a Long-descriptor translation table lookup’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
This field resets to an architecturally \textit{UNKNOWN} value.

## Accessing the IFSR32\_EL2

Accesses to this register use the following encodings:

\textbf{MRS} \texttt{<Xt>, IFSR32\_EL2}

\begin{center}
\begin{tabular}{|c|c|c|c|c|}

    \texttt{IFSR32\_EL2 = \texttt{X[t]}};
\end{verbatim}
ISR_EL1, Interrupt Status Register

The ISR_EL1 characteristics are:

**Purpose**

Shows the pending status of the IRQ, FIQ, or SError interrupt.

When executing at EL2, EL3 or Secure EL1 when SCR_EL3.EEL2 == 0b0, this shows the pending status of the physical IRQ, FIQ, or SError interrupts.

When executing at either Non-secure EL1 or at Secure EL1 when SCR_EL3.EEL2 == 0b1:

- If the HCR_EL2.{IMO,FMO,AMO} bit has a value of 1, the corresponding ISR_EL1.{I,F,A} bit shows the pending status of the virtual IRQ, FIQ, or SError.
- If the HCR_EL2.{IMO,FMO,AMO} bit has a value of 0, the corresponding ISR_EL1.{I,F,A} bit shows the pending status of the physical IRQ, FIQ, or SError.

**Configuration**

AArch64 System register ISR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ISR[31:0].

**Attributes**

ISR_EL1 is a 64-bit register.

**Field descriptions**

The ISR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | A | I | F | RES0 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:9]**

Reserved, RES0.

**A, bit [8]**

SErrror interrupt pending bit.

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No pending SError.</td>
</tr>
<tr>
<td>0b1</td>
<td>An SError interrupt is pending.</td>
</tr>
</tbody>
</table>

If the SError interrupt is edge-triggered, this field is cleared to zero when the physical SError interrupt is taken.

**I, bit [7]**

IRQ pending bit. Indicates whether an IRQ interrupt is pending:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No pending IRQ.</td>
</tr>
<tr>
<td>0b1</td>
<td>An IRQ interrupt is pending.</td>
</tr>
</tbody>
</table>
**F, bit [6]**

FIQ pending bit. Indicates whether an FIQ interrupt is pending.

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No pending FIQ.</td>
</tr>
<tr>
<td>0b1</td>
<td>An FIQ interrupt is pending.</td>
</tr>
</tbody>
</table>

**Bits [5:0]**

Reserved, RES0.

**Accessing the ISR_EL1**

Accesses to this register use the following encodings:

```
MRS <Xt>, ISR_EL1
```

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

LORC_EL1, LORegion Control (EL1)

The LORC_EL1 characteristics are:

**Purpose**

Enables and disables LORegions, and selects the current LORegion descriptor.

**Configuration**

This register is present only when ARMv8.1-LOR is implemented. Otherwise, direct accesses to LORC_EL1 are **UNDEFINED**.

If no LORegion descriptors are supported by the PE, then this register is **RES0**.

**Attributes**

LORC_EL1 is a 64-bit register.

**Field descriptions**

The LORC_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | DS | RES0 | EN |

**Bits [63:10]**

Reserved, **RES0**.

**DS, bits [9:2]**

Descriptor Select. Selects the current LORegion descriptor accessed by **LORSA_EL1**, **LOREA_EL1**, and **LORN_EL1**.

The number of LORegion descriptors in **IMPLEMENTATION DEFINED**. The maximum number of LORegion descriptors supported is 256. If the number is less than 256, then bits[63:M+2] are **RES0**, where \( M = \log_2(\text{Number of LORegion descriptors supported by the implementation}) \).

If this field points to an LORegion descriptor that is not supported by an implementation, then the registers **LORN_EL1**, **LOREA_EL1**, and **LORSA_EL1** are **RES0**.

This field resets to an architecturally **UNKNOWN** value.

**Bit [1]**

Reserved, **RES0**.

**EN, bit [0]**

Enable. Indicates whether LORegions are enabled.

<table>
<thead>
<tr>
<th><strong>EN</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled. Memory accesses do not match any LORegions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enabled. Memory accesses may match a LORegion.</td>
</tr>
</tbody>
</table>
This bit is permitted to be cached in a TLB.

This field resets to 0.

LOREA_EL1, LORegion End Address (EL1)

The LOREA_EL1 characteristics are:

**Purpose**

Holds the physical address of the end of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

**Configuration**

This register is present only when ARMv8.1-LOR is implemented. Otherwise, direct accesses to LOREA_EL1 are **UNDEFINED**.

This register is **RES0** if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

**Attributes**

LOREA_EL1 is a 64-bit register.

**Field descriptions**

The LOREA_EL1 bit assignments are:

Any of the fields in this register are permitted to be cached in a TLB.

**Bits [63:52]**

Reserved, **RES0**.

**EA[51:48], bits [51:48]**

When ARMv8.2-LPA is implemented:

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, **RES0**.

**EA[47:16], bits [47:16]**

Bits [47:16] of the end physical address of an LORegion described in the current LORegion descriptor selected by LORC_EL1.DS. Bits[15:0] of this address are defined to be **0xFFFF**. For implementations with fewer than 48 bits, the upper bits of this field are **RES0**.
When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, EA[51:48] form the upper part of the address value. Otherwise, for implementations with fewer than 52 physical address bits, EA[51:48] are RES0.

This field resets to an architecturally UNKNOWN value.

**Bits [15:0]**

Reserved, RES0.

**Accessing the LOREA_EL1**

Accesses to this register use the following encodings:

**MRS <Xt>, LOREA_EL1**

    endif;
LORID_EL1, LORegionID (EL1)

The LORID_EL1 characteristics are:

**Purpose**

Indicates the number of LORegions and LORegion descriptors supported by the PE.

**Configuration**

This register is present only when ARMv8.1-LOR is implemented. Otherwise, direct accesses to LORID_EL1 are **UNDEFINED**.

If no LORegion descriptors are implemented, then the registers **LORC_EL1**, **LORN_EL1**, **LOREA_EL1**, and **LORSA_EL1** are **RES0**.

**Attributes**

LORID_EL1 is a 64-bit register.

**Field descriptions**

The LORID_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>63 62 61 60 59 58 57 56</th>
<th>55 54 53 52 51 50 49 48</th>
<th>47 46 45 44 43 42 41 40</th>
<th>39 38 37 36 35 34 33 32</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>RES0</strong></td>
<td><strong>RES0</strong></td>
<td><strong>RES0</strong></td>
<td><strong>RES0</strong></td>
</tr>
<tr>
<td></td>
<td><strong>LD</strong></td>
<td></td>
<td><strong>LR</strong></td>
</tr>
</tbody>
</table>

**Bits [63:24]**

Reserved, **RES0**.

**LD, bits [23:16]**

Number of LORegion descriptors supported by the PE. This is an 8-bit binary number.

**Bits [15:8]**

Reserved, **RES0**.

**LR, bits [7:0]**

Number of LORegions supported by the PE. This is an 8-bit binary number.

---

**Note**

If LORID_EL1 indicates that no LORegions are implemented, then LoadLOAcquire and StoreLORelease will behave as LoadAcquire and StoreRelease.

---

**Accessing the LORID_EL1**

Accesses to this register use the following encodings:
MRS <Xt>, LORID_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b1010</td>
<td>0b0100</td>
<td>0b111</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TLOR == '1' then

  else
    return LORID_EL1;
  endif
elsif PSTATE.EL == EL3 then
  return LORID_EL1;
else
  return UD;
LORN_EL1, LORegion Number (EL1)

The LORN_EL1 characteristics are:

**Purpose**

Holds the number of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

**Configuration**

This register is present only when ARMv8.1-LOR is implemented. Otherwise, direct accesses to LORN_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

**Attributes**

LORN_EL1 is a 64-bit register.

**Field descriptions**

The LORN_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    | RES0 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

Any of the fields in this register are permitted to be cached in a TLB.

**Bits [63:8]**

Reserved, RES0.

**Num, bits [7:0]**

Number of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

The maximum number of LORegions supported by the PE is 256. If the maximum number is less than 256, then bits[8:N] are RES0, where N is \( \log_2 \) (Number of LORegions supported by the PE).

If this field points to a LORegion that is not supported by the PE, then the current LORegion descriptor does not match any LORegion.

This field resets to an architecturally UNKNOWN value.

**Accessing the LORN_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, LORN_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
</table>

LORSA_EL1, LORegion Start Address (EL1)

The LORSA_EL1 characteristics are:

Purpose

Indicates whether the current LORegion descriptor selected by LORC_EL1.DS is enabled, and holds the physical address of the start of the LORegion.

Configuration

This register is present only when ARMv8.1-LOR is implemented. Otherwise, direct accesses to LORSA_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

Attributes

LORSA_EL1 is a 64-bit register.

Field descriptions

The LORSA_EL1 bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th>RES0</th>
<th>SA[51:48]</th>
<th>SA[47:16]</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:52]

Reserved, RES0.

SA[51:48], bits [51:48]

When ARMv8.2-LPA is implemented:

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SA[47:16], bits [47:16]

Bits [47:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS. Bits[15:0] of this address are defined to be 0x0000. For implementations with fewer than 48 bits, the upper bits of this field are RES0.
When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, SA[51:48] form the upper part of the address value. Otherwise, for implementations with fewer than 52 physical address bits, SA[51:48] are RES0.

This field resets to an architecturally **UNKNOWN** value.

**Bits [15:1]**

Reserved, RES0.

**Valid, bit [0]**

Indicates whether the current LORegion Descriptor is enabled.

<table>
<thead>
<tr>
<th>Valid</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled</td>
</tr>
<tr>
<td>0b1</td>

MAIR_EL1, Memory Attribute Indirection Register (EL1)

The MAIR_EL1 characteristics are:

**Purpose**

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL1.

**Configuration**

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PRRR[31:0] when TTBCR.EAE == 0.

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MAIR0[31:0] when TTBCR.EAE == 1.

AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register NMRR[31:0] when TTBCR.EAE == 0.

AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register MAIR1[31:0] when TTBCR.EAE == 1.

**Attributes**

MAIR_EL1 is a 64-bit register.

**Field descriptions**

The MAIR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Attr7 | Attr6 | Attr5 | Attr4 |
| Attr3 | Attr2 | Attr1 | Attr0 |

MAIR_EL1 is permitted to be cached in a TLB.

**Attr<n>, bits [8n+7:8n], for n = 0 to 7**

Attr is encoded as follows:
<table>
<thead>
<tr>
<th>Attr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000dd00</td>
<td>Device memory. See encoding of 'dd' for the type of Device memory.</td>
</tr>
<tr>
<td>0b0000ddxx, (xx != 00)</td>
<td>UNPREDICTABLE</td>
</tr>
<tr>
<td>0booooiiii, (oooo != 0000 and iii != 0000)</td>
<td>Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.</td>
</tr>
<tr>
<td>0b11110000</td>
<td>Tagged Normal Memory. Inner+Outer Write-Back Non-transient memory, Inner+Outer Read-Allocate, Inner+Outer Write-Allocate.</td>
</tr>
<tr>
<td>0bxxxx0000, (xxxx != 0000 and xxxx != 1111)</td>
<td>UNPREDICTABLE</td>
</tr>
</tbody>
</table>

'dd' is encoded as follows:

<table>
<thead>
<tr>
<th>dd</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Device-nGnRnE memory</td>
</tr>
<tr>
<td>0b01</td>
<td>Device-nGnRE memory</td>
</tr>
<tr>
<td>0b10</td>
<td>Device-nGRE memory</td>
</tr>
<tr>
<td>0b11</td>
<td>Device-GRE memory</td>
</tr>
</tbody>
</table>

'oooo' is encoded as follows:

<table>
<thead>
<tr>
<th>'oooo'</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>See encoding of Attr</td>
</tr>
<tr>
<td>0b00RW, RW not</td>
<td>Normal memory, Outer Write-Through Transient</td>
</tr>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable</td>
</tr>
<tr>
<td>0b01RW, RW not</td>
<td>Normal memory, Outer Write-Back Transient</td>
</tr>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Write-Through Non-transient</td>
</tr>
<tr>
<td>0b11RW</td>
<td>Normal memory, Outer Write-Back Non-transient</td>
</tr>
</tbody>
</table>

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

<table>
<thead>
<tr>
<th>'iiii'</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>See encoding of Attr</td>
</tr>
<tr>
<td>0b00RW, RW not</td>
<td>Normal memory, Inner Write-Through Transient</td>
</tr>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable</td>
</tr>
<tr>
<td>0b01RW, RW not</td>
<td>Normal memory, Inner Write-Back Transient</td>
</tr>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Write-Through Non-transient</td>
</tr>
<tr>
<td>0b11RW</td>
<td>Normal memory, Inner Write-Back Non-transient</td>
</tr>
</tbody>
</table>

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

<table>
<thead>
<tr>
<th>R or W</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Allocate</td>
</tr>
<tr>
<td>0b1</td>
<td>Allocate</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Accessing the MAIR_EL1**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic MAIR_EL1 or MAIR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:
MRS <Xt>, MAIR_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>

MAIR_EL2, Memory Attribute Indirection Register (EL2)

The MAIR_EL2 characteristics are:

**Purpose**

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL2.

**Configuration**

AArch64 System register MAIR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HMAIR0[31:0].

AArch64 System register MAIR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HMAIR1[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MAIR_EL2 is a 64-bit register.

**Field descriptions**

The MAIR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Attr7</th>
<th>Attr6</th>
<th>Attr5</th>
<th>Attr4</th>
<th>Attr3</th>
<th>Attr2</th>
<th>Attr1</th>
<th>Attr0</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62</td>
<td>61</td>
<td>60</td>
<td>59</td>
<td>58</td>

</tr>
</tbody>
</table>

MAIR_EL2 is permitted to be cached in a TLB.

**Attr<n>, bits [8n+7:8n], for n = 0 to 7**

Attr is encoded as follows:

<table>
<thead>
<tr>
<th>Attr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000dd00</td>
<td>0b00000ddxx, (xx != 00) Normal memory See encoding of 'dd' for the type of Device memory. UNPREDICTABLE</td>
</tr>
<tr>
<td>0b00000ddxx, (xx != 00) Normal memory. See encoding of 'dd' for the type of Device memory.</td>
<td></td>
</tr>
<tr>
<td>0b00000ddxx, (xx != 00) Normal memory. See encoding of 'dd' for the type of Device memory.</td>
<td></td>
</tr>
<tr>
<td>0b00000ddxx, (xx != 00) Normal memory. See encoding of 'dd' for the type of Device memory.</td>
<td></td>
</tr>
<tr>
<td>0b11110000</td>
<td>0b11110000 Tagged Normal Memory. Inner+Outer Write-Back Non-transient memory, Inner+Outer Read-Allocate, Inner+Outer Write-Allocate. UNPREDICTABLE</td>
</tr>
<tr>
<td>0bxxxx0000, (xxxx != 0000 and xxxx != 1111) Tagged Normal Memory. Inner+Outer Write-Back Non-transient memory, Inner+Outer Read-Allocate, Inner+Outer Write-Allocate. UNPREDICTABLE</td>
<td></td>
</tr>
</tbody>
</table>
'dd' is encoded as follows:

<table>
<thead>
<tr>
<th>dd</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Device-nGnRnE memory</td>
</tr>
<tr>
<td>0b01</td>

</tr>
<tr>
<td>0b10</td>
<td>Device-nGRE memory</td>
</tr>
<tr>
<td>0b11</td>
<td>Device-GRE memory</td>
</tr>
</tbody>
</table>

'oooo' is encoded as follows:

<table>
<thead>
<tr>
<th>'oooo'</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>See encoding of Attr</td>
</tr>
<tr>
<td>0b00RW</td>
<td>Normal memory, Outer Write-Through Transient</td>
</tr>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Write-Through Non-transient</td>
</tr>
<tr>
<td>0b0100</td>
<td>Normal memory, Outer Non-cacheable</td>
</tr>
<tr>
<td>0b01RW</td>
<td>Normal memory, Outer Write-Back Transient</td>
</tr>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Write-Back Non-transient</td>
</tr>
</tbody>
</table>

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

<table>
<thead>
<tr>
<th>'iiii'</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>See encoding of Attr</td>
</tr>
<tr>
<td>0b00RW</td>
<td>Normal memory, Inner Write-Through Transient</td>
</tr>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Write-Through Non-transient</td>
</tr>
<tr>
<td>0b0100</td>
<td>Normal memory, Inner Non-cacheable</td>
</tr>
<tr>
<td>0b01RW</td>
<td>Normal memory, Inner Write-Back Transient</td>
</tr>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Write-Back Non-transient</td>
</tr>
</tbody>
</table>

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

<table>
<thead>
<tr>
<th>R or W</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Allocate</td>
</tr>
<tr>
<td>0b1</td>
<td>Allocate</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Accessing the MAIR_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic MAIR_EL2 or MAIR_EL1 is not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, MAIR_EL2

<table>
<thead>
<tr>

        endif
    elsif PSTATE.EL == EL3 then
        return MDCCSR_EL0;
    endif
```
The MDCR_EL2 characteristics are:

**Purpose**

Provides EL2 configuration options for self-hosted debug and the Performance Monitors Extension.

**Configuration**

AArch64 System register MDCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HDCR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MDCR_EL2 is a 64-bit register.

**Field descriptions**

The MDCR_EL2 bit assignments are:

When ARMv8.6-MTPMU is implemented and EL3 is not implemented:

<table>
<thead>
<tr>
<th>MTPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ARMv8.6-MTPMU is disabled. The Effective value of PMEVTYPEP&lt;n&gt;_EL0.MT is zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMEVTYPEP&lt;n&gt;_EL0.MT bits not affected by this bit.</td>
</tr>
</tbody>
</table>

If ARMv8.6-MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0.

On a Cold reset, this field resets to 1.

**Otherwise:**

Reserved, RES0.
**TDCC, bit [27]**

When ARMv8.6-FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

<table>
<thead>
<tr>
<th>TDCC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any register accesses to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Trap exception to EL2, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.</td>
</tr>
</tbody>
</table>

The DCC registers trapped by this control are:

**AArch64:** `OSDTRRX_EL1`, `OSDTRTX_EL1`, `MDCCSR_EL0`, `MDCCINT_EL1`, and, when the PE is in Non-debug state, `DBGDTR_EL0`, `DBGDTRRX_EL0`, and `DBGDTRTX_EL0`.

**AArch32:** `DBGDTRRXext`, `DBGDTRTXext`, `DBGDSCRint`, `DBGDCCINT`, and, when the PE is in Non-debug state, `DBGDTRRXint` and `DBGDTRTXint`.

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to `DBGDTRTXint` and STC from `DBGDTRRXint`.
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL2.TDCC does not trap any accesses to:

**AArch64:** `DBGDTR_EL0`, `DBGDTRRX_EL0`, and `DBGDTRTX_EL0`.

**AArch32:** `DBGDTRRXint` and `DBGDTRTXint`.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**HLP, bit [26]**

When ARMv8.5-PMU is implemented:

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

<table>
<thead>
<tr>
<th>HLP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counter overflow on increment that causes unsigned overflow of <code>PMEVCNTR&lt;n&gt;_EL0[31:0]</code>.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counter overflow on increment that causes unsigned overflow of <code>PMEVCNTR&lt;n&gt;_EL0[63:0]</code>.</td>
</tr>
</tbody>
</table>

If MDCR_EL2.HPMN is less than `PMCR_EL0.N` or `PMCR.N`, this bit affects the operation of event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] or [MDCR_EL2.HPMN..(PMCR.N-1)]. Otherwise this bit has no effect on the operation of the event counters.

**Note**

The effect of MDCR_EL2.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the MDCR_EL2.HPMN field.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**E2TB, bits [25:24]**

When **TRBE** is implemented:

EL2 Trace Buffer. If EL2 is implemented and enabled in the current Security state, controls the owning translation regime and access to Trace Buffer control registers from EL1.

<table>
<thead>
<tr>
<th>E2TB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>If EL2 is implemented and enabled in the current Security state, Trace Buffer owning Exception level is EL2. Accesses to Trace Buffer controls at EL1 generate a Trap exception to EL2.</td>
</tr>
<tr>
<td>0b10</td>
<td>Trace Buffer owning Exception level is EL1. If TraceBufferEnabled() == TRUE, tracing is prohibited at EL2. If EL2 is implemented and enabled in the current Security state, accesses to Trace Buffer controls at EL1 generate a Trap exception to EL2.</td>
</tr>
<tr>
<td>0b11</td>
<td>Trace Buffer owning Exception level is EL1. If TraceBufferEnabled() == TRUE, tracing is prohibited at EL2.</td>
</tr>
</tbody>
</table>

The Trace Buffer control registers trapped by this control are: TRBBASE_EL1, TRBLIMIT_EL1, TRBMAR_EL1, TRBPTR_EL1, TRBSR_EL1, and TRBTRG_EL1.

If EL2 is not implemented or is disabled, the PE behaves as if this field is 0b11, other than for a direct read of the register.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HCCD, bit [23]**

When ARMv8.5-PMU is implemented:

Hypervisor Cycle Counter Disable. Prohibits PMCCNTR_EL0 from counting at EL2.

<table>
<thead>
<tr>
<th>HCCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR_EL0 is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting by PMCCNTR_EL0 is prohibited at EL2.</td>
</tr>
</tbody>
</table>

This bit does not affect the CPU_CYCLES event or any other event that counts cycles.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [22:20]**

Reserved, RES0.
TTRF, bit [19]

When ARMv8.4-Trace is implemented:

Traps use of the Trace Filter Control registers at EL1 to EL2, as follows:

- Access to TRFCR_EL1 is trapped to EL2, reported using EC syndrome value 0x18.
- Access to TRFCR is trapped to EL2, reported using EC syndrome value 0x03.

<table>
<thead>
<tr>
<th>TTRF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to TRFCR_EL1 and TRFCR at EL1 are not affected by this control.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to TRFCR_EL1 and TRFCR at EL1 generate a trap exception to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

HPMD, bit [17]

When ARMv8.1-PMU is implemented:

Guest Performance Monitors Disable. This control prohibits event counting at EL2.

<table>
<thead>
<tr>
<th>HPMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting allowed at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting prohibited at EL2.</td>
</tr>
</tbody>
</table>

This control applies only to:

- The event counters in the range [0..(MDCR_EL2.HPMN-1)].
- If ARMv8.2-Debug is not implemented, event counting is prohibited unless enabled by the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().

The other event counters are unaffected, and when PMCR_EL0.DP is set to 1, PMCCNTR_EL0.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [16:15]

Reserved, RES0.

TPMS, bit [14]

When SPE is implemented:

Trap Performance Monitor Sampling. When EL2 is enabled in the current Security state, this field controls access to Statistical Profiling control registers from EL1.
TPMS

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not trap Statistical Profiling controls to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to Statistical Profiling controls at EL1 generate a Trap</td>
</tr>
<tr>
<td></td>
<td>exception to EL2 when EL2 is enabled in the current Security</td>
</tr>
<tr>
<td></td>
<td>state.</td>
</tr>
</tbody>
</table>

The Statistical Profiling control registers trapped by this control are: `PMSCR_EL1`, `PMSEVFR_EL1`, `PMSFCR_EL1`, `PMSICR_EL1`, `PMSIDR_EL1`, `PMSIRR_EL1`, and `PMSLATFR_EL1`.

 Otherwise:

Reserved, RES0.

**E2PB, bits [13:12]**

When SPE is implemented:

EL2 Profiling Buffer. If EL2 is implemented and enabled in the Profiling Buffer owning Security state, this field controls the owning translation regime. If EL2 is implemented and enabled in the current Security state, this field controls access to Profiling Buffer control registers from EL1.

<table>
<thead>
<tr>
<th>E2PB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>If EL2 is implemented and enabled in the Profiling Buffer owning Security state, the Profiling Buffer uses the EL2 or EL2&amp;0 stage 1 translation regime. Otherwise the Profiling Buffer uses the EL1&amp;0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.</td>
</tr>
<tr>
<td>0b10</td>
<td>Profiling Buffer uses the EL1&amp;0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.</td>
</tr>
<tr>
<td>0b11</td>
<td>Profiling Buffer uses the EL1&amp;0 stage 1 translation regime. Accesses to Profiling Buffer control registers at EL1 are not trapped to EL2.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The Profiling Buffer control registers trapped by this control are: `PMBLIMITR_EL1`, `PMBPTR_EL1`, and `PMBSR_EL1`.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TDRA, bit [11]**

Trap Debug ROM Address register access. Traps System register accesses to the Debug ROM registers to EL2 when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64 state, accesses to `MDRAR_EL1` are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 or EL1 is using AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05 and MRRC or MCRR accesses are trapped to EL2, reported using EC syndrome value 0x0C:
  - `DBGDRAR`, `DBGDSAR`.

<table>
<thead>
<tr>
<th>TDRA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 and EL1 System register accesses to the Debug ROM registers are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by <code>DBGDSCRext</code>, UDCCdis or <code>MDSCR_EL1.TDCC</code>.</td>
</tr>
</tbody>
</table>
This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- \texttt{MDCR\_EL2.TDE == 1.}
- \texttt{HCR\_EL2.TGE == 1.}

\textbf{Note}

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{TDOSA, bit [10]}

When ARMv8.0-DoubleLock is implemented:

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - \texttt{OSLR\_EL1, OSLSR\_EL1, OSDLR\_EL1, and DBGPRCR\_EL1.}
  - Any \texttt{IMPLEMENTATION DEFINED} register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:
  - \texttt{DBGOSLAR, DBGOSLSR, DBGOSDLR, and DBGPRCR.}
  - Any \texttt{IMPLEMENTATION DEFINED} register with similar functionality that the implementation specifies as trapped by this bit.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

\textbf{Note}

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- \texttt{MDCR\_EL2.TDE == 1.}
- \texttt{HCR\_EL2.TGE == 1.}

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{Otherwise:}

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - \texttt{OSLR\_EL1, OSLSR\_EL1, and DBGPRCR\_EL1.}
  - Any \texttt{IMPLEMENTATION DEFINED} register with similar functionality that the implementation specifies as trapped by this bit.
In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:

- DBGOSLSR, DBGOSLAR, and DBGPRCR.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to OSDLR_EL1 are trapped.

It is IMPLEMENTATION DEFINED whether accesses to DBGOSDLR are trapped.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

**Note**

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1.
- HCR_EL2.TGE == 1.

**Note**

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TDA, bit [9]**

Trap Debug Access. Traps EL0 and EL1 System register accesses to debug System registers that are not trapped by MDCR_EL2.TDRA or MDCR_EL2.TDOSA, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2 reported using EC syndrome value 0x18:
  - MDCCSR_EL0, MDCCINT_EL1, OSDTRRX_EL1, MDCSCR_EL1, OSDTRTX_EL1, OSECRR_EL1, DBGBVR<n>_EL1, DBGBCR<n>_EL1, DBGWVR<n>_EL1, DBGWCR<n>_EL1, DBGCLAIMSET_EL1, DBGCLAIMCLR_EL1, DBGAUTHSTATUS_EL1.
  - When not in Debug state, DBGDTR_EL0, DBGDTRRX_EL0, DBGDTRTX_EL0.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05.
  - DBGDIR, DBGDSRCINT, DBGDCINT, DBGWAR, DBGVCR, DBGDSRExt, DBGDTRXext, DBGDTRRXext, DBGWBVR<n>, DBGBCR<n>, DBGBXVR<n>, DBGWCR<n>, DBGWVR<n>, DBGCLAIMSET, DBGCLAIMCLR, DBGAUTHSTATUS, DBGDEVID, DBGDEVID1, DBGDEVID2, DBGOSFCCR.
  - When not in Debug state, DBGDTRRXInt and DBGDTRTXInt.
- In AArch32 state, STC accesses to DBGDTRRXInt and LDC accesses to DBGDTRXInt are trapped to EL2, reported using EC syndrome value 0x06.

<table>
<thead>
<tr>
<th>TDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 or EL1 System register accesses to the debug registers are trapped from both Execution states to EL2 when EL2 is enabled in the current Security state, unless the access generates a higher priority exception.</td>
</tr>
</tbody>
</table>

Traps of AArch32 accesses to DBGDTRRXInt and DBGDTRTXInt are ignored in Debug state.

Traps of AArch64 accesses to DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0 are ignored in Debug state.
This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- \texttt{MDCR\_EL2.TDE == 1}
- \texttt{HCR\_EL2.TGE == 1}

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**TDE, bit [8]**

Trap Debug exceptions.

<table>
<thead>
<tr>
<th>TDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the routing of debug exceptions, and has no effect on accesses to debug registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>Debug exceptions generated at EL1 or EL0 are routed to EL2 when EL2 is enabled in the current Security state. The MDCR_EL2.{TDRA, TDOSA, TDA} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.</td>
</tr>
</tbody>
</table>

This field is treated as being 1 for all purposes other than a direct read when \texttt{HCR\_EL2.TGE == 1}.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**HPME, bit [7]**

When PMUv3 is implemented:

- \texttt{[MDCR\_EL2.HPMN..(N-1)] event counters enable.}

<table>
<thead>
<tr>
<th>HPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] are enabled by PMCNTENSET_EL0.</td>
</tr>
</tbody>
</table>

If MDCR\_EL2.HPMN is less than PMCR\_EL0.N or PMCR.N, the event counters in the range [MDCR\_EL2.HPMN..(PMCR\_EL0.N-1)] or [HDCR.HPMN..(PMCR.N-1)], are enabled and disabled by this bit. Otherwise this bit has no effect on the operation of the event counters.

**Note**

The effect of MDCR\_EL2.HPMN on the operation of this bit applies regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the HPMN field.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

Otherwise:

Reserved, RES0.

**TPM, bit [6]**

When PMUv3 is implemented:

Trap Performance Monitors accesses. Traps EL0 and EL1 accesses to all Performance Monitor registers to EL2 when EL2 is enabled in the current Security state, from both Execution states, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
If ARMv8.4-PMU is implemented, **PMMIR_EL1**.

- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, MRRC or MRCR accesses are trapped to EL2 and reported using EC syndrome value 0x04:
  - PMCR, PMCNTENSET, PMCNTENCLR, PMOVSB, PMSWINC, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXETYPE, PMXEVTYPER, PMUSERENR, PMINTENSET, PMINTENCLR, PMOVSSER, PMEVCNTR<n>, PMEVTYPER<n>, PMCCFILTR.

- If ARMv8.4-PMU is implemented, **PMMIR**.

- If ARMv8.1-PMU is implemented, **PMCEID2**, and **PMCEID3**.

### TPM

<table>
<thead>
<tr>
<th>TPM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 and EL1 accesses to all Performance Monitor registers are trapped to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

#### Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

### TPMCR, bit [5]

**When PMUv3 is implemented:**

Trap **PMCR_EL0** or **PMCR** accesses. Traps EL0 and EL1 accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to **PMCR_EL0** are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, accesses to **PMCR** are trapped to EL2, reported using EC syndrome value 0x03.

<table>
<thead>
<tr>
<th>TPMCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 and EL1 accesses to the <strong>PMCR_EL0</strong> or <strong>PMCR</strong> are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by <strong>PMUSERENR</strong>, EN or <strong>PMUSERENR_EL0</strong>, EN.</td>
</tr>
</tbody>
</table>

#### Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.
HPMN, bits [4:0]

When PMUv3 is implemented:

Defines the number of event counters that are accessible from EL3, EL2, EL1, and from EL0 if permitted.

If HPMN is less than PMCR_EL0.N, HPMN divides the Performance Monitors into two ranges: [0..(HPMN-1)] and [HPMN..(PMCR_EL0.N-1)].

For an event counter in the range [0..(HPMN-1)]:

- The counter is accessible from EL3, EL2, and EL1, and from EL0 if permitted by PMUSERENR_EL0 or PMUSERENR.
- If Armv8.5-PMU is implemented, PMCR_EL0.LP or PMCR.LP determines whether the counter overflow flag is set on unsigned overflow of PMEVCNTR<n>_EL0[31:0] or PMEVCNTR<n>_EL0[63:0].
- The counter is enabled by PMCR_EL0.E or PMCR.E and bit <n> of PMCNTENSET_EL0.

Note

If HPMN is equal to PMCR_EL0.N, this applies to all event counters.

If HPMN is less than PMCR_EL0.N, for an event counter in the range [HPMN..(PMCR_EL0.N-1)]:

- The counter is accessible from EL2 and EL3.
- If Armv8.4-ScEL2 is disabled or is not implemented, the counter is also accessible from Secure EL1, and from Secure EL0 if permitted by PMUSERENR_EL0.
- If Armv8.5-PMU is implemented, MDCR_EL2.HLP or HDCR.HLP determines whether the counter overflow flag is set on unsigned overflow of PMEVCNTR<n>_EL0[31:0] or PMEVCNTR<n>_EL0[63:0].
- The counter is enabled by MDCR_EL2.HPME or HDCR.HPME and bit <n> of PMCNTENSET_EL0.

If this field is set to 0, or to a value larger than PMCR_EL0.N, then the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of MDCR_EL2.HPMN is UNKNOWN.
- Either:
  - An UNKNOWN number of counters are reserved for EL2 and EL3 use. That is, the PE behaves as if MDCR_EL2.HPMN is set to an UNKNOWN non-zero value less than or equal to PMCR_EL0.N.
  - All counters are reserved for EL2 and EL3 use, meaning no counters are accessible from EL1 and EL0.

On a Warm reset, this field resets to the value in PMCR_EL0.N.

Otherwise:

Reserved, RES0.

Accessing the MDCR_EL2

Accesses to this register use the following encodings:

MRS <Xt>, MDCR_EL2

<table>
<thead>
<tr>

    else
        MDCR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    MDCR_EL2 = X[t];
The MDCR_EL3 characteristics are:

**Purpose**

Provides EL3 configuration options for self-hosted debug and the Performance Monitors Extension.

**Configuration**

AArch64 System register MDCR_EL3 bits [31:0] can be mapped to AArch32 System register SDCR[31:0], but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to MDCR_EL3 are UNDEFINED.

**Attributes**

MDCR_EL3 is a 64-bit register.

**Field descriptions**

The MDCR_EL3 bit assignments are:

| Bits: [63:29] | RES0 | MTPME | TDCC | NSTB | SCCDE | ETADE | PMAD Ti | ETAD | EPMAD | EDAD | TTRF | STE | SPD32 | NSPB | RES0 | TDOA | TDA | RES0 | TPM |
|---------------|------|-------|------|------|-------|-------|---------|------|-------|------|------|-----|------|------|------|------|------|------|
| 313029        | 28   | 27    | 26   | 25   | 24    | 23    | 22      | 21   | 20    | 19   | 18   | 17  | 16   | 15   | 14   | 13   | 12   | 11   | 10   |

**Reserved, RES0.**

**MTPME, bit [28]**

When ARMv8.6-MTPMU is implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>_EL0.MT bits.

<table>
<thead>
<tr>
<th>MTPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ARMv8.6-MTPMU is disabled. The Effective value of PMEVTYPER&lt;n&gt;_EL0.MT is zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMEVTYPER&lt;n&gt;_EL0.MT bits not affected by this bit.</td>
</tr>
</tbody>
</table>

If ARMv8.6-MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0.

On a Cold reset, this field resets to 1.

**Reserved, RES0.**
TDCC, bit [27]

When ARMv8.6-FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL2, EL1, and EL0 to EL3.

<table>
<thead>
<tr>
<th>TDCC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any register accesses to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to the DCC registers at EL2, EL1, and EL0 generate a Trap exception to EL3, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.</td>
</tr>
</tbody>
</table>

The DCC registers trapped by this control are:

AArch64: OSDTRRX_EL1, OSDTRTX_EL1, MDCCSR_EL0, MDCCINT_EL1, and, when the PE is in Non-debug state, DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXint.

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to DBGDTRTXint and STC from DBGDTRRXint.
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL3.TDCC does not trap any accesses to:

AArch64: DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXint and DBGDTRTXint.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

NSTB, bits [25:24]

When TRBE is implemented:

Non-secure Trace Buffer. Controls the owning translation regime and accesses to Trace Buffer control registers from EL2 and EL1.
<table>
<thead>
<tr>
<th>NSTB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Trace Buffer owning security state is Secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.</td>
</tr>
<tr>
<td>0b01</td>
<td>Trace Buffer owning security state is Secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure state. Accesses to Trace Buffer control registers at EL2 and EL1 in Non-secure state generate Trap exceptions to EL3.</td>
</tr>
<tr>
<td>0b10</td>
<td>Trace Buffer owning security state is Non-secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.</td>
</tr>
<tr>
<td>0b11</td>
<td>Trace Buffer owning security state is Non-secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 in Secure state generate Trap exceptions to EL3.</td>
</tr>
</tbody>
</table>

The Trace Buffer control registers trapped by this control are: TRBBASER_EL1, TRBLIMITR_EL1, TRBMAR_EL1, TRBPTR_EL1, TRBSR_EL1, and TRBTRG_EL1.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b1, the PE behaves as if this field is 0b11.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, the PE behaves as if this field is 0b01.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**SCCD, bit [23]**

When ARMv8.5-PMU is implemented:

Secure Cycle Counter Disable. Prohibits PMCCNTR_EL0 from counting in Secure state.

<table>
<thead>
<tr>
<th>SCCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR_EL0 is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting by PMCCNTR_EL0 is prohibited in Secure state.</td>
</tr>
</tbody>
</table>

This bit does not affect the CPU_CYCLES event or any other event that counts cycles.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**ETAD, bit [22]**

When TRBE is implemented:

External Trace Non-secure Access Disable. Controls Non-secure access to PE Trace Unit registers by an external debugger.

<table>
<thead>
<tr>
<th>ETAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure accesses from an external debugger to PE Trace Unit are allowed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure accesses from an external debugger to PE Trace Unit are prohibited.</td>
</tr>
</tbody>
</table>

If the Trace Extension does not support external debug interface accesses this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this field is 0b1.
On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**EPMAD, bit [21]**

When ARMv8.4-Debug is implemented and PMUv3 is implemented:

External Performance Monitors Non-secure Access Disable. Controls Non-secure access to Performance Monitor registers by an external debugger.

<table>
<thead>
<tr>
<th>EPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure access to Performance Monitor registers from external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure access to Performance Monitor registers from external debugger is not permitted.</td>
</tr>
</tbody>
</table>

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

When PMUv3 is implemented:

External Performance Monitors Access Disable. Controls access to Performance Monitor registers by an external debugger.

<table>
<thead>
<tr>
<th>EPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to Performance Monitor registers from external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to Performance Monitor registers from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
</tbody>
</table>

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**EDAD, bit [20]**

When ARMv8.4-Debug is implemented:

External Debug Non-secure Access Disable. Controls Non-secure access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure access to debug registers from external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure access to breakpoint and watchpoint registers, and OSLAR_EL1 from external debugger is not permitted.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this field is 0b1.
On a Warm reset, this field resets to 0.

When ARMv8.2-Debug is implemented:

External Debug Access Disable. Controls access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to debug registers, and to OSLAR_EL1 from external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to breakpoint and watchpoint registers, and to OSLAR_EL1 from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, this field resets to 0.

Otherwise:

External Debug Access disable. Controls access to breakpoint, watchpoint, and optionally OSLAR_EL1 registers by an external debugger:

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to debug registers from external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to breakpoint and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the OSLAR_EL1 register from an external debugger is permitted or not permitted.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, this field resets to 0.

TTRF, bit [19]

When ARMv8.4-Trace is implemented:

Trap Trace Filter controls. Traps use of the Trace Filter control registers at EL2 and EL1 to EL3.

The Trace Filter registers trapped by this control are:

- TRFCR_EL2, TRFCR_EL12, TRFCR_EL1, reported using EC syndrome value 0x18.
- HTRFCR and TRFCR, reported using EC syndrome value 0x03.

<table>
<thead>
<tr>
<th>TTRF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to Trace Filter registers at EL2 and EL1 are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to Trace Filter registers at EL2 and EL1 generate a Trap exception to EL3, unless the access generates a higher priority exception.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.
STE, bit [18]

When ARMv8.4-Trace is implemented:

Secure Trace enable. Enables tracing in Secure state.

<table>
<thead>
<tr>
<th>STE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace in Secure state is not affected by this bit.</td>
</tr>
</tbody>
</table>

This bit also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

If EL3 is not implemented the Effective value of SCR_EL3.NS is 0b0, the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SPME, bit [17]

When ARMv8.2-Debug is implemented and PMUv3 is implemented:

Secure Performance Monitors enable. This allows event counting in Secure state.

<table>
<thead>
<tr>
<th>SPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting prohibited in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting in Secure state not affected by this bit.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

When PMUv3 is implemented:

Secure Performance Monitors enable. This allows event counting in Secure state.

<table>
<thead>
<tr>
<th>SPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting prohibited in Secure state, unless ExternalSecureNoninvasiveDebugEnabled() is TRUE.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting in Secure state not affected by this bit.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SDD, bit [16]

AArch64 Secure Self-hosted invasive debug disable. Disables Software debug exceptions in Secure state, other than Breakpoint Instruction exceptions.

<table>
<thead>
<tr>
<th>SDD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Debug exceptions in Secure state are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Debug exceptions, other than Breakpoint Instruction exceptions, are disabled from all Exception levels in Secure state.</td>
</tr>
</tbody>
</table>
The SDD bit is ignored unless both of the following are true:

- The PE is in Secure state.
- The Effective value of \( \text{SCR}_{\text{EL3}}.\text{RW} \) is \( 0b1 \).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SPD32, bits [15:14]**

**When EL1 is capable of using AArch32:**

AArch32 Secure self-hosted privileged debug. Enables or disables debug exceptions from Secure EL1 using AArch32, other than Breakpoint Instruction exceptions.

<table>
<thead>
<tr>
<th>SPD32</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Legacy mode. Debug exceptions from Secure EL1 are enabled by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
<tr>
<td>0b10</td>
<td>Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.</td>
</tr>
<tr>
<td>0b11</td>
<td>Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.</td>
</tr>
</tbody>
</table>

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored if the PE is either:

- In Non-secure state.
- In Secure state and Secure EL1 is using AArch64.

If Secure EL1 is using AArch32 then:

- If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of \( \text{SDER32}_{\text{EL3}}.\text{SUIDEN} \) is \( 0b1 \).

If EL3 is not implemented and the Effective value of \( \text{SCR}_{\text{EL3}}.\text{NS} \) is \( 0b0 \), then the Effective value of this field is \( 0b11 \).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**NSPB, bits [13:12]**

**When SPE is implemented:**

Non-secure Profiling Buffer. This field controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers.
### NSPB

<table>
<thead>
<tr>
<th>NSPB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in both security states generate Trap exceptions to EL3.</td>
</tr>
<tr>
<td>0b01</td>
<td>Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure state generate Trap exceptions to EL3.</td>
</tr>
<tr>
<td>0b10</td>
<td>Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in both security states generate Trap exceptions to EL3.</td>
</tr>
<tr>
<td>0b11</td>
<td>Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Secure state generate Trap exceptions to EL3.</td>
</tr>
</tbody>
</table>

The Statistical Profiling and Profiling Buffer control registers trapped by this control are: \texttt{PMBLIMITR\_EL1}, \texttt{PMBPTR\_EL1}, \texttt{PMBSR\_EL1}, \texttt{PMSCR\_EL1}, \texttt{PMSCR\_EL2}, \texttt{PMSEVFR\_EL1}, \texttt{PMSFCR\_EL1}, \texttt{PMSICR\_EL1}, \texttt{PMSIDR\_EL1}, \texttt{PMSIRR\_EL1}, and \texttt{PMSLATFR\_EL1}.

If EL3 is not implemented and the Effective value of \texttt{SCR\_EL3.NS} is 0b1, the Effective value of this field is 0b11.

If EL3 is not implemented and the Effective value of \texttt{SCR\_EL3.NS} is 0b0, the Effective value of this field is 0b01.

On a Warm reset, this field resets to an \texttt{UNKNOWN} value.

### Otherwise:

Reserved, RES0.

### Bit [11]

Reserved, RES0.

### TDOSA, bit [10]

**When ARMv8.0-DoubleLock is implemented:**

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

Accesses to the registers are trapped as follows:

- Accesses from AArch64 state, \texttt{OSLAR\_EL1}, \texttt{OSLSR\_EL1}, \texttt{OSDLR\_EL1}, \texttt{DBGPRCR\_EL1} and any \texttt{IMPLEMENTATION DEFINED} register with similar functionality that the implementation specifies as trapped by this bit, are trapped to EL3 and reported using EC syndrome value 0x18.
- Accesses using MCR or MRC to \texttt{DBGOSLAR}, \texttt{DBGOSLSR}, \texttt{DBGOSDLR}, and \texttt{DBGPRCR}, are trapped to EL3 and reported using EC syndrome value 0x05.
- Accesses to any \texttt{IMPLEMENTATION DEFINED} register with similar functionality that the implementation specifies as trapped by this bit.

### TDOSA

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by \texttt{HDCR_TDOSA} or \texttt{MDCR_EL2_TDOSA}.</td>
</tr>
</tbody>
</table>

### Note

The powerdown debug registers are not accessible at EL0.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

The following registers are affected by this trap:

- AArch64: **OSLAR_EL1**, **OSLSR_EL1**, and **DBGPRC_EL1**.
- AArch32: **DBGOSLR**, **DBGOSLSR**, and **DBGPCR**.
- AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- It is IMPLEMENTATION DEFINED whether accesses to **OSDLR_EL1** and **DBGOSDLR** are trapped.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by <strong>HDCR.TDOSA</strong> or <strong>MDCR_EL2.TDOSA</strong>.</td>
</tr>
</tbody>
</table>

**Note**

The powerdown debug registers are not accessible at EL0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**TDA, bit [9]**

Trap Debug Access. Traps EL2, EL1, and EL0 System register accesses to those debug System registers that cannot be trapped using the **MDCR_EL3.TDOSA** field.

Accesses to the debug registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported using EC syndrome value 0x18:
  - **DBGWBVR<n>_EL1**, **DBGWBCCR<n>_EL1**, **DBGWVR<n>_EL1**, **DBGWCR<n>_EL1**, **DBGCLAIMSET_EL1**, **DBGCLAIMCLR_EL1**, **DBGAUTHSTATUS_EL1**, **DBGVR32_EL2**.
  - AArch64: **MDCR_EL2**, **MDRAR_EL1**, **MDCCSR_EL0**, **MDCCINT_EL1**, **MDSCR_EL1**, **OSDTRRX_EL1**, **OSDTRTX_EL1**, **OSECCR_EL1**.
- In AArch32 state, **SDER** is trapped to EL3 and reported using EC syndrome value 0x03.
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x05, accesses using MCRR or MRRC are reported using EC syndrome value 0x0C:
  - **DBGCLAIMSET**, **DBGCLAIMCLR**, **DBGAUTHSTATUS**, **DBGDEVID**, **DBGDEVID1**, **DBGDEVID2**, **DBGOSCCCR**.
- In AArch32 state, STC accesses to **DBGDTRRXint** and LDC accesses to **DBGDTRTXint** are reported using EC syndrome value 0x06.
- When not in Debug state, the following registers are also trapped to EL3:
  - AArch64 accesses to **DBGDTR_EL0**, **DBGDTRRX_EL0**, and **DBGDTRTX_EL0**, reported using EC syndrome value 0x18.
  - AArch32 accesses using MCR or MRC to **DBGDTRRXint** and **DBGDTRTXint** reported using EC syndrome value 0x05.

<td>EL0, EL1, and EL2 accesses to the debug registers, other than the registers that can be trapped by <strong>MDCR_EL3.TDOSA</strong>, are trapped to EL3, from both Security states and both Execution states, unless it is trapped by <strong>DBGDSCRExtd.UCCdis</strong>, <strong>MDSCR_EL1.TDCC</strong>, <strong>HDCR.TDA</strong> or <strong>MDCR_EL2.TDA</strong>.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [8:7]**

Reserved, **RES0**.
When PMUv3 is implemented:

Trap Performance Monitor register accesses. Accesses to all Performance Monitor registers from EL0, EL1 and EL2 to EL3, from both Security states and both Execution states are trapped as follows:

- In AArch64 state, accesses to the following registers are trapped to EL3 and are reported using EC syndrome value 0x18:
  - PM_CR_EL0, PMCNTENSET_EL0, PMCNTENCLR_EL0, PMOVSCLR_EL0, PMSWINC_EL0, PMSEL_EL0, PMCEID0_EL0, PMCEID1_EL0, PMCCNTR_EL0, PMXEVTPERM_EL0, PMXEVCTR_EL0, PMUSERENR_EL0, PMINTENSET_EL1, PMINTENCLR_EL1, PMOVSET_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMUSERENR_EL0.
  - If ARMv8.4-PMU is implemented, PMMIR_EL1.

- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x03, accesses using MCRR or MRRC are reported using EC syndrome value 0x04:
  - PM_CR, PMCNTENSET, PMCNTENCLR, PMOVSR, PMSWINC, PMSEL, PMCEID0, PMCEID1, PMCCNTR, PMXEVTPERM, PMXEVCTR, PMUSERENR, PMINTENSET, PMINTENCLR, PMOVSET, PMEVCNTR<n>, PMEVTYPER<n>, PMCFILTR.
  - If ARMv8.1-PMU is implemented, PMCEID2, and PMCEID3.
  - If ARMv8.4-PMU is implemented, PMMIR.

    UNDEFINED;
elsif PSTATE.EL == EL3 then
    MDCR_EL3 = X[t];
MDRAR_EL1, Monitor Debug ROM Address Register

The MDRAR_EL1 characteristics are:

**Purpose**

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Armv8 deprecates any use of this register.

**Configuration**

AArch64 System register MDRAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register DBGDRAR[63:0].

**Attributes**

MDRAR_EL1 is a 64-bit register.

**Field descriptions**

The MDRAR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ROMADDR[51:48] | ROMADDR[47:12] |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ROMADDR[47:12] | RES0 | Valid |

**Bits [63:52]**

Reserved, RES0.

**ROMADDR[51:48], bits [51:48]**

When ARMv8.2-LPA is implemented:

Otherwise:

Reserved, RES0.

**ROMADDR[47:12], bits [47:12]**

Bits[47:12] of the ROM table physical address.

When ARMv8.2-LPA is implemented, ROMADDR[51:48] forms the upper part of the address value. Otherwise, ROMADDR[51:48] is RES0.

If the physical address size in bits (PAsize) is less than 52, then the register bits corresponding to ROMADDR [51:PAsize] are RES0.

Bits [11:0] of the ROM table physical address are zero.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.
In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Bits [11:2]

Reserved, RES0.

Valid, bits [1:0]

This field indicates whether the ROM Table address is valid. The permitted values of this field are:

<table>
<thead>
<tr>
<th>Valid</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>ROM Table address is not valid. Software must ignore ROMADDR.</td>
</tr>
<tr>
<td>0b11</td>
<td>ROM Table address is valid.</td>
</tr>
</tbody>
</table>

Other values are reserved.

Accessing the MDRAR_EL1

Accesses to this register use the following encodings:

MRS <Xt>, MDRAR_EL1

<table>
<thead>
<tr>

MDSCR_EL1, Monitor Debug System Control Register

The MDSCR_EL1 characteristics are:

**Purpose**

Main control register for the debug implementation.

**Configuration**

AArch64 System register MDSCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDSCRx[31:0].

**Attributes**

MDSCR_EL1 is a 64-bit register.

**Field descriptions**

The MDSCR_EL1 bit assignments are:

**Bits [63:32]**

Reserved, RES0.

**TFO, bit [31]**

When ARMv8.4-Trace is implemented:

Trace Filter override. Used for save/restore of EDSCR.TFO.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TFO. Reads and writes of this bit are indirect accesses to EDSCR.TFO.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is RW.
- When OSLSR_EL1.OSLK == 0, access to this field is RO.

**Otherwise:**

Reserved, RES0.

**RXfull, bit [30]**

Used for save/restore of EDSCR.RXfull.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.
When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.RXfull. Reads and writes of this bit are indirect accesses to EDSCR.RXfull.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is RW.
- When OSLSR_EL1.OSLK == 0, access to this field is RO.

TXfull, bit [29]

Used for save/restore of EDSCR.TXfull.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TXfull. Reads and writes of this bit are indirect accesses to EDSCR.TXfull.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is RW.
- When OSLSR_EL1.OSLK == 0, access to this field is RO.

Bit [28]

Reserved, RES0.

RXO, bit [27]

Used for save/restore of EDSCR.RXO.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.RXO. Reads and writes of this bit are indirect accesses to EDSCR.RXO.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is RW.
- When OSLSR_EL1.OSLK == 0, access to this field is RO.

TXU, bit [26]

Used for save/restore of EDSCR.TXU.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TXU. Reads and writes of this bit are indirect accesses to EDSCR.TXU.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is RW.
- When OSLSR_EL1.OSLK == 0, access to this field is RO.

Bits [25:24]

Reserved, RES0.
INTdis, bits [23:22]

Used for save/restore of $EDSCR$. INTdis.

When $OSLSR_EL1.OSLK == 0$, and software must treat this bit as UNK/SBZP.

When $OSLSR_EL1.OSLK == 1$, this field holds the value of $EDSCR$. INTdis. Reads and writes of this field are indirect accesses to $EDSCR$. INTdis.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When $OSLSR_EL1.OSLK == 1$, access to this field is RW.
- When $OSLSR_EL1.OSLK == 0$, access to this field is RO.

TDA, bit [21]

Used for save/restore of $EDSCR$. TDA.

When $OSLSR_EL1.OSLK == 0$, software must treat this bit as UNK/SBZP.

When $OSLSR_EL1.OSLK == 1$, this bit holds the value of $EDSCR$. TDA. Reads and writes of this bit are indirect accesses to $EDSCR$. TDA.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When $OSLSR_EL1.OSLK == 1$, access to this field is RW.
- When $OSLSR_EL1.OSLK == 0$, access to this field is RO.

Bit [20]

Reserved, RES0.

SC2, bit [19]

When ARMv8.0-PCSample is implemented, ARMv8.1-VHE is implemented and ARMv8.2-PCSample is not implemented:

Used for save/restore of $EDSCR$. SC2.

When $OSLSR_EL1.OSLK == 0$, software must treat this bit as UNK/SBZP.

When $OSLSR_EL1.OSLK == 1$, this bit holds the value of $EDSCR$. SC2. Reads and writes of this bit are indirect accesses to $EDSCR$. SC2.

Accessing this field has the following behavior:

- When $OSLSR_EL1.OSLK == 1$, access to this field is RW.
- When $OSLSR_EL1.OSLK == 0$, access to this field is RO.

Otherwise:

Reserved, RES0.

Bits [18:16]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.
**MDE, bit [15]**

Monitor debug events. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

<table>
<thead>
<tr>
<th>MDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Breakpoint, Watchpoint, and Vector Catch exceptions disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Breakpoint, Watchpoint, and Vector Catch exceptions enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**HDE, bit [14]**

Used for save/restore of EDSCR.HDE.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.HDE. Reads and writes of this bit are indirect accesses to EDSCR.HDE.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is RW.
- When OSLSR_EL1.OSLK == 0, access to this field is RO.

**KDE, bit [13]**

Local (kernel) debug enable. If EL_D is using AArch64, enable debug exceptions within EL_D. Permitted values are:

<table>
<thead>
<tr>
<th>KDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Debug exceptions, other than Breakpoint Instruction exceptions, disabled within EL_D.</td>
</tr>
<tr>
<td>0b1</td>
<td>All debug exceptions enabled within EL_D.</td>
</tr>
</tbody>
</table>

RES0 if EL_D is using AArch32.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TDCC, bit [12]**

Traps EL0 accesses to the Debug Communication Channel (DCC) registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states, as follows:

- In AArch64 state, MRS or MSR accesses to the following DCC registers are trapped, reported using EC syndrome value 0x18:
  - MDCCSR_EL0.
  - If not in Debug state, DBGDTR_EL0, DBGDTRTX_EL0, and DBGDTRRX_EL0.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped, reported using EC syndrome value 0x05:
  - DBGDSCRint, DBGDIIDR, DBGDSAR, DBGDRAR.
  - If not in Debug state, DBGDTRRXint, and DBGDTRRXint.
- In AArch32 state, LDC access to DBGDTRRXint and STC access to DBGDTRTXint are trapped, reported using EC syndrome value 0x06.
- In AArch32 state, MRRC accesses to DBGDSAR and DBGDRAR are trapped, reported using EC syndrome value 0x0C.

<table>
<thead>
<tr>
<th>TDCC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>

</tr>
<tr>
<td></td>
<td>EL0 using AArch32: EL0 accesses to the AArch32 DCC registers are trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bits [11:7]
Reserved, RES0.

ERR, bit [6]

Used for save/restore of EDSCR.ERR.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.ERR. Reads and writes of this bit are indirect accesses to EDSCR.ERR.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is RW.
- When OSLSR_EL1.OSLK == 0, access to this field is RO.

Bits [5:1]
Reserved, RES0.

SS, bit [0]
Software step control bit. If EL1 is using AArch64, enable Software step. Permitted values are:

<table>
<thead>
<tr>
<th>SS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Software step disabled</td>
</tr>
<tr>
<td>0b1</td>
<td>Software step enabled</td>
</tr>
</tbody>
</table>

RES0 if EL1 is using AArch32.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the MDSCR_EL1

Individual fields within this register might have restricted accessibility when OSLSR_EL1.OSLK == 0 (the OS lock is unlocked). See the field descriptions for more detail.

Accesses to this register use the following encodings:

MRS <Xt>, MDSCR_EL1

<table>

**MIDR_EL1, Main ID Register**

The MIDR_EL1 characteristics are:

**Purpose**

Provides identification information for the PE, including an implementer code for the device and a device ID number.

**Configuration**

AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MIDR_EL1[31:0].

AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to External register MIDR_EL1[31:0].

**Attributes**

MIDR_EL1 is a 64-bit register.

**Field descriptions**

The MIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>62</td>
<td>Implementer, bits [31:24]</td>
</tr>

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.
**Variant, bits [23:20]**

An implementation defined variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

**Architecture, bits [19:16]**

The permitted values of this field are:

<table>
<thead>
<tr>
<th>Architecture</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Armv4.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Armv4T.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Armv5 (obsolete).</td>
</tr>
<tr>
<td>0b0100</td>
<td>Armv5T.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Armv5TE.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Armv5TEJ.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv6.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Architectural features are individually identified in the ID_* registers, see 'ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K12.3.3.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**PartNum, bits [15:4]**

An implementation defined primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

**Revision, bits [3:0]**

An implementation defined revision number for the device.

**Accessing the MIDR_EL1**

Accesses to this register use the following encodings:

```
MRS <Xt>, MIDR_EL1
```

MPAM0_EL1, MPAM0 Register (EL1)

The MPAM0_EL1 characteristics are:

**Purpose**

Holds information to generate MPAM labels for memory requests when executing at EL0. When EL2 is present and enabled, the MPAM virtualization option is present, \( \text{MPAMHCR\_EL2.\_GSTAPP\_PLK} == 1 \) and \( \text{HCR\_EL2.\_TGE} == 0 \), \( \text{MPAM1\_EL1} \) is used instead of MPAM0_EL1 to generate MPAM information to label memory requests.

If EL2 is present and enabled, and \( \text{HCR\_EL2.E2H} == 0 \) or \( \text{HCR\_EL2.TGE} == 0 \), the MPAM virtualization option is present and \( \text{MPAMHCR\_EL2.EL0\_VPMEN} == 1 \), then MPAM PARTIDs in MPAM0_EL1 are virtual and mapped into physical PARTIDs for the current Security state.

**Configuration**

This register is present only when MPAM is implemented. Otherwise, direct accesses to MPAM0_EL1 are UNDEFINED.

**Attributes**

MPAM0_EL1 is a 64-bit register.

**Field descriptions**

The MPAM0_EL1 bit assignments are:

<table>

</tr>
</tbody>
</table>

**Bits [63:48]**

Reserved, RES0.

**PMG_D, bits [47:40]**

Performance monitoring group property for PARTID_D.

This field resets to an architecturally UNKNOWN value.

**PMG_I, bits [39:32]**

Performance monitoring group property for PARTID_I.

This field resets to an architecturally UNKNOWN value.

**PARTID_D, bits [31:16]**

Partition ID for data accesses, including load and store accesses, made from EL0.

This field resets to an architecturally UNKNOWN value.

**PARTID_I, bits [15:0]**

Partition ID for instruction accesses made from EL0.
This field resets to an architecturally _UNKNOWN_ value.

### Accessing the MPAM0_EL1

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

**MRS <Xt>, MPAM0_EL1**

<table>
<thead>

AArch64.SystemAccessTrap(EL3, 0x18);
else
  MPAM0_EL1 = X[t];
elsesi PSTATE.EL == EL3 then
  MPAM0_EL1 = X[t];
The MPAM1_EL1 characteristics are:

**Purpose**

Holds information to generate MPAM labels for memory requests when executing at EL1.

When EL2 is present and enabled, the MPAM virtualization option is present, MPAMHCR_EL2.GSTAPP.PLK == 1 and HCR_EL2.TGE == 0, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM labels for memory requests when executing at EL0.

MPAM1_EL1 is an alias for MPAM2_EL2 when executing at EL2 with HCR_EL2.E2H == 1.

MPAM1_EL12 is an alias for MPAM1_EL1 when executing at EL2 or EL3 with HCR_EL2.E2H == 1.

If EL2 is present and enabled, the MPAM virtualization option is present and MPAMHCR_EL2.EL1_VPMEN == 1, MPAM PARTIDs in MPAM1_EL1 are virtual and mapped into physical PARTIDs for the current Security state. This mapping of MPAM1_EL1 virtual PARTIDs to physical PARTIDs when EL1_VPMEN is 1 also applies when MPAM1_EL1 is used at EL0 due to MPAMHCR_EL2.GSTAPP.PLK.

**Configuration**

AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register MPAM3_EL3[63] when EL3 is implemented.

AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register MPAM2_EL2[63] when EL3 is not implemented and EL2 is implemented.

This register is present only when MPAM is implemented. Otherwise, direct accesses to MPAM1_EL1 are UNDEFINED.

**Attributes**

MPAM1_EL1 is a 64-bit register.

**Field descriptions**

The MPAM1_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>MPAMEN</th>
<th>RES0</th>
<th>FORCED_NS</th>
<th>PARTID_D</th>
<th>PMG_D</th>
<th>PMG_I</th>
<th>RES0</th>
<th>PARTID_I</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>63</td>
<td>62 61</td>
<td>60</td>
<td>59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**MPAMEN, bit [63]**

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

<table>
<thead>
<tr>
<th>MPAMEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The default PARTID and default PMG are output in MPAM information.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.</td>
</tr>
</tbody>
</table>

If neither EL3 nor EL2 is implemented, this field is read/write.

If EL3 is implemented, this field is read-only and reads the current value of the read/write bit MPAM3_EL3.MPAMEN.

If EL3 is not implemented and EL2 is implemented, this field is read-only and reads the current value of the read/write bit MPAM2_EL2.MPAMEN.
This field resets to 0.

Accessing this field has the following behavior:

- When EL3 is not implemented and EL2 is not implemented, access to this field is RW.
- Otherwise, access to this field is RO.

**Bits [62:61] - FORCED_NS, bit [60]**

Reserved, RES0.

**When ARMv8.6-MPAM is implemented:**

In the Secure state, FORCED_NS indicates the state of MPAM3_EL3.FORCE_NS.

<table>
<thead>
<tr>
<th>FORCED_NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>In the Non-secure state, always reads as 0.</td>
</tr>
<tr>
<td></td>
<td>In the Secure state, indicates that MPAM3_EL3.FORCE_NS == 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>In the Secure state, indicates that MPAM3_EL3.FORCE_NS == 1.</td>
</tr>
</tbody>
</table>

Always reads as 0 in the Non-secure state.

Writes are ignored.

Access to this field is RO.

**Otherwise:**

Reserved, RES0.

**Bits [59:48]**

Reserved, RES0.

**PMG_D, bits [47:40]**

Performance monitoring group property for PARTID_D.

This field resets to an architecturally UNKNOWN value.

**PMG_I, bits [39:32]**

Performance monitoring group property for PARTID_I.

This field resets to an architecturally UNKNOWN value.

**PARTID_D, bits [31:16]**

Partition ID for data accesses, including load and store accesses, made from EL1.

This field resets to an architecturally UNKNOWN value.

**PARTID_I, bits [15:0]**

Partition ID for instruction accesses made from EL1.

This field resets to an architecturally UNKNOWN value.
Accessing the MPAM1_EL1

When `HCR_EL2.E2H` is 1, without explicit synchronization, accesses from EL3 using the mnemonic MPAM1_EL1 or MPAM1_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

</tr>
</tbody>
</table>

If EL3 is not implemented, this field is read/write.

If EL3 is implemented, this field is read-only and reads the current value of the read/write MPAM3_EL3.MPAMEN bit.

This field resets to 0.

Accessing this field has the following behavior:

- When EL3 is not implemented, access to this field is **RW**.
- Otherwise, access to this field is **RO**.

**Bits [62:59]**

Reserved, RES0.
**TIDR, bit [58]**

When ARMv8.6-MPAM is implemented and MPAMIDR_EL1.HAS_TIDR == 1:

TIDR traps accesses to MPAMIDR_EL1 from EL1 to EL2.

<table>
<thead>
<tr>
<th>TIDR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trap accesses to MPAMIDR_EL1 from EL1 to EL2.</td>
</tr>
</tbody>
</table>

MPAMHCR_EL2.TRAP_MPAMIDR_EL1 == 1 also traps MPAMIDR_EL1 accesses from EL1 to EL2. If either TIDR or TRAP_MPAMIDR_EL1 are 1, accesses are trapped.

**Otherwise:**

Reserved, RES0.

**Bits [57:50]**

Reserved, RES0.

**TRAPMPAM0EL1, bit [49]**

TRAPMPAM0EL1: Trap accesses from EL1 to the MPAM0_EL1 register trap to EL2.

<table>
<thead>
<tr>
<th>TRAPMPAM0EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to MPAM0_EL1 from EL1 are not trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to MPAM0_EL1 from EL1 are trapped to EL2.</td>
</tr>
</tbody>
</table>

This field resets to:

- If EL3 is not implemented, 1.
- If EL3 is implemented, an architecturally UNKNOWN value.

**TRAPMPAM1EL1, bit [48]**

TRAPMPAM1EL1: Trap accesses from EL1 to the MPAM1_EL1 register trap to EL2.

<table>
<thead>
<tr>
<th>TRAPMPAM1EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to MPAM1_EL1 from EL1 are not trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to MPAM1_EL1 from EL1 are trapped to EL2.</td>
</tr>
</tbody>
</table>

This field resets to:

- If EL3 is not implemented, 1.
- If EL3 is implemented, an architecturally UNKNOWN value.

**PMG_D, bits [47:40]**

Performance monitoring group for data accesses.

This field resets to an architecturally UNKNOWN value.

**PMG_I, bits [39:32]**

Performance monitoring group for instruction accesses.

This field resets to an architecturally UNKNOWN value.
PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL2.

This field resets to an architecturally **UNKNOWN** value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL2.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the MPAM2_EL2**

None of the fields in this register are permitted to be cached in a TLB.

The MPAM_EL3 characteristics are:

**Purpose**

Holds information to generate MPAM labels for memory requests when executing at EL3.

**Configuration**

AArch64 System register MPAM_EL3 bit [63] is architecturally mapped to AArch64 System register MPAM2_EL2[63] when EL2 is implemented.

AArch64 System register MPAM_EL3 bit [63] is architecturally mapped to AArch64 System register MPAM1_EL1[63].

This register is present only when MPAM is implemented. Otherwise, direct accesses to MPAM_EL3 are UNDEFINED.

**Attributes**

MPAM_EL3 is a 64-bit register.

**MPAMEN, bit [63]**

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

Values of this field are:

<table>
<thead>
<tr>
<th>MPAMEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The default PARTID and default PMG are output in MPAM information when executing at any ELn.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.</td>
</tr>
</tbody>
</table>

This field is always read/write in MPAM3_EL3.

This field resets to 0.

**TRAPLOWER, bit [62]**

Trap direct accesses to any MPAM system registers that are not UNDEFINED from all ELn lower than EL3.

<table>
<thead>
<tr>
<th>TRAPLOWER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not force trapping of direct accesses of MPAM system registers to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>Force all direct accesses of MPAM system registers to trap to EL3.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 1.
SDEFLT, bit [61]
When ARMv8.6-MPAM is implemented and MPAMIDR_EL1.HAS_SDEFLT == 1:

SDEFLT overrides the PARTID with the default PARTID when executing in the Secure state.

<table>
<thead>
<tr>
<th>SDEFLT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The PARTID is determined normally in the Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The PARTID is always PARTID 0 when executing in the Secure state.</td>
</tr>
</tbody>
</table>

This field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

FORCE_NS, bit [60]
When ARMv8.6-MPAM is implemented and MPAMIDR_EL1.HAS_FORCE_NS == 1:

FORCE_NS forces MPAM_NS to always be 1 in the Secure state.

<table>
<thead>
<tr>
<th>FORCE_NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAM_NS is 0 when executing in the Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM_NS is 1 when executing in the Secure state.</td>
</tr>
</tbody>
</table>

An implementation is permitted to have this field as RAO if the implementation does not support generating MPAM_NS as 0.

This field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [59:48]
Reserved, RES0.

PMG_D, bits [47:40]
Performance monitoring group for data accesses.

This field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]
Performance monitoring group for instruction accesses.

PARTID_D, bits [31:16]
Partition ID for data accesses, including load and store accesses, made from EL3.

This field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]
Partition ID for instruction accesses made from EL3.

This field resets to an architecturally UNKNOWN value.
Accessing the MPAM3_EL3

The MPAMHCR_EL2 characteristics are:

**Purpose**

Controls the PARTID virtualization features of MPAM. It controls the mapping of virtual PARTIDs into physical PARTIDs in MPAM_0_EL1 when EL0_VPMEN == 1 and in MPAM_1_EL1 when EL1_VPMEN == 1.

**Configuration**

This register is present only when MPAM is implemented and MPAMIDR_EL1.HAS_HCR == 1. Otherwise, direct accesses to MPAMHCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MPAMHCR_EL2 is a 64-bit register.

**Field descriptions**

The MPAMHCR_EL2 bit assignments are:

</tbody>
</table>

This field resets to:

- If EL3 is not implemented, 1.
- If EL3 is implemented, an architecturally UNKNOWN value.

**Bits [30:9]**

Reserved, RES0.
GSTAPP_PLK, bit [8]

Make the PARTIDs at EL0 the same as the PARTIDs at EL1. When executing at EL0, EL2 is enabled, HCR_EL2.TGE == 0 and GSTAPP_PLK = 1, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM labels for memory requests.

<table>
<thead>
<tr>
<th>GSTAPP_PLK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAM0_EL1 is used to generate MPAM labels when executing at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM1_EL1 is used to generate MPAM labels when executing at EL0 with EL2 enabled and HCR_EL2.TGE == 0. Otherwise MPAM0_EL1 is used.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally Unknown value.

Bits [7:2]

Reserved, RES0.

EL1_VPMEN, bit [1]

Enable the virtual PARTID mapping of the PARTID fields in MPAM1_EL1 when executing at EL1. This bit also enables virtual PARTID mapping when MPAM1_EL1 is used to generate MPAM labels for memory requests at EL0 due to GSTAPP_PLK == 1.

<table>
<thead>
<tr>
<th>EL1_VPMEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAM1_EL1 PARTID_I and MPAM1_EL1 PARTID_D are physical PARTIDs that are used to label memory system requests.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM1_EL1 PARTID_I and MPAM1_EL1 PARTID_D are virtual PARTIDs that are used to index the PhyPARTID fields of MPAMVPM0_EL2 to MPAMVPM7_EL2 registers to map the virtual PARTID into a physical PARTID to label memory system requests.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally Unknown value.

EL0_VPMEN, bit [0]

Enable the virtual PARTID mapping of the PARTID fields of MPAM0_EL1 unless HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1.

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1, EL0_VPMEN is ignored and MPAM0_EL1 PARTID fields are not mapped.

When MPAMHCR_EL2.GSTAPP_PLK == 1 and HCR_EL2.TGE == 0, MPAM1_EL1 is used as the source of PARTIDs and the virtual PARTID mapping of MPAM1_EL1 PARTIDs is controlled by MPAMHCR_EL2.EL1_VPMEN.

<table>

The MPAMIDR_EL1 characteristics are:

**Purpose**

Indicates the presence and maximum PARTID and PMG values supported in the implementation. It also indicates whether the implementation supports MPAM virtualization.

**Configuration**

This register is present only when MPAM is implemented. Otherwise, direct accesses to MPAMIDR_EL1 are UNDEFINED.

**Attributes**

MPAMIDR_EL1 is a 64-bit register.

**Field descriptions**

The MPAMIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>HAS_SDEFLT</td>
<td>0b0</td>
</tr>
<tr>
<td>62</td>
<td>HAS_FORCE_NS</td>
<td>0b0</td>
</tr>
<tr>

<td>0b0</td>
</tr>
<tr>
<td>58</td>
<td>HAS_HCR</td>
<td>0b0</td>
</tr>
<tr>
<td>57</td>
<td>PARTID_MAX</td>
<td>0b0</td>
</tr>
</tbody>
</table>

MPAMIDR_EL1 indicates the MPAM implementation parameters of the PE.

**Bits [63:62]**

Reserved, RES0.

**HAS_SDEFLT, bit [61]**

HAS_SDEFLT indicates support for MPAM3_EL3.SDEFLT bit. Defined values are:

<table>
<thead>
<tr>
<th>HAS_SDEFLT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The SDEFLT bit is not implemented in MPAM3_EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>The SDEFLT bit is implemented in MPAM3_EL3.</td>
</tr>
</tbody>
</table>

When MPAM3_EL3.SDEFLT == 1, accesses from the Secure execution state use the default PARTID, PARTID == 0.

**HAS_FORCE_NS, bit [60]**

HAS_FORCE_NS indicates support for MPAM3_EL3.FORCE_NS bit. Defined values are:

<table>
<thead>
<tr>
<th>HAS_FORCE_NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The FORCE_NS bit is not implemented in MPAM3_EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>The FORCE_NS bit is implemented in MPAM3_EL3.</td>
</tr>
</tbody>
</table>

When MPAM3_EL3.FORCE_NS == 1, accesses from the Secure execution state have MPAM_NS == 1.

**Bit [59]**

Reserved, RES0.
HAS_TIDR, bit [58]

HAS_TIDR indicates support for MPAM2_EL2.TIDR bit. Defined values are:

<table>
<thead>
<tr>
<th>HAS_TIDR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The TIDR bit is not implemented in MPAM2_EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>The TIDR bit is implemented in MPAM2_EL2.</td>
</tr>
</tbody>
</table>

Bits [57:40]

Reserved, RES0.

PMG_MAX, bits [39:32]

The largest value of PMG that the implementation can generate. The PMG_I and PMG_D fields of every MPAMn_ELx must implement at least enough bits to represent PMG_MAX.

Bits [31:21]

Reserved, RES0.

VPMR_MAX, bits [20:18]

If HAS_HCR == 0, VPMR_MAX must be 0b000. Otherwise, it indicates the maximum register index n for the MPAMVPM<n>_EL2 registers.

HAS_HCR, bit [17]

HAS_HCR indicates that the PE implementation supports MPAM virtualization, including MPAMHCR_EL2, MPAMVPMV_EL2 and MPAMVPM<n>_EL2 with n in the range 0 to VPMR_MAX. Must be 0 if EL2 is not implemented in either security state.

<table>
<thead>
<tr>
<th>HAS_HCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAM virtualization is not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM virtualization is supported.</td>
</tr>
</tbody>
</table>

Bit [16]

Reserved, RES0.

PARTID_MAX, bits [15:0]

The largest value of PARTID that the implementation can generate. The PARTID_I and PARTID_D fields of every MPAMn_ELx must implement at least enough bits to represent PARTID_MAX.

MPAMVPM0_EL2, MPAM Virtual PARTID Mapping Register 0

The MPAMVPM0_EL2 characteristics are:

**Purpose**

MPAMVPM0_EL2 provides mappings from virtual PARTIDs 0 - 3 to physical PARTIDs.

The **MPAMIDR_EL1.VPMR_MAX** field gives the index of the highest implemented MPAMVPM<n>_EL2 register. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If **MPAMIDR_EL1.VPMR_MAX == 0**, there is only a single MPAMVPM<n>_EL2 register, **MPAMVPM0_EL2**.

Virtual PARTID mapping is enabled by **MPAMHCR_EL2.EL1_VPMEN** for PARTIDs in **MPAM1_EL1** and by **MPAMHCR_EL2.EL0_VPMEN** for PARTIDs in **MPAM0_EL1**.

A virtual-to-physical PARTID mapping entry, **PhyPARTID<n>**, is only valid when the **MPAMVPMV_EL2.VPM_V** bit in bit position n is set to 1.

**Configuration**

This register is present only when MPAM is implemented and **MPAMIDR_EL1.HAS_HCR == 1**. Otherwise, direct accesses to **MPAMVPM0_EL2** are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MPAMVPM0_EL2 is a 64-bit register.

**Field descriptions**

The MPAMVPM0_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

```
The MPAMVPM3_EL2 characteristics are:

**Purpose**

MPAMVPM3_EL2 provides mappings from virtual PARTIDs 12 - 15 to physical PARTIDs.

\[ \text{MPAMIDR\_EL1}.\text{VPMR\_MAX} \] field gives the index of the highest implemented MPAMVPM\(<n>\)_EL2 registers. VPMR\_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If \[ \text{MPAMIDR\_EL1}.\text{VPMR\_MAX} == 0 \], there is only a single MPAMVPM\(<n>\)_EL2 register, MPAMVPM0\_EL2.

Virtual PARTID mapping is enabled by MPAMHCR\_EL2.EL1\_VPMEN for PARTIDs in MPAM1\_EL1 and by MPAMHCR\_EL2.EL0\_VPMEN for PARTIDs in MPAM0\_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID\(<n>\), is only valid when the MPAMVPMV\_EL2\_VPM\_V bit in bit position \( n \) is set to 1.

**Configuration**

This register is present only when MPAM is implemented, MPAMIDR\_EL1.HAS\_HCR == 1 and MPAMIDR\_EL1.VPMR\_MAX > 2. Otherwise, direct accesses to MPAMVPM3\_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MPAMVPM3\_EL2 is a 64-bit register.

**Field descriptions**

**Field descriptions**

The MPAMVPM7_EL2 bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PhyPARTID31 | PhyPARTID29 | PhyPARTID30 | PhyPARTID28 |

**PhyPARTID31**, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 31. PhyPARTID31 gives the mapping of virtual PARTID 31 to a physical PARTID.

- This field resets to an architecturally **UNKNOWN** value.

**PhyPARTID30**, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 30. PhyPARTID30 gives the mapping of virtual PARTID 30 to a physical PARTID.

- This field resets to an architecturally **UNKNOWN** value.

**PhyPARTID29**, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 29. PhyPARTID29 gives the mapping of virtual PARTID 29 to a physical PARTID.
This field resets to an architecturally **UNKNOWN** value.

**PhyPARTID28, bits [15:0]**

Virtual PARTID Mapping Entry for virtual PARTID 28. PhyPARTID28 gives the mapping of virtual PARTID 28 to a physical PARTID.

This field resets to an architecturally **UNKNOWN** value.

### Accessing the MPAMVPM7_EL2

Accesses to this register use the following encodings:

```
MPAMVPMV_EL2, MPAM Virtual Partition Mapping Valid Register

The MPAMVPMV_EL2 characteristics are:

**Purpose**

Valid bits for virtual PARTID mapping entries. Each bit \( m \) corresponds to virtual PARTID mapping entry \( m \) in the MPAMVPM\(<n>_EL2\) registers where \( n = m >> 2 \).

**Configuration**

This register is present only when MPAM is implemented and MPAMIDR_EL1.HAS_HCR == 1. Otherwise, direct accesses to MPAMVPMV_EL2 are **UNDEFINED**.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MPAMVPMV_EL2 is a 64-bit register.

**Field descriptions**

The MPAMVPMV_EL2 bit assignments are:

<table>

elsif PSTATE.EL == EL3 then
    MPAMVPMV_EL2 = X[t];

The MPIDR_EL1 characteristics are:

**Purpose**

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

**Configuration**

AArch64 System register MPIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MPIDR[31:0].

In a uniprocessor system Arm recommends that each Aff<n> field of this register returns a value of 0.

**Attributes**

MPIDR_EL1 is a 64-bit register.

**Field descriptions**

The MPIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td>62</td>
<td>Aff3</td>
</tr>
<tr>
<td>61</td>
<td>RES0</td>
</tr>
<tr>
<td>60</td>
<td>MT</td>
</tr>
<tr>
<td>59</td>
<td>Aff2</td>
</tr>
<tr>
<td>58</td>
<td>RES0</td>
</tr>
<tr>
<td>57</td>
<td>Aff1</td>
</tr>
<tr>
<td>56</td>
<td>RES0</td>
</tr>
<tr>
<td>55</td>
<td>Aff0</td>
</tr>
</tbody>
</table>

**Bits [63:40]**

Reserved, RES0.

**Aff3, bits [39:32]**

Affinity level 3. See the description of Aff0 for more information.

Aff3 is not supported in AArch32 state.

**Bit [31]**

Reserved, RES1.

**U, bit [30]**

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Processor is part of a multiprocessor system.</td>
</tr>
<tr>
<td>1</td>
<td>Processor is part of a uniprocessor system.</td>
</tr>
</tbody>
</table>

**Bits [29:25]**

Reserved, RES0.
Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels. The possible values of this bit are:

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Performance of PEs at the lowest affinity level, or PEs with MPIDR_EL1.MT set to 1, different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.</td>
</tr>
<tr>
<td>0b1</td>
<td>Performance of PEs at the lowest affinity level, or PEs with MPIDR_EL1.MT set to 1, different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.</td>
</tr>
</tbody>
</table>

**Aff2, bits [23:16]**

Affinity level 2. See the description of Aff0 for more information.

**Aff1, bits [15:8]**

Affinity level 1. See the description of Aff0 for more information.

**Aff0, bits [7:0]**

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1. {Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

**Accessing the MPIDR_EL1**

Accesses to this register use the following encodings:

```plaintext
MRS <Xt>, MPIDR_EL1
```

<table>

MVFR0_EL1, AArch32 Media and VFP Feature Register 0

The MVFR0_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR1_EL1 and MVFR2_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

AArch64 System register MVFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to MVFR0_EL1 are UNKNOWN.

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

Attributes

MVFR0_EL1 is a 64-bit register.

Field descriptions

The MVFR0_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| FPRound | FPShVec | FPSqrt | FPDivide | FPTrap | FPDP | FPSP | SIMDReg |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

FPRound, bits [31:28]

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes. Defined values are:

<table>
<thead>
<tr>
<th>FPRound</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the FPSCR setting.</td>
</tr>
<tr>
<td>0b0001</td>
<td>All rounding modes supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.
FPShVec, bits [27:24]

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors. Defined values are:

<table>
<thead>
<tr>
<th>FPShVec</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Short vectors not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Short vector operation supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

FPSqrt, bits [23:20]

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations. Defined values are:

<table>
<thead>
<tr>
<th>FPSqrt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPDivide, bits [19:16]

Indicates whether the floating-point implementation provides support for VFP divide operations. Defined values are:

<table>
<thead>
<tr>
<th>FPDivide</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPTrap, bits [15:12]

Floating Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping. Defined values are:

<table>
<thead>
<tr>
<th>FPTrap</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

A value of 0b0001 indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

FPDP, bits [11:8]

Double Precision. Indicates whether the floating-point implementation provides support for double-precision operations. Defined values are:
FPDP

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
</tr>
<tr>
<td>0b0001</td>
</tr>
<tr>
<td>0b0010</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is 0b0001.
- VDIV.F64 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

FPSP, bits [7:4]

Single Precision. Indicates whether the floating-point implementation provides support for single-precision operations. Defined values are:

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
</tr>
<tr>
<td>0b0001</td>
</tr>
<tr>
<td>0b0010</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0b0001.
- VDIV.F32 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank. Defined values are:

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
</tr>
<tr>
<td>0b0001</td>
</tr>
<tr>
<td>0b0010</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

Accessing the MVFR0_EL1

Accesses to this register use the following encodings:
MRS <Xt>, MVFR0_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b0000</td>

<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        end
    else
        UNDEFINED;
    end
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return MVFR0_EL1;
    end
elsif PSTATE.EL == EL2 then
    return MVFR0_EL1;
elsif PSTATE.EL == EL3 then
    return MVFR0_EL1;

The MVFR1_EL1 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with `MVFR0_EL1` and `MVFR2_EL1`.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

**Configuration**

AArch64 System register MVFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register `MVFR1[31:0]`.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to MVFR1_EL1 are UNKNOWN.

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

**Attributes**

MVFR1_EL1 is a 64-bit register.

**Field descriptions**

The MVFR1_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>

<tr>
<td>0 0 0 0</td>
<td>Not implemented.</td>
<td></td>
</tr>
<tr>
<td>0 0 0 1</td>
<td>Implemented.</td>
<td></td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.
FPHP, bits [27:24]

Floating Point Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

<table>
<thead>
<tr>
<th>FPHP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds instructions for conversion between double-precision and half-precision.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds support for half-precision floating-point arithmetic.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 in an implementation without floating-point support.
- 0b0010 in an implementation with floating-point support that does not include the ARMv8.2-FP16 extension.
- 0b0011 in an implementation with floating-point support that includes the ARMv8.2-FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the SIMDHP field, meaning the permitted values are:

<table>
<thead>
<tr>
<th>Half Precision instructions supported</th>
<th>FPHP</th>
<th>SIMDHP</th>
</tr>
</thead>
<tbody>
<tr>
<td>No support</td>
<td>0b0000</td>
<td>0b0000</td>
</tr>
<tr>
<td>Conversions only</td>
<td>0b0010</td>
<td>0b0001</td>
</tr>
<tr>
<td>Conversions and arithmetic</td>
<td>0b0011</td>
<td>0b0010</td>
</tr>
</tbody>
</table>

SIMDHP, bits [23:20]

Advanced SIMD Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

<table>
<thead>
<tr>
<th>SIMDHP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds support for half-precision floating-point arithmetic.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 in an implementation without SIMD floating-point support.
- 0b0010 in an implementation with SIMD floating-point support that does not include the ARMv8.2-FP16 extension.
- 0b0011 in an implementation with SIMD floating-point support that includes the ARMv8.2-FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the FPHP field, meaning the permitted values are:

<table>
<thead>
<tr>
<th>Half Precision instructions supported</th>
<th>FPHP</th>
<th>SIMDHP</th>
</tr>
</thead>
<tbody>
<tr>
<td>No support</td>
<td>0b0000</td>
<td>0b0000</td>
</tr>
<tr>
<td>Conversions only</td>
<td>0b0010</td>
<td>0b0001</td>
</tr>
<tr>
<td>Conversions and arithmetic</td>
<td>0b0011</td>
<td>0b0010</td>
</tr>
</tbody>
</table>

SIMDSP, bits [19:16]

Advanced SIMD Single Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDSP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented. This value is permitted only if the SIMDiInt field is 0b0001.</td>
</tr>
</tbody>
</table>
All other values are reserved.

In Armv8-A, the permitted values are \texttt{0b0000} and \texttt{0b0001}.

**SIMDInt, bits [15:12]**

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDInt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>Implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are \texttt{0b0000} and \texttt{0b0001}.

**SIMDLS, bits [11:8]**

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDLS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>Implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are \texttt{0b0000} and \texttt{0b0001}.

**FPDNaN, bits [7:4]**

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode. Defined values are:

<table>
<thead>
<tr>
<th>FPD NaN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>Not implemented, or hardware supports only the Default NaN mode.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>Hardware supports propagation of NaN values.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are \texttt{0b0000} and \texttt{0b0001}.

**FPFtZ, bits [3:0]**

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation. Defined values are:

<table>
<thead>
<tr>
<th>FPFtZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>Not implemented, or hardware supports only the Flush-to-Zero mode of operation.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>Hardware supports full denormalized number arithmetic.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are \texttt{0b0000} and \texttt{0b0001}.

**Accessing the MVFR\textsubscript{1} EL1**

Accesses to this register use the following encodings:
MRS <Xt>, MVFR1_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>

  else
    return MVFR1_EL1;
  end;
elsif PSTATE.EL == EL2 then
  return MVFR1_EL1;
elsif PSTATE.EL == EL3 then
  return MVFR1_EL1;
The MVFR2_EL1 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with `MVFR0_EL1` and `MVFR1_EL1`.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D7.1.3.

**Configuration**

AArch64 System register MVFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register `MVFR2[31:0]`.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to MVFR2_EL1 are **UNKNOWN**.

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

**Attributes**

MVFR2_EL1 is a 64-bit register.

**Field descriptions**

The MVFR2_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>

OSDTRTX_EL1, OS Lock Data Transfer Register, Transmit

The OSDTRTX_EL1 characteristics are:

**Purpose**

Used for save/restore of DBGDTRTX_EL0. It is a component of the Debug Communications Channel.

**Configuration**

AArch64 System register OSDTRTX_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXext[31:0].

**Attributes**

OSDTRTX_EL1 is a 64-bit register.

**Field descriptions**

The OSDTRTX_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>31-0</td>
<td>Return DTRTX without side-effect</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**Bits [31:0]**

Return DTRTX without side-effect.

Reads of this register return the value in DTRTX and do not change TXfull.

Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter H4.

**Accessing the OSDTRTX_EL1**

Arm deprecates reads and writes of OSDTRTX_EL1 when the OS Lock is unlocked.

Accesses to this register use the following encodings:

```
MRS <Xt>, OSDTRTX_EL1
```

<table>

OSECCR_EL1, OS Lock Exception Catch Control Register

The OSECCR_EL1 characteristics are:

**Purpose**

Provides a mechanism for an operating system to access the contents of EDECCR that are otherwise invisible to software, so it can save/restore the contents of EDECCR over powerdown on behalf of the external debugger.

**Configuration**

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSECCR[31:0].

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to External register EDECCR[31:0].

If OSLSR_EL1.OSLK == 0, then OSECCR_EL1 returns an UNKNOWN value on reads and ignores writes.

**Attributes**

OSECCR_EL1 is a 64-bit register.

**Field descriptions**

The OSECCR_EL1 bit assignments are:

**When OSLSR_EL1.OSLK == 1:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

**Purpose**

Used to lock or unlock the OS Lock.

**Configuration**

AArch64 System register OSLAR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSLAR[31:0].

AArch64 System register OSLAR_EL1 bits [31:0] are architecturally mapped to External register OSLAR_EL1[31:0].

**Attributes**

OSLAR_EL1 is a 64-bit register.

**Field descriptions**

The OSLAR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | OSLK |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:1]**

Reserved, RES0.

**OSLK, bit [0]**

On writes to OSLAR_EL1, bit[0] is copied to the OS Lock.

Use OSLSR_EL1.OSLK to check the current status of the lock.

**Accessing the OSLAR_EL1**

Accesses to this register use the following encodings:

```
MSR OSLAR_EL1, <Xt>
```

<table>
<thead>
<tr>

        OSLAR_EL1 = X[t];
OSLR_EL1, OS Lock Status Register

The OSLR_EL1 characteristics are:

**Purpose**

Provides the status of the OS Lock.

**Configuration**

AArch64 System register OSLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSLR[31:0].

**Attributes**

OSLR_EL1 is a 64-bit register.

**Field descriptions**

The OSLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</th>
<th>RES0</th>
<th>OSLM[1]</th>
<th>nTT</th>
<th>OSLK</th>
<th>OSLM[0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td>RES0</td>
<td>OSLM[1]</td>
<td>nTT</td>
<td>OSLK</td>
<td>OSLM[0]</td>
</tr>
</tbody>
</table>

**Bits [63:4]**

Reserved, RES0.

**OSLM[1], bit [3]**

This field is bit[1] of OSLM[1:0].

OS lock model implemented. Identifies the form of OS save and restore mechanism implemented.

<table>
<thead>
<tr>
<th>OSLM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>OS Lock not implemented.</td>
</tr>
<tr>
<td>0b10</td>
<td>OS Lock implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

The OSLM field is split as follows:

- OSLM[1] is OSLSR_EL1[3].
- OSLM[0] is OSLSR_EL1[0].

**nTT, bit [2]**

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

**OSLK, bit [1]**

OS Lock Status.
OSLK, Meaning

<table>
<thead>
<tr>
<th>OSLK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>OS Lock unlocked.</td>
</tr>
<tr>
<td>0b1</td>
<td>OS Lock locked.</td>
</tr>
</tbody>
</table>

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

The following resets apply:

- On a Cold reset, this field resets to 1.
- On a Warm reset, the value of this field is unchanged.

OSLM[0], bit [0]

This field is bit[0] of OSLM[1:0].

See OSLM[1] for the field description.

Accessing the OSLSR_EL1

Accesses to this register use the following encodings:

PAR_EL1, Physical Address Register

The PAR_EL1 characteristics are:

**Purpose**

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

**Configuration**

AArch64 System register PAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register PAR[63:0].

**Attributes**

PAR_EL1 is a 64-bit register.

**Field descriptions**

The PAR_EL1 bit assignments are:

**When PAR_EL1.F == 0b0:**

<table>
<thead>
<tr>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- The PAR_EL1.{ATTR, SH} fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors.
- See the PAR_EL1.NS bit description for constraints on the value it returns.

**ATTR, bits [63:56]**

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR_EL1, MAIR_EL2, and MAIR_EL3.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally UNKNOWN value.

**Bits [55:52]**

Reserved, RES0.
PA[51:48], bits [51:48]

When ARMv8.2-LPA is implemented:

Extension to PA[47:12]. See PA[47:12] for more details.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, **RES**0.

PA[47:12], bits [47:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[47:12].

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, the PA[51:48] bits form the upper part of the address value. Otherwise the PA[51:48] bits are **RES**0.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are **RES**0.

This field resets to an architecturally **UNKNOWN** value.

Bit [11]

Reserved, **RES**1.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

This field resets to an architecturally **UNKNOWN** value.

NS, bit [9]

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, when **SCR_EL3.EEL2** is 1, this bit reflects the Security state of the intermediate physical address space of the translation for the instructions:

- In AArch64 state: **AT S1E1R**, **AT S1E1W**, **AT S1E1RP**, **AT S1E1WP**, **AT S1E0R**, and **AT S1E0W**.
- In AArch32 state: **ATS1CPR**, **ATS1CPW**, **ATS1CPRP**, **ATS1CPWP**, **ATS1CUR**, and **ATS1CUW**.

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is **UNKNOWN**.

This field resets to an architecturally **UNKNOWN** value.

SH, bits [8:7]

Shareability attribute, for the returned output address. Permitted values are:

<table>
<thead>
<tr>
<th>SH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

The value 0b01 is reserved.

**Note**
This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally **UNKNOWN** value.

**Bits [6:1]**

Reserved, RES0.

**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Address translation completed successfully.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**When PAR_EL1.F == 0b1:**

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

**IMPLEMENTATION DEFINED, bits [63:56]**

**IMPLEMENTATION DEFINED.**

This field resets to an architecturally **UNKNOWN** value.

**IMPLEMENTATION DEFINED, bits [55:52]**

**IMPLEMENTATION DEFINED.**

This field resets to an architecturally **UNKNOWN** value.

**IMPLEMENTATION DEFINED, bits [51:48]**

**IMPLEMENTATION DEFINED.**

This field resets to an architecturally **UNKNOWN** value.

**Bits [47:12]**

Reserved, RES0.

**Bit [11]**

Reserved, RES1.
Bit [10]

Reserved, RES0.

S, bit [9]

Indicates the translation stage at which the translation aborted:

<table>
<thead>
<tr>
<th>S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Translation aborted because of a fault in the stage 1 translation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Translation aborted because of a fault in the stage 2 translation.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

PTW, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

This field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status code, as shown in the Data Abort ESR encoding.
<table>
<thead>
<tr>
<th>FST</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>

    else
        PAR_EL1 = X[t];
    elsif PSTATE.EL == EL2 then
        PAR_EL1 = X[t];
    elsif PSTATE.EL == EL3 then
        PAR_EL1 = X[t];
```
PMBIDR_EL1, Profiling Buffer ID Register

The PMBIDR_EL1 characteristics are:

Purpose

Provides information to software as to whether the buffer can be programmed at the current Exception level.

Configuration

This register is present only when SPE is implemented. Otherwise, direct accesses to PMBIDR_EL1 are UNDEFINED.

Attributes

PMBIDR_EL1 is a 64-bit register.

Field descriptions

The PMBIDR_EL1 bit assignments are:

<table>

</tbody>
</table>

Bits [63:6]

Reserved, RES0.

F, bit [5]

Flag updates. Defines whether the address translation performed by the Profiling Buffer manages the Access Flag and dirty state.

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hardware management of the Access Flag and dirty state for accesses made by the Statistical Profiling Extension is always disabled for all translation stages.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hardware management for the Access Flag and dirty state for accesses made by the Statistical Profiling Extension is controlled in the same way as explicit memory accesses in the owning translation regime.</td>
</tr>
</tbody>
</table>

If hardware management of the Access Flag is disabled for a stage of translation, an access to Page or Block with the Access flag bit not set in the descriptor will generate an Access Flag fault.

If hardware management of the dirty state is disabled for a stage of translation, an access to a Page or Block will ignore the Dirty Bit Modifier in the descriptor might generate a Permission fault, depending on the values of the access permission bits in the descriptor.

P, bit [4]

Programming not allowed. The Profiling Buffer is owned by a higher Exception level or the other Security state.
Meaning

0b0   Profiling Buffer is owned by the current or a lower Exception level in the current Security state.
0b1   Profiling Buffer is owned by a higher Exception level or the other Security state.

The value read from this field depends on the current Exception level and the Effective values of \texttt{MDCR\_EL3\_NSPB} and \texttt{MDCR\_EL2\_E2PB}:

- If EL3 is implemented, and either \texttt{MDCR\_EL3\_NSPB == 0b00} or \texttt{MDCR\_EL3\_NSPB == 0b01}, this bit reads as one from:
  - Non-secure EL1.
  - Non-secure EL2.
  - If Secure EL2 is implemented and enabled, and \texttt{MDCR\_EL2\_E2PB == 0b00}, Secure EL1.
- If EL3 is implemented, and either \texttt{MDCR\_EL3\_NSPB == 0b10} or \texttt{MDCR\_EL3\_NSPB == 0b11}, this bit reads as one from:
  - Secure EL1.
  - If Secure EL2 is implemented, Secure EL2.
  - If EL2 is implemented and \texttt{MDCR\_EL2\_E2PB == 0b00}, Non-secure EL1.
- If EL3 is not implemented, EL2 is implemented, and \texttt{MDCR\_EL2\_E2PB == 0b00}, this bit reads as one from EL1.
- Otherwise, this bit reads as zero.

\textbf{Align, bits [3:0]}

Defines the minimum alignment constraint for \texttt{PMBPTR\_EL1}. If this field is non-zero, then the PE must pad every record up to a multiple of this size.

\begin{table}[h]
\centering
\begin{tabular}{|c|c|}
\hline
\textbf{Align} & \textbf{Meaning} \\
\hline
0b0000 & Byte \\
0b0001 & Halfword. \\
0b0010 & Word. \\
0b0011 & Doubleword. \\
0b0100 & 16 Bytes. \\
0b0101 & 32 Bytes. \\
0b0110 & 64 Bytes. \\
0b0111 & 128 Bytes. \\
0b1000 & 256 Bytes. \\
0b1001 & 512 Bytes. \\
0b1010 & 1KB. \\
0b1011 & 2KB. \\
\hline
\end{tabular}
\end{table}

For more information, see Restrictions on the current write pointer.

\section*{Accessing the PMBIDR\_EL1}

Accesses to this register use the following encodings:

\begin{verbatim}
MRS <Xt>, PMBIDR_EL1
\end{verbatim}

\begin{table}[h]
\centering
\begin{tabular}{|c|c|c|c|c|}
\hline
\textbf{op0} & \textbf{op1} & \textbf{CRn} & \textbf{CRm} & \textbf{op2} \\
\hline
0b11 & 0b000 & 0b1001 & 0b1010 & 0b111 \\
\hline
\end{tabular}
\end{table}

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  return PMBIDR_EL1;
elsif PSTATE.EL == EL2 then
  return PMBIDR_EL1;
elsif PSTATE.EL == EL3 then
  return PMBIDR_EL1;
The PMBLIMITR_EL1 characteristics are:

**Purpose**

Defines the upper limit for the profiling buffer, and enables the profiling buffer

**Configuration**

This register is present only when SPE is implemented. Otherwise, direct accesses to PMBLIMITR_EL1 are UNDEFINED.

**Attributes**

PMBLIMITR_EL1 is a 64-bit register.

**Field descriptions**

The PMBLIMITR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>LIMIT</td>
</tr>
<tr>
<td>62</td>
<td>RES0</td>
</tr>
<tr>
<td>61</td>
<td>FM</td>
</tr>
<tr>
<td>60</td>
<td>E</td>
</tr>
</tbody>
</table>

**LIMIT, bits [63:12]**

Limit address. PMBLIMITR_EL1.LIMIT:Zeros(12) is the address of the first byte in memory after the last byte in the profiling buffer. If the smallest implemented translation granule is not 4KB, then bits[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value, Log2(smallest implemented translation granule).

This field resets to an architecturally UNKNOWN value.

**Bits [11:3]**

Reserved, RES0.

**FM, bits [2:1]**

Fill mode

<table>
<thead>
<tr>
<th>FM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Stop collection and raise maintenance interrupt on buffer fill.</td>
</tr>
</tbody>
</table>

All other values are reserved. If this field is programmed with a reserved value, the PE behaves as if this field has a defined value, other than for a direct read of the register. Software must not rely on the behavior of reserved values, as they might change in a future version of the architecture.

This field resets to an architecturally UNKNOWN value.

**E, bit [0]**

Profiling Buffer enable
### PMBLIMITR_EL1, Profiling Buffer Limit Address Register

<table>

PMBPTR_EL1, Profiling Buffer Write Pointer Register

The PMBPTR_EL1 characteristics are:

**Purpose**

Defines the current write pointer for the profiling buffer.

**Configuration**

This register is present only when SPE is implemented. Otherwise, direct accesses to PMBPTR_EL1 are undefined.

**Attributes**

PMBPTR_EL1 is a 64-bit register.

**Field descriptions**

The PMBPTR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**PTR**, bits [63:0]

Current write address. Defines the virtual address of the next entry to be written to the buffer.

The architecture places restrictions on the values software can write to the pointer. For more information see 'Restrictions on the current write pointer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D6.3.5.

**Note**

As a result, an implementation might treat some of bits[M:0], where M is defined by PMBIDR_EL1.Align, as RES0.

On a management interrupt, PMBPTR_EL1 is frozen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMBPTR_EL1**

Accesses to this register use the following encodings:

<td>0b100101</td>
<td>Stage 2 Data Abort on write to Profiling Buffer.</td>
<td>MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer</td>
</tr>
</tbody>
</table>

All other values are reserved. Reserved values might be defined in a future version of the architecture.

Writing a reserved value to this field will make the value of this field UNKNOWN. Values that are not supported act as reserved values when writing to this register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bits [25:20]

Reserved, RES0.

DL, bit [19]

Partial record lost.

Following a buffer management event other than an asynchronous External abort, indicates whether the last record written to the Profiling Buffer is complete.

<table>
<thead>
<tr>
<th>DL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PMBPTR_EL1 points to the first byte after the last complete record written to the Profiling Buffer.</td>
</tr>
<tr>
<td>0b1</td>
<td>Part of a record was lost because of a buffer management event or synchronous External abort. PMBPTR_EL1 might not point to the first byte after the last complete record written to the buffer, and so restarting collection might result in a data record stream that software cannot parse. All records prior to the last record have been written to the buffer.</td>
</tr>
</tbody>
</table>

When the buffer management event was because of an asynchronous external abort, this bit is set to 1 and software must not assume that any valid data has been written to the Profiling Buffer.

This bit is RES0 if the PE never sets this bit as a result of a buffer management event caused by an asynchronous External abort.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [18]

External abort.

<table>
<thead>
<tr>
<th>EA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An external abort has not been asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>An external abort has been asserted and detected by the Statistical Profiling Extension.</td>
</tr>
</tbody>
</table>

This bit is RES0 if the PE never sets this bit as the result of an External abort.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [17]

Service

<table>
<thead>
<tr>
<th>S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PMBIRQ is not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMBIRQ is asserted. All profiling data has either been written to the buffer or discarded.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

COLL, bit [16]

Collision detected.

<table>
<thead>
<tr>
<th>COLL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No collision events detected.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one collision event was recorded.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
MSS, bits [15:0]

Management Event Specific Syndrome.
Contains syndrome specific to the management event.
The syndrome contents for each management event are described in the following sections.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer**

<table>

PMCCFILTR_EL0, Performance Monitors Cycle Count Filter Register

The PMCCFILTR_EL0 characteristics are:

**Purpose**

Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

**Configuration**

AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCCFILTR[31:0].

AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to External register PMCCFILTR_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR_EL0 are UNDEFINED.

**Attributes**

PMCCFILTR_EL0 is a 64-bit register.

**Field descriptions**

The PMCCFILTR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>62</td>
<td>P, Privileged filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.</td>
</tr>
<tr>
<td>30</td>
<td>U, User filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>P</td>
</tr>
<tr>
<td>30</td>
<td>P</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.
<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count cycles in EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

**NSK, bit [29]**

When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

- If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.
- Otherwise, cycles in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

Otherwise:

Reserved, RES0.

**NSU, bit [28]**

When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

- If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.
- Otherwise, cycles in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

Otherwise:

Reserved, RES0.

**NSH, bit [27]**

When EL2 is implemented:

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

- If Secure EL2 is implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

<table>
<thead>
<tr>
<th>NSH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not count cycles in EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count cycles in EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

Otherwise:

Reserved, RES0.

**M, bit [26]**

When EL3 is implemented:

Secure EL3 filtering bit.

- If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.
Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

---

**Note**

This field is not visible in the AArch32 PMCCFILTR System register.

---

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

---

**Otherwise:**

Reserved, RES0.

---

**Bit [25]**

Reserved, RES0.

---

**SH, bit [24]**

**When ARMv8.4-SecEL2 is implemented:**

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted. Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is not implemented or is disabled, this field is RES0.

---

**Note**

This field is not visible in the AArch32 PMCCFILTR System register.

---

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

---

**Otherwise:**

Reserved, RES0.

---

**T, bit [23]**

**When TME is implemented:**

Non-transactional state filtering bit.

<table>
<thead>
<tr>
<th>T</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This bit has no effect on filtering of cycles.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in Non-transactional state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

---

**Otherwise:**

Reserved, RES0.

---

**Bits [22:0]**

Reserved, RES0.
Accessing the PMCCFILTR_EL0

PMCCFILTR_EL0 can also be accessed by using PMXEVTYPER_EL0 with PMSELR_EL0.SEL set to 0b11111.

Accesses to this register use the following encodings:

MRS <Xt>, PMCCFILTR_EL0

The PMCCNTR_EL0 characteristics are:

**Purpose**

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See 'Time as measured by the Performance Monitors cycle counter' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for more information.

PMCCFILTR_EL0 determines the modes and states in which the PMCCNTR_EL0 can increment.

**Configuration**

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register PMCCNTR[63:0].

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to External register PMCCNTR_EL0[63:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCCNTR_EL0 are UNDEFINED.

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR_EL0 continues to increment when clocks are stopped by WFI and WFE instructions.

**Attributes**

PMCCNTR_EL0 is a 64-bit register.

**Field descriptions**

The PMCCNTR_EL0 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     | CCNT |
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   | CCNT |

**CCNT, bits [63:0]**

Cycle count. Depending on the values of PMCR_EL0.{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR_EL0.C sets this field to 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMCCNTR_EL0**

PMCEID0_EL0, Performance Monitors Common Event Identification register 0

The PMCEID0_EL0 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0000 to 0x001F and 0x4000 to 0x401F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

Note

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEID<n>_EL0 registers see The section describing 'Event numbers and common events' in chapter D5 'The Performance Monitors Extension' of the Arm Architecture Reference Manual, for Armv8-A architecture profile.

Configuration

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCEID0[31:0].

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to AArch32 System register PMCEID2[31:0].

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to External register PMCEID0[31:0].

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to External register PMCEID2[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCEID0_EL0 are UNDEFINED.

Attributes

PMCEID0_EL0 is a 64-bit register.

Field descriptions

The PMCEID0_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| IDhi<n>, bit [n+32], for n = 0 to 31 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  |
| IDhi<n>, bit [n+32], for n = 0 to 31 |

When ARMv8.1-PMU is implemented:

IDhi[n] corresponds to common event (0x4000 + n).

For each bit:
A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

---

**Accessing the PMCEID0_EL0**

Accesses to this register use the following encodings:

\[
\begin{array}{ccccc}
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
0b11 & 0b011 & 0b1001 & 0b1100 & 0b110 \\
\end{array}
\]
if PSTATE_EL == EL0 then

PMCEID1_EL0, Performance Monitors Common Event Identification register 1

The PMCEID1_EL0 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0020 to 0x003F and 0x4020 to 0x403F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

---

**Note**

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

---

For more information about the common events and the use of the PMCEID<n>_EL0 registers see The section describing 'Event numbers and common events' in chapter D5 'The Performance Monitors Extension' of the Arm Architecture Reference Manual, for Armv8-A architecture profile.

**Configuration**

AArch64 System register PMCEID1_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCEID1[31:0].

AArch64 System register PMCEID1_EL0 bits [63:32] are architecturally mapped to AArch32 System register PMCEID3[31:0].

AArch64 System register PMCEID1_EL0 bits [31:0] are architecturally mapped to External register PMCEID1[31:0].

AArch64 System register PMCEID1_EL0 bits [63:32] are architecturally mapped to External register PMCEID3[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCEID1_EL0 are UNDEFINED.

**Attributes**

PMCEID1_EL0 is a 64-bit register.

**Field descriptions**

The PMCEID1_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>IDhi&lt;n&gt;, bit [n+32], for n = 0 to 31</td>
</tr>
<tr>
<td>30</td>
<td>D31</td>
</tr>
<tr>
<td>29</td>
<td>D30</td>
</tr>
<tr>
<td>28</td>
<td>D29</td>
</tr>
<tr>
<td>27</td>
<td>D28</td>
</tr>
<tr>
<td>26</td>
<td>D27</td>
</tr>
<tr>
<td>25</td>
<td>D26</td>
</tr>
<tr>
<td>24</td>
<td>D25</td>
</tr>
<tr>
<td>23</td>
<td>D24</td>
</tr>
<tr>
<td>22</td>
<td>D23</td>
</tr>
<tr>
<td>21</td>
<td>D22</td>
</tr>
<tr>
<td>20</td>
<td>D21</td>
</tr>
<tr>
<td>19</td>
<td>D20</td>
</tr>
<tr>
<td>18</td>
<td>D19</td>
</tr>
<tr>
<td>17</td>
<td>D18</td>
</tr>
<tr>
<td>16</td>
<td>D17</td>
</tr>
<tr>
<td>15</td>
<td>D16</td>
</tr>
<tr>
<td>14</td>
<td>D15</td>
</tr>
<tr>
<td>13</td>
<td>D14</td>
</tr>
<tr>
<td>12</td>
<td>D13</td>
</tr>
<tr>
<td>11</td>
<td>D12</td>
</tr>
<tr>
<td>10</td>
<td>D11</td>
</tr>
<tr>
<td>9</td>
<td>D10</td>
</tr>
<tr>
<td>8</td>
<td>D9</td>
</tr>
<tr>
<td>7</td>
<td>D8</td>
</tr>
<tr>
<td>6</td>
<td>IDhi&lt;n&gt;, bit [n+32], for n = 0 to 31</td>
</tr>
</tbody>
</table>

When Armv8.1-PMU is implemented:

IDhi[n] corresponds to common event (0x4020 + n).

For each bit:
A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

**Otherwise:**

Reserved, RES0.

**ID<n>, bit [n], for n = 0 to 31**

ID[n] corresponds to common event (0x0020 + n).

For each bit:

<table>
<thead>
<tr>
<th>ID&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The common event is not implemented, or not counted.</td>
</tr>
<tr>
<td>0b1</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

**Accessing the PMCEID1_EL0**

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b011</td>
<td>0b1001</td>
<td>0b1100</td>
<td>0b111</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    if !ELUsingAArch32(EL1) && PMUSERENR_EL0.EN == '0' then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    end if
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && MDCR_EL2.TPM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif HaveEL(EL3) && !ELUsingAArch32(EL3) && MDCR_EL3.TPM == '1' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return PMCEID1_EL0;
    end if
elsif PSTATE.EL == EL1 then

The PMCNTENCLR_EL0 characteristics are:

**Purpose**

Disables the Cycle Count Register, **PMCCNTR_EL0**, and any implemented event counters **PMEVCNTR<n>**. Reading this register shows which counters are enabled.

**Configuration**

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register **PMCNTENCLR[31:0]**.

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to External register **PMCNTENCLR_EL0[31:0]**.

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCNTENCLR_EL0 are undefined.

**Attributes**

PMCNTENCLR_EL0 is a 64-bit register.

**Field descriptions**

The PMCNTENCLR_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | C | P<n>, bit [n] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

Reserved, RES0.

**C, bit [31]**

**PMCCNTR_EL0** disable bit. Disables the cycle counter register. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter is enabled. When written, disables the cycle counter.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**P<n>, bit [n], for n = 0 to 30**

Event counter disable bit for **PMEVCNTR<n>_EL0**.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in **MDCR_EL2.HPMN**. Otherwise, N is the value in **PMCR_EL0.N**.
<table>
<thead>
<tr>

    end
elsif PSTATE.EL == EL3 then
    PMCNTENSET_EL0 = X[t];
The PMCR_EL0 characteristics are:

**Purpose**

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

**Configuration**

AArch64 System register PMCR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCR[31:0].

AArch64 System register PMCR_EL0 bits [7:0] are architecturally mapped to External register PMCR_EL0[7:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCR_EL0 are UNDEFINED.

**Attributes**

PMCR_EL0 is a 64-bit register.

**Field descriptions**

The PMCR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit 63-32</th>
<th>Bit 31-24</th>
<th>Bit 23-16</th>
<th>Bit 15-8</th>
<th>Bit 7-0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMP</td>
<td>PMCR_EL0.IDCODE</td>
<td>N</td>
<td>RES0</td>
<td>LP</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**IMP, bits [31:24]**

Implementer code. This field has an IMPLEMENTATION DEFINED value.

If this field is zero, then PMCR_EL0.IDCODE is RES0 and software must use the MIDR_EL1 to identify the PE.

Otherwise, this field and PMCR_EL0.IDCODE identifies the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as MIDR_EL1.Implementer.

Access to this field is RO.

**IDCODE, bits [23:16]**

When PMCR_EL0.IMP != 0x00:

Identification code. This field has an IMPLEMENTATION DEFINED value.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

Access to this field is RO.
Otherwise:

Reserved, RES0.

**N, bits [15:11]**

Indicates the number of event counters implemented. This value is in the range of 0b00000-0b11111. If the value is 0b00000 then only PMCCNTR_EL0 is implemented. If the value is 0b11111 PMCCNTR_EL0 and 31 event counters are implemented.

When EL2 is implemented and enabled for the current Security state, reads of this field from EL1 and EL0 return the value of MDCR_EL2.HPMN.

Access to this field is RO.

**Bits [10:8]**

Reserved, RES0.

**LP, bit [7]**

When ARMv8.5-PMU is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

<table>
<thead>
<tr>
<th>LP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;n&gt;_EL0[31:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;n&gt;_EL0[63:0].</td>
</tr>
</tbody>
</table>

If EL2 is implemented and MDCR_EL2.HPMN or HDCR HPMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [HDCR_HPMN..(PMCR_EL0.N-1)] or [MDCR_EL2.HPMN..(PMCR_EL0.N-1)].

**Note**

The effect of MDCR_EL2.HPMN or HDCR_HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of MDCR_EL2.HPMN or HDCR_HPMN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**LC, bit [6]**

When AArch32 is supported at any Exception level:

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

<table>
<thead>
<tr>
<th>LC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[31:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[63:0].</td>
</tr>
</tbody>
</table>

Arm deprecates use of PMCR_EL0.LC = 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES1.

**DP, bit [5]**

When EL3 is implemented or (ARMv8.1-PMU is implemented and EL2 is implemented):

Disable cycle counter when event counting is prohibited.

<table>
<thead>
<tr>
<th>DP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR_EL0 is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>When event counting for counters in the range [0, (MDCR_EL2.HPMN-1)] is prohibited, cycle counting by PMCCNTR_EL0 is disabled.</td>
</tr>
</tbody>
</table>

For more information about the interaction between the Performance Monitors and EL3, see ‘Effect of EL3 and EL2’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**X, bit [4]**

When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

<table>
<thead>
<tr>
<th>X</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not export events.</td>
</tr>
<tr>
<td>0b1</td>
<td>Export events where not prohibited.</td>
</tr>
</tbody>
</table>

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RAZ/WI.

**D, bit [3]**

When AArch32 is supported at any Exception level:

Clock divider.

<table>
<thead>
<tr>
<th>D</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When enabled, PMCCNTR_EL0 counts every clock cycle.</td>
</tr>
<tr>
<td>0b1</td>
<td>When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.</td>
</tr>
</tbody>
</table>

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset PMCCNTR_EL0 to zero.</td>
</tr>
</tbody>
</table>

This bit is always RAZ.

Note

Resetting PMCCNTR_EL0 does not change the cycle counter overflow bit.

The value of PMCR_EL0.LC is ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is WO.

P, bit [1]

Event counter reset. The effects of writing to this bit are:

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset all event counters accessible in the current Exception level, not including PMCCNTR_EL0, to zero.</td>
</tr>
</tbody>
</table>

This bit is always RAZ.

In EL0 and EL1:

- If EL2 is implemented and enabled in the current Security state, and MDCR_EL2.HPMN is less than PMCR_EL0.N, a write of 1 to this bit does not reset event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)].
- If EL2 is not implemented, EL2 is disabled in the current Security state, or MDCR_EL2.HPMN equals PMCR_EL0.N, a write of 1 to this bit resets all the event counters.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

Note

Resetting the event counters does not change the event counter overflow bits.

If ARMv8.5-PMU is implemented, the values of MDCR_EL2.HLP and PMCR_EL0.LP are ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is WO.

E, bit [0]

Enable.

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All event counters in the range [0..(PMN-1)] and PMCCNTR_EL0, are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>All event counters in the range [0..(PMN-1)] and PMCCNTR_EL0, are enabled by PMCNTENSEL_EL0.</td>
</tr>
</tbody>
</table>
If EL2 is implemented, then:

- If EL2 is using AArch32, PMN is **HDCR HPMN**.
- If EL2 is using AArch64, PMN is **MDCR_EL2 HPMN**.
- If PMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range \([\text{PMN}..(\text{PMCR_EL0.N}-1)]\).

If EL2 is not implemented, PMN is PMCR_EL0.N.

**Note**

The effect of **MDCR_EL2 HPMN** or **HDCR HPMN** on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of **MDCR_EL2 HPMN** or **HDCR HPMN**.

On a Warm reset, this field resets to 0.

### Accessing the PMCR_EL0

Accesses to this register use the following encodings:

**MRS <Xt>, PMCR_EL0**

<table>
<thead>
<tr>

    endif

PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

**Purpose**

Holds event counter n, which counts events, where n is 0 to 30.

**Configuration**

AArch64 System register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVCNTR<n>[31:0].

AArch64 System register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to External register PMEVCNTR<n>_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMEVCNTR<n>_EL0 are UNDEFINED.

**Attributes**

PMEVCNTR<n>_EL0 is a 64-bit register.

**Field descriptions**

The PMEVCNTR<n>_EL0 bit assignments are:

**When ARMv8.5-PMU is implemented:**

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**Event counter n**

Bits [63:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**RES0**

**Event counter n**

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the PMEVCNTR<n>_EL0**

PMEVCNTR<n>_EL0 can also be accessed by using PMXEVCNTR_EL0 with PMSELR_EL0.SEL set to the value of <n>.

If ARMv8.6-FGT is implemented and <n> is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of PMEVCNTR<n>_EL0 is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If ARMv8.6-FGT is not implemented and <n> is greater than or equal to the number of accessible counters, then reads and writes of PMEVCNTR<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

**Note**

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.{ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters. See MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings:

```
MRS <Xt>, PMEVCNTR<n>_EL0
```

<table>

PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

**Purpose**

Configures event counter n, where n is 0 to 30.

**Configuration**

AArch64 System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVTYPER<n>[31:0].

AArch64 System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to External register PMEVTYPER<n>_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPER<n>_EL0 are UNDEFINED.

**Attributes**

PMEVTYPER<n>_EL0 is a 64-bit register.

**Field descriptions**

The PMEVTYPER<n>_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>User filtering bit. Controls counting in EL0.</td>
</tr>
<tr>
<td>29</td>
<td>evtCount[15:10]</td>
</tr>
<tr>
<td>28</td>
<td>evtCount[9:0]</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P, bit [31]**

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit.

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count events in EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count events in EL1.</td>
</tr>
</tbody>
</table>

**U, bit [30]**

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit.
U | Meaning
---|---
0b0 | Count events in EL0.
0b1 | Do not count events in EL0.

On a Warm reset, this field resets to an architecturally unknown value.

**NSK, bit [29]**

*When EL3 is implemented:*

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.

**NSU, bit [28]**

*When EL3 is implemented:*

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.

**NSH, bit [27]**

*When EL2 is implemented:*

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<n>_EL0.SH bit.

<table>
<thead>
<tr>
<th>NSH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not count events in EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count events in EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.

**M, bit [26]**

*When EL3 is implemented:*

Secure EL3 filtering bit.
If the value of this bit is equal to the value of the `PMEVTYPER<n>_EL0.P` bit, events in Secure EL3 are counted. Otherwise, events in Secure EL3 are not counted.

Most applications can ignore this field and set its value to `0b0`.

**Note**

This field is not visible in the AArch32 `PMEVTYPER<n>` System register.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

**Otherwise:**

Reserved, `RES0`.

**MT, bit [25]**

When (ARMv8.6-MTPMU is implemented and enabled) or an IMPLEMENTATION DEFINED multi-threaded PMU Extension is implemented:

**Multithreading.**

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count events only on controlling PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count events from any PE with the same affinity at level 1 and above as this PE.</td>
</tr>
</tbody>
</table>

**Note**

- When the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

**Otherwise:**

Reserved, `RES0`.

**SH, bit [24]**

When ARMv8.4-SecEL2 is implemented and EL3 is implemented:

**Secure EL2 filtering.**

If the value of this bit is not equal to the value of the `PMEVTYPER<n>_EL0.NSH` bit, events in Secure EL2 are counted. Otherwise, events in Secure EL2 are not counted.

**Note**

This field is not visible in the AArch32 `PMEVTYPER<n>` System register.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

**Otherwise:**

Reserved, `RES0`. 

PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30
**T, bit [23]**

When TME is implemented:

Transactional state filtering bit. Controls counting in Transactional state. The possible values of this bit are:

<table>
<thead>
<tr>
<th>T</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This bit has no effect on the filtering of events.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count events in Transactional state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [22:16]**

Reserved, RES0.

**evtCount[15:10], bits [15:10]**

When ARMv8.1-PMU is implemented:

Extension to evtCount[9:0]. See evtCount[9:0] for more details.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**evtCount[9:0], bits [9:0]**

Event to count. The event number of the event that is counted by event counter `PMEVCNTR<n>_EL0`.

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in Allocation of the PMU event number space.

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- If 16-bit evtCount is implemented, for the range 0x4000 to 0x403F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

**Note**

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the PMEVTPYPER<n>_EL0

PMEVTPYPER<n>_EL0 can also be accessed by using PMXEVTPYPER_EL0 with PMSELR_EL0, SEL set to n.

If ARMv8.6-FGT is implemented and <n> is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of PMEVTPYPER<n>_EL0 is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If ARMv8.6-FGT is not implemented and <n> is greater than or equal to the number of accessible counters, then reads and writes of PMEVTPYPER<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0, EN.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2, HPMN identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters. See MDCR_EL2, HPMN for more details.

Accesses to this register use the following encodings:

PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

**Purpose**

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Configuration**

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENCLR[31:0].

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to External register PMINTENCLR_EL1[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMINTENCLR_EL1 are UNDEFINED.

**Attributes**

PMINTENCLR_EL1 is a 64-bit register.

**Field descriptions**

The PMINTENCLR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| C | RES0 | P<n>, bit [n] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

Reserved, RES0.

**C, bit [31]**

PMCCNTR_EL0 overflow interrupt request disable bit. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.</td>
</tr>
</tbody>
</table>

**P<n>, bit [n], for n = 0 to 30**

Event counter overflow interrupt request disable bit for PMEVCNTR<n>_EL0.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.
When read, means that the PMEVCNTR\textsubscript{n\_EL0} event counter interrupt request is disabled. When written, has no effect.

When read, means that the PMEVCNTR\textsubscript{n\_EL0} event counter interrupt request is enabled. When written, disables the PMEVCNTR\textsubscript{n\_EL0} interrupt request.

On a Warm reset, this field resets to an architecturally \textit{UNKNOWN} value.

PMINTENSE_SET_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSE_SET_EL1 characteristics are:

**Purpose**

Enables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Configuration**

AArch64 System register PMINTENSE_SET_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENSE_SET[31:0].

AArch64 System register PMINTENSE_SET_EL1 bits [31:0] are architecturally mapped to External register PMINTENSE_SET_EL1[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMINTENSE_SET_EL1 are UNDEFINED.

**Attributes**

PMINTENSE_SET_EL1 is a 64-bit register.

**Field descriptions**

The PMINTENSE_SET_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| C  | RES0 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**Bits [63:32]**

Reserved, RES0.

**C, bit [31]**

PMCCNTR_EL0 overflow interrupt request enable bit. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 0 to 30**

Event counter overflow interrupt request enable bit for PMEVCNTR<n>_EL0.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.
Meaning
---
0b0 When read, means that the PMEVCNTR<\text{n}> EL0 event counter interrupt request is disabled. When written, has no effect.
0b1 When read, means that the PMEVCNTR<\text{n}> EL0 event counter interrupt request is enabled. When written, enables the PMEVCNTR<\text{n}> EL0 interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear Register

The PMOVSCLR_EL0 characteristics are:

**Purpose**

Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<n>. Writing to this register clears these bits.

**Configuration**

AArch64 System register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSR[31:0].

AArch64 System register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to External register PMOVSLR_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMOVSCLR_EL0 are UNDEFINED.

**Attributes**

PMOVSCLR_EL0 is a 64-bit register.

**Field descriptions**

The PMOVSCLR_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| C  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| RES0 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [63:32]**

Reserved, RES0.

**C, bit [31]**

Cycle counter overflow clear bit.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.</td>
</tr>
</tbody>
</table>

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 0 to 30**

Event counter overflow clear bit for PMEVCNTR<n>_EL0.
If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that PMEVCNTR&lt;n&gt;_EL0 has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that PMEVCNTR&lt;n&gt;_EL0 has overflowed since this bit was last cleared. When written, clears the PMEVCNTR&lt;n&gt;_EL0 overflow bit to 0.</td>
</tr>
</tbody>
</table>

If ARMv8.5-PMU is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMEVCNTR<n>_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMOVSCLR_EL0**

PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET_EL0 characteristics are:

**Purpose**

Sets the state of the overflow bit for the Cycle Count Register, **PMCCNTR_EL0**, and each of the implemented event counters **PMEVCNTR<n>**.

**Configuration**

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register **PMOVSSET[31:0]**.

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to External register **PMOVSSET_EL0[31:0]**.

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMOVSSET_EL0 are **UNDEFINED**.

**Attributes**

PMOVSSET_EL0 is a 64-bit register.

**Field descriptions**

The PMOVSSET_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td><strong>RES0</strong></td>
</tr>
<tr>
<td>62</td>
<td><strong>C</strong></td>
</tr>
<tr>
<td>31</td>
<td><strong>P&lt;n&gt;</strong>, bit [n]</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, **RES0**.

**C, bit [31]**

Cycle counter overflow set bit.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.</td>
</tr>
</tbody>
</table>

**PMCR_EL0.LC** controls whether an overflow is detected from unsigned overflow of **PMCCNTR_EL0[31:0]** or unsigned overflow of **PMCCNTR_EL0[63:0]**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**P<n>**, bit [n], for n = 0 to 30

Event counter overflow set bit for **PMEVCNTR<n> EL0**.
If \( N \) is less than 31, then bits \([30: N]\) are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, \( N \) is the value in \text{MDCR\_EL2.HPMN}. Otherwise, \( N \) is the value in \text{PMCR\_EL0.N}.

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that \text{PMEVcnTR&lt;n&gt;_EL0} has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that \text{PMEVcnTR&lt;n&gt;_EL0} has overflowed since this bit was last cleared. When written, sets the \text{PMEVcnTR&lt;n&gt;_EL0} overflow bit to 1.</td>
</tr>
</tbody>
</table>

If ARMv8.5-PMU is implemented, \text{MDCR\_EL2.HLP} and \text{PMCR\_EL0.LP} control whether an overflow is detected from unsigned overflow of \text{PMEVCNTR<n>_EL0[31:0]} or unsigned overflow of \text{PMEVCNTR<n>_EL0[63:0]}.

On a Warm reset, this field resets to an architecturally \text{UNKNOWN} value.

### Accessing the PMOVSSET\_EL0

Accesses to this register use the following encodings:

MRS \(<Xt>, \text{PMOVSSET}\_\text{EL0}\)

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>

The PMSCR_EL1 characteristics are:

### Purpose

Provides EL1 controls for Statistical Profiling

### Configuration

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSCR_EL1 are UNDEFINED.

### Attributes

PMSCR_EL1 is a 64-bit register.

### Field descriptions

The PMSCR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>62-61</td>
<td></td>
<td></td>
</tr>
<tr>
<td>59-60</td>
<td></td>
<td></td>
</tr>
<tr>
<td>49-50</td>
<td></td>
<td></td>
</tr>
<tr>
<td>39-40</td>
<td></td>
<td></td>
</tr>
<tr>
<td>29-30</td>
<td>RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>19-20</td>
<td></td>
<td></td>
</tr>
<tr>
<td>9-10</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0-1</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Bits [63:8]

Reserved, RES0.

#### PCT, bits [7:6]

**When EL2 is implemented:**

Physical Timestamp. If timestamp sampling is enabled and the Profiling Buffer is owned by EL1, requests which timestamp counter value is collected.

If ARMv8.6-ECV is implemented, this is a two bit field as shown. Otherwise, bit[7] is RES0.

<table>
<thead>
<tr>
<th>PCT</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Virtual counter, CNTVCT_EL0 is</td>
<td>0b00</td>
</tr>
<tr>
<td></td>
<td>collected.</td>
<td></td>
</tr>
<tr>
<td>0b01</td>
<td>Physical counter, CNTPCT_EL0 is</td>
<td>0b01</td>
</tr>
<tr>
<td></td>
<td>collected.</td>
<td></td>
</tr>
<tr>
<td>0b11</td>
<td>Physical counter, CNTPCT_EL0 minus</td>
<td>When ARMv8.6-ECV is</td>
</tr>
<tr>
<td></td>
<td>CNTPOFF_EL2 is collected.</td>
<td>implemented</td>
</tr>
</tbody>
</table>

If the Profiling Buffer owning Exception level is EL2, this field is ignored.

If the Profiling Buffer owning Exception level is EL1, this field is combined with PMSCR_EL2.PCT to determine which timestamp counter value is collected. For more information, see 'Controlling the data that is collected' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

When EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if either of the following are true:

- CNTHCTL_EL2.ECV is 0.
- SCR_EL3.ECVEn is 0.
- HCR_EL2.(E2H, TGE) is \{1, 1\}.
On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

Otherwise:

Physical Timestamp. Reserved. This field reads as `0b01` and ignores writes. Software should treat this field as UNK/SBZP.

When EL2 is not implemented, the Effective values of `CNTVOFF_EL2` and `CNTPOFF_EL2` are zero, meaning the virtual counter and physical counter have the same value.

**TS, bit [5]**

Timestamp enable.

<table>
<thead>
<tr>
<th>TS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timestamp sampling disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timestamp sampling enabled.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE if EL2 is implemented and the Profiling Buffer is owned by EL2. For more information, see 'Controlling the data that is collected' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

**PA, bit [4]**

Physical Address sample enable.

<table>
<thead>
<tr>
<th>PA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Physical addresses are not collected.</td>
</tr>
<tr>
<td>0b1</td>
<td>Physical addresses are collected.</td>
</tr>
</tbody>
</table>

If EL2 is implemented:

- If the Profiling Buffer is owned by EL1, this bit is combined with `PMSCR_EL2.PA` to determine which address is collected. For more information, see 'Controlling the data that is collected' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
- If the Profiling Buffer is owned by EL2, this bit is ignored by the PE.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

**CX, bit [3]**

`CONTEXTIDR_EL1` sample enable.

<table>
<thead>
<tr>
<th>CX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><code>CONTEXTIDR_EL1</code> is not collected.</td>
</tr>
<tr>
<td>0b1</td>
<td><code>CONTEXTIDR_EL1</code> is collected.</td>
</tr>
</tbody>
</table>

If EL2 is implemented and enabled in the current Security state when an operation is sampled:

- If the PE is at EL2, this bit is ignored by the PE.
- If `HCR_EL2.TGE == 1`, this bit is ignored by the PE.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

**Bit [2]**

Reserved, RES0.

**E1SPE, bit [1]**

EL1 Statistical Profiling Enable.
**E1SPE, bit [0]**

EL1 Statistical Profiling Enable. Controls sampling at EL1 when HCR_EL2.TGE == 0 or if EL2 is disabled or not implemented.

<table>
<thead>
<tr>
<th>E1SPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sampling disabled at EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sampling enabled at EL1.</td>
</tr>
</tbody>
</table>

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when HCR_EL2.TGE == 1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**E0SPE, bit [0]**

EL0 Statistical Profiling Enable. Controls sampling at EL0 when HCR_EL2.TGE == 0 or if EL2 is disabled or not implemented.

<table>
<thead>
<tr>
<th>E0SPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sampling disabled at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sampling enabled at EL0.</td>
</tr>
</tbody>
</table>

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when HCR_EL2.TGE == 1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the PMSCR_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, PMSCR_EL1

```
if PSTATE.EL == EL0 then

**PMSCR_EL2, Statistical Profiling Control Register (EL2)**

The PMSCR_EL2 characteristics are:

**Purpose**

Provides EL2 controls for Statistical Profiling

**Configuration**

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSCR_EL2 are **UNDEFINED**.

**Attributes**

PMSCR_EL2 is a 64-bit register.

**Field descriptions**

The PMSCR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | PCT | TS | PA | CX | RES0 | E2SPE | E0HSPE |

**Bits [63:8]**

Reserved, RES0.

**PCT, bits [7:6]**

Physical Timestamp. If timestamp sampling is enabled, determines which counter is collected. The behavior depends on the Profiling Buffer owning Exception level.

If ARMv8.6-ECV is implemented, this is a two bit field as shown. Otherwise, bit[7] is RES0.

<table>
<thead>
<tr>
<th>PCT</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Virtual counter, <strong>CNTVCT_EL0</strong>, is collected. If the Profiling Buffer owning Exception level is EL2: Physical counter, <strong>CNTPCT_EL0</strong>, is collected. If the Profiling Buffer owning Exception level is EL1: Timestamp value is selected by <strong>PMSCR_EL1.PCT</strong>.</td>
<td>When ARMv8.6-ECV is implemented</td>
</tr>
<tr>
<td>0b01</td>
<td>Virtual counter, <strong>CNTVCT_EL0</strong>, is collected. If the Profiling Buffer owning Exception level is EL2: Physical counter, <strong>CNTPCT_EL0</strong>, minus <strong>CNTPOFF_EL2</strong> is collected. If the Profiling Buffer owning Exception level is EL1: If <strong>PMSCR_EL1.PCT == 0b00</strong>, the virtual counter, <strong>CNTVCT_EL0</strong>, is collected. Otherwise, the physical counter, <strong>CNTPCT_EL0</strong>, minus <strong>CNTPOFF_EL2</strong> is collected.</td>
<td></td>
</tr>
</tbody>
</table>

When EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if either of the following are true:
• **CNTHCTL_EL2**: ECV is 0.
• **SCR_EL3**: ECVEn is 0.
• **HCR_EL2**: \(\{E2H, TGE\}\) is \(\{1, 1\}\).

If EL2 is not implemented or EL2 is disabled in the current Security state, the PE behaves as if this field is set to `0b01`, other than for a direct read of the register.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**TS, bit [5]**

Timestamp Enable.

<table>
<thead>
<tr>
<th>TS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>0b0</code></td>
<td>Timestamp sampling disabled.</td>
</tr>
<tr>
<td><code>0b1</code></td>
<td>Timestamp sampling enabled.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when any of the following are true:

- The Profiling Buffer owning Exception level is EL1.
- In Secure state, and either ARMv8.4-SecEL2 is not implemented or Secure EL2 is disabled.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PA, bit [4]**

Physical Address Sample Enable.

<table>
<thead>
<tr>
<th>PA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>0b0</code></td>
<td>Physical addresses are not collected.</td>
</tr>
<tr>
<td><code>0b1</code></td>
<td>Physical addresses are collected.</td>
</tr>
</tbody>
</table>

If the Profiling Buffer owning Exception level is EL1, and EL2 is enabled in the current Security state, this bit is combined with **PMSCR_EL1**.PA to determine which address is collected.

If EL2 is not implemented or EL2 is disabled in the current Security state, the PE ignores the value of this bit and behaves as if this bit is set to 1, other than for a direct read of the register.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**CX, bit [3]**

**CONTEXTIDR_EL2** Sample Enable.

<table>
<thead>
<tr>
<th>CX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>0b0</code></td>
<td><strong>CONTEXTIDR_EL2</strong> is not collected.</td>
</tr>
<tr>
<td><code>0b1</code></td>
<td><strong>CONTEXTIDR_EL2</strong> is collected.</td>
</tr>
</tbody>
</table>

If EL2 is not implemented or EL2 is disabled in the current Security state, the PE ignores the value of this bit.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [2]**

Reserved, **RES0**.

**E2SPE, bit [1]**

EL2 Statistical Profiling Enable.

<table>
<thead>
<tr>
<th>E2SPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>0b0</code></td>
<td>Sampling disabled at EL2.</td>
</tr>
<tr>
<td><code>0b1</code></td>
<td>Sampling enabled at EL2.</td>
</tr>
</tbody>
</table>
This bit is \texttt{RES0} if \texttt{MDCR_EL2.E2PB} $\neq 0b00$.

If EL2 is disabled in the current Security state, this bit is ignored by the PE.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{E0HSPE, bit [0]}

EL0 Statistical Profiling Enable.

\begin{center}
\begin{tabular}{|c|c|}
\hline
\textbf{E0HSPE} & \textbf{Meaning} \\
\hline
$0b0$ & Sampling disabled at EL0. \\
$0b1$ & Sampling enabled at EL0. \\
\hline
\end{tabular}
\end{center}

If \texttt{MDCR_EL2.E2PB} $\neq 0b00$, this bit is \texttt{RES0}.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when \texttt{HCR_EL2.TGE} $== 0$.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

PMSELR_EL0, Performance Monitors Event Counter Selection Register

The PMSELR_EL0 characteristics are:

**Purpose**

Selects the current event counter PMEVCNTR<n>_EL0 or the cycle counter, CCNT.

PMSELR_EL0 is used in conjunction with PMXEVTYPER_EL0 to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with PMXEVCNTR_EL0, to determine the value of a selected event counter.

**Configuration**

AArch64 System register PMSELR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMSELR[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMSELR_EL0 are UNDEFINED.

**Attributes**

PMSELR_EL0 is a 64-bit register.

**Field descriptions**

The PMSELR_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:5]**

Reserved, RES0.

**SEL, bits [4:0]**

Selects event counter, PMEVCNTR<n>_EL0, where n is the value held in this field. This value identifies which event counter is accessed when a subsequent access to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 occurs.

This field can take any value from 0 (0b00000) to (PMCR.N)-1, or 31 (0b11111).

When PMSELR_EL0.SEL is 0b11111, it selects the cycle counter and:

- A read of the PMXEVTYPER_EL0 returns the value of PMCCFILTR_EL0.
- A write of the PMXEVTYPER_EL0 writes to PMCCFILTR_EL0.
- A read or write of PMXEVCNTR_EL0 has CONSTRAINED UNPREDICTABLE effects. See PMXEVCNTR_EL0 for more details.

For details of the results of accesses to the event counters, see PMXEVTYPER_EL0 and PMXEVCNTR_EL0.

For information about the number of counters accessible at each Exception level, see MDCR_EL2.HPMN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the PMSELR_EL0

Accesses to this register use the following encodings:

MRS <Xt>, PMSELR_EL0

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

PMSEVFR_EL1, Sampling Event Filter Register

The PMSEVFR_EL1 characteristics are:

**Purpose**

Controls sample filtering by events. The overall filter is the logical AND of these filters. For example, if E[3] and E[5] are both set to 1, only samples that have both event 3 (Level 1 unified or data cache refill) and event 5 set (TLB walk) are recorded.

**Configuration**

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSEVFR_EL1 are UNDEFINED.

**Attributes**

PMSEVFR_EL1 is a 64-bit register.

**Field descriptions**

The PMSEVFR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>

<td>[44]</td>
<td>[43]</td>
</tr>
</tbody>
</table>

**E[63], bit [63]**

E[63] is the event filter for event 63. If event 63 is not implemented, or filtering on event 63 is not supported, the corresponding bit is RAZ/WI.

<table>
<thead>
<tr>
<th>E[63]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event 63 is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have event 63 == 0.</td>
</tr>
</tbody>
</table>

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E[62], bit [62]**

E[62] is the event filter for event 62. If event 62 is not implemented, or filtering on event 62 is not supported, the corresponding bit is RAZ/WI.

<table>
<thead>
<tr>
<th>E[62]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event 62 is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have event 62 == 0.</td>
</tr>
</tbody>
</table>

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.
E[61], bit [61]

E[61] is the event filter for event 61. If event 61 is not implemented, or filtering on event 61 is not supported, the corresponding bit is RAZ/WI.

<table>
<thead>
<tr>
<th>E[61]</th>
<th>Meaning</th>

<tr>
<td>0b0</td>
<td>Event 24 is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have event 24 == 0.</td>
</tr>
</tbody>
</table>

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:19]

Reserved, RAZ/WI.

E[18], bit [18]

When ARMv8.3-SPE is implemented and SVE is implemented:

Empty predicate.

<table>
<thead>
<tr>
<th>E[18]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Empty predicate event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Empty predicate event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[17], bit [17]

When ARMv8.3-SPE is implemented and SVE is implemented:

Partial predicate.

<table>
<thead>
<tr>
<th>E[17]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Partial predicate event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Partial predicate event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
This bit is ignored by the PE when \texttt{PMSFCR\_EL1.FE} == 0.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{Otherwise:}

Reserved, RAZ/WI.

\textbf{E[16], bit [16]}

\textbf{When TME is implemented:}

Transaction

<table>
<thead>
<tr>
<th>\textbf{E[16]}</th>
<th>\textbf{Meaning}</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>Transactional event is ignored.</td>
</tr>
<tr>
<td>\texttt{0b1}</td>
<td>Do not record samples that have the Transactional event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when \texttt{PMSFCR\_EL1.FE} == 0.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{Otherwise:}

Reserved, RAZ/WI.

\textbf{E[15], bit [15]}

\texttt{E[15]} is the event filter for event 15. If event 15 is not implemented, or filtering on event 15 is not supported, the corresponding bit is RAZ/WI.

<table>
<thead>
<tr>
<th>\textbf{E[15]}</th>
<th>\textbf{Meaning}</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>Event 15 is ignored.</td>
</tr>
<tr>
<td>\texttt{0b1}</td>
<td>Do not record samples that have event 15 == 0.</td>
</tr>
</tbody>
</table>

An \texttt{IMPLEMENTATION DEFINED} event might be recorded as a multi-bit field. In this case, if the corresponding bits of \texttt{PMSEVFR\_EL1} define an \texttt{IMPLEMENTATION DEFINED} filter for the event.

This field is ignored by the PE when \texttt{PMSFCR\_EL1.FE} == 0

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{E[14], bit [14]}

\texttt{E[14]} is the event filter for event 14. If event 14 is not implemented, or filtering on event 14 is not supported, the corresponding bit is RAZ/WI.

<table>
<thead>
<tr>
<th>\textbf{E[14]}</th>
<th>\textbf{Meaning}</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>Event 14 is ignored.</td>
</tr>
<tr>
<td>\texttt{0b1}</td>
<td>Do not record samples that have event 14 == 0.</td>
</tr>
</tbody>
</table>

An \texttt{IMPLEMENTATION DEFINED} event might be recorded as a multi-bit field. In this case, if the corresponding bits of \texttt{PMSEVFR\_EL1} define an \texttt{IMPLEMENTATION DEFINED} filter for the event.

This field is ignored by the PE when \texttt{PMSFCR\_EL1.FE} == 0

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{E[13], bit [13]}

\texttt{E[13]} is the event filter for event 13. If event 13 is not implemented, or filtering on event 13 is not supported, the corresponding bit is RAZ/WI.
### PMSEVFR_EL1, Sampling Event Filter Register

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event 13 is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have event 13 == 0.</td>
</tr>
</tbody>
</table>

An **IMPLEMENTATION DEFINED** event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an **IMPLEMENTATION DEFINED** filter for the event.

This field is ignored by the PE when `PMSFCR_EL1.FE == 0`

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### E[12], bit [12]

E[12] is the event filter for event 12. If event 12 is not implemented, or filtering on event 12 is not supported, the corresponding bit is RAZ/WI.

<table>
<thead>
<tr>
<th>E[12]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event 12 is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have event 12 == 0.</td>
</tr>
</tbody>
</table>

An **IMPLEMENTATION DEFINED** event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an **IMPLEMENTATION DEFINED** filter for the event.

This field is ignored by the PE when `PMSFCR_EL1.FE == 0`

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### E[11], bit [11]

**When ARMv8.3-SPE is implemented:**

Alignment.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Alignment event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Alignment event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when `PMSFCR_EL1.FE == 0`

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RAZ/WI.

### Bits [10:8]

Reserved, RAZ/WI.

### E[7], bit [7]

Mispredicted.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Mispredicted event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Mispredicted event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when `PMSFCR_EL1.FE == 0`

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Bit [6]

Reserved, RAZ/WI.
E[5], bit [5]

TLB walk.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TLB walk event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the TLB walk event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [4]

Reserved, RAZ/WI.

E[3], bit [3]

Level 1 data or unified cache refill.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Level 1 data or unified cache refill event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Level 1 data or unified cache refill event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RAZ/WI.

E[1], bit [1]

When the PE supports sampling of speculative instructions:

Architecturally retired.

When the PE supports sampling of speculative instructions:

<table>
<thead>
<tr>
<th>E[1]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Architecturally retired event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Architecturally retired event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

If the PE does not support the sampling of speculative instructions, or always discards the sample record for speculative instructions, this bit reads as an UNKNOWN value and the PE ignores its value.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, UNKNOWN.

Bit [0]

Reserved, RAZ/WI.

PMSFCR_EL1, Sampling Filter Control Register

The PMSFCR_EL1 characteristics are:

**Purpose**

Controls sample filtering. The filter is the logical AND of the FL, FT and FE bits. For example, if FE == 1 and FT == 1 only samples including the selected operation types and the selected events will be recorded.

**Configuration**

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSFCR_EL1 are UNDEFINED.

**Attributes**

PMSFCR_EL1 is a 64-bit register.

**Field descriptions**

The PMSFCR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>

</tr>
<tr>
<td>33</td>
<td>32</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:19]**

Reserved, RES0.

**ST, bit [18]**

Store filter enable

<table>
<thead>
<tr>
<th>ST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not record store operations</td>
</tr>
<tr>
<td>0b1</td>
<td>Record all store operations, including vector stores and all atomic operations</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**LD, bit [17]**

Load filter enable

<table>
<thead>
<tr>
<th>LD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not record load operations</td>
</tr>
<tr>
<td>0b1</td>
<td>Record all load operations, including vector loads and atomic operations that return data</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
B, bit [16]

Branch filter enable

<table>
<thead>
<tr>
<th>B</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not record branch and exception return operations</td>
</tr>
<tr>
<td>0b1</td>
<td>Record all branch and exception return operations</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:3]

Reserved, RES0.

FL, bit [2]

Filter by latency

<table>
<thead>
<tr>
<th>FL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Latency filtering disabled</td>
</tr>
<tr>
<td>0b1</td>
<td>Latency filtering enabled. Samples with a total latency less than PMSLATFR_EL1.MINLAT will not be recorded</td>
</tr>
</tbody>
</table>

If this field is set to 1 and PMSLATFR_EL1.MINLAT is set to zero, it is CONstrained UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FL is set to 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

FT, bit [1]

Filter by operation type. The filter is the logical OR of the ST, LD and B bits. For example, if LD and ST are both set, both load and store operations are recorded

<table>
<thead>
<tr>
<th>FT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Type filtering disabled</td>
</tr>
<tr>
<td>0b1</td>
<td>Type filtering enabled. Samples not one of the selected operation types will not be recorded</td>
</tr>
</tbody>
</table>

If this field is set to 1 and the PMSFCR_EL1.{ST, LD, B} bits are all set to zero, it is CONstrained UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FT is set to 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

FE, bit [0]

Filter by event

<table>
<thead>
<tr>
<th>FE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event filtering disabled</td>
</tr>
<tr>
<td>0b1</td>
<td>Event filtering enabled. Samples not including the events selected by PMSEVFR_EL1 will not be recorded</td>
</tr>
</tbody>
</table>

If this field is set to 1 and PMSEVFR_EL1 is set to zero, it is CONstrained UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FE is set to 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMSICR_EL1, Sampling Interval Counter Register

The PMSICR_EL1 characteristics are:

**Purpose**

Software must write zero to PMSICR_EL1 before enabling sample profiling for a sampling session. Software must then treat PMSICR_EL1 as an opaque, 64-bit, read/write register used for context switches only.

**Configuration**

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSICR_EL1 are UNDEFINED.

**Attributes**

The value of PMSICR_EL1 does not change whilst profiling is disabled.

**Field descriptions**

The PMSICR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ECOUNT | RES0 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**ECOUNT, bits [63:56]**

When PMSIDR_EL1.ERnd == 0b1:

Secondary sample interval counter.

When **PMSIDR_EL1**.ERnd is 1, this field provides the secondary counter used after the primary counter reaches zero. Whilst the secondary counter is nonzero and profiling is enabled, the secondary counter decrements by 1 for each member of the sample population. The primary counter also continues to decrement since it is also nonzero. When the secondary counter reaches zero, a member of the sampling population is selected for sampling.

When **PMSIDR_EL1**.ERnd is 0, this field is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [55:32]**

Reserved, RES0.

**COUNT, bits [31:0]**

Primary sample interval counter

Provides the primary counter used for sampling.

The primary counter is reloaded when the value of this register is zero and the PE moves from a state or Exception level where profiling is disabled to a state or Exception level where profiling is enabled.
Whilst the primary counter is nonzero and sampling is enabled, the primary counter decrements by 1 for each member of the sample population.

When the counter reaches zero, the behavior depends on the values of PMSIDR_EL1.ERnd and PMSIRR_EL1.RND:

- If PMSIRR_EL1.RND == 0 or PMSIDR_EL1.ERnd == 0:
  - A member of the sampling population is selected for sampling
  - The primary counter is reloaded

- If PMSIRR_EL1.RND == 1 and PMSIDR_EL1.ERnd == 1:
  - The secondary counter is set to a random or pseudorandom value in the range 0x00 to 0xFF
  - The primary counter is reloaded

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMSICR_EL1**

Accesses to this register use the following encodings:

\[

}
Purpose

Defines the interval between samples

Configuration

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSIRR_EL1 are UNDEFINED.

Attributes

PMSIRR_EL1 is a 64-bit register.

Field descriptions

The PMSIRR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | INTERVAL | RES0 | RND |

Bits [63:32]

Reserved, RES0.

INTERVAL, bits [31:8]

Bits [31:8] of the PMSICR_EL1 interval counter reload value. Software must set this to a non-zero value. If software sets this to zero, an UNKNOWN sampling interval is used. Software should set this to a value greater than the minimum indicated by PMSIDR_EL1.Interval

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:1]

Reserved, RES0.

RND, bit [0]

Controls randomization of the sampling interval

<table>
<thead>
<tr>
<th>RND</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disable randomization of sampling interval</td>
</tr>
<tr>
<td>0b1</td>
<td>Add (pseudo-)random jitter to sampling interval</td>
</tr>
</tbody>
</table>

The random number generator is not architected.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMSIRR_EL1

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

endif
**PMSLATFR_EL1, Sampling Latency Filter Register**

The PMSLATFR_EL1 characteristics are:

**Purpose**

Controls sample filtering by latency

**Configuration**

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSLATFR_EL1 are **UNDEFINED**.

**Attributes**

PMSLATFR_EL1 is a 64-bit register.

**Field descriptions**

The PMSLATFR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>59</td>
<td>MINLAT</td>
</tr>
</tbody>
</table>

**Bits [63:12]**

Reserved, RES0.

**MINLAT, bits [11:0]**

Minimum latency. When PMSFCR_EL1.FL == 1, defines the minimum total latency for filtered operations. Samples with a total latency less than MINLAT will not be recorded.

This field is ignored by the PE when PMSFCR_EL1.FL == 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the PMSLATFR_EL1**

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>

The PMSWINC_EL0 characteristics are:

**Purpose**

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see ‘SW_INCR’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D5.

**Configuration**

AArch64 System register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMSWINC[31:0].

AArch64 System register PMSWINC_EL0 bits [31:0] are architecturally mapped to External register PMSWINC_EL0[31:0].

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMSWINC_EL0 are UNDEFINED.

**Attributes**

PMSWINC_EL0 is a 64-bit register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Traps EL0 accesses to the Performance Monitor registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states as follows:

- In AArch64 state, MRS or MSR accesses to the following registers are reported using EC syndrome value 0x18:
  - PMCR_EL0, PMOVSCLR_EL0, PMSELR_EL0, PMCEID0_EL0, PMCEID1_EL0, PMCCNTR_EL0, PMXEVTYPER_EL0, PMXEVCNTR_EL0, PMCNETSET_EL0, PMCNTENSET_EL0, PMCNTENSET_EL0, PMOVSSET_EL0, PMEVTYPER_EL0, PMEVTYPER_EL0, PMCCFILTR_EL0.
  - PMSWINC_EL0, MSR accesses only.
  - If ARMv8.4-PMU is implemented, PMMIR_EL1

- In AArch32 state, MRC or MCR accesses to the following registers are reported using EC syndrome value 0x03, MRRC or MCRR accesses are trapped to EL2 and reported using EC syndrome value 0x04:
  - PMCR, PMOVSER, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTYPER, PMXEVNTR, PMCNETSET, PMCNETENCLR, PMOVSSET, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMCCFILTR.
  - PMSWINC, MCR accesses only.
  - If ARMv8.4-PMU is implemented, PMMIR.
  - If ARMv8.1-PMU is implemented, in AArch32 state, PMCEID2, and PMCEID3.

- In AArch32 state, MRRC or MCRR accesses to PMCCNTR are reported using EC syndrome value 0x04.
Table: Meaning of EL0 Accesses to Registers

<table>
<thead>
<tr>
<th>EN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>While at EL0, accesses to the specified registers at EL0 are trapped, unless overridden by one of PMUSERENR_EL0.{ER, CR, SW}.</td>
</tr>
<tr>
<td>0b1</td>
<td>While at EL0, software can access all of the specified registers.</td>
</tr>
</tbody>
</table>

**Note**

The EL0 access is trapped only if the corresponding EL1 access is permitted. If PMUSERENR_EL0.EN is 0, write access to PMSWINC_EL0 and PMSWINC from EL0 are trapped, but read access is **undefined**.

The affected registers do not include PMINTENSET_EL1, PMINTENCLR_EL1, PMINTENSET, and PMINTENCLR.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

## Accessing the PMUSERENR_EL0

Accesses to this register use the following encodings:

### MRS <Xt>, PMUSERENR_EL0

PMXEVCNTR_EL0, Performance Monitors Selected Event Count Register

The PMXEVCNTR_EL0 characteristics are:

**Purpose**

Reads or writes the value of the selected event counter, \texttt{PMEVCNTR<n>\_EL0}. \texttt{PMSELR\_EL0}.SEL determines which event counter is selected.

**Configuration**

AArch64 System register PMXEVCNTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register \texttt{PMXEVCNTR[31:0]}.

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMXEVCNTR_EL0 are UNDEFINED.

**Attributes**

PMXEVCNTR_EL0 is a 64-bit register.

**Field descriptions**

The PMXEVCNTR_EL0 bit assignments are:

**When ARMv8.5-PMU is implemented:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| PMEVCNTR<n>| PMEVCNTR<n> |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**PMEVCNTR<n>, bits [63:0]**

Value of the selected event counter, \texttt{PMEVCNTR<n>\_EL0}, where n is the value stored in \texttt{PMSELR\_EL0}.SEL.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | PMEVCNTR<n> |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

Reserved, RES0.

**PMEVCNTR<n>, bits [31:0]**

Value of the selected event counter, \texttt{PMEVCNTR<n>\_EL0}, where n is the value stored in \texttt{PMSELR\_EL0}.SEL.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the PMXEVCNTR_EL0

If ARMv8.6-FGT is implemented and PMSELR_EL0.SEL is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of PMXEVCNTR_EL0 is as follows:

- If PMSELR_EL0.SEL selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If ARMv8.6-FGT is not implemented and PMSELR_EL0.SEL is greater than or equal to the number of accessible counters, then reads and writes of PMXEVCNTR_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if PMSELR_EL0.SEL has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- If EL2 is implemented and enabled in the current Security state, and PMSELR_EL0.SEL is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.{ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters. See MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings:

end
PMXEVTYPE_EL0, Performance Monitors Selected Event Type Register

The PMXEVTYPE_EL0 characteristics are:

**Purpose**

When PMSELR_EL0.SEL selects an event counter, this accesses a PMEVTYPE<n>_EL0 register. When PMSELR_EL0.SEL selects the cycle counter, this accesses PMCCFILTR_EL0.

**Configuration**

AArch64 System register PMXEVTYPE_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMXEVTYPE(31:0).

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMXEVTYPE_EL0 are UNDEFINED.

**Attributes**

PMXEVTYPE_EL0 is a 64-bit register.

**Field descriptions**

The PMXEVTYPE_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

Bits [63:32]

Reserved, RES0.

Bits [31:0]

When PMSELR_EL0.SEL == 31, this register accesses PMCCFILTR_EL0.

Otherwise, this register accesses PMEVTYPE<n>_EL0 where n is the value in PMSELR_EL0.SEL.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMXEVTYPE_EL0**

If ARMv8.6-FGT is implemented, and PMSELR_EL0.SEL is not 31 and is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of PMXEVTYPE_EL0 is as follows:

- If PMSELR_EL0.SEL selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If ARMv8.6-FGT is not implemented, and PMSELR_EL0.SEL is not 31 and is greater than or equal to the number of accessible counters, then reads and writes of PMXEVTYPE_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
• Accesses to the register execute as a NOP
• Accesses to the register behave as if PMSELR_EL0.SEL has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
• Accesses to the register behave as if PMSELR_EL0.SEL is 31.
• If EL2 is implemented and enabled in the current Security state, PMSELR_EL0 is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

**Note**

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.EN.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters. See MDCR_EL2.HPMN for more details.

REVIDR_EL1, Revision ID Register

The REVIDR_EL1 characteristics are:

**Purpose**

Provides implementation-specific minor revision information.

**Configuration**

AArch64 System register REVIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register REVIDR[31:0].

If REVIDR_EL1 has the same value as MIDR_EL1, then its contents have no significance.

**Attributes**

REVIDR_EL1 is a 64-bit register.

**Field descriptions**

The REVIDR_EL1 bit assignments are:

<table>

RMR_EL1, Reset Management Register (EL1)

The RMR_EL1 characteristics are:

**Purpose**

When this register is implemented:

- A write to the register at EL1 can request a Warm reset.
- If EL1 can use all Execution states, this register specifies the Execution state that the PE boots into on a Warm reset.

**Configuration**

AArch64 System register RMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register RMR[31:0] when the highest implemented Exception level is EL1.

This register is present only when the highest implemented Exception level is EL1. Otherwise, direct accesses to RMR_EL1 are **UNDEFINED**.

When EL1 is the highest implemented Exception level:

- If EL1 can use all Execution states then this register must be implemented.
- If EL1 cannot use AArch32 then it is **IMPLEMENTATION DEFINED** whether the register is implemented.

**Attributes**

RMR_EL1 is a 64-bit register.

**Field descriptions**

The RMR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | RR | AA64 |

**Bits [63:2]**

Reserved, RES0.

**RR, bit [1]**

Reset Request. Setting this bit to 1 requests a Warm reset.

This field resets to 0.

**AA64, bit [0]**

When AArch32 is supported at any Exception level:

When EL1 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

<table>
<thead>
<tr>
<th>AA64</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>AArch64.</td>
</tr>
</tbody>
</table>
On coming out of the Warm reset, execution starts at the implementation defined reset vector address of the specified execution state.

If EL1 can only use AArch64 state, this bit is RAO/WI.

When implemented as a RW field, this field resets to 1 on a Cold reset.

**Otherwise:**

Reserved, RAO/WI.

### Accessing the RMR_EL1

Accesses to this register use the following encodings:

**MRS <Xt>, RMR_EL1**

<table>
<thead>
<tr>
<th>op0</th>

The RNDR characteristics are:

**Purpose**

Random Number. Returns a 64-bit random number which is reseeded from the True Random Number source at an IMPLEMENTATION DEFINED rate.

If the hardware returns a genuine random number, PSTATE.NZCV is set to 0b0000.

If the instruction cannot return a genuine random number in a reasonable period of time, PSTATE.NZCV is set to 0b0100 and the data value returned is 0.

RNDR is a read-only register.

**Configuration**

This register is present only when ARMv8.5-RNG is implemented. Otherwise, direct accesses to RNDR are UNDEFINED.

**Attributes**

RNDR is a 64-bit register.

**Field descriptions**

The RNDR bit assignments are:

| Bit 63 | Bit 62 | Bit 61 | Bit 60 | Bit 59 | Bit 58 | Bit 57 | Bit 56 | Bit 55 | Bit 54 | Bit 53 | Bit 52 | Bit 51 | Bit 50 | Bit 49 | Bit 48 | Bit 47 | Bit 46 | Bit 45 | Bit 44 | Bit 43 | Bit 42 | Bit 41 | Bit 40 | Bit 39 | Bit 38 | Bit 37 | Bit 36 | Bit 35 | Bit 34 | Bit 33 | Bit 32 |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
|        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |

**RNDR, bits [63:0]**

Random Number. Returns a 64-bit Random Number which is reseeded from the True Random Number source at an IMPLEMENTATION DEFINED rate.

This field resets to an architecturally UNKNOWN value.

**Accessing the RNDR**

Accesses to this register use the following encodings:

\[
\text{MRS <Xt>, RNDR}
\]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b011</td>
<td>0b0010</td>
<td>0b0100</td>
<td>0b000</td>
</tr>
</tbody>
</table>
if PSTATE_EL == EL0 then
    return RNDR;
elsif PSTATE_EL == EL1 then
    return RNDR;
elsif PSTATE_EL == EL2 then
    return RNDR;
elsif PSTATE_EL == EL3 then
    return RNDR;
**RNDRRS, Reseeded Random Number**

The RNDRRS characteristics are:

**Purpose**

Reseeded Random Number. Returns a 64-bit random number which is reseeded from the True Random Number source at an IMPLEMENTATION DEFINED rate.

If the hardware returns a genuine random number, PSTATE.NZCV is set to 0b0000.

If the instruction cannot return a genuine random number in a reasonable period of time, PSTATE.NZCV is set to 0b0100 and the data value returned is 0.

RNDRRS is a read-only register.

**Configuration**

This register is present only when ARMv8.5-RNG is implemented. Otherwise, direct accesses to RNDRRS are UNDEFINED.

**Attributes**

RNDRRS is a 64-bit register.

**Field descriptions**

The RNDRRS bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     | RNDRRS |     |     | RNDRRS |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

**RNDRRS, bits [63:0]**

Reseeded Random Number. Returns a 64-bit Random Number which is reseeded from the True Random Number source immediately before this read.

This field resets to an architecturally UNKNOWN value.

**Accessing the RNDRRS**

Accesses to this register use the following encodings:

MRS <Xt>, RNDRRS

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>

SCR_EL3, Secure Configuration Register

The SCR_EL3 characteristics are:

**Purpose**

Defines the configuration of the current Security state. It specifies:

- The Security state of EL0, EL1, and EL2. The Security state is either Secure or Non-secure.
- The Execution state at lower Exception levels.
- Whether IRQ, FIQ, SError interrupts, and External abort exceptions are taken to EL3.
- Whether various operations are trapped to EL3.

**Configuration**

AArch64 System register SCR_EL3 bits [31:0] can be mapped to AArch32 System register SCR[31:0], but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to SCR_EL3 are UNDEFINED.

**Attributes**

SCR_EL3 is a 64-bit register.

**Field descriptions**

The SCR_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>AMVOFFEN</td>
<td>Activity Monitors Virtual Offsets Enable</td>
</tr>
<tr>
<td>35</td>
<td>TME</td>
<td>TMR Enable</td>
</tr>
</tbody>
</table>

**Bits [63:36]**

Reserved, RES0.

**AMVOFFEN, bit [35]**

When ARMv8.6-AMU is implemented:

Activity Monitors Virtual Offsets Enable.

<table>
<thead>
<tr>
<th>AMVOFFEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to AMEVCNTVOFF0&lt;n&gt; EL2 and AMEVCNTVOFF1&lt;n&gt; EL2 at EL2 are trapped to EL3. Indirect reads of the virtual offset registers are zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to AMEVCNTVOFF0&lt;n&gt; EL2 and AMEVCNTVOFF1&lt;n&gt; EL2 are not affected by this field.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TME, bit [34]**
When TME is implemented:

Enables access to the TSTART, TCOMMIT, TTEST and TCANCEL instructions at EL0, EL1 and EL2.

<table>
<thead>
<tr>
<th>TME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0, EL1 and EL2 accesses to TSTART, TCOMMIT, TTEST and TCANCEL</td>
</tr>
<tr>
<td></td>
<td>instructions are UNDEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instruction to be UNDEFINED.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TWEDEL, bits [33:30]**

When ARMv8.6-TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when SCR_EL3.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by SCR_EL3.TWE as $2^{(TWEDEL + 8)}$ cycles.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TWEDEn, bit [29]**

When ARMv8.6-TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by SCR_EL3.TWE.

<table>

<tr>
<td>0b1</td>
<td>The delay for taking a WFE trap is at least the number of cycles defined</td>
</tr>
<tr>
<td></td>
<td>in SCR_EL3.TWEDEL.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**ECVEn, bit [28]**

When ARMv8.6-ECV is implemented:

ECV Enable. Enables access to the CNTPOFF_EL2 register.

<table>
<thead>
<tr>
<th>ECVEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2 accesses to CNTPOFF_EL2 are trapped to EL3, and the value of CNTPOFF_EL2 is treated as 0 for all purposes other than direct reads</td>
</tr>
<tr>
<td></td>
<td>or writes to the register from EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 accesses to CNTPOFF_EL2 are not trapped to EL3 by this mechanism.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**FGTEn, bit [27]**

When ARMv8.6-FGT is implemented:

Enables access to the Fine-Grained Traps registers: `HAFGRTR_EL2`, `HDFGRTR_EL2`, `HDFGWTR_EL2`, `HFGTR_EL2` and `HFGWTR_EL2`.

<table>
<thead>
<tr>
<th>FGTEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2 Accesses to <code>HAFGRTR_EL2</code>, <code>HDFGRTR_EL2</code>, <code>HDFGWTR_EL2</code>, <code>HFGTR_EL2</code>, <code>HFGWTR_EL2</code> registers are trapped to EL3, and those registers behave as if all bits are set to 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 Accesses to <code>HAFGRTR_EL2</code>, <code>HDFGRTR_EL2</code>, <code>HDFGWTR_EL2</code>, <code>HFGTR_EL2</code>, <code>HFGWTR_EL2</code> registers are not trapped to EL3 by this mechanism.</td>
</tr>
</tbody>
</table>

Traps caused by accesses to the fine-grained trap registers are reported using the EC code of 0x18 and its associated ISS.

Otherwise:

Reserved, RES0.

**ATA, bit [26]**

When ARMv8.5-MemTag is implemented:

Allocation Tag Access. Controls access at EL2, EL1 and EL0 to Allocation Tags.

When access is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.
- MRS and MSR instructions at EL1 and EL2 using `GCR_EL1`, `RGSR_EL1`, `TFSR_EL1`, `TFSR_EL2` or `TFSRE0_EL1` that are not `UNDEFINED` or trapped to a lower Exception level are trapped to EL3.
- MRS and MSR instructions at EL2 using `TFSR_EL12` that are not `UNDEFINED` are trapped to EL3.

<table>
<thead>
<tr>
<th>ATA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access is not prevented.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

This field resets to an architecturally `UNKNOWN` value.

Otherwise:

Reserved, RES0.

**EnSCXT, bit [25]**
When ARMv8.0-CSV2 is implemented:

Enable access to the SCXTNUM_EL2, SCXTNUM_EL1, and SCXTNUM_EL0 registers. The defined values are:

<table>
<thead>
<tr>
<th>EnSCXT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2, EL1 and EL0 access to SCXTNUM_EL0, EL2 and EL1 access to SCXTNUM_EL1, EL2 access to SCXTNUM_EL2 registers are disabled by this mechanism, causing an exception to EL3, and the values of these registers to be treated as 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause accesses to SCXTNUM_EL0, SCXTNUM_EL1, SCXTNUM_EL2 to be trapped.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:22]

Reserved, RES0.

FIEN, bit [21]

When ARMv8.4-RAS is implemented:

Fault Injection enable. Trap accesses to the RAS ERX* registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1 from EL1 and EL2 to EL3, reported using EC syndrome value 0x18.

<table>
<thead>
<tr>
<th>FIEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, the Effective value of SCR_EL3.FIEN is 0b1.

If ERRIDR_EL1.NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMEA, bit [20]

When ARMv8.4-DFE is implemented:

Non-maskable External Aborts. When SCR_EL3.EA == 1, controls whether PSTATE.A masks SError interrupts at EL3.

<table>
<thead>
<tr>
<th>NMEA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If SCR_EL3.EA == 1, asserted SError interrupts are not taken at EL3 if PSTATE.A == 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>If SCR_EL3.EA == 1, asserted SError interrupts are taken at EL3 regardless of the value of PSTATE.A.</td>
</tr>
</tbody>
</table>

When SCR_EL3.EA == 0:

- Asserted SError interrupts are not taken at EL3 regardless of the value of PSTATE.A and this field.
- This field is ignored and its Effective value is 0.
This field resets to 0.

Otherwise:

Reserved, RES0.

**EASE, bit [19]**

*When ARMv8.4-DFE is implemented:*

External aborts to SError interrupt vector.

<table>
<thead>
<tr>
<th>EASE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Synchronous External abort exceptions taken to EL3 are taken to the appropriate synchronous exception vector offset from VBAR_EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>Synchronous External abort exceptions taken to EL3 are taken to the appropriate SError interrupt vector offset from VBAR_EL3.</td>
</tr>
</tbody>
</table>

This field resets to 0.

Otherwise:

Reserved, RES0.

**EEL2, bit [18]**

*When ARMv8.4-SecEL2 is implemented:*

Secure EL2 Enable.

<table>
<thead>
<tr>
<th>EEL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All behaviors associated with Secure EL2 are disabled. All registers, including timer registers, defined by ARMv8.4-SecEL2 are UNDEFINED, and those timers are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>All behaviors associated with Secure EL2 are enabled.</td>
</tr>
</tbody>
</table>

When the value of this bit is 1, then:

- When SCR_EL3.NS == 0, the SCR_EL3.RW bit is treated as 1 for all purposes other than reading or writing the register.

- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2, using the EC value of ESR_EL2. EC== 0x3:
  - A read or write of the SCR.
  - A read or write of the NSACR.
  - A read or write of the MVBAR.
  - A read or write of the SDCR.
  - Execution of an ATS12NSO** instruction.

- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2 using the EC value of ESR_EL2. EC== 0x0:
  - Execution of an SRS instruction that uses R13_mon.
  - Execution of an MRS (Banked register) or MSR (Banked register) instruction that would access SPSR_mon, R13_mon, or R14_mon.

**Note**

If the Effective value of SCR_EL3.EEL2 is 0, then these operations executed in Secure EL1 using AArch32 are trapped to EL3.
In a Secure only implementation that does not implement EL3 but implements EL2, behaves as if SCR_EL3.EEL2 == 1.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

API, bit [17]

When ARMv8.4-SecEL2 is implemented and ARMv8.3-PAuth is implemented:

Controls the use of the following instructions related to Pointer Authentication. Traps are reported using EC syndrome value 0x09:

- PACGA, which is always enabled.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETTA, ERETAB, LDRAA and LDRAB when:
  - In EL0, when HCR_EL2.TGE==0 or HCR_EL2.E2H==0, and the associated SCTLR_EL1.En<N><M> == 1.
  - In EL0, when HCR_EL2.TGE==1 and HCR_EL2.E2H==1, and the associated SCTLR_EL2.En<N><M> == 1.
  - In EL1, when the associated SCTLR_EL1.En<N><M> == 1.
  - In EL2, when the associated SCTLR_EL2.En<N><M> == 1.

<table>
<thead>
<tr>
<th>API</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.API bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

An instruction is trapped only if Pointer Authentication is enabled for that instruction, for more information, see ‘System register control of pointer authentication’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Note

If ARMv8.3-PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

This field resets to an architecturally UNKNOWN value.

When ARMv8.4-SecEL2 is not implemented and ARMv8.3-PAuth is implemented:

Controls the use of instructions related to Pointer Authentication:

- PACGA.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETTA, ERETAB, LDRAA and LDRAB when:
  - In Non-secure EL0, when HCR_EL2.TGE==0 or HCR_EL2.E2H==0, and the associated SCTLR_EL1.En<N><M> == 1.
  - In Non-secure EL0, when HCR_EL2.TGE==1 and HCR_EL2.E2H==1, and the associated SCTLR_EL2.En<N><M> == 1.
  - In Secure EL0, when the associated SCTLR_EL2.En<N><M> == 1.
  - In Secure or Non-secure EL1, when the associated SCTLR_EL1.En<N><M> == 1.
  - In EL2, when the associated SCTLR_EL2.En<N><M> == 1.
<table>
<thead>
<tr>
<th>API</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.API bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

**Note**

If ARMv8.3-PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**APK, bit [16]**

When ARMv8.3-PAuth is implemented:

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers, using EC syndrome value \(0\times18\), from EL1 or EL2 to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APK bit or other traps:

- \(APIAKeyLo\_EL1\), \(APIAKeyHi\_EL1\), \(APIBKeyLo\_EL1\), \(APIBKeyHi\_EL1\).
- \(APDAKeyLo\_EL1\), \(APDAKeyHi\_EL1\), \(APDBKeyLo\_EL1\), \(APDBKeyHi\_EL1\).
- \(APGAKeyLo\_EL1\), and \(APGAKeyHi\_EL1\).

**APK Meaning**

<table>
<thead>
<tr>
<th>APK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to the registers holding “key” values for pointer authentication from EL1 or EL2 are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APK bit or other traps.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

For more information, see ‘System register control of pointer authentication’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Note**

If ARMv8.3-PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TERR, bit [15]**

When RAS is implemented:

Trap Error record accesses. Accesses to the RAS ERR and RAS ERX registers from EL1 and EL2 to EL3 are trapped as follows:

- If EL1 is using AArch64, \(ERRIDR\_EL1\), \(ERRSELR\_EL1\), \(ERRXADDR\_EL1\), \(ERRXCTL\_EL1\), \(ERXF\_EL1\), \(ERXMISC0\_EL1\), \(ERXMISC1\_EL1\), and \(ERXSTATUS\_EL1\), are trapped and reported using EC syndrome value \(0\times18\).
• If ARMv8.4-RAS is implemented, \texttt{ERXMISC2	extunderscore EL1} and \texttt{ERXMISC3	extunderscore EL1}, are trapped and reported using EC syndrome value 0x18.

• If EL1 is using AArch32, accesses by MCR or MRC to the following registers are reported using EC syndrome value 0x03, accesses by MCRR or MRRC are reported using EC syndrome value 0x04:
  - \texttt{ERRIDR}, \texttt{ERRSELR}, \texttt{ERXADDR}, \texttt{ERXADDR2}, \texttt{ERXCTLR}, \texttt{ERXCTRLR2}, \texttt{ERXFR}, \texttt{ERXFR2}, \texttt{ERXMISC0}, \texttt{ERXMISC1}, \texttt{ERXMISC2}, \texttt{ERXMISC3}, and \texttt{ERXSTATUS}.

• If ARMv8.4-RAS is implemented, accesses by MCR or MRC to the following registers are reported using EC syndrome value 0x03, accesses by MCRR or MRRC are reported using EC syndrome value 0x04:
  - \texttt{ERXMISC4}, \texttt{ERXMISC5}, \texttt{ERXMISC6}, and \texttt{ERXMISC7}.

<table>
<thead>
<tr>
<th>TERR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally \texttt{UNKNOWN} value.

Otherwise:

Reserved, RES0.

TLOR, bit [14]

When ARMv8.1-LOR is implemented:

Trap LOR registers. Traps accesses to the \texttt{LORSA	extunderscore EL1}, \texttt{LOREA	extunderscore EL1}, \texttt{LORN	extunderscore EL1}, \texttt{LORC	extunderscore EL1}, and \texttt{LORID	extunderscore EL1} registers from EL1 and EL2 to EL3, unless the access has been trapped to EL2.

<table>
<thead>
<tr>
<th>TLOR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 and EL2 accesses to the LOR registers that are not UNDEFINED are trapped to EL3, unless it is trapped \texttt{HCR_EL2\textunderscore TLOR}.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally \texttt{UNKNOWN} value.

Otherwise:

Reserved, RES0.

TWE, bit [13]

Traps EL2, EL1, and EL0 execution of WFE instructions to EL3, from both Security states and both Execution states, reported using EC syndrome value 0x01.

<table>
<thead>
<tr>
<th>TWE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt to execute a WFE instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by \texttt{SCTLR\textunderscore nTWE}, \texttt{HCR\textunderscore TWE}, \texttt{SCTLR\textunderscore EL1\textunderscore nTWE}, \texttt{SCTLR\textunderscore EL2\textunderscore nTWE}, or \texttt{HCR\textunderscore EL2\textunderscore TWE}.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or
WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**TWI, bit [12]**

Traps EL2, EL1, and EL0 execution of WFI instructions to EL3, from both Security states and both Execution states, reported using EC syndrome value 0x01.

<table>
<thead>
<tr>
<th>TWI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt to execute a WFI instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by <code>SCTLR.nTWI</code>, <code>HCR.TWI</code>, <code>SCTLR_EL1.nTWI</code>, <code>SCTLR_EL2.nTWI</code>, or <code>HCR_EL2.TWI</code>.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFI instructions can cause the PE to enter a low-power state, see ‘Wait for Interrupt’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**ST, bit [11]**

Traps Secure EL1 accesses to the Counter-timer Physical Secure timer registers to EL3, from AArch64 state only, reported using EC syndrome value 0x18.

<table>
<thead>
<tr>
<th>ST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure EL1 using AArch64 accesses to the <code>CNTPS.TVAL.EL1</code>, <code>CNTPS.CTL.EL1</code>, and <code>CNTPS.CVAL.EL1</code> are trapped to EL3 when Secure EL2 is disabled. If Secure EL2 is enabled, the behavior is as if the value of this field was 0b1.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

**Note**

Accesses to the Counter-timer Physical Secure timer registers are always enabled at EL3. These registers are not accessible at EL0.

This field resets to an architecturally **UNKNOWN** value.

**RW, bit [10]**

When AArch32 is supported at any Exception level:

Execution state control for lower Exception levels.
SCR_EL3, Secure Configuration Register

<table>
<thead>
<tr>
<th>RW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Lower levels are all AArch32.</td>
</tr>
</tbody>
</table>
| 0b1 | The next lower level is AArch64. If EL2 is present:  
• EL2 is AArch64.  
• EL2 controls EL1 and EL0 behaviors.  
If EL2 is not present:  
• EL1 is AArch64.  
• EL0 is determined by the Execution state described in the current process state when executing at EL0. |

If AArch32 state is not supported by the implementation at EL2 and AArch32 state is not supported by the implementation at EL1, then this bit is RAO/WI.

If AArch32 state is supported by the implementation at EL1, SCR_EL3.NS == 1 and AArch32 state is not supported by the implementation at EL2, the Effective value of this bit is 1.

If AArch32 state is supported by the implementation at EL1, ARMv8.4-SecEL2 is implemented and SCR_EL3.{EEL2, NS} == {1, 0}, the Effective value of this bit is 1.

This bit is permitted to be cached in a TLB.  
This field resets to an architecturally UNKNOWN value.

Otherwise:  
Reserved, RAO/WI.

**SIF, bit [9]**

When ARMv8.4-SecEL2 is implemented:

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from memory marked in the first stage of translation as being Non-secure. The possible values for this bit are:

<table>
<thead>
<tr>
<th>SIF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state instruction fetches from memory marked in the first stage of translation as being Non-secure are permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure state instruction fetches from memory marked in the first stage of translation as being Non-secure are not permitted.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.  
This field resets to an architecturally UNKNOWN value.

Otherwise:

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory.

<table>
<thead>
<tr>
<th>SIF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state instruction fetches from Non-secure memory are permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure state instruction fetches from Non-secure memory are not permitted.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.  
This field resets to an architecturally UNKNOWN value.

**HCE, bit [8]**

Hypervisor Call instruction enable. Enables HVC instructions at EL3 and, if EL2 is enabled in the current Security state, at EL2 and EL1, in both Execution states, reported using EC syndrome value 0x00.
<table>
<thead>
<tr>
<th>HCE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>HVC instructions are UNDEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>HVC instructions are enabled at EL3, EL2, and EL1.</td>
</tr>
</tbody>
</table>

**Note**

HVC instructions are always UNDEFINED at EL0 and, if Secure EL2 is disabled, at Secure EL1. Any resulting exception is taken from the current Exception level to the current Exception level.

If EL2 is not implemented, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

**SMD, bit [7]**

Secure Monitor Call disable. Disables SMC instructions at EL1 and above, from both Security states and both Execution states, reported using EC syndrome value 0x00.

<table>
<thead>
<tr>
<th>SMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SMC instructions are enabled at EL3, EL2 and EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>SMC instructions are UNDEFINED.</td>
</tr>
</tbody>
</table>

**Note**

SMC instructions are always UNDEFINED at EL0. Any resulting exception is taken from the current Exception level to the current Exception level.

If HCR_EL2.TSC or HCR.TSC traps attempted EL1 execution of SMC instructions to EL2, that trap has priority over this disable.

This field resets to an architecturally UNKNOWN value.

**Bit [6]**

Reserved, RES0.

**Bits [5:4]**

Reserved, RES1.

**EA, bit [3]**

External Abort and SError interrupt routing.

<table>
<thead>
<tr>
<th>EA</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0 | When executing at Exception levels below EL3, External aborts and SError interrupts are not taken to EL3. In addition, when executing at EL3:  
• SError interrupts are not taken.  
• External aborts are taken to EL3. |
| 0b1 | When executing at any Exception level, External aborts and SError interrupts are taken to EL3. |

For more information, see 'Asynchronous exception routing' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers' Model).

This field resets to an architecturally UNKNOWN value.

**FIQ, bit [2]**

Physical FIQ Routing.
### FIQ, bit [2]

Physical FIQ Routing.

<table>
<thead>
<tr>

<td>When executing at EL3, physical FIQ interrupts are not taken.</td>
</tr>
<tr>
<td>0b1</td>
<td>When executing at any Exception level, physical FIQ interrupts are taken to EL3.</td>
</tr>
</tbody>
</table>

For more information, see ‘Asynchronous exception routing’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1.

This field resets to an architecturally UNKNOWN value.

### IRQ, bit [1]

Physical IRQ Routing.

<table>
<thead>
<tr>
<th>IRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When executing at Exception levels below EL3, physical IRQ interrupts are not taken to EL3.</td>
</tr>
<tr>
<td></td>
<td>When executing at EL3, physical IRQ interrupts are not taken.</td>
</tr>
<tr>
<td>0b1</td>
<td>When executing at any Exception level, physical IRQ interrupts are taken to EL3.</td>
</tr>
</tbody>
</table>

For more information, see ‘Asynchronous exception routing’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1.

This field resets to an architecturally UNKNOWN value.

### NS, bit [0]

Non-secure bit.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Indicates that EL0 and EL1 are in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Indicates that Exception levels lower than EL3 are in Non-secure state, and so memory accesses from those Exception levels cannot access Secure memory.</td>
</tr>
</tbody>
</table>

When SCR_EL3.{EEL2, NS} == {1, 0}, then EL2 is using AArch64 and in Secure state.

This field resets to an architecturally UNKNOWN value.

### Accessing the SCR_EL3

Accesses to this register use the following encodings:

MRS <Xt>, SCR_EL3

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b110</td>
<td>0b0001</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  UNDEFINED;
elsif PSTATE.EL == EL2 then
  UNDEFINED;
elsif PSTATE.EL == EL3 then
  return SCR_EL3;
### MSR SCR_EL3, \(<\!Xt\!>\)

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b110</td>
<td>0b0001</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
UNDEFINED;
elsi PSTATE.EL == EL1 then
UNDEFINED;
elsi PSTATE.EL == EL2 then
UNDEFINED;
elsi PSTATE.EL == EL3 then
SCR_EL3 = X[t];
SCTLR_EL1, System Control Register (EL1)

The SCTLR_EL1 characteristics are:

**Purpose**

Provides top level control of the system, including its memory system, at EL1 and EL0.

**Configuration**

AArch64 System register SCTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register SCTLR[31:0].

**Attributes**

SCTLR_EL1 is a 64-bit register.

**Field descriptions**

The SCTLR_EL1 bit assignments are:

<table>

**Bits [63:54]**

Reserved, RES0.

**TME, bit [53]**

When TME is implemented:

- Enables the Transactional Memory Extension at EL1.

<table>
<thead>
<tr>
<th>TME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a TSTART instruction at EL1 is trapped to EL1, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be undefined at EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any TSTART instruction to be trapped.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TME0, bit [52]**

When TME is implemented:

- Enables the Transactional Memory Extension at EL0.
Any attempt to execute a TSTART instruction at EL0 is trapped to EL1, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL0.

If ARMv8.1-VHE is implemented, EL2 is implemented and enabled in the current Security state, and HCR_EL2.{E2H, TGE} == {1,1}, this field has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TMT, bit [51]**

When TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL1.

<table>
<thead>
<tr>
<th>TMT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any TSTART instruction to fail.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the TSTART instruction is executed at EL1, the transaction fails with a TRIVIAL failure cause.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TMT0, bit [50]**

When TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL0.

<table>
<thead>
<tr>
<th>TMT0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any TSTART instruction to fail.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the TSTART instruction is executed at EL0, the transaction fails with a TRIVIAL failure cause.</td>
</tr>
</tbody>
</table>

If ARMv8.1-VHE is implemented, EL2 is implemented and enabled in the current Security state, and HCR_EL2.{E2H, TGE} == {1,1}, this field has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TWEDEL, bits [49:46]**

When ARMv8.6-TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL1.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by SCTLR_EL1.nTWE as $2^{(TWEDEL + 8)}$ cycles.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

**TWEDEn, bit [45]**

When ARMv8.6-TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by SCTLR_EL1.nTWE.

<table>
<thead>
<tr>
<th><strong>TWEDEn</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The delay for taking a WFE trap is IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>The delay for taking a WFE trap is at least the number of cycles defined in SCTLR_EL1.TWEDEL.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**DSSBS, bit [44]**

When ARMv8.0-SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry. The defined values are:

<table>
<thead>
<tr>
<th><strong>DSSBS</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.SSBS is set to 0 on an exception to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>PSTATE.SSBS is set to 1 on an exception to EL1.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL1, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:
Reserved, RES0.

**ATA, bit [43]**

When ARMv8.5-MemTag is implemented:

Allocation Tag Access in EL1. When SCR_EL3.ATA=1 and HCR_EL2.ATA=1, controls EL1 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

<table>
<thead>
<tr>
<th><strong>ATA</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to Allocation Tags is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to Allocation Tags is not prevented.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.
**ATA0, bit [42]**

*When ARMv8.5-MemTag is implemented:*

Allocation Tag Access in EL0. When SCR_EL3.ATA=1, HCR_EL2.ATA=1, and HCR_EL2.{E2H,TGE} != {1,1}, controls EL0 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

<table>
<thead>
<tr>
<th>ATA0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to Allocation Tags is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to Allocation Tags is not prevented.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

**Note**

Software may change this control bit on a context switch.

In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TCF, bits [41:40]**

*When ARMv8.5-MemTag is implemented:*

Tag Check Fault in EL1. Controls the effect of Tag Check Faults due to Loads and Stores in EL1.

<table>
<thead>
<tr>
<th>TCF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Tag Check Faults have no effect on the PE.</td>
</tr>
<tr>
<td>0b01</td>
<td>Tag Check Faults causes a synchronous exception.</td>
</tr>
<tr>
<td>0b10</td>
<td>Tag Check Faults are asynchronously accumulated.</td>
</tr>
</tbody>
</table>

The value 0b11 is reserved.

In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.
TCF0, bits [39:38]

When ARMv8.5-MemTag is implemented:

Tag Check Fault in EL0. When \texttt{HCR\_EL2.\{E2H,TGE\}} \neq \{1,1\}, controls the effect of Tag Check Faults due to Loads and Stores in EL0.

<table>
<thead>
<tr>
<th>TCF0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Tag Check Faults have no effect on the PE.</td>
</tr>
<tr>
<td>0b01</td>
<td>Tag Check Faults causes a synchronous exception.</td>
</tr>
<tr>
<td>0b10</td>
<td>Tag Check Faults are asynchronously accumulated.</td>
</tr>
</tbody>
</table>

The value 0b11 is reserved.

\textbf{Note}

Software may change this control bit on a context switch.

In a system where the PE resets into EL1, this field resets to an architecturally \texttt{UNKNOWN} value.

Otherwise:

Reserved, \texttt{RES0}.

ITFSB, bit [37]

When ARMv8.5-MemTag is implemented:

When synchronous exceptions are not being generated by Tag Check Faults which are generated for Loads and Stores in EL0 or EL1, controls the auto-synchronization of Tag Check Faults into \texttt{TFSRE0\_EL1} and \texttt{TFSR\_EL1}.

<table>
<thead>
<tr>
<th>ITFSB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tag Check Faults are not synchronized on entry to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tag Check Faults are synchronized on entry to EL1.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL1, this field resets to an architecturally \texttt{UNKNOWN} value.

Otherwise:

Reserved, \texttt{RES0}.

BT1, bit [36]

When ARMv8.5-BTI is implemented:

PAC Branch Type compatibility at EL1.

<table>
<thead>
<tr>
<th>BT1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When the PE is executing at EL1, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the PE is executing at EL1, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL1, this field resets to an architecturally \texttt{UNKNOWN} value.

Otherwise:

Reserved, \texttt{RES0}.
**BT0, bit [35]**

When ARMv8.5-BTI is implemented:

PAC Branch Type compatibility at EL0.

<table>
<thead>
<tr>
<th>BT0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
</tbody>
</table>

When \textit{HCR_EL2}.E2H == 1 && \textit{HCR_EL2}.TGE == 1, the value of the SCTLR_EL1.BT0 has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally \textit{UNKNOWN} value.

**Otherwise:**

Reserved, RES0.

**Bits [34:32]**

Reserved, RES0.

**EnIA, bit [31]**

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see ‘System register control of pointer authentication’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>EnIA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL1, this field resets to an architecturally \textit{UNKNOWN} value.

**Otherwise:**

Reserved, RES0.

**EnIB, bit [30]**

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see ‘System register control of pointer authentication’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
### EnIB

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.</td>
<td>0b0</td>
</tr>
<tr>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.</td>
<td>0b1</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### LSMAOE, bit [29]

**When ARMv8.2-LSMAOC is implemented:**

Load Multiple and Store Multiple Atomicity and Ordering Enable.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.</td>
<td>0b0</td>
</tr>
<tr>
<td>The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.</td>
<td>0b1</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2 {E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

### nTLSMD, bit [28]

**When ARMv8.2-LSMAOC is implemented:**

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.</td>
<td>0b0</td>
</tr>
<tr>
<td>All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.</td>
<td>0b1</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2 {E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.
In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

**EnDA, bit [27]**

**When ARMv8.3-PAuth is implemented:**

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>EnDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**UCI, bit [26]**

Traps EL0 execution of cache maintenance instructions, to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using EC syndrome value 0x18.

This applies to DC_CVAU, DC_CIVAC, DC_CVAC, DC_CVAP, and IC_IVAU.

If ARMv8.2-DCCVADP is implemented, this trap also applies to DC_CVADP.

If ARMv8.5-MemTag is implemented, this trap also applies to DC_CIGVAC, DC_CIGDVAC, DC_CGVAC, DC_CGDVAC, DC_CGVAP, and DC_CGDVAP.

If ARMv8.2-DCCVADP and ARMv8.5-MemTag are implemented, this trap also applies to DC_CGVADP and DC_CGDVADP.

<table>
<thead>
<tr>
<th>UCI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of the specified instructions at EL0 using AArch64 is trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is \{1, 1\}, this bit has no effect on execution at EL0.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.
If the Point of Unification is before any level of data cache, it is implementation defined whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is implementation defined whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

In a system where the PE resets into EL1, this field resets to an architecturally unknown value.

EE, bit [25]

Endianness of data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime.

The possible values of this bit are:

<table>
<thead>
<tr>
<th>EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&amp;0 translation regime are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&amp;0 translation regime are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of \texttt{HCR_EL2.(E2H, TGE)} is \{1, 1\}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to an implementation defined value.

E0E, bit [24]

Endianness of data accesses at EL0.

The possible values of this bit are:

<table>
<thead>
<tr>
<th>E0E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL0 are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL0 are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation only supports Little-endian access at EL0 then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.

If an implementation only supports Big-endian access at EL0 then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDRSH, LDRSW, STTR, and STTRH instructions executed at EL1.

When ARMv8.1-VHE is implemented, and the value of \texttt{HCR_EL2.(E2H, TGE)} is \{1, 1\}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally unknown value.

SPAN, bit [23]

When ARMv8.1-PAN is implemented:

Set Privileged Access Never, on taking an exception to EL1.

<table>
<thead>
<tr>
<th>SPAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.PAN is set to 1 on taking an exception to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The value of PSTATE.PAN is left unchanged on taking an exception to EL1.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented, and the value of \texttt{HCR_EL2.(E2H, TGE)} is \{1, 1\}, this bit has no effect on execution at EL0.
In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES1**.

**EIS, bit [22]**

**When ARMv8.5-CSEH is implemented:**

Exception Entry is Context Synchronizing. The defined values are:

<table>
<thead>
<tr>
<th>EIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The taking of an exception to EL1 is not a context synchronizing event.</td>
</tr>
<tr>
<td>0b1</td>
<td>The taking of an exception to EL1 is a context synchronizing event.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented, and the value of **HCR_EL2** {E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

If **SCTLR_EL1.EIS** is set to 0b0:

- Indirect writes to **ESR_EL1, FAR_EL1, SPSR_EL1, ELR_EL1** are synchronized on exception entry to EL1, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of **SCTLR_EL1.EIS**:

- Changes to the PSTATE information on entry to EL1.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES1**.

**IESB, bit [21]**

**When ARMv8.2-IESB is implemented:**

Implicit Error Synchronization event enable. Possible values are:

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>An implicit error synchronization event is added:</td>
</tr>
<tr>
<td></td>
<td>• At each exception taken to EL1.</td>
</tr>
<tr>
<td></td>
<td>• Before the operational pseudocode of each <strong>ERET</strong> instruction</td>
</tr>
<tr>
<td></td>
<td>executed at EL1.</td>
</tr>
</tbody>
</table>

When the PE is in Debug state, the effect of this field is **CONSTRAINED UNPREDICTABLE**, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each **DCPSX** instruction taken to EL1 and before each **DRPS** instruction executed at EL1, in addition to the other cases where it is added.

In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.
Otherwise:
Reserved, RES0.

**TSCXT, bit [20]**

*When ARMv8.0-CSV2 is implemented:*

Trap EL0 Access to the `SCXTNUM_EL0` register, when EL0 is using AArch64. The defined values are:

<table>
<thead>
<tr>
<th>TSCXT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 access to <code>SCXTNUM_EL0</code> is not disabled by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 access to <code>SCXTNUM_EL0</code> is disabled, causing an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and <code>HCR_EL2.TGE</code> is 1. The value of <code>SCXTNUM_EL0</code> is treated as 0.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented, and the value of `HCR_EL2.{E2H, TGE}` is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

Otherwise:
Reserved, RES1.

**WXN, bit [19]**

Write permission implies XN (Execute-never). For the EL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the EL1&amp;0 translation regime is forced to XN for accesses from software executing at EL1 or EL0.</td>
</tr>
</tbody>
</table>

This bit applies only when SCTLR_EL1.M bit is set.

The WXN bit is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of `HCR_EL2.{E2H, TGE}` is {1, 1}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**nTWE, bit [18]**

Traps EL0 execution of WFE instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and `HCR_EL2.TGE` is 1, from both Execution states, reported using EC syndrome value **0x01**.

<table>
<thead>
<tr>
<th>nTWE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a WFE instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

**Note**
Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When ARMv8.1-VHE is implemented, and the value of `HCR_EL2.E2H, TGE` is `{1, 1}`, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Bit [17]**

Reserved, RES0.

**nTWI, bit [16]**

Traps EL0 execution of WFI instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and `HCR_EL2.TGE` is 1, from both Execution states, reported using EC syndrome value 0x01.

<table>
<thead>
<tr>
<th>nTWI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a WFI instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When ARMv8.1-VHE is implemented, and the value of `HCR_EL2.E2H, TGE` is `{1, 1}`, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**UCT, bit [15]**

Traps EL0 accesses to the `CTR_EL0` to EL1, or to EL2 when it is implemented and enabled for the current Security state and `HCR_EL2.TGE` is 1, from AArch64 state only, reported using EC value 0x18.

<table>
<thead>
<tr>
<th>UCT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to the <code>CTR_EL0</code> from EL0 using AArch64 are trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented, and the value of `HCR_EL2.E2H, TGE` is `{1, 1}`, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**DZE, bit [14]**

Traps EL0 execution of `DC ZVA` instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and `HCR_EL2.TGE` is 1, from AArch64 state only, reported using EC syndrome value 0x18.

If ARMv8.5-MemTag is implemented, this trap also applies to `DC GVA` and `DC GZVA`.
Meaning

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>0b1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped. Reading DCZID_EL0.DZP from EL0 returns 1, indicating that the instructions this trap applies to are not supported.</td>
<td></td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.\{E2H, TGE\} is \{1, 1\}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

### EnDB, bit [13]

*When ARMv8.3-PAuth is implemented:*

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see ‘System register control of pointer authentication’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>0b1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.</td>
<td></td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

*Note*

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

### I, bit [12]

Instruction access Cacheability control, for accesses at EL0 and EL1:

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>0b1</th>
</tr>
</thead>
<tbody>
<tr>
<td>All instruction access to Normal memory from EL0 and EL1 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&amp;0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer None-cacheable memory.</td>
<td></td>
<td>This control has no effect on the Cacheability of instruction access to Normal memory from EL0 and EL1. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&amp;0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.</td>
</tr>
</tbody>
</table>

When the value of the HCR_EL2.DC bit is 1, then instruction access to Normal memory from EL0 and EL1 are Cacheable regardless of the value of the SCTLR_EL1.I bit.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.\{E2H, TGE\} is \{1, 1\}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to 0.
**EOS, bit [11]**

*When ARMv8.5-CSEH is implemented:*

Exception Exit is Context Synchronizing. The defined values are:

<table>
<thead>
<tr>
<th>EOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An exception return from EL1 is not a context synchronizing event</td>
</tr>
<tr>
<td>0b1</td>
<td>An exception return from EL1 is a context synchronizing event</td>
</tr>
</tbody>
</table>

*When ARMv8.1-VHE is implemented, and the value of HCR_EL2.\{E2H, TGE\} is \{1,1\}, this bit has no effect on execution at EL0.*

*If SCTLR_EL1.EOS is set to 0b0:*

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL1.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL1 and ELR_EL1 on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**EnRCTX, bit [10]**

*When ARMv8.0-PredInv is implemented:*

Enable EL0 access to the following instructions:

- AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions.
- AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions.

The defined values are:

<table>
<thead>
<tr>
<th>EnRCTX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 access to these instructions is disabled, and these instructions</td>
</tr>
<tr>
<td></td>
<td>are trapped to EL1, or to EL2 when it is implemented and enabled for</td>
</tr>
<tr>
<td></td>
<td>the current Security state and HCR_EL2.TGE is 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 access to these instructions is enabled.</td>
</tr>
</tbody>
</table>

*When ARMv8.1-VHE is implemented, and the value of HCR_EL2.\{E2H, TGE\} is \{1,1\}, this bit has no effect on execution at EL0.*

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
UMA, bit [9]

User Mask Access. Traps EL0 execution of MSR and MRS instructions that access the PSTATE.{D, A, I, F} masks to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using EC syndrome value 0x18.

<table>
<thead>
<tr>
<th>UMA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt at EL0 using AArch64 to execute an MRS, MSR(REGISTER), or MSR(IMMEDIATE) instruction that accesses the DAIF is trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SED, bit [8]

When AArch32 is supported at any Exception level and EL0 is capable of using AArch32:

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

<table>
<thead>
<tr>
<th>SED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SETEND instruction execution is enabled at EL0 using AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>SETEND instructions are UNDEFINED at EL0 using AArch32 and any attempt at EL0 to access a SETEND instruction generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, reported using EC syndrome value 0x00.</td>
</tr>
</tbody>
</table>

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

ITD, bit [7]

When AArch32 is supported at any Exception level and EL0 is capable of using AArch32:

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.
<table>
<thead>
<tr>
<th>ITD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All IT instruction functionality is enabled at EL0 using AArch32.</td>
</tr>
</tbody>
</table>
| 0b1 | Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED and generates an exception, reported using EC syndrome value 0x00, to EL1 or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1:  
  • All encodings of the IT instruction with hw1[3:0]!=1000.  
  • All encodings of the subsequent instruction with the following values for hw1:  
    ◦ 0b11xxxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.  
    ◦ 0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section F3.2.5.  
    ◦ 0b10100xxxxxxxxxx: ADD Rd, PC, #imm  
    ◦ 0b01001xxxxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.  
    ◦ 0b010001xx1xxxx1111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.  
  These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.  
  It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:  
    • A 16-bit instruction, that can only be followed by another 16-bit instruction.  
    • The first half of a 32-bit instruction.  
  This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction. |

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see ‘Changes to an ITD control by an instruction in an IT block’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section E1.2.4

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAZ/WI.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nAA, bit [6]

When ARMv8.4-LSE is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL1 and EL0 under certain conditions.
SCTLR_EL1, System Control Register (EL1)

<table>
<thead>
<tr>
<th>nAA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDLAR, LDLARH, LDLARL, STLUR, STLURH, STLUR, STLLR, STLLRH, and STLRUH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDLAR, LDLARH, LDLARL, STLUR, STLURH, STLUR, STLLR, STLLRH, STLUR, or STLRUH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.</td>
</tr>
</tbody>
</table>

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.\{E2H, TGE\} is \{1, 1\}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**CP15BEN, bit [5]**

When AArch32 is supported at any Exception level and EL0 is capable of using AArch32:

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

<table>
<thead>
<tr>
<th>CP15BEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED and generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1. The exception is reported using EC syndrome value 0x0.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.</td>
</tr>
</tbody>
</table>

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAO/WI.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.\{E2H, TGE\} is \{1, 1\}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SA0, bit [4]**

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see ‘SP alignment checking’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers’ Model).

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.\{E2H, TGE\} is \{1, 1\}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.
SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL1 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers’ Model).

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Cacheability control, for data accesses.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All data access to Normal memory from EL0 and EL1, and Normal memory accesses to the EL1&amp;0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control has no effect on the Cacheability of:</td>
</tr>
<tr>
<td></td>
<td>• Data access to Normal memory from EL0 and EL1.</td>
</tr>
<tr>
<td></td>
<td>• Normal memory accesses to the EL1&amp;0 stage 1 translation tables.</td>
</tr>
</tbody>
</table>

When the value of the HCR_EL2.DC bit is 1, the PE ignores SCLTR.C. This means that Non-secure EL0 and Non-secure EL1 data accesses to Normal memory are Cacheable.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL1 and EL0.

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Alignment fault checking disabled when executing at EL1 or EL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Alignment fault checking enabled when executing at EL1 or EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.</td>
</tr>
</tbody>
</table>

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL1&0 stage 1 address translation.

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL1&amp;0 stage 1 address translation disabled. See the SCTLR_EL1.I field for the behavior of instruction accesses to Normal memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1&amp;0 stage 1 address translation enabled.</td>
</tr>
</tbody>
</table>
If the value of \( \text{HCR\_EL2} \{\text{DC, TGE}\} \) is not \( \{0, 0\} \) then in Non-secure state the PE behaves as if the value of the \( \text{SCTLR\_EL1} \).M field is 0 for all purposes other than returning the value of a direct read of the field.

When ARMv8.1-VHE is implemented, and the value of \( \text{HCR\_EL2} \{\text{E2H, TGE}\} \) is \( \{1, 1\} \), this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to 0.

### Accessing the SCTLR\_EL1

When \( \text{HCR\_EL2} \).E2H is 1, without explicit synchronization, access from EL3 using the mnemonic SCTLR\_EL1 or SCTLR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**MRS <Xt>, SCTLR\_EL1**

<table>

SCTLR_EL2, System Control Register (EL2)

The SCTLR_EL2 characteristics are:

**Purpose**

Provides top level control of the system, including its memory system, at EL2.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.E2H, TGE is {1, 1}, these controls apply also to execution at EL0.

**Configuration**

AArch64 System register SCTLR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSCTLR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

SCTLR_EL2 is a 64-bit register.

**Field descriptions**

The SCTLR_EL2 bit assignments are:

**When HCR_EL2.E2H != 0b1 or HCR_EL2.TGE != 0b1:**

**TME, bit [53]**

When TME is implemented:

Enables the Transactional Memory Extension at EL2.

<table>
<thead>
<tr>
<th>TME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a TSTART instruction at EL2 is trapped, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any TSTART instruction to be trapped.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

Bit [52]
Reserved, RES0.

**TMT, bit [51]**

When TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL2.

<table>
<thead>
<tr>
<th>TMT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any TSTART instruction to fail.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the TSTART instruction is executed at EL2, the transaction fails with a TRIVIAL failure cause.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**Bits [50:45]**

Reserved, RES0.

**DSSBS, bit [44]**

When ARMv8.0-SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

<table>
<thead>
<tr>
<th>DSSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.SSBS is set to 0 on an exception to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>PSTATE.SSBS is set to 1 on an exception to EL2.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:
Reserved, RES0.

**ATA, bit [43]**

When ARMv8.5-MemTag is implemented:

Allocation Tag Access. When SCR_EL3.ATA=1, controls EL2 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions that Load or Store data are Unchecked.
- Instructions that Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions that insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions that invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.
<table>
<thead>
<tr>
<th>ATA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to Allocation Tags is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to Allocation Tags is not prevented.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [42]**

Reserved, RES0.

**TCF, bits [41:40]**

*When ARMv8.5-MemTag is implemented:*

Tag Check Fault. Controls the effect of Tag Check Faults due to Loads and Stores in EL2.

<table>
<thead>
<tr>
<th>TCF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Tag Check Faults have no effect on the PE.</td>
</tr>
<tr>
<td>0b01</td>
<td>Tag Check Faults cause a synchronous exception.</td>
</tr>
<tr>
<td>0b10</td>
<td>Tag Check Faults are asynchronously accumulated.</td>
</tr>
</tbody>
</table>

The value 0b11 is reserved.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [39:38]**

Reserved, RES0.

**ITFSB, bit [37]**

*When ARMv8.5-MemTag is implemented:*

When synchronous exceptions are not being generated by Tag Check Faults, which are generated for Loads and Stores in EL0, EL1 or EL2, controls the auto-synchronization of Tag Check Faults into TFSRE0_EL1, TFSR_EL1, and TFSR_EL2.

<table>
<thead>
<tr>
<th>ITFSB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tag Check Faults are not synchronized on entry to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tag Check Faults are synchronized on entry to EL2.</td>
</tr>
</tbody>
</table>

**Otherwise:**

Reserved, RES0.

**BT, bit [36]**

*When ARMv8.5-BTI is implemented:*

PAC Branch Type compatibility at EL2.
### BT

<table>
<thead>
<tr>
<th>Meaning</th>
<th>BT</th>
</tr>
</thead>
<tbody>
<tr>
<td>When the PE is executing at EL2, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.</td>
<td>0b0</td>
</tr>
<tr>
<td>When the PE is executing at EL2, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.</td>
<td>0b1</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bits [35:32]**

Reserved, RES0.

**EnIA, bit [31]**

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see ‘System register control of pointer authentication’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>EnIA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**EnIB, bit [30]**

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see ‘System register control of pointer authentication’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>EnIB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**
This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:28]

Reserved, RES1.

EnDA, bit [27]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>EnDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime.
EE

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0b0</strong></td>
</tr>
<tr>
<td><strong>0b1</strong></td>
</tr>
</tbody>
</table>

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

**Bit [24]**

Reserved, RES0.

**Bit [23]**

Reserved, RES1.

**EIS, bit [22]**

*When ARMv8.5-CSEH is implemented:*

Exception entry is a context synchronization event. The defined values are:

<table>
<thead>
<tr>
<th>EIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0b0</strong></td>
<td>The taking of an exception to EL2 is not a context synchronization event.</td>
</tr>
<tr>
<td><strong>0b1</strong></td>
<td>The taking of an exception to EL2 is a context synchronization event.</td>
</tr>
</tbody>
</table>

If SCTLR_EL2.EIS is set to **0b0**:

- Indirect writes to ESR_EL2, FAR_EL2, SPSR_EL2, ELR_EL2, and HPFAR_EL2 are synchronized on exception entry to EL2, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EIS:

- Changes to the PSTATE information on entry to EL2.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**IESB, bit [21]**

*When ARMv8.2-IESB is implemented:*

Implicit Error Synchronization event enable.
**IESB**

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled.</td>
</tr>
</tbody>
</table>
| 0b1  | An implicit error synchronization event is added:  
  • At each exception taken to EL2.  
  • Before the operational pseudocode of each ERET instruction executed at EL2. |

When the PE is in Debug state, the effect of this field is **CONSTRAINED UNPREDICTABLE**, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bit [20]**

Reserved, RES0.

**WXN, bit [19]**

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN:

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the EL2 or EL2&amp;0 translation regime is forced to XN for accesses from software executing at EL2.</td>
</tr>
</tbody>
</table>

This bit applies only when SCTLR_EL2.M bit is set.

The WXN bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Bit [18]**

Reserved, RES1.

**Bit [17]**

Reserved, RES0.

**Bit [16]**

Reserved, RES1.

**Bits [15:14]**

Reserved, RES0.

**EnDB, bit [13]**

*When ARMv8.3-PAuth is implemented:*

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.
For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>EnDB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**I, bit [12]**

Instruction access Cacheability control, for accesses at EL2:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All instruction accesses to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&amp;0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control has no effect on the Cacheability of instruction access to Normal memory from EL2. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&amp;0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.</td>
</tr>
</tbody>
</table>

This bit has no effect on the EL1&0 or EL3 translation regimes.

In a system where the PE resets into EL2, this field resets to 0.

**EOS, bit [11]**

*When ARMv8.5-CSEH is implemented:*

Exception exit is a context synchronization Event.

<table>
<thead>
<tr>
<th>EOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An exception return from EL2 is not a context synchronization event.</td>
</tr>
<tr>
<td>0b1</td>
<td>An exception return from EL2 is a context synchronization event.</td>
</tr>
</tbody>
</table>

If SCTLR_EL2.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL2 and ELR_EL2 on exception return is synchronized.
Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.

Exit from Debug state.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**Bits [10:7]**

Reserved, RES0.

**nAA, bit [6]**

When ARMv8.4-LSE is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL2 under certain conditions.

<table>
<thead>
<tr>
<th>nAA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [5:4]**

Reserved, RES1.

**SA, bit [3]**

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see 'SP alignment checking' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers’ Model).

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**C, bit [2]**

Cacheability control, for data accesses.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All data accesses to Normal memory from EL2, and all Normal memory accesses to the EL2 translation tables, are Non-cacheable for all levels of data and unified cache.</td>
</tr>
</tbody>
</table>
| 0b1 | This control has no effect on the Cacheability of:  
  • Data access to Normal memory from EL2.  
  • Normal memory accesses to the EL2 translation tables. |
This bit has no effect on the EL1&0 or EL3 translation regimes.

In a system where the PE resets into EL2, this field resets to 0.

### A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2:

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Alignment fault checking disabled when executing at EL2. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Alignment fault checking enabled when executing at EL2. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.</td>
</tr>
</tbody>
</table>

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

### M, bit [0]

MMU enable for EL2 stage 1 address translation.

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2 stage 1 address translation disabled. See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 stage 1 address translation enabled.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to 0.

### When HCR_EL2.E2H == 0b1 and HCR_EL2.TGE == 0b1:

This format applies only from Armv8.1 when EL2 is enabled in the current Security state and \( HCR_{EL2.E2H,TGE} = 0b1 \).

### Bits [63:54]

Reserved, RES0.

### TME, bit [53]

When TME is implemented:

<table>
<thead>
<tr>
<th>TME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a TSTART instruction at EL2 is trapped, unless ( HCR_{EL2.TME} ) or ( SCR_{EL3.TME} ) causes TSTART instructions to be UNDEFINED at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any TSTART instruction to be trapped.</td>
</tr>
</tbody>
</table>
In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME0, bit [52]

When TME is implemented:

Enables the Transactional Memory Extension at EL0.

<table>
<thead>
<tr>
<th>TME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a TSTART instruction at EL0 is trapped to EL2, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any TSTART instruction to be trapped.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT, bit [51]

When TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL2.

<table>
<thead>
<tr>
<th>TMT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any TSTART instruction to fail.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the TSTART instruction is executed at EL2, the transaction fails with a TRIVIAL failure cause.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT0, bit [50]

When TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL0.

<table>
<thead>
<tr>
<th>TMT0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any TSTART instruction to fail.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the TSTART instruction is executed at EL0, the transaction fails with a TRIVIAL failure cause.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEL, bits [49:46]
When ARMv8.6-TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by SCTLR_EL2.nTWE as $2^{(TWEDEL + 8)}$ cycles.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TWEDEn, bit [45]**

When ARMv8.6-TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by SCTLR_EL2.nTWE.

<table>
<thead>
<tr>
<th>TWEDEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The delay for taking a WFE trap is IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>The delay for taking a WFE trap is at least the number of cycles defined in SCTLR_EL2.TWEDEL.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**DSSBS, bit [44]**

When ARMv8.0-SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

<table>
<thead>
<tr>
<th>DSSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.SSBS is set to 0 on an exception to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>PSTATE.SSBS is set to 1 on an exception to EL2.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

**ATA, bit [43]**

When ARMv8.5-MemTag is implemented:

Allocation Tag Access in EL2. When SCR_EL3.ATA=1, controls EL2 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.
### ATA, bit [42]

**ATA0, bit [42]**

*When ARMv8.5-MemTag is implemented:*

Allocation Tag Access in EL0. When `SCR_EL3.ATA=1`, controls EL0 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

### ATA0 Meaning

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to Allocation Tags is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to Allocation Tags is not prevented.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

**Note**

Software may change this control bit on a context switch.

In a system where the PE resets into EL2, this field resets to an architecturally `UNKNOWN` value.

**Otherwise:**

Reserved, RES0.

### TCF, bits [41:40]

**TCF, bits [41:40]**

*When ARMv8.5-MemTag is implemented:*

Tag Check Fault in EL2. Controls the effect of Tag Check Faults due to Loads and Stores in EL2.

### TCF Meaning

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Tag Check Faults have no effect on the PE.</td>
</tr>
<tr>
<td>0b01</td>
<td>Tag Check Faults causes a synchronous exception.</td>
</tr>
<tr>
<td>0b10</td>
<td>Tag Check Faults are asynchronously accumulated.</td>
</tr>
</tbody>
</table>

The value `0b11` is reserved.

In a system where the PE resets into EL2, this field resets to an architecturally `UNKNOWN` value.
T CF0, bits [39:38]

When ARMv8.5-MemTag is implemented:

Tag Check Fault in EL0. Controls the effect of Tag Check Faults due to Loads and Stores in EL0.

<table>
<thead>
<tr>
<th>TCF0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>Tag Check Faults have no effect on the PE.</td>
</tr>
<tr>
<td>001</td>
<td>Tag Check Faults causes a synchronous exception.</td>
</tr>
<tr>
<td>010</td>
<td>Tag Check Faults are asynchronously accumulated.</td>
</tr>
</tbody>
</table>

The value 0b11 is reserved.

Note

Software may change this control bit on a context switch.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]

When ARMv8.5-MemTag is implemented:

When synchronous exceptions are not being generated by Tag Check Faults which are generated for Loads and Stores in EL0, EL1 or EL2, controls the auto-synchronizaton of Tag Check Faults into TFSR_EL0, TFSR_EL1 and TFSR_EL2.

<table>
<thead>
<tr>
<th>ITFSB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Tag Check Faults are not synchronized on entry to EL2.</td>
</tr>
<tr>
<td>1</td>
<td>Tag Check Faults are synchronized on entry to EL2.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT1, bit [36]

When ARMv8.5-BTI is implemented:

PAC Branch Type compatibility at EL2.

<table>
<thead>
<tr>
<th>BT1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>When the PE is executing at EL2, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
<tr>
<td>1</td>
<td>When the PE is executing at EL2, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

**BT0, bit [35]**

When ARMv8.5-BTI is implemented:

PAC Branch Type compatibility at EL0.

<table>
<thead>
<tr>
<th>BT0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

Otherwise:
Reserved, RES0.

**Bits [34:32]**

Reserved, RES0.

**EnIA, bit [31]**

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see ‘System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>EnIA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

Otherwise:
Reserved, RES0.

**EnIB, bit [30]**

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.
For more information, see ‘System register control of pointer authentication’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>EnIB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**LSMAOE, bit [29]**

When ARMv8.2-LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

<table>
<thead>
<tr>
<th>LSMAOE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.</td>
</tr>
<tr>
<td>0b1</td>
<td>The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**nTLSMD, bit [28]**

When ARMv8.2-LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

<table>
<thead>
<tr>
<th>nTLSMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.</td>
</tr>
<tr>
<td>0b1</td>
<td>All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES1.

**EnDA, bit [27]**

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>EnDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**UCI, bit [26]**

Traps EL0 execution of cache maintenance instructions to EL2, from AArch64 state only. This applies to DC CVAU, DC CIVAC, DC CVAC, DC CVAP, and IC IVAU.

If ARMv8.2-DCCVADP is implemented, this trap also applies to DC CVADP.

If ARMv8.5-MemTag is implemented, this trap also applies to DC CIGVAC, DC CIGDVAC, DC CGVAC, DC CGDVAC, DC CGVAP, and DC CGDVAP.

If ARMv8.2-DCCVADP and ARMv8.5-MemTag are implemented, this trap also applies to DC CGVADP and DC CGDVADP.

<table>
<thead>
<tr>
<th>UCI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
EE, bit [25]

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL2&0 translation regime.

The possible values of this bit are:

<table>
<thead>
<tr>
<th>EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&amp;0 translation regime, and stage 2 translation table walks in the EL2&amp;0 translation regime are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&amp;0 translation regime, and stage 2 translation table walks in the EL2&amp;0 translation regime are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

E0E, bit [24]

Endianness of data accesses at EL0.

<table>
<thead>
<tr>
<th>E0E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL0 are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL0 are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation only supports Little-endian accesses at EL0 then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0 then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

SPAN, bit [23]

Set Privileged Access Never, on taking an exception to EL2.

<table>
<thead>
<tr>
<th>SPAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.PAN is set to 1 on taking an exception to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>The value of PSTATE.PAN is left unchanged on taking an exception to EL2.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

EIS, bit [22]

When ARMv8.5-CSEH is implemented:

Exception Entry is a context synchronization event.

<table>
<thead>
<tr>
<th>EIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The taking of an exception to EL2 is not a context synchronization event.</td>
</tr>
<tr>
<td>0b1</td>
<td>The taking of an exception to EL2 is a context synchronization event.</td>
</tr>
</tbody>
</table>

If SCTLR_EL2.EIS is set to 0b0:
Indirect writes to ESR_EL2, FAR_EL2, SPSR_EL2, ELR_EL2, HPFAR_EL2 are synchronized on exception entry to EL2, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.

Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.

Exception Catch debug events are synchronous debug events.

DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EIS:

- Changes to the PSTATE information on entry to EL2.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]

When ARMv8.2-IESB is implemented:

Implicit Error Synchronization event Enable.

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled.</td>
</tr>
</tbody>
</table>
| 0b1  | An implicit error synchronization event is added:
|      | • After each exception taken to EL2. |
|      | • Before the operational pseudocode of each ERET instruction executed at EL2. |

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSx instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]

When ARMv8.0-CSV2 is implemented:

Trap EL0 Access to the SCXTNUM_EL0 register, when EL0 is using AArch64.

<table>
<thead>
<tr>
<th>TSCXT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 access to SCXTNUM_EL0 is not disabled by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL2, and the SCXTNUM_EL0 value is treated at 0.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.
WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the EL2 or EL2&amp;0 translation regime is forced to XN for accesses from software executing at EL2.</td>
</tr>
</tbody>
</table>

This bit applies only when SCTLR_EL2.M bit is set.

The WXN bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to EL2, from both Execution states.

<table>
<thead>
<tr>
<th>nTWE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a WFE instruction at EL0 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps EL0 execution of WFI instructions to EL2, from both Execution states.

<table>
<thead>
<tr>
<th>nTWI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a WFI instruction at EL0 is trapped EL2, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.
In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**UCT, bit [15]**

Traps EL0 accesses to the CTR_EL0 to EL2, from AArch64 state only.

<table>
<thead>
<tr>
<th>UCT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to the CTR_EL0 from EL0 using AArch64 are trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**DZE, bit [14]**

Traps EL0 execution of DC ZVA instructions to EL2, from AArch64 state only.

If ARMv8.5-MemTag is implemented, this trap also applies to DC GVA and DC GZVA.

<table>
<thead>
<tr>
<th>DZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2. Reading DCZID_EL0.DZP from EL0 returns 1, indicating that the instructions that this trap applies to are not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**EnDB, bit [13]**

*When ARMv8.3-PAuth is implemented:*

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see ‘System register control of pointer authentication’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>EnDB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**I, bit [12]**

Instruction access Cacheability control, for accesses at EL2 and EL0:
I: All instruction access to Normal memory from EL2 and EL0 are Non-cacheable for all levels of instruction and unified cache.

0b0: If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

0b1: This control has no effect on the Cacheability of instruction access to Normal memory from EL2 and EL0.

If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL3 translation regimes.

In a system where the PE resets into EL2, this field resets to 0.

EOS, bit [11]

When ARMv8.5-CSEH is implemented:

Exception exit is a context synchronization event.

EOS: An exception return from EL2 is not a context synchronization event.

0b0: An exception return from EL2 is a context synchronization event.

If SCTLR_EL2.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL2 and ELR_EL2 on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnRCTX, bit [10]

When ARMv8.0-PredInv is implemented:

Enable EL0 Access to the following instructions:

- AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions.
- AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions.

The defined values are:

<table>
<thead>
<tr>
<th>EnRCTX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 access to these instructions is disabled, and these instructions are trapped to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 access to these instructions is enabled.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

Bit [9]
Reserved, RES0.

SED, bit [8]
When AArch32 is supported at any Exception level and EL0 is capable of using AArch32:

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

<table>
<thead>
<tr>
<th>SED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SETEND instruction execution is enabled at EL0 using AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>SETEND instructions are UNDEFINED at EL0 using AArch32.</td>
</tr>
</tbody>
</table>

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES1.

ITD, bit [7]
When AArch32 is supported at any Exception level and EL0 is capable of using AArch32:

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

<table>
<thead>
<tr>
<th>ITD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All IT instruction functionality is enabled at EL0 using AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED:</td>
</tr>
<tr>
<td></td>
<td>• All encodings of the IT instruction with hw1[3:0]! = 1000.</td>
</tr>
<tr>
<td></td>
<td>• All encodings of the subsequent instruction with the following values for hw1:</td>
</tr>
<tr>
<td></td>
<td>◦ 0b11xxxxxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.</td>
</tr>
<tr>
<td></td>
<td>◦ 0b101xxxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section F3.2.5.</td>
</tr>
<tr>
<td></td>
<td>◦ 0b10001xxxxxxxxxx: ADD Rd, PC, #imm</td>
</tr>
<tr>
<td></td>
<td>◦ 0b01001xxxxxxxxxxxx: LDR Rd, [PC, #imm]</td>
</tr>
<tr>
<td></td>
<td>◦ 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.</td>
</tr>
<tr>
<td></td>
<td>◦ 0b100x01xx1xxx1111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn.</td>
</tr>
</tbody>
</table>

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:
• A 16-bit instruction, that can only be followed by another 16-bit instruction.
• The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.
An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.
If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is **CONSTRAINED UNPREDICTABLE**. For more information see 'Changes to an ITD control by an instruction in an IT block' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section E1.2.4

ITD is optional, but if it is implemented in the **SCTLR** then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAZ/WI.

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES1**.

**nAA, bit [6]**

**When Armv8.4-LSE is implemented:**

Non-aligned access. This bit controls generation of Alignment faults at EL2 and EL0 under certain conditions.

<table>
<thead>
<tr>
<th>nAA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**CP15BEN, bit [5]**

**When AArch32 is supported at any Exception level and EL0 is capable of using AArch32:**

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the \( \text{coproc}==0b1111 \) encoding space from EL0:

<table>
<thead>
<tr>
<th>CP15BEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 using AArch32; EL0 execution of the <strong>CP15DMB</strong>, <strong>CP15DSB</strong>, and <strong>CP15ISB</strong> instructions is <strong>UNDEFINED</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 using AArch32; EL0 execution of the <strong>CP15DMB</strong>, <strong>CP15DSB</strong>, and <strong>CP15ISB</strong> instructions is enabled.</td>
</tr>
</tbody>
</table>

CP15BEN is optional, but if it is implemented in the **SCTLR** then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAO/WI.

In a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**SA0, bit [4]**

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For
more information, see ‘SP alignment checking’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers’ Model).

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**SA, bit [3]**

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see ‘SP alignment checking’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers’ Model).

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**C, bit [2]**

Cacheability control, for data accesses.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All data access to Normal memory from EL2 and EL0, and all Normal memory accesses to the EL2&amp;0 translation tables, are Non-cacheable for all levels of data and unified cache.</td>
</tr>
</tbody>
</table>
| 0b1 | This control has no effect on the Cacheability of:  
• Data access to Normal memory from EL2 and EL0.  
• Normal memory accesses to the EL2&0 translation tables. |

This bit has no effect on the EL3 translation regimes.

In a system where the PE resets into EL2, this field resets to 0.

**A, bit [1]**

Alignment check enable. This is the enable bit for Alignment fault checking at EL2 and EL0.

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Alignment fault checking disabled when executing at EL2 and EL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Alignment fault checking enabled when executing at EL2 and EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.</td>
</tr>
</tbody>
</table>

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**M, bit [0]**

MMU enable for EL2&0 stage 1 address translation. Possible values of this bit are:

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2&amp;0 stage 1 address translation disabled. See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2&amp;0 stage 1 address translation enabled.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL2, this field resets to 0.
Accessing the SCTLR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SCTLR_EL2 or SCTLR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, SCTLR_EL2

\[
\begin{array}{cccc}
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} \\
0b11 & 0b100 & 0b0001 & 0b0000 & 0b000 \\
\end{array}
\]

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;

end
The SCTLR_EL3 characteristics are:

**Purpose**

Provides top level control of the system, including its memory system, at EL3.

**Configuration**

This register is present only when EL3 is implemented. Otherwise, direct accesses to SCTLR_EL3 are **UNDEFINED**.

**Attributes**

SCTLR_EL3 is a 64-bit register.

**Field descriptions**

The SCTLR_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:54</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**TME, bit [53]**

When TME is implemented:

Enables the Transactional Memory Extension at EL3.

<table>
<thead>
<tr>
<th>TME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a TSTART instruction at EL3 is trapped, unless <strong>HCR_EL2.TME</strong> or <strong>SCR_EL3.TME</strong> causes TSTART instructions to be <strong>UNDEFINED</strong> at EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any TSTART instruction to be trapped.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL3, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bit [52]**

Reserved, RES0.
**TMT, bit [51]**

When TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL3.

<table>
<thead>
<tr>
<th>TMT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any TSTART instruction to fail.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the TSTART instruction is executed at EL3, the transaction fails with a TRIVIAL failure cause.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [50:45]**

Reserved, RES0.

**DSSBS, bit [44]**

When ARMv8.0-SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

<table>
<thead>
<tr>
<th>DSSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.SSBS is set to 0 on an exception to EL3.</td>
</tr>

<td>Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.
If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1. The EE bit is permitted to be cached in a TLB.

In a system where the PE resets into EL3, this field resets to an IMPLEMENTATION DEFINED value.

**Bit [24]**

Reserved, RES0.

**Bit [23]**

Reserved, RES1.

**EIS, bit [22]**

*When ARMv8.5-CSEH is implemented:*

Exception Entry is Context Synchronizing.

<table>
<thead>
<tr>
<th>EIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The taking of an exception to EL3 is not a context synchronizing event.</td>
</tr>
<tr>
<td>0b1</td>
<td>The taking of an exception to EL3 is a context synchronizing event.</td>
</tr>
</tbody>
</table>

If SCTLR_EL3.EIS is set to 0b0:

- Indirect writes to ESR_EL3, FAR_EL3, SPSR_EL3, ELR_EL3 are synchronized on exception entry to EL3, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EIS:

- Changes to the PSTATE information on entry to EL3.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Debug state exit.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**IESB, bit [21]**

*When ARMv8.2-IESB is implemented:*

Implicit Error Synchronization event enable.

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>An implicit error synchronization event is added:</td>
</tr>
<tr>
<td></td>
<td>• At each exception taken to EL3.</td>
</tr>
<tr>
<td></td>
<td>• Before the operational pseudocode of each ERET instruction executed at EL3.</td>
</tr>
</tbody>
</table>

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL3 and before each DRPS instruction executed at EL3, in addition to the other cases where it is added.
SCTLR_EL3, System Control Register (EL3)

When ARMv8.4-DFE is implemented, and the Effective value of SCR_EL3.NMEA is 1, this field is ignored and its Effective value is 1.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bit [20]**

Reserved, RES0.

**WXN, bit [19]**

Write permission implies XN (Execute-never). For the EL3 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the EL3 translation regime is forced to XN for accesses from software executing at EL3.</td>
</tr>
</tbody>
</table>

This bit applies only when SCTLR_EL3.M bit is set.

The WXN bit is permitted to be cached in a TLB.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**Bit [18]**

Reserved, RES1.

**Bit [17]**

Reserved, RES0.

**Bit [16]**

Reserved, RES1.

**Bits [15:14]**

Reserved, RES0.

**EnDB, bit [13]**

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL3 translation regime.

<table>
<thead>
<tr>
<th>EnDB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

---

**Note**
This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL3:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All instruction access to Normal memory from EL3 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control has no effect on the Cacheability of instruction access to Normal memory from EL3. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.</td>
</tr>
</tbody>
</table>

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

In a system where the PE resets into EL3, this field resets to 0.

EOS, bit [11]

When ARMv8.5-CSEH is implemented:

Exception Exit is Context Synchronizing.

<table>
<thead>
<tr>
<th>EOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An exception return from EL3 is not a context synchronizing event</td>
</tr>
<tr>
<td>0b1</td>
<td>An exception return from EL3 is a context synchronizing event</td>
</tr>
</tbody>
</table>

If SCTLR_EL3.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL3 and ELR_EL3 on exception return is synchronized.
- If the PE enters Debug state before the first instruction after an Exception return from EL3 to Non-secure state, any pending Halting debug event completes execution.
- The GIC behavior that allocates interrupts to FIQ or IRQ changes simultaneously with leaving the EL3 Exception level.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES1.

**Bits [10:7]**

Reserved, RES0.

**nAA, bit [6]**

*When ARMv8.4-LSE is implemented:*

Non-aligned access. This bit controls generation of Alignment faults at EL3 under certain conditions.

<table>
<thead>
<tr>
<th>nAA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLRR, STLRRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLRR, STLRRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [5:4]**

Reserved, RES1.

**SA, bit [3]**

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL3 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers’ Model).

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**C, bit [2]**

Cacheability control, for data accesses.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All data access to Normal memory from EL3, and all Normal memory accesses to the EL3 translation tables, are Non-cacheable for all levels of data and unified cache.</td>
</tr>
</tbody>
</table>
| 0b1 | This control has no effect on the Cacheability of:  
  • Data access to Normal memory from EL3.  
  • Normal memory accesses to the EL3 translation tables. |

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

In a system where the PE resets into EL3, this field resets to 0.
A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL3.

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Alignment fault checking disabled when executing at EL3. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Alignment fault checking enabled when executing at EL3. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.</td>
</tr>
</tbody>
</table>

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL3 stage 1 address translation. Possible values of this bit are:

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL3 stage 1 address translation disabled. See the SCTLR_EL3.I field for the behavior of instruction accesses to Normal memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL3 stage 1 address translation enabled.</td>
</tr>
</tbody>
</table>

In a system where the PE resets into EL3, this field resets to 0.

Provides a number that can be used to separate out different context numbers with the EL1 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

**Configuration**

This register is present only when ARMv8.0-CSV2 is implemented. Otherwise, direct accesses to SCXTNUM_EL1 are UNDEFINED.

**Attributes**

SCXTNUM_EL1 is a 64-bit register.

**Field descriptions**

The SCXTNUM_EL1 bit assignments are:

<table>

```
SDER32_EL3, AArch32 Secure Debug Enable Register

The SDER32_EL3 characteristics are:

**Purpose**

Allows access to the AArch32 register SDER from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Configuration**

AArch64 System register SDER32_EL3 bits [31:0] are architecturally mapped to AArch32 System register SDER[31:0].

This register is present only when EL3 is implemented and EL1 supports AArch32. Otherwise, direct accesses to SDER32_EL3 are undefined.

This register is ignored by the PE when when one or more of the following are true:

- The PE is in Non-secure state.
- EL1 is using AArch64.

**Attributes**

SDER32_EL3 is a 64-bit register.

**Field descriptions**

</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing the SDER32_EL3

Accesses to this register use the following encodings:

**MRS <Xt>, SDER32_EL3**

```plaintext
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  UNDEFINED;
elsif PSTATE.EL == EL2 then
  UNDEFINED;
elsif PSTATE.EL == EL3 then
  return SDER32_EL3;
```

**MSR SDER32_EL3, <Xt>**

```plaintext
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  UNDEFINED;
elsif PSTATE.EL == EL2 then
  UNDEFINED;
elsif PSTATE.EL == EL3 then
  SDER32_EL3 = X[t];
```
SP_EL0, Stack Pointer (EL0)

The SP_EL0 characteristics are:

**Purpose**

Holds the stack pointer associated with EL0. At higher Exception levels, this is used as the current stack pointer when the value of \texttt{SPSel.SP} is 0.

**Configuration**

There are no configuration notes.

**Attributes**

SP_EL0 is a 64-bit register.

**Field descriptions**

The SP_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Stack pointer</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60</td>
<td>Stack pointer</td>
</tr>
<tr>
<td>59 58 57 56</td>

<td>Stack pointer</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Stack pointer:

This field resets to an architecturally \texttt{UNKNOWN} value.

**Accessing the SP_EL0**

When the value of PSTATE.SP is 0, this register is accessible at all Exception levels as the current stack pointer.

Accesses to this register use the following encodings:

MRS <Xt>, SP_EL0

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b0100</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        return SP_EL0;
elsif PSTATE.EL == EL2 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        return SP_EL0;
elsif PSTATE.EL == EL3 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        return SP_EL0;

MSR SP_EL0, <Xt>

<table>
<thead>
<tr>
<th>op0</th>

<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b0100</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        SP_EL0 = X[t];
elsif PSTATE.EL == EL2 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        SP_EL0 = X[t];
elsif PSTATE.EL == EL3 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        SP_EL0 = X[t];
SP_EL1, Stack Pointer (EL1)

The SP_EL1 characteristics are:

**Purpose**

Holds the stack pointer associated with EL1. When executing at EL1, the value of \texttt{SPSel.SP} determines the current stack pointer:

<table>
<thead>
<tr>
<th>\texttt{SPSel.SP}</th>
<th>Current stack pointer</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>\texttt{SP_EL0}</td>
</tr>
<tr>
<td>\texttt{0b1}</td>
<td>\texttt{SP_EL1}</td>
</tr>
</tbody>
</table>

**Configuration**

There are no configuration notes.

**Attributes**

SP_EL1 is a 64-bit register.

**Field descriptions**

The SP_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Stack pointer</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>
<td>Stack pointer</td>
</tr>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td>Stack pointer</td>
</tr>
</tbody>
</table>

Note

When the value of \texttt{SPSel.SP} is 0, \texttt{SP_EL0} is used as the current stack pointer at all Exception levels.

**Accessing the SP_EL1**

This accessibility information only applies to accesses using the MRS or MSR instructions.

When the value of \texttt{SPSel.SP} is 1, this register is also accessible at EL1 as the current stack pointer.

**Note**

When the value of \texttt{SPSel.SP} is 0, \texttt{SP_EL0} is used as the current stack pointer at all Exception levels.

Accesses to this register use the following encodings:

\textbf{MRS <Xt>, SP_EL1}

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b11}</td>
<td>\texttt{0b100}</td>
<td>\texttt{0b0100}</td>
<td>\texttt{0b0001}</td>
<td>\texttt{0b000}</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
  UNDEFINED;

  end if;
elsif PSTATE.EL == EL2 then
  SP_EL1 = X[t];
elsif PSTATE.EL == EL3 then
  SP_EL1 = X[t];
end if;
SP_EL2, Stack Pointer (EL2)

The SP_EL2 characteristics are:

**Purpose**

Holds the stack pointer associated with EL2. When executing at EL2, the value of $\text{SPSel}. \text{SP}$ determines the current stack pointer:

<table>
<thead>
<tr>
<th>$\text{SPSel}. \text{SP}$</th>
<th>Current stack pointer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>$\text{SP_EL0}$</td>
</tr>
<tr>
<td>0b1</td>
<td>$\text{SP_EL2}$</td>
</tr>
</tbody>
</table>

**Configuration**

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

SP_EL2 is a 64-bit register.

**Field descriptions**

The SP_EL2 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |

    UNDEFINED;
elsif PSTATE.EL == EL3 then
    SP_EL2 = X[t];
SP_EL3, Stack Pointer (EL3)

The SP_EL3 characteristics are:

**Purpose**

Holds the stack pointer associated with EL3. When executing at EL3, the value of \texttt{SPSel.SP} determines the current stack pointer:

<table>
<thead>
<tr>
<th>\texttt{SPSel.SP}</th>
<th>Current stack pointer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SP_EL0</td>
</tr>
<tr>
<td>0b1</td>
<td>SP_EL3</td>
</tr>
</tbody>
</table>

**Configuration**

This register is present only when EL3 is implemented. Otherwise, direct accesses to SP_EL3 are \texttt{UNDEFINED}.

**Attributes**

SP_EL3 is a 64-bit register.

**Field descriptions**

The SP_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Stack pointer</td>
</tr>
<tr>
<td>62</td>
<td>Stack pointer</td>
</tr>
<tr>
<td>31</td>
<td>Stack pointer</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Stack pointer.

This field resets to an architecturally \texttt{UNKNOWN} value.

**Accessing the SP_EL3**

This register is not accessible using MRS and MSR instructions.

When the value of \texttt{SPSel.SP} is 1, this register is accessible at EL3 as the current stack pointer.

**Note**

When the value of \texttt{SPSel.SP} is 0, \texttt{SP_EL0} is used as the current stack pointer at all Exception levels.
SPSel, Stack Pointer Select

The SPSel characteristics are:

**Purpose**

Allows the Stack Pointer to be selected between SP_EL0 and SP_ELx.

**Configuration**

There are no configuration notes.

**Attributes**

SPSel is a 64-bit register.

**Field descriptions**

The SPSel bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | SP |

**Bits [63:1]**

Reserved, RES0.

**SP, bit [0]**

Stack pointer to use. Possible values of this bit are:

<table>
<thead>
<tr>
<th>SP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Use SP_EL0 at all Exception levels.</td>
</tr>
<tr>
<td>0b1</td>
<td>Use SP_ELx for Exception level ELx.</td>
</tr>
</tbody>
</table>

This field resets to 1.

**Accessing the SPSel**

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>MRS &lt;Xt&gt;, SPSel</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>op0</strong></td>
</tr>
<tr>
<td>0b11</td>

</tbody>
</table>
SPSR_abt, Saved Program Status Register (Abort mode)

The SPSR_abt characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Abort mode.

**Configuration**

AArch64 System register SPSR_abt bits [31:0] are architecturally mapped to AArch32 System register SPSR_abt[31:0].

If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

**Attributes**

SPSR_abt is a 64-bit register.

**Field descriptions**

The SPSR_abt bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.
V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Abort mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Abort mode.

On executing an exception return operation in Abort mode SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Abort mode, and copied to PSTATE.SSBS on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Abort mode, and copied to PSTATE.PAN on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
**DIT, bit [21]**

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Abort mode, and copied to PSTATE.DIT on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Abort mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Abort mode.

SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.

If the implementation does not support big-endian operation, SPSR_abt.E is RES0. If the implementation does not support little-endian operation, SPSR_abt.E is RES1. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_abt.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_abt.E is RES1.

This field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.
**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.

**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Abort mode, and copied to PSTATE.T on executing an exception return operation in Abort mode.

This field resets to an architecturally **UNKNOWN** value.

**M[4:0], bits [4:0]**

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

</table>

Other values are reserved. If SPSR_abt.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in 'Illegal return events from AArch32 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the SPSR_abt**

Accesses to this register use the following encodings:

```
MRS <Xt>, SPSR_abt

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b100</td>
<td>0b0100</td>
<td>0b0011</td>
<td>0b001</td>
</tr>
</tbody>
</table>
```

```
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == ‘1’ then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  return SPSR_abt;
elsif PSTATE.EL == EL3 then
  return SPSR_abt;

    SPSR_abt = X[t];
elsif PSTATE.EL == EL3 then
    SPSR_abt = X[t];
SPSR_EL1, Saved Program Status Register (EL1)

The SPSR_EL1 characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to EL1.

**Configuration**

AArch64 System register SPSR_EL1 bits [31:0] are architecturally mapped to AArch32 System register SPSR_svc[31:0].

**Attributes**

SPSR_EL1 is a 64-bit register.

**Field descriptions**

The SPSR_EL1 bit assignments are:

When AArch32 is supported at any Exception level and exception taken from AArch32 state:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>
<th>55</th>
<th>54</th>
<th>53</th>
<th>52</th>
<th>51</th>
<th>50</th>
<th>49</th>
<th>48</th>
<th>47</th>
<th>46</th>
<th>45</th>
<th>44</th>
<th>43</th>
<th>42</th>
<th>41</th>
<th>40</th>
<th>39</th>
<th>38</th>
<th>37</th>
<th>36</th>
<th>35</th>
<th>34</th>
<th>33</th>
<th>32</th>
</tr>
</thead>
</table>

An exception return from EL1 using AArch64 makes SPSR_EL1 become **UNKNOWN**.

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.
V, bit [28]
Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

Q, bit [27]
Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL1, and copied to PSTATE.Q on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

IT[1:0], bits [26:25]
If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to EL1, and copied to PSTATE.IT[1:0] on executing an exception return operation in EL1.

On executing an exception return operation in EL1 SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

DIT, bit [24]
When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:
Reserved, RES0.

SSBS, bit [23]
When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:
Reserved, RES0.

PAN, bit [22]
When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL1, and copied to PSTATE.GE on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to EL1, and copied to PSTATE.IT[7:2] on executing an exception return operation in EL1.

SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to EL1, and copied to PSTATE.E on executing an exception return operation in EL1.

If the implementation does not support big-endian operation, SPSR_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR_EL1.E is RES1. On executing an exception return operation in EL1, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL1.E is RES1.

This field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.
F, bit [6]
FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.
This field resets to an architecturally UNKNOWN value.

T, bit [5]
T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL1, and copied to PSTATE.T on executing an exception return operation in EL1.
This field resets to an architecturally UNKNOWN value.

M[4], bit [4]
Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL1 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>AArch32 execution state.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]
AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL1, and copied to PSTATE.M[3:0] on executing an exception return operation in EL1.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b0010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b1011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b1111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in ‘Illegal return events from AArch64 state’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
This field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:

<table>
<thead>
<tr>
<th>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
</tr>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
</tr>
</tbody>
</table>

An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:32]
Reserved, RES0.

N, bit [31]
Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.
This field resets to an architecturally UNKNOWN value.
**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**Bits [27:26]**

Reserved, RES0.

**TCO, bit [25]**

*When ARMv8.5-MemTag is implemented:*

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL1, and copied to PSTATE.TCO on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**DIT, bit [24]**

*When ARMv8.4-DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**UAO, bit [23]**

*When ARMv8.2-UAO is implemented:*

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL1, and copied to PSTATE.UAO on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**PAN, bit [22]**

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

**Bits [19:13]**

Reserved, RES0.

**SSBS, bit [12]**

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**BTYPE, bits [11:10]**

When ARMv8.5-BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL1, and copied to PSTATE.BTYPE on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.
D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL1, and copied to PSTATE.D on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

Bit [5]

Reserved, **RES0**.

M[4], bit [4]

When AArch32 is supported at any Exception level:

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL1 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch64 execution state.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, **RES0**.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL0t.</td>
</tr>
<tr>
<td>0b0100</td>
<td>EL1t.</td>
</tr>
<tr>
<td>0b0101</td>
<td>EL1h.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in 'Illegal return events from AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The bits in this field are interpreted as follows:
M[3:2] is set to the value of PSTATE.EL on taking an exception to EL1 and copied to PSTATE.EL on executing an exception return operation in EL1.

M[1] is unused and is 0 for all non-reserved values.

M[0] is set to the value of PSTATE.SP on taking an exception to EL1 and copied to PSTATE.SP on executing an exception return operation in EL1.

This field resets to an architecturally **UNKNOWN** value.

## Accessing the SPSR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic SPSR_EL1 or SPSR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

### MRS <Xt>, SPSR_EL1

```plaintext
|MRS <Xt>, SPSR_EL1|
|---|---|---|---|---|
|op0| op1| CRn| CRm| op2|
|0b11| 0b000| 0b0100| 0b0000| 0b000|

SPSR_EL2, Saved Program Status Register (EL2)

The SPSR_EL2 characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to EL2.

**Configuration**

AArch64 System register SPSR_EL2 bits [31:0] are architecturally mapped to AArch32 System register SPSR_hyp[31:0].

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

SPSR_EL2 is a 64-bit register.

**Field descriptions**

The SPSR_EL2 bit assignments are:

**When AArch32 is supported at any Exception level and exception taken from AArch32 state:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

An exception return from EL2 using AArch64 makes SPSR_EL2 become **UNKNOWN**.

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.
This field resets to an architecturally **UNKNOWN** value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL2, and copied to PSTATE.Q on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to EL2, and copied to PSTATE.IT[1:0] on executing an exception return operation in EL2.

On executing an exception return operation in EL2 SPSR_EL2.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**DIT, bit [24]**

*When ARMv8.4-DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, **RES0**.

**SSBS, bit [23]**

*When ARMv8.0-SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, **RES0**.

**PAN, bit [22]**

*When ARMv8.1-PAN is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL2, and copied to PSTATE.GE on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to EL2, and copied to PSTATE.IT[7:2] on executing an exception return operation in EL2.

SPSR_EL2.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to EL2, and copied to PSTATE.E on executing an exception return operation in EL2.

If the implementation does not support big-endian operation, SPSR_EL2.E is RES0. If the implementation does not support little-endian operation, SPSR_EL2.E is RES1. On executing an exception return operation in EL2, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL2.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL2.E is RES1.

This field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.
SPSR_EL2, Saved Program Status Register (EL2)

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL2, and copied to PSTATE.T on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL2 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>AArch32 execution state.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL2, and copied to PSTATE.M[3:0] on executing an exception return operation in EL2.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b0010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b1010</td>
<td>Hyp.</td>
</tr>
<tr>
<td>0b1011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b1111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in ‘Illegal return events from AArch64 state’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:

<table>
<thead>
<tr>
<th>RES0</th>
<th>SSBS</th>
<th>BTYPE</th>
<th>D</th>
<th>A</th>
<th>I</th>
<th>F</th>
<th>RES0[M[4]]</th>
<th>M[3:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62</td>
<td>61</td>
<td>60</td>
<td>59</td>
<td>58</td>
<td>57</td>
<td>56</td>
<td>55</td>
</tr>
</tbody>
</table>

An exception return from EL2 using AArch64 makes SPSR_EL2 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.
**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

**Bits [27:26]**

Reserved, RES0.

**TCO, bit [25]**

*When ARMv8.5-MemTag is implemented:*

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL2, and copied to PSTATE.TCO on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**DIT, bit [24]**

*When ARMv8.4-DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**UAO, bit [23]**

*When ARMv8.2-UAO is implemented:*

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL2, and copied to PSTATE.UAO on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:
Reserved, RES0.

PAN, bit [22]
When ARMv8.1-PAN is implemented:
Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.
This field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

SS, bit [21]
Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.
This field resets to an architecturally UNKNOWN value.

IL, bit [20]
Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.
This field resets to an architecturally UNKNOWN value.

Bits [19:13]
Reserved, RES0.

SSBS, bit [12]
When ARMv8.0-SSBS is implemented:
Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.
This field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

BTYPE, bits [11:10]
When ARMv8.5-BTI is implemented:
Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL2, and copied to PSTATE.BTYPE on executing an exception return operation in EL2.
This field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL2, and copied to PSTATE.D on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

When AArch32 is supported at any Exception level:

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL2 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch64 execution state.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL0t.</td>
</tr>
<tr>
<td>0b0100</td>
<td>EL1t.</td>
</tr>
<tr>
<td>0b0101</td>
<td>EL1h.</td>
</tr>
<tr>
<td>0b1000</td>
<td>EL2t.</td>
</tr>
<tr>
<td>0b1001</td>
<td>EL2h.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in 'Illegal return events from AArch64 state' in the Arm®Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
The bits in this field are interpreted as follows:

- $M[3:2]$ is set to the value of PSTATE.EL on taking an exception to EL2 and copied to PSTATE.EL on executing an exception return operation in EL2.
- $M[1]$ is unused and is 0 for all non-reserved values.
- $M[0]$ is set to the value of PSTATE.SP on taking an exception to EL2 and copied to PSTATE.SP on executing an exception return operation in EL2.

This field resets to an architecturally **UNKNOWN** value.

## Accessing the SPSR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SPSR_EL2 or SPSR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

### MRS <Xt>, SPSR_EL2

<table>
<thead>
<tr>

SPSR_EL3, Saved Program Status Register (EL3)

The SPSR_EL3 characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to EL3.

**Configuration**

AArch64 System register SPSR_EL3 bits [31:0] can be mapped to AArch32 System register SPSR_mon[31:0], but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to SPSR_EL3 are **UNDEFINED**.

**Attributes**

SPSR_EL3 is a 64-bit register.

**Field descriptions**

The SPSR_EL3 bit assignments are:

**When AArch32 is supported at any Exception level and exception taken from AArch32 state:**

<table>

</table>

An exception return from EL3 using AArch64 makes SPSR_EL1 become **UNKNOWN**.

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.
This field resets to an architecturally **UNKNOWN** value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL3, and copied to PSTATE.Q on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to EL3, and copied to PSTATE.IT[1:0] on executing an exception return operation in EL3.

On executing an exception return operation in EL3 SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**DIT, bit [24]**

*When ARMv8.4-DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**SSBS, bit [23]**

*When ARMv8.0-SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**PAN, bit [22]**

*When ARMv8.1-PAN is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL3, and copied to PSTATE.GE on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to EL3, and copied to PSTATE.IT[7:2] on executing an exception return operation in EL3.

SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to EL3, and copied to PSTATE.E on executing an exception return operation in EL3.

If the implementation does not support big-endian operation, SPSR_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR_EL1.E is RES1. On executing an exception return operation in EL3, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL1.E is RES1.

This field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.
F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

This field resets to an architecturally \texttt{UNKNOWN} value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL3, and copied to PSTATE.T on executing an exception return operation in EL3.

This field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{M[4], bit [4]}

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL3 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

\begin{center}
\begin{tabular}{lc}
\textbf{M[4]} & \textbf{Meaning} \\
0b1 & AArch32 execution state. \\
\end{tabular}
\end{center}

This field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{M[3:0], bits [3:0]}

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL3, and copied to PSTATE.M[3:0] on executing an exception return operation in EL3.

\begin{center}
\begin{tabular}{lc}
\textbf{M[3:0]} & \textbf{Meaning} \\
0b0000 & User. \\
0b0001 & FIQ. \\
0b0010 & IRQ. \\
0b0011 & Supervisor. \\
0b0110 & Monitor. \\
0b0111 & Abort. \\
0b1010 & Hyp. \\
0b1011 & Undefined. \\
0b1111 & System. \\
\end{tabular}
\end{center}

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in ‘Illegal return events from AArch64 state’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{When exception taken from AArch64 state:}

When an exception is taken from AArch64, the following bits are set:

\begin{center}
\begin{tabular}{cccccccccccccccccccccccccccc}
\end{tabular}
\end{center}

An exception return from EL3 using AArch64 makes SPSR_EL1 become \texttt{UNKNOWN}.

\textbf{Bits [63:32]}

Reserved, RES0.

\textbf{N, bit [31]}

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.
This field resets to an architecturally **UNKNOWN** value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**Bits [27:26]**

Reserved, RES0.

**TCO, bit [25]**

When ARMv8.5-MemTag is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL3, and copied to PSTATE.TCO on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**DIT, bit [24]**

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**UAO, bit [23]**

When ARMv8.2-UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL3, and copied to PSTATE.UAO on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**PAN, bit [22]**

*When ARMv8.1-PAN is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

**Bits [19:13]**

Reserved, RES0.

**SSBS, bit [12]**

*When ARMv8.0-SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**BTYPE, bits [11:10]**

*When ARMv8.5-BTI is implemented:*

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL3, and copied to PSTATE.BTYPE on executing an exception return operation in EL3.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.
D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL3, and copied to PSTATE.D on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

When AArch32 is supported at any Exception level:

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL3 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch64 execution state.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL0t.</td>
</tr>
<tr>
<td>0b0100</td>
<td>EL1t.</td>
</tr>
<tr>
<td>0b0101</td>
<td>EL1h.</td>
</tr>
<tr>
<td>0b1000</td>
<td>EL2t.</td>
</tr>
<tr>
<td>0b1001</td>
<td>EL2h.</td>
</tr>
<tr>
<td>0b1100</td>
<td>EL3t.</td>
</tr>
<tr>
<td>0b1101</td>
<td>EL3h.</td>
</tr>
</tbody>
</table>
Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in 'Illegal return events from AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL3 and copied to PSTATE.EL on executing an exception return operation in EL3.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL3 and copied to PSTATE.SP on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

### Accessing the SPSR_EL3

Accesses to this register use the following encodings:

**MRS <Xt>, SPSR_EL3**

<table>
<thead>
<tr>
<th>op0</th>

\]
SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to FIQ mode.

**Configuration**

AArch64 System register SPSR_fiq bits [31:0] are architecturally mapped to AArch32 System register SPSR_fiq[31:0]. If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

**Attributes**

SPSR_fiq is a 64-bit register.

**Field descriptions**

The SPSR_fiq bit assignments are:

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode.
This field resets to an architecturally **UNKNOWN** value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode.

This field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to FIQ mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in FIQ mode.

On executing an exception return operation in FIQ mode SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]**

*When Armv8.0-SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to FIQ mode, and copied to PSTATE.SSBS on executing an exception return operation in FIQ mode.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**PAN, bit [22]**

*When Armv8.1-PAN is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to FIQ mode, and copied to PSTATE.PAN on executing an exception return operation in FIQ mode.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**DIT, bit [21]**

*When Armv8.4-DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to FIQ mode, and copied to PSTATE.DIT on executing an exception return operation in FIQ mode.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and copied to PSTATE.IL on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode, and copied to PSTATE.GE on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to FIQ mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in FIQ mode.

SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR_fiq.E is RES0. If the implementation does not support little-endian operation, SPSR_fiq.E is RES1. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_fiq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_fiq.E is RES1.

This field resets to an architecturally UNKNOWN value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.
T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to FIQ mode, and copied to PSTATE.T on executing an exception return operation in FIQ mode.

This field resets to an architecturally **UNKNOWN** value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to FIQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in FIQ mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b10111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_fiq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in FIQ mode is an illegal return event, as described in ‘Illegal return events from AArch32 state’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to IRQ mode, and copied to PSTATE.Z on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode.
This field resets to an architecturally **UNKNOWN** value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to IRQ mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in IRQ mode.

On executing an exception return operation in IRQ mode SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]**

**When ARMv8.0-SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to IRQ mode, and copied to PSTATE.SSBS on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]**

**When ARMv8.1-PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to IRQ mode, and copied to PSTATE.PAN on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**DIT, bit [21]**

**When ARMv8.4-DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to IRQ mode, and copied to PSTATE.DIT on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to IRQ mode, and copied to PSTATE.IL on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to IRQ mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in IRQ mode.

SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR_irq.E is RES0. If the implementation does not support little-endian operation, SPSR_irq.E is RES1. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_irq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_irq.E is RES1.

This field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.
T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to IRQ mode, and copied to PSTATE.T on executing an exception return operation in IRQ mode.

This field resets to an architecturally **UNKNOWN** value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to IRQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in IRQ mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>

**SPSR_und, Saved Program Status Register (Undefined mode)**

The SPSR_und characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Undefined mode.

**Configuration**

AArch64 System register SPSR_und bits [31:0] are architecturally mapped to AArch32 System register SPSR_und[31:0].

If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

**Attributes**

SPSR_und is a 64-bit register.

**Field descriptions**

The SPSR_und bit assignments are:

| Bits | 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0 | N   | Z   | C   | V   | Q   | IT[1:0] | SSBS | PAND | IT[7:2] | GE | E   | A   | I   | F   | T   | M[4:0] | |
| 31   | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Undefined mode, and copied to PSTATE.N on executing an exception return operation in Undefined mode.

This field resets to an architecturally **UNKNOWN** value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Undefined mode, and copied to PSTATE.Z on executing an exception return operation in Undefined mode.

This field resets to an architecturally **UNKNOWN** value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode.

This field resets to an architecturally **UNKNOWN** value.
V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode.

This field resets to an architecturally **UNKNOWN** value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

This field resets to an architecturally **UNKNOWN** value.

IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Undefined mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Undefined mode.

On executing an exception return operation in Undefined mode SPSR_und.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

J, bit [24]

RES0.

In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

**When ARMv8.0-SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Undefined mode, and copied to PSTATE.SSBS on executing an exception return operation in Undefined mode.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

PAN, bit [22]

**When ARMv8.1-PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Undefined mode, and copied to PSTATE.PAN on executing an exception return operation in Undefined mode.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.
**DIT, bit [21]**

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Undefined mode, and copied to PSTATE.DIT on executing an exception return operation in Undefined mode.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, **RES0**.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to PSTATE.IL on executing an exception return operation in Undefined mode.

This field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to PSTATE.GE on executing an exception return operation in Undefined mode.

This field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Undefined mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Undefined mode.

SPSR_und.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR_und.E is **RES0**. If the implementation does not support little-endian operation, SPSR_und.E is **RES1**. On executing an exception return operation in Undefined mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_und.E is **RES0**, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_und.E is **RES1**.

This field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on executing an exception return operation in Undefined mode.

This field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I on executing an exception return operation in Undefined mode.

This field resets to an architecturally **UNKNOWN** value.
F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Undefined mode, and copied to PSTATE.T on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Undefined mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Undefined mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b10111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_und.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Undefined mode is an illegal return event, as described in 'Illegal return events from AArch32 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

**Accessing the SPSR_und**

Accesses to this register use the following encodings:

MRS <Xt>, SPSR_und

<table>
<thead>
<tr>
<th>op0</th>

SSBS, Speculative Store Bypass Safe

The SSBS characteristics are:

**Purpose**

Allows access to the Speculative Store Bypass Safe bit.

**Configuration**

This register is present only when ARMv8.0-SSBS is implemented. Otherwise, direct accesses to SSBS are UNDEFINED.

**Attributes**

SSBS is a 64-bit register.

**Field descriptions**

The SSBS bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | SSBS | RES0 |

**Bits [63:13]**

Reserved, RES0.

**SSBS, bit [12]**

Speculative Store Bypass Safe.

Prohibits speculative loads or stores which might practically allow a cache timing side channel.

A cache timing side channel might be exploited where a load or store uses an address that is derived from a register that is being loaded from memory using a load instruction speculatively read from a memory location. If PSTATE.SSBS is enabled, the address derived from the load instruction might be from earlier in the coherence order than the latest store to that memory location with the same virtual address.

<table>
<thead>
<tr>
<th>SSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hardware is not permitted to load or store speculatively, in a manner that could practically give rise to a cache timing side channel, using an address derived from a register value that has been loaded from memory using a load instruction (L) that speculatively reads an entry from earlier in the coherence order from that location being loaded from than the entry generated by the latest store (S) to that location using the same virtual address as L.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hardware is permitted to load or store speculatively, in a manner that could practically give rise to a cache timing side channel, using an address derived from a register value that has been loaded from memory using a load instruction (L) that speculatively reads an entry from earlier in the coherence order from that location being loaded from than the entry generated by the latest store (S) to that location using the same virtual address as L.</td>
</tr>
</tbody>
</table>

The value of this bit is set to the value in the SCTLR_ELx.DSSBS field on taking an exception to ELx.
This field resets to an **IMPLEMENTATION DEFINED** value.

**Bits [11:0]**

Reserved, RES0.

### Accessing the SSBS

Accesses to this register use the following encodings:

**MRS <Xt>, SSBS**

<table>

TCO, Tag Check Override

The TCO characteristics are:

Purpose

When ARMv8.5-MemTag is implemented, this register allows tag checks to be disabled globally.

Configuration

This register is present only when ARMv8.5-MemTag is implemented. Otherwise, direct accesses to TCO are UNDEFINED.

Attributes

TCO is a 64-bit register.

Field descriptions

The TCO bit assignments are:

TCO, Tag Check Override
TCR_EL1, Translation Control Register (EL1)

The TCR_EL1 characteristics are:

**Purpose**

The control register for stage 1 of the EL1&0 translation regime.

**Configuration**

AArch64 System register TCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register TTBCR[31:0].

AArch64 System register TCR_EL1 bits [63:32] are architecturally mapped to AArch32 System register TTBCR2[31:0].

**Attributes**

TCR_EL1 is a 64-bit register.

**Field descriptions**

The TCR_EL1 bit assignments are:

<table>

<tr>
<td>\texttt{0b1}</td>
<td>All accesses at EL1 and EL0 are Unchecked.</td>
</tr>
</tbody>
</table>

**Note**

Software may change this control bit on a context switch.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

E0PD1, bit [56]

When ARMv8.5-E0PD is implemented:

Faulting control for EL0 access to any address translated by TTBR1_EL1.

<table>
<thead>
<tr>
<th>E0PD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>Unprivileged access to any address translated by TTBR1_EL1 will not generate a fault by this mechanism.</td>
</tr>
<tr>
<td>\texttt{0b1}</td>
<td>Unprivileged access to any address translated by TTBR1_EL1 will generate a level 0 translation fault</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

E0PD0, bit [55]

When ARMv8.5-E0PD is implemented:

Faulting control for EL0 access to any address translated by TTBR0_EL1.

<table>
<thead>
<tr>
<th>E0PD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>Unprivileged access to any address translated by TTBR0_EL1 will not generate a fault by this mechanism.</td>

<tr>
<td>\texttt{0b1}</td>
<td>Unprivileged access to any address translated by TTBR0_EL1 will generate a level 0 translation fault</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.
NFD1, bit [54]

When SVE is implemented or TME is implemented:

Non-fault translation table walk disable for stage 1 translations using TTBR1_EL1.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault access from EL0 for a virtual address that is translated using TTBR1_EL1.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See 'The Scalable Vector Extension (SVE)', in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for more information.

If TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

Defined values are:

<table>
<thead>
<tr>
<th>NFD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not disable stage 1 translation table walks using TTBR1_EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on a virtual address that is translated using TTBR1_EL1 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]

When SVE is implemented or TME is implemented:

Non-fault translation table walk disable for stage 1 translations using TTBR0_EL1.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault access from EL0 for a virtual address that is translated using TTBR0_EL1.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See 'The Scalable Vector Extension (SVE)', in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for more information.

If TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

Defined values are:
NFD0

</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
**HPD1, bit [42]**

*When ARMv8.1-HPD is implemented:*

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR1_EL1.

<table>
<thead>
<tr>
<th>HPD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled.</td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**HPD0, bit [41]**

*When ARMv8.1-HPD is implemented:*

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL1.

<table>
<thead>
<tr>
<th>HPD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled.</td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**HD, bit [40]**

*When ARMv8.1-TTHM is implemented:*

Hardware management of dirty state in stage 1 translations from EL0 and EL1.

<table>
<thead>
<tr>
<th>HD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 hardware management of dirty state disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**HA, bit [39]**

*When ARMv8.1-TTHM is implemented:*

Hardware Access flag update in stage 1 translations from EL0 and EL1.
HA

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 Access flag update disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 Access flag update enabled.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TBI1, bit [38]**

Top Byte ignored - indicates whether the top byte of an address is used for address match for the TTBR1_EL1 region, or ignored and used for tagged addresses. Defined values are:

<table>
<thead>
<tr>
<th>TBI1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by TTBR1_EL1. It has an effect whether the EL1&0 translation regime is enabled or not.

If ARMv8.3-PAuth is implemented and TCR_EL1.TBID1 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

This field resets to an architecturally **UNKNOWN** value.

**TBI0, bit [37]**

Top Byte ignored - indicates whether the top byte of an address is used for address match for the TTBR0_EL1 region, or ignored and used for tagged addresses. Defined values are:

<table>
<thead>
<tr>
<th>TBI0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL1. It has an effect whether the EL1&0 translation regime is enabled or not.

If ARMv8.3-PAuth is implemented and TCR_EL1.TBID0 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

This field resets to an architecturally **UNKNOWN** value.

**AS, bit [36]**

ASID Size. Defined values are:
Meaning

<table>
<thead>
<tr>
<th>AS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>8 bit - the upper 8 bits of TTBR0_EL1 and TTBR1_EL1 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.</td>
</tr>
<tr>
<td>0b1</td>
<td>16 bit - the upper 16 bits of TTBR0_EL1 and TTBR1_EL1 are used for allocation and matching in the TLB.</td>
</tr>
</tbody>
</table>

If the implementation has only 8 bits of ASID, this field is RES0.

This field resets to an architecturally UNKNOWN value.

**Bit [35]**

Reserved, RES0.

**IPS, bits [34:32]**

Intermediate Physical Address Size.

<table>
<thead>
<tr>
<th>IPS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>32 bits, 4GB.</td>
</tr>
<tr>
<td>0b001</td>
<td>36 bits, 64GB.</td>
</tr>
<tr>
<td>0b010</td>
<td>40 bits, 1TB.</td>
</tr>
<tr>
<td>0b011</td>
<td>42 bits, 4TB.</td>
</tr>
<tr>
<td>0b100</td>
<td>44 bits, 16TB.</td>
</tr>
<tr>
<td>0b101</td>
<td>48 bits, 256TB.</td>
</tr>
<tr>
<td>0b110</td>
<td>52 bits, 4PB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 0b110 is permitted only if ARMv8.2-LPA is implemented and the translation granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL1 are 0b0000.

This field resets to an architecturally UNKNOWN value.

**TG1, bits [31:30]**

Granule size for the TTBR1_EL1.

<table>
<thead>
<tr>
<th>TG1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>16KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b11</td>
<td>64KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally UNKNOWN value.

**SH1, bits [29:28]**

Shareability attribute for memory associated with translation table walks using TTBR1_EL1.
SH1 | Meaning
---|---
0b00 | Non-shareable.
0b10 | Outer Shareable.
0b11 | Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is constrained unpredictable, as described in 'Reserved values in AArch64 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using TTBR1_EL1.

<table>
<thead>
<tr>
<th>ORGN1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using TTBR1_EL1.

<table>
<thead>
<tr>
<th>IRGN1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

EPD1, bit [23]

Translation table walk disable for translations using TTBR1_EL1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1_EL1. The encoding of this bit is:

<table>
<thead>
<tr>
<th>EPD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using TTBR1_EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using TTBR1_EL1 generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

A1, bit [22]

Selects whether TTBR0_EL1 or TTBR1_EL1 defines the ASID. The encoding of this bit is:

<table>
<thead>
<tr>
<th>A1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TTBR0_EL1 ASID defines the ASID.</td>
</tr>
<tr>
<td>0b1</td>
<td>TTBR1_EL1 ASID defines the ASID.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.
**T1SZ, bits [21:16]**

The size offset of the memory region addressed by TTBR1_EL1. The region size is \(2^{(64-T1SZ)}\) bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

This field resets to an architecturally **UNKNOWN** value.

**TG0, bits [15:14]**

Granule size for the TTBR0_EL1.

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally **UNKNOWN** value.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using TTBR0_EL1.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in AArch64 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL1.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL1.
<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>

</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**EPD0, bit [7]**

Translation table walk disable for translations using **TTBR0_EL1**. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using **TTBR0_EL1**. The encoding of this bit is:

<table>
<thead>
<tr>
<th>EPD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using <strong>TTBR0_EL1</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using <strong>TTBR0_EL1</strong> generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Bit [6]**

Reserved, **RES0**.

**T0SZ, bits [5:0]**

The size offset of the memory region addressed by **TTBR0_EL1**. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for **T0SZ** depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the TCR_EL1**

When **HCR_EL2.E2H** is 1, without explicit synchronization, access from EL3 using the mnemonic **TCR_EL1** or **TCR_EL12** are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**MRS <Xt>, TCR_EL1**

<table>

TCR_EL2, Translation Control Register (EL2)

The TCR_EL2 characteristics are:

### Purpose

The control register for stage 1 of the EL2, or EL2&0, translation regime:

- When the Effective value of `HCR_EL2.E2H` is 0, this register controls stage 1 of the EL2 translation regime, that supports a single VA range, translated using `TTBR0_EL2`.
- When the value of `HCR_EL2.E2H` is 1, this register controls stage 1 of the EL2&0 translation regime, that supports both:
  - A lower VA range, translated using `TTBR0_EL2`.
  - A higher VA range, translated using `TTBR1_EL2`.

### Configuration

AArch64 System register TCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register `HTCR[31:0].

If EL2 is not implemented, this register is `RES0` from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

### Attributes

TCR_EL2 is a 64-bit register.

### Field descriptions

The TCR_EL2 bit assignments are:

#### When HCR_EL2.E2H == 0:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | RES0 | RES1 | TCMA | TBID | HWU62 | HWU61 | HWU60 | HWU59 | HPD | RES1 | HD | HATB | RES0 | PS | TGO | SH0 | ORGN0 | ORGN0 | RES0 | TOSZ |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Any of the bits in TCR_EL2, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

- **Bits [63:32]**
  - Reserved, RES0.

- **Bit [31]**
  - Reserved, RES1.

- **TCMA, bit [30]**

  When ARMv8.5-MemTag is implemented:

  Controls the generation of Unchecked accesses at EL2 when address [59:56] = 0b0000.
### TCR_EL2, Translation Control Register (EL2)

<table>
<thead>
<tr>
<th>TCMA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the generation of Unchecked accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>All accesses are Unchecked.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### TBID, bit [29]

**When ARMv8.3-PAuth is implemented:**

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>TBID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL2.TBI applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL2.TBI applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL2.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### HWU62, bit [28]

**When ARMv8.2-TTPBHA is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU62</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
HWU61, bit [27]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU61</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU60</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU59</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

This field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**HPD, bit [24]**

**When ARMv8.1-HPD is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by \( \text{TTBR0\_EL2} \).

<table>
<thead>
<tr>
<th>HPD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled.</td>
</tr>
</tbody>
</table>

**Note**

In this case bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bit [23]**

Reserved, RES1.

**HD, bit [22]**

**When ARMv8.1-TTHM is implemented:**

Hardware management of dirty state in stage 1 translations from EL2.

<table>
<thead>
<tr>
<th>HD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 hardware management of dirty state disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HA, bit [21]**

**When ARMv8.1-TTHM is implemented:**

Hardware Access flag update in stage 1 translations from EL2.

<table>
<thead>
<tr>
<th>HA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 Access flag update disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 Access flag update enabled.</td>
</tr>
</tbody>
</table>
This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TBI, bit [20]**

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the `TTBR0_EL2` region, or ignored and used for tagged addresses.

For more information, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>TBI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL2 using AArch64 where the address would be translated by tables pointed to by `TTBR0_EL2`. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If ARMv8.3-PAuth is implemented and TCR_EL2.TBID is 1, then this field only applies to Data accesses.

If the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL2.
- An exception taken to EL2.
- An exception return to EL2.

This field resets to an architecturally **UNKNOWN** value.

**Bit [19]**

Reserved, RES0.

**PS, bits [18:16]**

Physical Address Size.

<table>
<thead>
<tr>
<th>PS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>32 bits, 4GB.</td>
</tr>
<tr>
<td>0b001</td>
<td>36 bits, 64GB.</td>
</tr>
<tr>
<td>0b010</td>
<td>40 bits, 1TB.</td>
</tr>
<tr>
<td>0b011</td>
<td>42 bits, 4TB.</td>
</tr>
<tr>
<td>0b100</td>
<td>44 bits, 16TB.</td>
</tr>
<tr>
<td>0b101</td>
<td>48 bits, 256TB.</td>
</tr>
<tr>
<td>0b110</td>
<td>52 bits, 4PB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 0b110 is permitted only if ARMv8.2-LPA is implemented and the translation granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are 0b0000.

This field resets to an architecturally **UNKNOWN** value.

**TG0, bits [15:14]**

Granule size for the `TTBR0_EL2`. 
TG0

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using TTBR0_EL2.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in AArch64 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Bits [7:6]

Reserved, RES0.
**T0SZ, bits [5:0]**

The size offset of the memory region addressed by TTBR0_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

This field resets to an architecturally **UNKNOWN** value.

### When ARMv8.1-VHE is implemented and HCR_EL2.E2H == 1:

This view of the register is only valid from Armv8.1 when HCR_EL2.E2H is 1.

Any of the bits in TCR_EL2 are permitted to be cached in a TLB.

**Bits [63:59]**

Reserved, RES0.

**TCMA1, bit [58]**

When ARMv8.5-MemTag is implemented:

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR_EL2.TGE=1, when address[59:55] = 0b111111.

<table>
<thead>
<tr>
<th>TCMA1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the generation of Unchecked accesses at EL2 or EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>All accesses are Unchecked.</td>
</tr>
</tbody>
</table>

**Note**

Software may change this control bit on a context switch.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**TCMA0, bit [57]**

When ARMv8.5-MemTag is implemented:

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR_EL2.TGE=1, when address[59:55] = 0b000000.

<table>
<thead>
<tr>
<th>TCMA0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the generation of Unchecked accesses at EL2 or EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>All accesses are Unchecked.</td>
</tr>
</tbody>
</table>

**Note**

Software may change this control bit on a context switch.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**E0PD1, bit [56]**

**When ARMv8.5-E0PD is implemented:**

Faulting control for EL0 access to any address translated by TTBR1_EL2.

<table>
<thead>
<tr>
<th>E0PD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Unprivileged access to any address translated by TTBR1_EL2 will not generate a fault by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>Unprivileged access to any address translated by TTBR1_EL2 will generate a level 0 translation fault</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**E0PD0, bit [55]**

**When ARMv8.5-E0PD is implemented:**

Faulting control for EL0 access to any address translated by TTBR0_EL2.

<table>
<thead>
<tr>
<th>E0PD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Unprivileged access to any address translated by TTBR0_EL2 will not generate a fault by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>Unprivileged access to any address translated by TTBR0_EL2 will generate a level 0 translation fault</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**NFD1, bit [54]**

**When SVE is implemented or TME is implemented:**

Non-fault translation table walk disable for stage 1 translations using TTBR1_EL2.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault access from EL0 for a virtual address that is translated using TTBR1_EL2.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See 'The Scalable Vector Extension (SVE)', in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for more information.

If TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

Defined values are:
<table>
<thead>
<tr>
<th>NFD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not disable stage 1 translation table walks using TTBR1_EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on a virtual address that is translated using TTBR1_EL2 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**NFD0, bit [53]**

*When SVE is implemented or TME is implemented:*

Non-fault translation table walk disable for stage 1 translations using TTBR0_EL2.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault access from EL0 for a virtual address that is translated using TTBR0_EL2.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

If TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

Defined values are:

<table>
<thead>
<tr>
<th>NFD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not disable stage 1 translation table walks using TTBR0_EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on a virtual address that is translated using TTBR0_EL2 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TBID1, bit [52]**

*When ARMv8.3-PAuth is implemented:*

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see ‘Address tagging in AArch64 state’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
## TCR_EL2, Translation Control Register (EL2)

### TBID1

<table>
<thead>
<tr>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL2.TBI1 applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL2.TBI1 applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR1_EL2.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

### TBID0, bit [51]

**When ARMv8.3-PAuth is implemented:**

Controls the use of the top byte of instruction addresses for address matching.

For more information, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL2.TBI0 applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL2.TBI0 applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL2.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

### HWU162, bit [50]

**When ARMv8.2-TTPBHA is implemented:**

Hardware Use. Indicates IMPLEMENTATIONDEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.

<table>
<thead>
<tr>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR1_EL2, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATIONDEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>

</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.
This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**HWU059, bit [43]**

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates **IMPLEMENTATION DEFINED** hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

<table>
<thead>
<tr>
<th>HWU059</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose if the value of TCR_EL2.HPD0 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**HPD1, bit [42]**

When ARMv8.1-HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR1_EL2.

<table>
<thead>
<tr>
<th>HPD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled.</td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**HPD0, bit [41]**

When ARMv8.1-HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL2.

<table>
<thead>
<tr>
<th>HPD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled.</td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:
Reserved, RES0.

**HD, bit [40]**

*When ARMv8.1-TTHM is implemented:*

Hardware management of dirty state in stage 1 translations from EL2.

<table>
<thead>
<tr>
<th>HD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 hardware management of dirty state disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

Otherwise:
Reserved, RES0.

**HA, bit [39]**

*When ARMv8.1-TTHM is implemented:*

Hardware Access flag update in stage 1 translations from EL2.

<table>
<thead>
<tr>
<th>HA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 Access flag update disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 Access flag update enabled.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

Otherwise:
Reserved, RES0.

**TBI1, bit [38]**

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR1_EL2 region, or ignored and used for tagged addresses.

For more information, see ‘Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>TBI1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by TTBR1_EL2. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If ARMv8.3-PAuth is implemented and TCR_EL2.TBID1 is 1, then this field only applies to Data accesses.

If the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

This field resets to an architecturally **UNKNOWN** value.
**TBI0, bit [37]**

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the `TTBR0_EL2` region, or ignored and used for tagged addresses.

For more information, see ‘Address tagging in AArch64 state’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

<table>
<thead>
<tr>
<th>TBI0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by `TTBR0_EL2`. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If Armv8.3-PAuth is implemented and TCR_EL2.TBID0 is 1, then this field only applies to Data accesses.

If the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

This field resets to an architecturally **UNKNOWN** value.

**AS, bit [36]**

ASID Size. Defined values are:

<table>
<thead>
<tr>
<th>AS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>8 bit - the upper 8 bits of <code>TTBR0_EL2</code> and <code>TTBR1_EL2</code> are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.</td>
</tr>
<tr>
<td>0b1</td>
<td>16 bit - the upper 16 bits of <code>TTBR0_EL2</code> and <code>TTBR1_EL2</code> are used for allocation and matching in the TLB.</td>
</tr>
</tbody>
</table>

If the implementation has only 8 bits of ASID, this field is **RES0**.

This field resets to an architecturally **UNKNOWN** value.

**Bit [35]**

Reserved, **RES0**.

**IPS, bits [34:32]**

Intermediate Physical Address Size.

<table>
<thead>
<tr>
<th>IPS</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>32 bits, 4GB.</td>
<td></td>
</tr>
<tr>
<td>0b001</td>
<td>36 bits, 64GB.</td>
<td></td>
</tr>
<tr>
<td>0b010</td>
<td>40 bits, 1TB.</td>
<td></td>
</tr>
<tr>
<td>0b011</td>
<td>42 bits, 4TB.</td>
<td></td>
</tr>
<tr>
<td>0b100</td>
<td>44 bits, 16TB.</td>
<td></td>
</tr>
<tr>
<td>0b101</td>
<td>48 bits, 256TB.</td>
<td></td>
</tr>
<tr>
<td>0b110</td>
<td>52 bits, 4PB.</td>
<td>When Armv8.2-LPA is implemented</td>
</tr>
</tbody>
</table>

Other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 0b110 is permitted only if Armv8.2-LPA is implemented and the translation granule size is 64KB.
In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are 0b0000.

This field resets to an architecturally UNKNOWN value.

**TG1, bits [31:30]**

Granule size for the TTBR1_EL2.

<table>
<thead>
<tr>
<th>TG1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>16KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b11</td>
<td>64KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally UNKNOWN value.

**SH1, bits [29:28]**

Shareability attribute for memory associated with translation table walks using TTBR1_EL2. Defined values are:

<table>
<thead>
<tr>
<th>SH1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in AArch64 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

**ORGN1, bits [27:26]**

Outer cacheability attribute for memory associated with translation table walks using TTBR1_EL2.

<table>
<thead>
<tr>
<th>ORGN1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**IRGN1, bits [25:24]**

Inner cacheability attribute for memory associated with translation table walks using TTBR1_EL2.
IRGN1

<table>
<thead>
<tr>
<th>IRGN1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**EPD1, bit [23]**

Translation table walk disable for translations using TTBR1_EL2. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1_EL2. The encoding of this bit is:

<table>
<thead>
<tr>
<th>EPD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using TTBR1_EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using TTBR1_EL2 generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**A1, bit [22]**

Selects whether TTBR0_EL2 or TTBR1_EL2 defines the ASID. The encoding of this bit is:

<table>
<thead>
<tr>
<th>A1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TTBR0_EL2.ASID defines the ASID.</td>
</tr>
<tr>
<td>0b1</td>
<td>TTBR1_EL2.ASID defines the ASID.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**T1SZ, bits [21:16]**

The size offset of the memory region addressed by TTBR1_EL2. The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

This field resets to an architecturally **UNKNOWN** value.

**TG0, bits [15:14]**

Granule size for the TTBR0_EL2.

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally **UNKNOWN** value.
**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using TTBR0_EL2.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in AArch64 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>

</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**EPD0, bit [7]**

Translation table walk disable for translations using TTBR0_EL2. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0_EL2. The encoding of this bit is:

<table>
<thead>
<tr>
<th>EPD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using TTBR0_EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using TTBR0_EL2 generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Bit [6]**

Reserved, RES0.
**T0SZ, bits [5:0]**

The size offset of the memory region addressed by TTBR0_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

This field resets to an architecturally **UNKNOWN** value.

### Accessing the TCR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TCR_EL2 or TCR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**MRS <Xt>, TCR_EL2**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

TCR_EL3, Translation Control Register (EL3)

The TCR_EL3 characteristics are:

**Purpose**

The control register for stage 1 of the EL3 translation regime.

**Configuration**

This register is present only when EL3 is implemented. Otherwise, direct accesses to TCR_EL3 are UNDEFINED.

**Attributes**

TCR_EL3 is a 64-bit register.

**Field descriptions**

The TCR_EL3 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  |

Any of the bits in TCR_EL3 are permitted to be cached in a TLB.

**Bits [63:32]**

Reserved, RES0.

**Bit [31]**

Reserved, RES1.

**TCMA, bit [30]**

**When ARMv8.5-MemTag is implemented:**

Controls the generation of Unchecked accesses at EL3 when address [59:56] = 0b0000.

<table>
<thead>
<tr>
<th>TCMA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the generation of Unchecked accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>All accesses are Unchecked.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
**TBID, bit [29]**

*When ARMv8.3-PAuth is implemented:*

Controls the use of the top byte of instruction addresses for address matching.

<table>
<thead>
<tr>
<th>TBID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL3.TBI applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL3.TBI applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL3.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

This field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

**HWU62, bit [28]**

*When ARMv8.2-TTPBHA is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU62</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

This field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

**HWU61, bit [27]**

*When ARMv8.2-TTPBHA is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU61</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

This field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**HWU60, bit [26]**

*When ARMv8.2-TTPBHA is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU60</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU59, bit [25]**

*When ARMv8.2-TTPBHA is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU59</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HPD, bit [24]**

*When ARMv8.1-HPD is implemented:*

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by **TTBR0_EL3**.
HPD, bit [61]

Hierarchical permissions are enabled.

Hierarchical permissions are disabled.

Note
In this case bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

HD, bit [22]

When ARMv8.1-TTHM is implemented:

Hardware management of dirty state in stage 1 translations from EL3.

<table>
<thead>
<tr>
<th>HD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 hardware management of dirty state disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]

When ARMv8.1-TTHM is implemented:

Hardware Access flag update in stage 1 translations from EL3.

<table>
<thead>
<tr>
<th>HA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 Access flag update disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 Access flag update enabled.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI, bit [20]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR0_EL3 region, or ignored and used for tagged addresses.
TBI

<table>
<thead>
<tr>
<th>TBI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL3 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL3. It has an effect whether the EL3 translation regime is enabled or not.

If ARMv8.3-PAuth is implemented and TCR_EL3.TBID is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL3.
- A exception taken to EL3.
- A exception return to EL3.

For more information, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Note**

This control determines the scope of address tagging. It never causes an exception to be generated.

This field resets to an architecturally UNKNOWN value.

**Bit [19]**

Reserved, RES0.

**PS, bits [18:16]**

Physical Address Size.

<table>
<thead>
<tr>
<th>PS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>32 bits, 4GB.</td>
</tr>
<tr>
<td>0b01</td>
<td>36 bits, 64GB.</td>
</tr>
<tr>
<td>0b10</td>
<td>40 bits, 1TB.</td>
</tr>
<tr>
<td>0b11</td>
<td>42 bits, 4TB.</td>
</tr>
<tr>
<td>0b100</td>
<td>44 bits, 16TB.</td>
</tr>
<tr>
<td>0b101</td>
<td>48 bits, 256TB.</td>
</tr>
<tr>
<td>0b110</td>
<td>52 bits, 4PB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 0b110 is permitted only if ARMv8.2-LPA is implemented and the translation granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL3 are 0b0000.

This field resets to an architecturally UNKNOWN value.

**TG0, bits [15:14]**

Granule size for the TTBR0_EL3.

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.
If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally UNKNOWN value.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using TTBR0_EL3.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in AArch64 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.2.2.

This field resets to an architecturally UNKNOWN value.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL3.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL3.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Bits [7:6]**

Reserved, RES0.

**T0SZ, bits [5:0]**

The size offset of the memory region addressed by TTBR0_EL3. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.
This field resets to an architecturally **UNKNOWN** value.

**Accessing the TCR_EL3**

Accesses to this register use the following encodings:

**MRS <Xt>, TCR_EL3**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b110</td>

    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    TCR_EL3 = X[t];
```
TFSR_EL1, Tag Fault Status Register (EL1)

The TFSR_EL1 characteristics are:

**Purpose**

Holds accumulated Tag Check Faults occurring in EL1 that are not taken precisely.

**Configuration**

This register is present only when ARMv8.5-MemTag is implemented and ID_AA64PFR1_EL1.MTE != 0b0001. Otherwise, direct accesses to TFSR_EL1 are **UNDEFINED**.

**Attributes**

TFSR_EL1 is a 64-bit register.

**Field descriptions**

The TFSR_EL1 bit assignments are:

The TFSR_EL2 characteristics are:

**Purpose**

Holds accumulated Tag Check Faults occurring in EL2 that are not taken precisely.

**Configuration**

This register is present only when ARMv8.5-MemTag is implemented and ID_AA64PFR1_EL1.MTE != 0b0001. Otherwise, direct accesses to TFSR_EL2 are UNDEFINED.

**Attributes**

TFSR_EL2 is a 64-bit register.

**Field descriptions**

The TFSR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>62</td>
<td>TF1</td>
</tr>
<tr>
<td>61</td>
<td>Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b1 occurs. When HCR_EL2.E2H==0b0, this field is RES0. This field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>60</td>
<td>TF0</td>
</tr>
<tr>
<td>59</td>
<td>Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b0 occurs. This field resets to an architecturally UNKNOWN value.</td>
</tr>
</tbody>
</table>

**Accessing the TFSR_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TFSR_EL2 or TFSR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

The TLBI ALLE1 characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If \( \text{SCR} \_{EL3}.NS \) is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
- If \( \text{SCR} \_{EL3}.NS \) is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation only applies to the PE that executes this System instruction.

**Note**

For the EL1&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI ALLE1 is a 64-bit System instruction.

**Field descriptions**

TLBI ALLE1 ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBI ALLE1 instruction**

Accesses to this instruction use the following encodings:

```
TLBI ALLE1{, <Xt>}
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
<th>Rt</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b100</td>
<td>0b1000</td>
<td>0b0111</td>
<td>0b100</td>
<td>0b11111</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
   UNDEFINED;
elsif PSTATE.EL == EL1 then
   if EL2Enabled() && HCR_EL2.NV == '1' then
      AArch64.SystemAccessTrap(EL2, 0x10);
   else
      UNDEFINED;
   endif
elsif PSTATE.EL == EL2 then
   TLBI_ALLE1();
elsif PSTATE.EL == EL3 then
   TLBI_ALLE1();
The TLBI ALLE1IS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If `SCR_EL3`.NS is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
- If `SCR_EL3`.NS is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

For the EL1&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI ALLE1IS is a 64-bit System instruction.

**Field descriptions**

TLBI ALLE1IS ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBI ALLE1IS instruction**

Accesses to this instruction use the following encodings:

```
TLBI ALLE1IS{, <Xt>}
```

<table>

elsif PSTATE.EL == EL3 then
    TLBI_ALLE1IS();
The TLBI ALLE1OS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If \( \text{SCR}_{-}\text{EL3}.\text{NS} \) is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
- If \( \text{SCR}_{-}\text{EL3}.\text{NS} \) is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

For the EL1&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI ALLE1OS are UNDEFINED.

**Attributes**

TLBI ALLE1OS is a 64-bit System instruction.

**Field descriptions**

TLBI ALLE1OS ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBI ALLE1OS instruction**

Accesses to this instruction use the following encodings:

\[

TLBI ASIDE1, TLB Invalidate by ASID, EL1

The TLBI ASIDE1 characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3_NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate an address using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate an address using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI ASIDE1 is a 64-bit System instruction.

**Field descriptions**

The TLBI ASIDE1 input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

**Field descriptions**

The TLBI ASIDE1OS input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ASID | RES0 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**ASID, bits [63:48]**

ASID value to match. Any appropriate TLB entries that match the ASID values will be affected by this System instruction.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are \( \text{RES0} \).
Bits [47:0]

Reserved, RES0.

Executing the TLBI ASIDE1OS instruction

Accesses to this instruction use the following encodings:

The TLBI IPAS2E1 characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS==1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.NS==0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI IPAS2E1 is a 64-bit System instruction.

**NS, bit [63]**

When ARMv8.4-SecEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.
When ARMv8.4-SecEL2 is not implemented or is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

**Bits [62:48]**

Reserved, RES0.

**TTL, bits [47:44]**

**When ARMv8.4-TTL is implemented:**

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

**Bits [43:40]**

Reserved, RES0.

**IPA[51:48], bits [39:36]**

**When ARMv8.2-LPA is implemented:**

Extension to IPA[47:12]. See IPA[47:12] for more details.

Otherwise:

Reserved, RES0.
IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

**Executing the TLBI IPAS2E1 instruction**

Accesses to this instruction use the following encodings:

\[
\text{TLBI IPAS2E1}\{, \langle Xt \rangle\}
\]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b100</td>
<td>0b1000</td>
<td>0b0100</td>
<td>0b001</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  TLBI_IPAS2E1(X[t]);
elsif PSTATE.EL == EL3 then
  if !EL2Enabled() then
    //no operation
  else
    TLBI_IPAS2E1(X[t]);
The TLBI IPAS2E1IS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - $\text{SCR\_EL3.NS}==1$ and the entry would be required to translate the specified IPA using the Non-secure EL1\&0 translation regime.
  - $\text{SCR\_EL3.NS}==0$ and the entry would be required to translate the specified IPA using the Secure EL1\&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI IPAS2E1IS is a 64-bit System instruction.

**TLBI IPAS2E1OS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable**

The TLBI IPAS2E1OS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - \( \text{SCR\_EL3.} \text{NS}==1 \) and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - \( \text{SCR\_EL3.} \text{NS}==0 \) and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI IPAS2E1OS are UNDEFINED.

**Attributes**

TLBI IPAS2E1OS is a 64-bit System instruction.

**Field descriptions**

    //no operation
  else
    TLBI_IPAS2E1OS(X[t]);

TLBI IPAS2E1OS{, <Xt>}
The TLBI IPAS2LE1 characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS==1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.NS==0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

**NS, bit [63]**

When ARMv8.4-SecEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.
When ARMv8.4-SecEL2 is not implemented or is disabled in the current Security state, this field is res0.

**Otherwise:**

Reserved, res0.

**Bits [62:48]**

Reserved, res0.

**TTL, bits [47:44]**

**When ARMv8.4-TTL is implemented:**

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is res0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as:</td>
</tr>
<tr>
<td></td>
<td>0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00.</td>
</tr>
<tr>
<td></td>
<td>0b01 : Level 1.</td>
</tr>
<tr>
<td></td>
<td>0b10 : Level 2.</td>
</tr>
<tr>
<td></td>
<td>0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as:</td>
</tr>
<tr>
<td></td>
<td>0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00.</td>
</tr>
<tr>
<td></td>
<td>0b01 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00.</td>
</tr>
<tr>
<td></td>
<td>0b10 : Level 2.</td>
</tr>
<tr>
<td></td>
<td>0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as:</td>
</tr>
<tr>
<td></td>
<td>0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00.</td>
</tr>
<tr>
<td></td>
<td>0b01 : Level 1.</td>
</tr>
<tr>
<td></td>
<td>0b10 : Level 2.</td>
</tr>
<tr>
<td></td>
<td>0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, res0.

**Bits [43:40]**

Reserved, res0.

**IPA[51:48], bits [39:36]**

**When ARMv8.2-LPA is implemented:**

Extension to IPA[47:12]. See IPA[47:12] for more details.

**Otherwise:**

Reserved, res0.
IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2LE1 instruction

Accesses to this instruction use the following encodings:

```
TLBI IPAS2LE1{, <Xt>}
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b100</td>
<td>0b1000</td>
<td>0b0100</td>
<td>0b101</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  TLBI_IPAS2LE1(X[t]);
elsif PSTATE.EL == EL3 then
  if !EL2Enabled() then
    //no operation
  else
    TLBI_IPAS2LE1(X[t]);
```
The TLBI IPAS2LE1IS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - **SCR_EL3.NS==1** and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - **SCR_EL3.NS==0** and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI IPAS2LE1IS is a 64-bit System instruction.

    else
        TLBI_IPAS2LE1IS(X[t]);

TLBI IPAS2LE1OS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBI IPAS2LE1OS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS==1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.NS==0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI IPAS2LE1OS are UNDEFINED.

**Attributes**

TLBI IPAS2LE1OS is a 64-bit System instruction.

</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

**Bits [43:40]**

Reserved, RES0.

**IPA[51:48], bits [39:36]**

Extension to IPA[47:12]. See IPA[47:12] for more details.

**IPA[47:12], bits [35:0]**

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.
When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

**Executing the TLBI IPAS2LE1OS instruction**

Accesses to this instruction use the following encodings:

TLBI IPAS2LE1OS{, <Xt>}

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b100</td>
<td>0b1000</td>
<td>0b0100</td>
<td>0b100</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  TLBI_IPAS2LE1OS(X[t]);
elsif PSTATE.EL == EL3 then
  if !EL2Enabled() then
    //no operation
  else
    TLBI_IPAS2LE1OS(X[t]);

The TLBI RIPAS2E1 characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS==1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.NS==0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)\times2^{(5\times\text{SCALE} +1) \times \text{Translation_Granule_Size}})\].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RIPAS2E1 are **UNDEFINED**.

**Attributes**

TLBI RIPAS2E1 is a 64-bit System instruction.
Field descriptions

The TLBI RIPAS2E1 input value bit assignments are:

<table>
<thead>
<tr>
<th>NS</th>
<th>RES0</th>
<th>TG</th>
<th>SCALE</th>
<th>NUM</th>
<th>TTL</th>
<th>BaseADDR</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>BaseADDR</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
</tr>
</tbody>
</table>

NS, bit [63]

When ARMv8.4-SecEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When ARMv8.4-SecEL2 is not implemented or is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
### TTL

<table>
<thead>
<tr>
<th>TTL</th>

</tbody>
</table>

### BaseADDR, bits [36:0]

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

### Executing the TLBI RIPAS2E1 instruction

Accesses to this instruction use the following encodings:

\[
\text{TLBI RIPAS2E1}, \ <\text{Xt}> \\
\]

<table>

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
The TLBI RIPAS2E1IS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - \texttt{SCR_EL3.NS}==1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - \texttt{SCR_EL3.NS}==0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)*2^{(5*\text{SCALE} +1)} * \text{Translation_Granule_Size})]\).

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If \text{TTL}==01 and \text{BaseADDR}[29:12] is not equal to 000000000000000000.
  - If \text{TTL}==10 and \text{BaseADDR}[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If \text{TTL}==10 and \text{BaseADDR}[24:14] is not equal to 000000000.
- For the 64K translation granule:
  - If \text{TTL}==01 and \text{BaseADDR}[41:16] is not equal to 00000000000000000000000000.
  - If \text{TTL}==10 and \text{BaseADDR}[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RIPAS2E1IS are UNDEFINED.

**Attributes**

TLBI RIPAS2E1IS is a 64-bit System instruction.
The TLBI RIPAS2E1IS input value bit assignments are:

<table>
<thead>
<tr>
<th>NS</th>
<th>RES0</th>
<th>TG</th>
<th>SCALE</th>
<th>NUM</th>
<th>TTL</th>
<th>BaseADDR</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62</td>
<td>61</td>
<td>60</td>
<td>59</td>
<td>58</td>
<td>57</td>
</tr>
<tr>
<td>56</td>
<td>55</td>
<td>54</td>
<td>53</td>
<td>52</td>
<td>51</td>
<td>50</td>
</tr>
<tr>
<td>49</td>
<td>48</td>
<td>47</td>
<td>46</td>
<td>45</td>
<td>44</td>
<td>43</td>
</tr>
<tr>
<td>42</td>
<td>41</td>
<td>40</td>
<td>39</td>
<td>38</td>
<td>37</td>
<td>36</td>
</tr>
<tr>
<td>35</td>
<td>34</td>
<td>33</td>
<td>32</td>
<td>31</td>
<td>30</td>
<td>29</td>
</tr>
<tr>
<td>28</td>
<td>27</td>
<td>26</td>
<td>25</td>
<td>24</td>
<td>23</td>
<td>22</td>
</tr>
<tr>
<td>21</td>
<td>20</td>
<td>19</td>
<td>18</td>
<td>17</td>
<td>16</td>
<td>15</td>
</tr>
<tr>
<td>14</td>
<td>13</td>
<td>12</td>
<td>11</td>
<td>10</td>
<td>9</td>
<td>8</td>
</tr>
<tr>
<td>7</td>
<td>6</td>
<td>5</td>
<td>4</td>
<td>3</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

NS, bit [63]

When ARMv8.4-SecEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When ARMv8.4-SecEL2 is not implemented or is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
### TTL

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
</tbody>
</table>
| 0b01 | When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries.  
When using a 16KB translation granule, this value is reserved.  
Hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

### BaseADDR, bits [36:0]

The starting address for the range of the maintenance instruction.

- When using a 4KB translation granule, this field is BaseADDR[48:12].
- When using a 16KB translation granule, this field is BaseADDR[50:14].
- When using a 64KB translation granule, this field is BaseADDR[52:16].

### Executing the TLBI RIPAS2E1IS instruction

Accesses to this instruction use the following encodings:

```
TLBI RIPAS2E1IS{, <Xt>}
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b100</td>
<td>0b1000</td>
<td>0b0000</td>
<td>0b010</td>
</tr>
</tbody>
</table>

```python
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  TLBI_RIPAS2E1IS(X[t]);
elsif PSTATE.EL == EL3 then
  if !EL2Enabled() then
    //no operation
  else
    TLBI_RIPAS2E1IS(X[t]);
```

The TLBI RIPAS2E1OS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - $\text{SCR}\_\text{EL3}.\text{NS}==1$ and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - $\text{SCR}\_\text{EL3}.\text{NS}==0$ and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)^2\times(5\times\text{SCALE} +1) \times \text{Translation\_Granule\_Size}]]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **unpredictable** when:

- For the 4K translation granule:
  - If $\text{TTL}==01$ and $\text{BaseADDR}[29:12]$ is not equal to 00000000000000000000000000.
  - If $\text{TTL}==10$ and $\text{BaseADDR}[20:12]$ is not equal to 000000000.
- For the 16K translation granule:
  - If $\text{TTL}==10$ and $\text{BaseADDR}[24:14]$ is not equal to 0000000000.
- For the 64K translation granule:
  - If $\text{TTL}==01$ and $\text{BaseADDR}[41:16]$ is not equal to 0000000000000000000000000000000000.
  - If $\text{TTL}==10$ and $\text{BaseADDR}[28:16]$ is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RIPAS2E1OS are **undefined**.

**Attributes**

TLBI RIPAS2E1OS is a 64-bit System instruction.

</tbody>
</table>

NS, bit [63]

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When ARMv8.4-SecEL2 is not implemented or is disabled in the current Security state, this field is RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
<tr>
<td>0b01</td>

<tbody>
<tr>
<td>0b01</td>
<td>0b100</td>
<td>0b1000</td>
<td>0b0100</td>
<td>0b011</td>
</tr>
</tbody>
</table>

```c
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  TLBI_RIPAS2E10S(X[t]);
elsif PSTATE.EL == EL3 then
  if !EL2Enabled() then
    //no operation
  else
    TLBI_RIPAS2E10S(X[t]);
```
The TLBI RIPAS2LE1 characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - \( \text{SCR\_EL3}.\text{NS}==1 \) and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - \( \text{SCR\_EL3}.\text{NS}==0 \) and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)^{2}^{(5^{\text{SCALE}}+1)} \times \text{Translation\_Granule\_Size}])\).

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1 are **UNDEFINED**.

**Attributes**

TLBI RIPAS2LE1 is a 64-bit System instruction.

### NS, bit [63]

**When ARMv8.4-SecEL2 is implemented:**

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When ARMv8.4-SecEL2 is not implemented or is disabled in the current Security state, this field is RES0.

**Otherwise:**

Reserved, RES0.

### Bits [62:48]

Reserved, RES0.

### TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

### SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

### NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

### TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation</td>
</tr>
<tr>
<td></td>
<td>table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>When using a 4KB or 64KB translation granule, all entries to invalidate</td>
</tr>
<tr>
<td></td>
<td>are Level 1 translation table entries. When using a 16KB translation</td>
</tr>
<tr>
<td></td>
<td>granule, this value is reserved. Hardware should treat this field as</td>
</tr>
<tr>
<td></td>
<td>0b00.</td>
</tr>
<tr>

<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

**BaseADDR, bits [36:0]**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RIPAS2LE1 instruction**

Accesses to this instruction use the following encodings:

TLBI RIPAS2LE1{, <Xt>}

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

The TLBI RIPAS2LE1IS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS=1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.NS=0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)\times2^{(5\times\text{SCALE} +1)} \times \text{Translation_Granule_Size})]\).

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1IS are UNDEFINED.

**Attributes**

TLBI RIPAS2LE1IS is a 64-bit System instruction.
### Field descriptions

The TLBI RIPAS2LE1IS input value bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Bit Assignment</th>

<tr>
<td>SCALE</td>
<td>60</td>
</tr>
<tr>
<td>NUM</td>
<td>59</td>
</tr>
<tr>
<td>TTL</td>
<td>58</td>
</tr>
<tr>
<td>BaseADDR</td>
<td>57</td>
</tr>
</tbody>
</table>

#### NS, bit [63]

**When ARMv8.4-SecEL2 is implemented:**

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When ARMv8.4-SecEL2 is not implemented or is disabled in the current Security state, this field is RES0.

**Otherwise:**

Reserved, RES0.

#### Bits [62:48]

Reserved, RES0.

#### TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

#### SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

#### NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

#### TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
### TTL Meaning

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation</td>
</tr>
<tr>
<td></td>
<td>table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>When using a 4KB or 64KB translation granule, all entries to</td>
</tr>
<tr>
<td></td>
<td>invalidate are Level 1 translation table entries.</td>
</tr>
<tr>
<td></td>
<td>When using a 16KB translation granule, this value is reserved.</td>
</tr>
<tr>
<td></td>
<td>Hardware should treat this field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

### BaseADDR, bits [36:0]

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

### Executing the TLBI RIPAS2LE1IS instruction

Accesses to this instruction use the following encodings:

```
TLBI RIPAS2LE1IS{, <Xt>}
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b100</td>
<td>0b1000</td>
<td>0b0000</td>
<td>0b11</td>
</tr>
</tbody>
</table>

```python
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    TLBI_RIPAS2LE1IS(X[t]);
elsif PSTATE.EL == EL3 then
    if !EL2Enabled() then
        //no operation
    else
        TLBI_RIPAS2LE1IS(X[t]);
```

09/12/2019 19:22; 4931eb80e191d85311fc84f3b3483d27b25d

TLBI RIPAS2LE1OS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBI RIPAS2LE1OS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS==1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.NS==0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)^2 \times (5 \times \text{SCALE} +1) \times \text{Translation_Granule_Size})\].

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
TLBIRIPAS2LE1OS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

- If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1OS are UNDEFINED.

**Attributes**

TLBI RIPAS2LE1OS is a 64-bit System instruction.

**Field descriptions**

The TLBI RIPAS2LE1OS input value bit assignments are:

<table>

</tr>
</tbody>
</table>

**BaseADDR, bits [36:0]**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RIPAS2LE1OS instruction**

Accesses to this instruction use the following encodings:

TLBI RIPAS2LE1OS{, <Xt>}

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b100</td>
<td>0b1000</td>
<td>0b0100</td>
<td>0b111</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  TLBI_RIPAS2LE1OS(X[t]);
elsif PSTATE.EL == EL3 then
  if !EL2Enabled() then
    //no operation
  else
    TLBI_RIPAS2LE1OS(X[t]);
The TLBI RVAAE1 characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3.NS`:
  - If `HCR_EL2.{E2H, TGE}` is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If `HCR_EL2.{E2H, TGE}` is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula `[BaseADDR <= VA < BaseADDR + ((NUM +1)*2^(5*SCALE +1) * Translation_Granule_Size)]`.

The invalidation applies to the PE that executes this System instruction.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granularity:
  - If `TTL==01` and `BaseADDR[29:12]` is not equal to `00000000000000000000000000`.
  - If `TTL==10` and `BaseADDR[20:12]` is not equal to `00000000000`.

- For the 16K translation granularity:
  - If `TTL==10` and `BaseADDR[24:14]` is not equal to `00000000000`.

- For the 64K translation granularity:
  - If `TTL==01` and `BaseADDR[41:16]` is not equal to `00000000000000000000000000000000`.
  - If `TTL==10` and `BaseADDR[28:16]` is not equal to `000000000000000000000000`.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVAAE1 are **UNDEFINED**.

**Attributes**

TLBI RVAAE1 is a 64-bit System instruction.

elsif PSTATE.EL == EL3 then
  TLBI_RVAAE1(X[t]);
TLBI RVAAE1IS, TLB Range Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI RVAAE1IS characteristics are:

**Purpose**

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1)^*2^{(5*\text{SCALE} + 1)} * \text{Translation_Granule_Size})\].

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVAAE1IS are UNDEFINED.

**Attributes**

TLBI RVAAE1IS is a 64-bit System instruction.

**Field descriptions**

The TLBI RVAAE1IS input value bit assignments are:

<p>|   | 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |   |

TLBI RVAAE1OS, TLB Range Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBI RVAAE1OS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \[\text{BaseADDR} <= \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)\times 2^{(5\times \text{SCALE} +1)} \times \text{Translation_Granule Size})\].

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

TLBI RVAALE1, TLB Range Invalidate by VA, All ASID, Last level, EL1

The TLBI RVAALE1 characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1) \times \text{Translation_Granule_Size}})]\).

The invalidation applies to the PE that executes this System instruction.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVAALE1 are **UNDEFINED**.

**Attributes**

TLBI RVAALE1 is a 64-bit System instruction.

### BaseADDR, bits [36:0]

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].
Executing the TLBI RVAALE1 instruction

Accesses to this instruction use the following encodings:

TLBI RVAALE1{, <Xt>}

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b000</td>
<td>0b1000</td>
<td>0b0110</td>
<td>0b111</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLB == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
    HFGITR_EL2.TLBIRVAALE1 == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    TLBI_RVAALE1(X[t]);
  endif
elsif PSTATE.EL == EL2 then
  TLBI_RVAALE1(X[t]);
elsif PSTATE.EL == EL3 then
  TLBI_RVAALE1(X[t]);
The TLBI RVAALE1IS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3.NS`:
  - If `HCR_EL2.{E2H, TGE}` is not `{1, 1}`, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If `HCR_EL2.{E2H, TGE}` is `{1, 1}`, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \[(BaseADDR <= VA < BaseADDR + ((NUM +1)*2^(5*SCALE +1) * Translation_Granule_Size))\].

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if `SCR_EL3.EEL2==1`, then:

- A PE with `SCR_EL3.EEL2==1` is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with `SCR_EL3.EEL2==0`.
- A PE with `SCR_EL3.EEL2==0` is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with `SCR_EL3.EEL2==1`.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If `TTL==01` and `BaseADDR[29:12]` is not equal to `00000000000000000000000000`.
  - If `TTL==10` and `BaseADDR[20:12]` is not equal to `0000000000`.
- For the 16K translation granule:
  - If `TTL==10` and `BaseADDR[24:14]` is not equal to `000000000000`.
- For the 64K translation granule:
  - If `TTL==01` and `BaseADDR[41:16]` is not equal to `0000000000000000000000000000000000`. 
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVAALE1IS are UNDEFINED.

**Attributes**

TLBI RVAALE1IS is a 64-bit System instruction.

**Field descriptions**

The TLBI RVAALE1IS input value bit assignments are:

|     | 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

The TLBI RVAALE1OS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \( \text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)2^{(5\text{SCALE} +1)} \times \text{Translation\_Granule\_Size}) \).

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
○ If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

TLBI RVAE1, TLB Range Invalidate by VA, EL1

The TLBI RVAE1 characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3 NS:
  - If HCR_EL2 {E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2 {E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula $[\text{BaseADDR} <= \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)*2^{(5*\text{SCALE} +1)} * \text{TranslationGranuleSize})]$.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000000000000000.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVAE1 are **UNDEFINED**.

**Attributes**

TLBI RVAE1 is a 64-bit System instruction.

</tbody>
</table>

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>

```
TLBI RVAE1IS, TLB Range Invalidate by VA, EL1, Inner Shareable

The TLBI RVAE1IS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)^2)^*(5\times\text{SCALE} +1) \times \text{Translation Granule Size}\].

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
TLBI RVAE1IS, TLB Range Invalidate by VA, EL1, Inner Shareable

- If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
- If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

Configuration

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVAE1IS are UNDEFINED.

Attributes

TLBI RVAE1IS is a 64-bit System instruction.

Field descriptions

The TLBI RVAE1IS input value bit assignments are:

</tbody>
</table>

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>

<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
<table>
<thead>
<tr>
<th>TTL</th>

```
TLBI RVAE1OS, TLB Range Invalidate by VA, EL1, Outer Shareable

The TLBI RVAE1OS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3.NS`:
  - If `HCR_EL2.{E2H, TGE}` is not `{1, 1}`, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If `HCR_EL2.{E2H, TGE}` is `{1, 1}`, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula `[BaseADDR <= VA < BaseADDR + ((NUM +1)*2^((5*SCALE +1) * Translation_Granule_Size))]`.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if `SCR_EL3.EEL2==1`, then:

- A PE with `SCR_EL3.EEL2==1` is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with `SCR_EL3.EEL2==0`.
- A PE with `SCR_EL3.EEL2==0` is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with `SCR_EL3.EEL2==1`.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If `TTL==01` and `BaseADDR[29:12]` is not equal to `00000000000000000000000000000000`.
  - If `TTL==10` and `BaseADDR[20:12]` is not equal to `00000000000000000000000000000000`.
- For the 16K translation granule:
  - If `TTL==10` and `BaseADDR[24:14]` is not equal to `00000000000000000000000000000000`.
- For the 64K translation granule:
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.

If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000000000000000.

Configuration

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVAE1OS are UNDEFINED.

Attributes

TLBI RVAE1OS is a 64-bit System instruction.

Field descriptions

The TLBI RVAE1OS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit Width</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-48</td>
<td>ASID</td>
</tr>
<tr>
<td>47-46</td>
<td>TG</td>
</tr>
<tr>
<td>45-44</td>
<td>SCALE</td>
</tr>
<tr>
<td>43-39</td>
<td>NUM</td>
</tr>
<tr>
<td>38-37</td>
<td>TTL</td>
</tr>
<tr>
<td>31-0</td>
<td>BaseADDR</td>
</tr>
</tbody>
</table>

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
### TTL

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>

```
TLBI RVAE2, TLB Range Invalidate by VA, EL2

The TLBI RVAE2 characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula
  \[ \text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation_Granule_Size}) \],
  using the EL2 or EL2&0 translation regime.
- If \( \text{HCR}_{\text{EL2}}.E2H = 0 \), the entry is from any level of the translation table walk.
- If \( \text{HCR}_{\text{EL2}}.E2H = 1 \), one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

**Configuration**

TLBI RVAE2IS, TLB Range Invalidate by VA, EL2, Inner Shareable

The TLBI RVAE2IS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula $([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{5 \times \text{SCALE} + 1}) \times \text{Translation Granule Size})$, using the EL2 or EL2&0 translation regime.
- If $\text{HCR EL2}.E2H == 0$, the entry is from any level of the translation table walk.
- If $\text{HCR EL2}.E2H == 1$, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVAE2IS are **UNDEFINED**.

**Attributes**

TLBI RVAE2IS is a 64-bit System instruction.

**Field descriptions**

The TLBI RVAE2IS input value bit assignments are:
ASID, bits [63:48]

When HCR_EL2.E2H == 1:

```
TLBI RVAE2OS, TLB Range Invalidate by VA, EL2, Outer Shareable

The TLBI RVAE2OS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{5 \times \text{SCALE} + 1}) \times \text{Translation_Granule_Size})\], using the EL2 or EL2&0 translation regime.
- If \(\text{HCR\_EL2\_E2H} = 0\), the entry is from any level of the translation table walk.
- If \(\text{HCR\_EL2\_E2H} = 1\), one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If \(\text{TTL} = 01\) and \(\text{BaseADDR}[29:12]\) is not equal to 000000000000000000.
  - If \(\text{TTL} = 10\) and \(\text{BaseADDR}[20:12]\) is not equal to 00000000.

- For the 16K translation granule:
  - If \(\text{TTL} = 10\) and \(\text{BaseADDR}[24:14]\) is not equal to 00000000.

- For the 64K translation granule:
  - If \(\text{TTL} = 01\) and \(\text{BaseADDR}[41:16]\) is not equal to 00000000000000000000000000.
  - If \(\text{TTL} = 10\) and \(\text{BaseADDR}[28:16]\) is not equal to 000000000000.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVAE2OS are **UNDEFINED**.

**Attributes**

TLBI RVAE2OS is a 64-bit System instruction.

**Field descriptions**

The TLBI RVAE2OS input value bit assignments are:
ASID, bits [63:48]

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>

```
TLBI RVAE3, TLB Range Invalidate by VA, EL3

The TLBI RVAE3 characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation Granule Size})]\).

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

TLBI RVALE1, TLB Range Invalidate by VA, Last level, EL1

The TLBI RVALE1 characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1) \times 2^{(5 \times \text{SCALE} +1)} \times \text{Translation_Granule_Size})\].

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVALE1 are **UNDEFINED**.

**Attributes**

TLBI RVALE1 is a 64-bit System instruction.
## Field descriptions

The TLBI RVALE1 input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ASID | TG | SCALE | NUM | TTL | BaseADDR |

### ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

### TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

### SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

### NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

### TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. When using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

### BaseADDR, bits [36:0]

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].
When using a 16KB translation granule, this field is BaseADDR\[50:14\].
When using a 64KB translation granule, this field is BaseADDR\[52:16\].

**Executing the TLBI RVALE1 instruction**

Accesses to this instruction use the following encodings:

```
TLBI RVALE1\{, <Xt>\}
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b000</td>
<td>0b1000</td>
<td>0b0110</td>
<td>0b101</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAAArch32(EL2) && HCR_EL2.TTLB == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
        HFGITR_EL2.TLBIRVALE1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAAArch32(EL2) && HCR_EL2.FB == '1' then
        TLBI_RVALEIIS(X[t]);
    else
        TLBI_RVALE1(X[t]);
    end
elsif PSTATE.EL == EL2 then
    TLBI_RVALE1(X[t]);
elsif PSTATE.EL == EL3 then
    TLBI_RVALE1(X[t]);
```
The TLBI RVAE1IS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \[\text{[BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)*2^{*5*\text{SCALE} +1}) \times \text{Translation_Granule_Size}]\).

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 0000000000000000000000000000000000.
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVALE1IS are UNDEFINED.

**Attributes**

TLBI RVALE1IS is a 64-bit System instruction.

elsif PSTATE.EL == EL3 then
  TLBI_RVALE1OS(X[t]);
The TLBI RVALE2 characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula \[ \text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation Granule Size}) \] using the EL2 or EL2&E2 translation regime.
- If \( \text{HCR\_EL2.E2H} = 0 \), the entry is from the final level of the translation table walk.
- If \( \text{HCR\_EL2.E2H} = 1 \), one of the following applies:
  - The entry is a global entry from the final level of translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVALE2 are **UNDEFINED**.

**Attributes**

TLBI RVALE2 is a 64-bit System instruction.

**Field descriptions**

The TLBI RVALE2 input value bit assignments are:
ASID, bits [63:48]

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are \texttt{RES0}.

Otherwise:

Reserved, \texttt{RES0}.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
<tr>

<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b100</td>
<td>0b1000</td>
<td>0b0110</td>
<td>0b101</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() & HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    TLBI_RVALE2(X[t]);
elsif PSTATE.EL == EL3 then
    if !EL2Enabled() then
        UNDEFINED;
    else
        TLBI_RVALE2(X[t]);
The TLBI RVALE2IS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula 
  \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation Granule Size})\] using the EL2 or EL2&0 translation regime.
- If \text{HCR.EL2.E2H} = 0, the entry is from the final level of the translation table walk.
- If \text{HCR.EL2.E2H} = 1, one of the following applies:
  - The entry is a global entry from the final level of translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI RVALE2IS are **UNDEFINED**.

**Attributes**

TLBI RVALE2IS is a 64-bit System instruction.

**Field descriptions**

The TLBI RVALE2IS input value bit assignments are:
ASID, bits [63:48]

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved</td>
</tr>
<tr>
<td>0b01</td>

TLBI RVALE3, TLB Range Invalidate by VA, Last level, EL3

The TLBI RVALE3 characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation Granule Size})\].

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If \(TTL=01\) and \(\text{BaseADDR}[29:12]\) is not equal to 00000000000000000000.
  - If \(TTL=10\) and \(\text{BaseADDR}[20:12]\) is not equal to 000000000.

- For the 16K translation granule:
  - If \(TTL=10\) and \(\text{BaseADDR}[24:14]\) is not equal to 0000000000.

- For the 64K translation granule:
  - If \(TTL=01\) and \(\text{BaseADDR}[41:16]\) is not equal to 00000000000000000000000000.
  - If \(TTL=10\) and \(\text{BaseADDR}[28:16]\) is not equal to 0000000000000.

</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. When using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</td>

The TLBI VAAE1 characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VAAE1 is a 64-bit System instruction.

**Field descriptions**

The TLBI VAAE1 input value bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |

**Bits [63:48]**

Reserved, RES0.

**TTL, bits [47:44]**

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.
<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAAE1 instruction**

Accesses to this instruction use the following encodings:

<table>

  TLBI_VAAE1(X[t]);
elsif PSTATE.EL == EL3 then
  TLBI_VAAE1(X[t]);
TLBI VAAE1IS, TLB Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI VAAE1IS characteristics are:

**Purpose**

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VAAE1IS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAAE1IS input value bit assignments are:
Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.
Executing the TLBI VAAE1IS instruction

Accesses to this instruction use the following encodings:

TLBI VAAE1IS{, <Xt>}

<table>

elsif PSTATE.EL == EL3 then
  TLBI_VAAE1IS(X[t]);
TLBI VAAE1OS, TLB Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBI VAAE1OS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3.NS`:
  - If `HCR_EL2.{E2H, TGE}` is not \(\{1, 1\}\), the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If `HCR_EL2.{E2H, TGE}` is \(\{1, 1\}\), the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if `SCR_EL3.EEL2==1`, then:

- A PE with `SCR_EL3.EEL2==1` is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with `SCR_EL3.EEL2==0`.
- A PE with `SCR_EL3.EEL2==0` is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with `SCR_EL3.EEL2==1`.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI VAAE1OS are UNDEFINED.

**Attributes**

TLBI VAAE1OS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAAE1OS input value bit assignments are:
Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<td>0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAALE1 instruction

Accesses to this instruction use the following encodings:

TLBI VAALE1IS, TLB Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBI VAALE1IS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VAALE1IS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAALE1IS input value bit assignments are:
Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>

TLBI VAE1, TLB Invalidate by VA, EL1

The TLBI VAE1 characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3_NS`:
  - If `HCR_EL2.{E2H, TGE}` is not `{1, 1}`, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If `HCR_EL2.{E2H, TGE}` is `{1, 1}`, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VAE1 is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE1 input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

**TTL, bits [47:44]**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Page 1652
When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE1 instruction

Accesses to this instruction use the following encodings:

TLBI VAE1{, <Xt>}

<table>

elsif PSTATE.EL == EL3 then
    TLBI_VAE1(X[t]);
TLBI VAE1IS, TLB Invalidate by VA, EL1, Inner Shareable

The TLBI VAE1IS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VAE1IS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE1IS input value bit assignments are:
ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b00xx | No information supplied as to the translation table level.  
Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as:  
0b00 : Reserved. Treat as if TTL<3:2> is 0b00.  
0b01 : Level 1.  
0b10 : Level 2.  
0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as:  
0b00 : Reserved. Treat as if TTL<3:2> is 0b00.  
0b01 : Reserved. Treat as if TTL<3:2> is 0b00.  
0b10 : Level 2.  
0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as:  
0b00 : Reserved. Treat as if TTL<3:2> is 0b00.  
0b01 : Level 1.  
0b10 : Level 2.  
0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
• Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

• Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAE1IS instruction**

Accesses to this instruction use the following encodings:

```
TLBI VAE1IS{, <Xt>}

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b000</td>
<td>0b1000</td>
<td>0b0011</td>
<td>0b001</td>
</tr>
</tbody>
</table>
```

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLB == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLBIS == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
    HFGITR_EL2.TLBIVAE1IS == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    TLBI_VAE1IS(X[t]);
  endif;
elsif PSTATE.EL == EL2 then
  TLBI_VAE1IS(X[t]);
elsif PSTATE.EL == EL3 then
  TLBI_VAE1IS(X[t]);
```
The TLBI VAE1OS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3_NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI VAE1OS are **UNDEFINED**.

**Attributes**

TLBI VAE1OS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE1OS input value bit assignments are:
ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>

</tr>
</tbody>
</table>
| 0b01xx    | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as:  
   0b00 : Reserved. Treat as if TTL<3:2> is 0b00.  
   0b01 : Level 1.  
   0b10 : Level 2.  
   0b11 : Level 3. |
| 0b10xx    | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as:  
   0b00 : Reserved. Treat as if TTL<3:2> is 0b00.  
   0b01 : Reserved. Treat as if TTL<3:2> is 0b00.  
   0b10 : Level 2.  
   0b11 : Level 3. |
| 0b11xx    | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as:  
   0b00 : Reserved. Treat as if TTL<3:2> is 0b00.  
   0b01 : Level 1.  
   0b10 : Level 2.  
   0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAE2OS instruction**

Accesses to this instruction use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  TLBI_VAE2OS(X[t]);
elsif PSTATE.EL == EL3 then
  if !EL2Enabled() then
    UNDEFINED;
  else
    TLBI_VAE2OS(X[t]);
The TLBI VAE3 characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VAE3 is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE3 input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>

<td>55-12</td>
<td>VA</td>
</tr>
<tr>
<td>47-44</td>
<td>TTL</td>
</tr>
</tbody>
</table>

**Bits [63:48]**

Reserved, RES0.

**TTL, bits [47:44]**

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.
TTL | Meaning
---|---
0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
0b00 : Reserved. Treat as if TTL<3:2> is 0b00.
0b01 : Level 1.
0b10 : Level 2.
0b11 : Level 3.
0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
0b00 : Reserved. Treat as if TTL<3:2> is 0b00.
0b01 : Reserved. Treat as if TTL<3:2> is 0b00.
0b10 : Level 2.
0b11 : Level 3.
0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
0b00 : Reserved. Treat as if TTL<3:2> is 0b00.
0b01 : Level 1.
0b10 : Level 2.
0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAE3 instruction**

Accesses to this instruction use the following encodings:

```
TLBI VAE3{, <Xt>}
```

The TLBI VALE1 characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3:NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VALE1 is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE1 input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ASID | TTL | VA[55:12] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.
**TTL, bits [47:44]**

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

| 0b10xx   | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as:  
            | 0b00: Reserved. Treat as if TTL<3:2> is 0b00.                                                                                           |
            | 0b01: Reserved. Treat as if TTL<3:2> is 0b00.                                                                                           |
            | 0b10: Level 2.                                                                                                                          |
            | 0b11: Level 3.                                                                                                                          |
| 0b11xx   | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as:  
            | 0b00: Reserved. Treat as if TTL<3:2> is 0b00.                                                                                           |
            | 0b01: Level 1.                                                                                                                          |
            | 0b10: Level 2.                                                                                                                          |
            | 0b11: Level 3.                                                                                                                          |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE1 instruction**

Accesses to this instruction use the following encodings:

`TLBI VALE1{, <Xt>}`

<table>

<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b00</td>
<td>0b1000</td>
<td>0b0111</td>
<td>0b101</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLB == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
            HFGITR_EL2.TLBIVALE1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.FB == '1'
        TLBI_VALE1IS(X[t]);
    else
        TLBI_VAAE1(X[t]);
    end if
elsif PSTATE.EL == EL2 then
    TLBI_VAAE1(X[t]);
elsif PSTATE.EL == EL3 then
    TLBI_VAAE1(X[t]);
else
    TLBI_VAAE1(X[t]);
end if
The TLBI VALE1IS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of $SCR_EL3$.NS:
  - If $HCR_EL2$.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If $HCR_EL2$.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if $SCR_EL3$.EEL2==1, then:

- A PE with $SCR_EL3$.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with $SCR_EL3$.EEL2==0.
- A PE with $SCR_EL3$.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with $SCR_EL3$.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VALE1IS is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE1IS input value bit assignments are:
ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

• Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the
instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the
instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE1IS instruction**

The TLBI VALE1OS characteristics are:

### Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

### Configuration

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI VALE1OS are UNDEFINED.

### Attributes

TLBI VALE1OS is a 64-bit System instruction.

### Field descriptions

The TLBI VALE1OS input value bit assignments are:
ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
• Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

• Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

TLBI VALE2, TLB Invalidate by VA, Last level, EL2

The TLBI VALE2 characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime.
- If HCR_EL2.E2H == 0, the entry is from the final level of the translation table walk.
- If HCR_EL2.E2H == 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of translation table walk that matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VALE2 is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE2 input value bit assignments are:

The TLBI VALE2IS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime.
- If \( \text{HCR\_EL2\_E2H} == 0 \), the entry is from the final level of the translation table walk.
- If \( \text{HCR\_EL2\_E2H} == 1 \), one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of translation table walk that matches the specified ASID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VALE2IS is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE2IS input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ASID | TTL | VA[55:12] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.
**TTL, bits [47:44]**

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE2IS instruction**

Accesses to this instruction use the following encodings:

TLBI VALE2IS{, <Xt>}

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b100</td>
<td>0b1000</td>
<td>0b0011</td>
<td>0b101</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    TLBI_VALE2IS(X[t]);
elsif PSTATE.EL == EL3 then
    if !EL2Enabled() then
        UNDEFINED;
    else
        TLBI_VALE2IS(X[t]);

The TLBI VALE2OS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime.
- If HCR_EL2.E2H == 0, the entry is from the final level of the translation table walk.
- If HCR_EL2.E2H == 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of translation table walk that matches the specified ASID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI VALE2OS are UNDEFINED.

**Attributes**

TLBI VALE2OS is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE2OS input value bit assignments are:

<table>

<td>0</td>
</tr>
</tbody>
</table>

**ASID, bits [63:48]**

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.
Reserved, RES0.

**TTL, bits [47:44]**

*When ARMv8.4-TTL is implemented:*

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise: Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE2OS instruction**

Accesses to this instruction use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  TLBI_VALE2OS(X[t]);
elsif PSTATE.EL == EL3 then
  if !EL2Enabled() then
    UNDEFINED;
  else
    TLBI_VALE2OS(X[t]);

The TLBI VALE3 characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VALE3 is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE3 input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td>62</td>
<td>TTL</td>
</tr>
<tr>
<td>55-12</td>
<td>VA[55:12]</td>
</tr>
</tbody>
</table>

**Bits [63:48]**

Reserved, RES0.

**TTL, bits [47:44]**

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.
### TTL Meaning

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE3 instruction**

Accesses to this instruction use the following encodings:

```
TLBI VALE3{, <Xt>}  op0  op1  CRn  CRm  op2
0b01  0b110  0b1000  0b0111  0b101
```
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  UNDEFINED;
elsif PSTATE.EL == EL2 then
  UNDEFINED;
elsif PSTATE.EL == EL3 then
  TLBI_VALE3(X[t]);
**TLBI VALE3IS, TLB Invalidate by VA, Last level, EL3, Inner Shareable**

The TLBI VALE3IS characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VALE3IS is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE3IS input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | TTL | VA[55:12] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:48]**

Reserved, RES0.

**TTL, bits [47:44]**

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.
## TTL

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

### Otherwise:

Reserved, RES0.

### VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### Executing the TLBI VALE3IS instruction

Accesses to this instruction use the following encodings:

TLBI VALE3IS{, <Xt>}

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>0b110</td>
<td>0b1000</td>
<td>0b0011</td>
<td>0b101</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    TLBI_VALE3IS(X[t]);

TLBI VALE3OS, TLB Invalidate by VA, Last level, EL3, Outer Shareable

The TLBI VALE3OS characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Configuration**

This instruction is present only when ARMv8.4-TLBI is implemented. Otherwise, direct accesses to TLBI VALE3OS are UNDEFINED.

**Attributes**

TLBI VALE3OS is a 64-bit System instruction.

<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is \texttt{RES0}.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

#### Otherwise:

Reserved, \texttt{RES0}.

#### VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as \texttt{RES0}.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are \texttt{RES0} and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are \texttt{RES0} and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### Executing the TLBI VALE3OS instruction

Accesses to this instruction use the following encodings:

`TLBI VALE3OS{, <Xt>}`

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

    UNDEFINED;
elsif PSTATE.EL == EL3 then
    TLBI_VALE3OS(X[t]);
TLBI VMALLE1, TLB Invalidate by VMID, All at stage 1, EL1

The TLBI VMALLE1 characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3`.
  - If `HCR_EL2` is not `{1, 1}`, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If `HCR_EL2` is `{1, 1}`, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

**Note**

For the EL1&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VMALLE1 is a 64-bit System instruction.

**Field descriptions**

TLBI VMALLE1 ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBI VMALLE1 instruction**

Accesses to this instruction use the following encodings:

TLBI VMALLE1{, <Xt>}

<table>
<thead>
<tr>

    TLBI_VMALLE1IS();
  end if
elsif PSTATE.EL == EL2 then
  TLBI_VMALLE1();
elsif PSTATE.EL == EL3 then
  TLBI_VMALLE1();
The TLBI VMALLE1IS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

---

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

---

**Configuration**

There are no configuration notes.

TPIDR_EL0, EL0 Read/Write Software Thread ID Register

The TPIDR_EL0 characteristics are:

**Purpose**

Provides a location where software executing at EL0 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

**Configuration**

AArch64 System register TPIDR_EL0 bits [31:0] are architecturally mapped to AArch32 System register TPIDRURW[31:0].

**Attributes**

TPIDR_EL0 is a 64-bit register.

**Field descriptions**

The TPIDR_EL0 bit assignments are:

<table>

Purpose

Describes constraints on using the Trace Buffer Extension to software, including whether the Trace Buffer Extension can be programmed at the current Exception level.

Configuration

This register is present only when TRBE is implemented. Otherwise, direct accesses to TRBIDR_EL1 are UNDEFINED.

Attributes

TRBIDR_EL1 is a 64-bit register.

Field descriptions

The TRBIDR_EL1 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0 | RES0 | F | P | Align |

Bits [63:6]

Reserved, RES0.

F, bit [5]

Flag Updates. Defines whether the address translation performed by the Trace Buffer Extension manages the Access Flag and dirty state.

<table>
<thead>
<tr>
<th>F Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0 Trace buffer address translation does not manage the Access flag and dirty state in translation tables.</td>
</tr>
<tr>
<td>0b1 Trace buffer address translation manages the Access Flag and dirty state in the same way as the MMU on this PE.</td>
</tr>
</tbody>
</table>

P, bit [4]

Programming not allowed. The trace buffer is owned by a higher Exception level or by the other Security state.

<table>
<thead>
<tr>
<th>P Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0 The owning Exception level is the current Exception level or a lower Exception level, and the owning Security state is the current Security state.</td>
</tr>
<tr>
<td>0b1 The owning Exception level is a higher Exception level, or the owning Security state is not the current Security state.</td>
</tr>
</tbody>
</table>

The value read from this field depends on the current Exception level and the values of MDCR_EL3.NSTB and MDCR_EL2.E2TB:

- If EL3 is implemented and either MDCR_EL3.NSTB == 0b00 or MDCR_EL3.NSTB == 0b01, meaning the owning Security state is Secure state, this bit reads as one from:
  - Non-secure EL2.
Non-secure EL1.

If Secure EL2 is implemented and enabled, and \texttt{MDCR\_EL2.E2TB == 0b00}, Secure EL1.

- If EL3 is implemented and either \texttt{MDCR\_EL3.NSTB == 0b10} or \texttt{MDCR\_EL3.NSTB == 0b11}, meaning the owning Security state is Non-secure state, this bit reads as one from:
  - Secure EL1.
  - If Secure EL2 is implemented, Secure EL2.
  - If EL2 is implemented and \texttt{MDCR\_EL2.E2TB == 0b00}, Non-secure EL1.

- If EL3 is not implemented, EL2 is implemented, and \texttt{MDCR\_EL2.E2TB == 0b00}, this bit reads as one from EL1.
- Otherwise, this bit reads as zero.

**Align, bits [3:0]**

Defines the minimum alignment constraint for writes to \texttt{TRBPTR\_EL1} and \texttt{TRTRGR\_EL1}.

<table>
<thead>
<tr>
<th>Align</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Byte.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Halfword.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Word.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Doubleword.</td>
</tr>
<tr>
<td>0b0100</td>
<td>16 bytes.</td>
</tr>
<tr>
<td>0b0101</td>

</tr>
<tr>
<td>0b0111</td>
<td>128 bytes.</td>
</tr>
<tr>
<td>0b1000</td>
<td>256 bytes.</td>
</tr>
<tr>
<td>0b1001</td>
<td>512 bytes.</td>
</tr>
<tr>
<td>0b1010</td>
<td>1KB.</td>
</tr>
<tr>
<td>0b1011</td>
<td>2KB.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Accessing the TRBIDR\_EL1**

Accesses to this register use the following encodings:

\[
\text{MRS ~\texttt{<Xt>, TRBIDR\_EL1}}
\]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b1001</td>
<td>0b1011</td>
<td>0b111</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() \&\& !ELUsingAArch32(EL2) \&\& (!HaveEL(EL3) || SCR\_EL3.FGTEn == '1') \&\& HDFGRTR\_EL2.TRBIDR\_EL1 == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    return TRBIDR\_EL1;
elsif PSTATE.EL == EL2 then
  return TRBIDR\_EL1;
elsif PSTATE.EL == EL3 then
  return TRBIDR\_EL1;
**TRBLIMITR_EL1, Trace Buffer Limit Address Register**

The TRBLIMITR_EL1 characteristics are:

**Purpose**

Defines the top address for the trace buffer, and controls the trace buffer modes and enable.

**Configuration**

This register is present only when TRBE is implemented. Otherwise, direct accesses to TRBLIMITR_EL1 are UNDEFINED.

**Attributes**

TRBLIMITR_EL1 is a 64-bit register.

**Field descriptions**

The TRBLIMITR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| 63   | LIMIT  | Trace Buffer Limit pointer address. (TRBLIMITR_EL1.LIMIT << 12) is the address of the last byte in the trace buffer plus one. Bits [11:0] of the Limit pointer address are always zero. If the smallest implemented translation granule is not 4KB, then TRBLIMITR_EL1[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value Log2(smallest implemented translation granule). The following resets apply:  
  - On a Cold reset, this field resets to an architecturally UNKNOWN value.  
  - On a Warm reset, the value of this field is unchanged. |
| 5    | nVM    | Address mode.  
  - 0b0: The trace buffer pointers are virtual addresses.  
  - 0b1: The trace buffer pointers are:  
    - Physical address in the owning security state if the owning translation regime has no stage 2 translation.  
    - Intermediate physical addresses in the owning security state if the owning translation regime has stage 2 translations. |

The following resets apply:
• On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
• On a Warm reset, the value of this field is unchanged.

**TM, bits [4:3]**

Trigger mode.

<table>
<thead>
<tr>
<th>TM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Stop on trigger. Flush then stop collection and raise maintenance interrupt on Trigger Event.</td>
</tr>
<tr>
<td>0b01</td>
<td>IRQ on trigger. Continue collection and raise maintenance interrupt on Trigger Event.</td>
</tr>
<tr>
<td>0b11</td>
<td>Ignore trigger. Continue collection and do not raise maintenance interrupt on Trigger Event.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The following resets apply:
• On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
• On a Warm reset, the value of this field is unchanged.

**FM, bits [2:1]**

Trace buffer mode.

<table>
<thead>
<tr>
<th>FM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Fill mode. Stop collection and raise maintenance interrupt on current write pointer wrap.</td>
</tr>
<tr>
<td>0b01</td>
<td>Wrap mode. Continue collection and raise maintenance interrupt on current write pointer wrap.</td>
</tr>
<tr>
<td>0b11</td>
<td>Circular Buffer mode. Continue collection and do not raise maintenance interrupt on current write pointer wrap.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The following resets apply:
• On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
• On a Warm reset, the value of this field is unchanged.

**E, bit [0]**

Trace Buffer Extension enable.

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace Buffer Extension disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace Buffer Extension enabled by this control.</td>
</tr>
</tbody>
</table>

Regardless of the value of this bit, the Trace Buffer Extension is disabled when `SelfHostedTraceEnabled() == FALSE`. All output is discarded by the Trace Buffer Extension when it is disabled.

This field resets to 0.

**Accessing the TRBLIMITR_EL1**

The PE might ignore a direct write to TRBLIMITR_EL1, other than a direct write that modifies TRBLIMITR_EL1.E, if TRBLIMITR_EL1.E == 0b1.

Accesses to this register use the following encodings:
TRBLIMITR_EL1, Trace Buffer Limit Address Register

The TRBMAR_EL1 characteristics are:

**Purpose**

Controls Trace Buffer Extension accesses to memory.

If the trace buffer pointers specify virtual addresses, the address properties are defined by the translation tables and this register is ignored.

**Configuration**

This register is present only when TRBE is implemented. Otherwise, direct accesses to TRBMAR_EL1 are undefined.

**Attributes**

TRBMAR_EL1 is a 64-bit register.

**Field descriptions**

The TRBMAR_EL1 bit assignments are:

elsif PSTATE.EL == EL3 then
    TRBMAR_EL1 = X[t];
The TRBPTR_EL1 characteristics are:

**Purpose**

Defines the current write pointer for the trace buffer.

**Configuration**

This register is present only when TRBE is implemented. Otherwise, direct accesses to TRBPTR_EL1 are **UNDEFINED**.

**Attributes**

TRBPTR_EL1 is a 64-bit register.

**Field descriptions**

The TRBPTR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | PTR |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

**PTR, bits [63:0]**

Trace Buffer current write pointer address.

Defines the virtual address of the next entry to be written to the trace buffer.

The architecture places restrictions on the values that software can write to the pointer.

**Note**

As a result of the restrictions an implementation might treat some of PTR[M:0] as RES0, where M is defined by TRBIDR_EL1.Align.

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.

**Accessing the TRBPTR_EL1**

The PE might ignore a direct write to TRBPTR_EL1 if TRBLIMITR_EL1.E == 0b1.

Accesses to this register use the following encodings:

MRS <Xt>, TRBPTR_EL1

The TRBSR_EL1 characteristics are:

**Purpose**

Provides syndrome information to software for a trace buffer management event.

**Configuration**

This register is present only when TRBE is implemented. Otherwise, direct accesses to TRBSR_EL1 are **UNDEFINED**.

**Attributes**

TRBSR_EL1 is a 64-bit register.

**Field descriptions**

The TRBSR_EL1 bit assignments are:

```
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| EC | RES0 | IRQ | TRG | WRAP | RES0 | EA | S | RES0 | MSS |
```

**Bits [63:32]**

Reserved, RES0.

**EC, bits [31:26]**

Event class. Top-level description of the cause of the trace buffer management event.

<table>
<thead>
<tr>
<th>EC</th>
<th>Meaning</th>
<th>MSS</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b100100</td>
<td>Stage 1 Data Abort on write to trace buffer.</td>
<td>MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer</td>
</tr>
<tr>
<td>0b100101</td>
<td>Stage 2 Data Abort on write to trace buffer.</td>
<td>MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer</td>
</tr>
<tr>
<td>0b000000</td>
<td>Other trace buffer management event. All trace buffer management events other than those described by the other defined Event class codes.</td>
<td>MSS encoding for other trace buffer management events</td>
</tr>
</tbody>
</table>

All other values are reserved.

The following resets apply:

- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
- On a Warm reset, the value of this field is unchanged.
Bits [25:23]
   Reserved, RES0.

IRQ, bit [22]
   Maintenance interrupt status.

<table>
<thead>
<tr>
<th>IRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt is not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt is asserted.</td>
</tr>
</tbody>
</table>

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

TRG, bit [21]
   Triggered.

<table>
<thead>
<tr>
<th>TRG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Detected Trigger has been observed since this bit was last cleared to zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Detected Trigger has been observed since this bit was last cleared to zero.</td>
</tr>
</tbody>
</table>

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

WRAP, bit [20]
   Wrapped.

<table>
<thead>
<tr>
<th>WRAP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The current write pointer has not wrapped since this bit was last cleared to zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>The current write pointer has wrapped since this bit was last cleared to zero.</td>
</tr>
</tbody>
</table>

For each byte of trace the Trace Buffer Extension Accepts and writes to the trace buffer at the address in the current write pointer, if the current write pointer is equal to the Limit pointer minus one, the current write pointer is wrapped by setting it to the Base pointer, and this bit is set to 0b1.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

Bit [19]
   Reserved, RES0.

EA, bit [18]
   External Abort.
<table>
<thead>
<tr>
<th>EA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An External Abort has not been asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>An External Abort has been asserted and detected by the Trace Buffer Extension.</td>
</tr>
</tbody>
</table>

This bit is RES0 if the PE never sets this bit as the result of an External Abort.

The following resets apply:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

**S, bit [17]**

Stopped.

<table>
<thead>
<tr>
<th>S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Collection has not been stopped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Collection is stopped.</td>
</tr>
</tbody>
</table>

The following resets apply:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

**Bit [16]**

Reserved, RES0.

**MSS, bits [15:0]**

Management Event Specific Syndrome. Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

The following resets apply:
- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

**MSS encoding for other trace buffer management events**

<table>

**Bits [63:32]**

Reserved, RES0.

**TRG, bits [31:0]**

Trigger count.

Specifies the number of bytes of trace to capture following a Detected Trigger before a Trigger Event.

TRBTRG_EL1 decrements by 1 for every byte of trace written to the trace buffer when all of the following are true:

- TRBTRG_EL1 is nonzero.
- TRBSR_EL1.TRG is set to 0b1.

The architecture places restrictions on the values that software can write to the counter.

---

**Note**

As a result of the restrictions an implementation might treat some of TRG[M:0] as RES0, where M is defined by TRBIDR_EL1.Align.

---

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

**Accessing the TRBTRG_EL1**

The PE might ignore a direct write to TRBTRG_EL1 if TRBLIMITR_EL1.E == 0b1.
Accesses to this register use the following encodings:

TRCACATR<n>, Address Comparator Access Type Register <n>, n = 0 - 15

The TRCACATR<n> characteristics are:

**Purpose**

Defines the type of access for the corresponding TRCACVR<n> Register. This register configures the context type, Exception levels, alignment, masking that is applied by the Address Comparator, and how the Address Comparator behaves when it is one half of an Address Range Comparator.

**Configuration**

AArch64 System register TRCACATR<n> bits [63:0] are architecturally mapped to External register TRCACATR<n>[63:0].

This register is present only when ETE is implemented and TRCIDR4.NUMACPAIRS * 2 > n. Otherwise, direct accesses to TRCACATR<n> are UNDEFINED.

**Attributes**

TRCACATR<n> is a 64-bit register.

**Field descriptions**

The TRCACATR<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit Positions</th>
<th>Bit Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:15</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>14</td>
<td>EXLEVEL_NS_EL2, bit [14]</td>
</tr>
</tbody>
</table>

**EXLEVEL_NS_EL2, bit [14]**

When Non-secure EL2 is implemented:

Non-secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Non-secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Non-secure EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Non-secure EL2.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
EXLEVEL_NS_EL1, bit [13]
When Non-secure EL1 is implemented:

Non-secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Non-secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Non-secure EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Non-secure EL1.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL0, bit [12]
When Non-secure EL0 is implemented:

Non-secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Non-secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Non-secure EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Non-secure EL0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [11]
When EL3 is implemented:

Secure EL3 address comparison control. Controls whether a comparison can occur at EL3 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Secure EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Secure EL3.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [10]
When EL2 is implemented and ARMv8.4-SecEL2 is implemented:

Secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Secure state.
The Address Comparator performs comparisons in Secure EL2.

The Address Comparator does not perform comparisons in Secure EL2.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [9]

When Secure EL1 is implemented:

Secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Secure EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Secure EL1.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL0, bit [8]

When Secure EL0 is implemented:

Secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Secure EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Secure EL0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

CONTEXT, bits [6:4]

Selects a Context Identifier Comparator or Virtual Context Identifier Comparator:
The width of this field is dependent on the maximum number of Context Identifier Comparators or Virtual Context Identifier Comparators implemented. Unimplemented bits are RES0.

If TRCIDR4.NUMCIDC == 0b0000 and TRCIDR4.NUMVMIDC == 0b0000, then this field is RES0.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

### CONTEXTTYPE, bits [3:2]

Controls whether the Address Comparator is dependent on a Context Identifier Comparator, a Virtual Context Identifier Comparator, or both comparisons:

<table>
<thead>
<tr>
<th>CONTEXTTYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The Address Comparator is not dependent on the Context Identifier Comparators or Virtual Context Identifier Comparators.</td>
</tr>
<tr>
<td>0b01</td>
<td>The Address Comparator is dependent on the Context Identifier Comparator that the CONTEXT field specifies. If both the Context Identifier Comparator and the address comparison match, the Address Comparator signals a match.</td>
</tr>
<tr>
<td>0b10</td>
<td>The Address Comparator is dependent on the Virtual Context Identifier Comparator that the CONTEXT field specifies. If both the Virtual Context Identifier Comparator and the address comparison match, the Address Comparator signals a match.</td>
</tr>
<tr>
<td>0b11</td>
<td>The Address Comparator is dependent on the Context Identifier Comparator and Virtual Context Identifier Comparator that the CONTEXT field specifies. If the Context Identifier Comparator, the Virtual Context Identifier Comparator and address comparison all match, the Address Comparator signals a match.</td>
</tr>
</tbody>
</table>

If TRCIDR4.NUMCIDC == 0b0000, then bit [2] is RES0.

If TRCIDR4.NUMVMIDC == 0b0000, then bit [3] is RES0.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

### Bits [1:0]

Reserved, RES0.

### Accessing the TRCACATR<n>

Must be programmed if any of the following are true:

- TRCBBCTL.RANGE[n/2] == 0b1.
- TRCRSCTL<a>.GROUP == 0b0100 and TRCRSCTL<a>.SAC[n] == 0b1.
- TRCRSCTL<a>.GROUP == 0b0101 and TRCRSCTL<a>.ARC[n/2] == 0b1.
- TRCVIIEXCTLR.EXCLUDE[n/2] == 0b1.
- TRCVIIEXCTLR.INCLUDE[n/2] == 0b1.
- TRCVISSCTL.START[n] == 0b1.
- TRCVISSCTLR.STOP[n] == 0b1.
- TRCSSCCR<>.ARC[n/2] == 0b1.
- TRCSSCCR<>.SAC[n] == 0b1.
- TRCOCTLR.RANGE[n/2] == 0b1.
Writes are **CONSTRAINED** **UNPREDICTABLE** if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

TRCACVR<n>, Address Comparator Value Register <n>, n = 0 - 15

The TRCACVR<n> characteristics are:

**Purpose**

Contains the address value.

**Configuration**

AArch64 System register TRCACVR<n> bits [63:0] are architecturally mapped to External register TRCACVR<n>[63:0].

This register is present only when ETE is implemented and TRCIDR4.NUMACPAIRS * 2 > n. Otherwise, direct accesses to TRCACVR<n> are UNDEFINED.

**Attributes**

TRCACVR<n> is a 64-bit register.

**Field descriptions**

The TRCACVR<n> bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ADDRESS | ADDRESS |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

**ADDRESS, bits [63:0]**

Address Value.

The Address Comparators can support implementations that use multiple address widths. When the trace unit compares the ADDRESS field with an address that has a width less than this field, then the address must be zero-extended to the ADDRESS field width. The trace unit then compares all implemented bits. For example, in a system that supports both 32-bit and 64-bit addresses, when the PE is in AArch32 state the comparator must zero-extend the 32-bit address and compare against the full 64 bits that are stored in the TRCACVR<n>. This requires that the trace analyzer always programs all implemented bits of the TRCACVR<n>.

The result of writing a value other than all zeros or all ones to ADDRESS at bits[63:P] is an UNKNOWN value, where P is defined as the virtual address size supported by the PE.

The result of writing a value of all zeros or all ones to ADDRESS at bits[63:P] is the written value, and a read of the register returns the written value.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCACVR<n>**

Must be programmed if any of the following are true:

- TRCBBCTLR RANGE[n/2] == 0b1.
- TRCRSCCTRL<a>.GROUP == 0b0100 and TRCRSCTRL<a>.SAC[n] == 0b1.
- TRCRSCTRL<a>.GROUP == 0b0101 and TRCRSCTRL<a>.ARC[n/2] == 0b1.
- TRCVIIECTRL EXCLUDE[n/2] == 0b1.
- TRCVIIECTRL INCLUDE[n/2] == 0b1.
• TRCVISSCTRL START[n] == 0b1.
• TRCVISSCTRL STOP[n] == 0b1.
• TRCSSCCR<> .ARC[n/2] == 0b1.
• TRCSSCCR<> .SAC[n] == 0b1.
• TRCQCTLR .RANGE[n/2] == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

TRAUTHSTATUS, Authentication Status Register

The TRAUTHSTATUS characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

For additional information see the CoreSight Architecture Specification.

**Configuration**

AArch64 System register TRAUTHSTATUS bits [31:0] are architecturally mapped to External register TRAUTHSTATUS[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRAUTHSTATUS are UNDEFINED.

**Attributes**

TRAUTHSTATUS is a 64-bit register.

**Field descriptions**

The TRAUTHSTATUS bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | RES0 | SNID | SID | NSNID | NSID |

**Bits [63:8]**

Reserved, RES0.

**SNID, bits [7:6]**

Secure Non-invasive Debug. Indicates whether Secure non-invasive debug features are implemented and enabled.

<table>
<thead>
<tr>
<th>SNID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00b0</td>
<td>Secure non-invasive debug features not implemented.</td>
</tr>
<tr>
<td>01b0</td>
<td>Implemented and disabled.</td>
</tr>
<tr>
<td>01b1</td>
<td>Implemented and enabled.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When EL3 is implemented, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

When EL3 is not implemented and the PE is Non-secure, this field reads as 0b00.

When EL3 is not implemented and the PE is Secure, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

**SID, bits [5:4]**

Secure Invasive Debug. Indicates whether Secure invasive debug features are implemented and enabled.

</table>

All other values are reserved.

This field reads as 0b00.

**Accessing the TRCAUTHSTATUS**

For implementations that support multiple access mechanisms, different access mechanisms can return different values for reads of TRCAUTHSTATUS if the authentication signals have changed and that change has not yet been synchronized by a Context synchronization event. This scenario can happen if, for example, the external debugger view is implemented separately from the system instruction view to allow for separate power domains, and so observes changes on the signals differently.

Accesses to this register use the following encodings:

MRS <Xt>, TRCAUTHSTATUS

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

TRCAUXCTRLR, Auxillary Control Register

The TRCAUXCTRLR characteristics are:

**Purpose**

The function of this register is IMPLEMENTATION DEFINED.

**Configuration**

AArch64 System register TRCAUXCTRLR bits [31:0] are architecturally mapped to External register TRCAUXCTRLR[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCAUXCTRLR are UNDEFINED.

**Attributes**

TRCAUXCTRLR is a 64-bit register.

**Field descriptions**

The TRCAUXCTRLR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>31-0</td>
<td>IMPLEMENTATION DEFINED, bits [31:0]</td>
</tr>
</tbody>
</table>

- **Bits [63:32]**: Reserved, RES0.
- **IMPLEMENTATION DEFINED, bits [31:0]**: IMPLEMENTATION DEFINED. This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.
  - On a Trace unit reset, this field resets to 0.

**Accessing the TRCAUXCTRLR**

If this register is set to nonzero then it might cause the behavior of a trace unit to contradict this architecture specification. See the documentation of the specific implementation for information about the IMPLEMENTATION DEFINED support for this register.

Accesses to this register use the following encodings:

**MRS <Xt>, TRCAUXCTRLR**

**Bits [63:9]**

Reserved, RES0.

**MODE, bit [8]**

Mode.

<table>
<thead>
<tr>
<th>MODE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exclude Mode. Branch broadcasting is not active for instructions in the address ranges defined by RANGE. If RANGE == 0x00 then branch broadcasting is active for all instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Include Mode. Branch broadcasting is active for instructions in the address ranges defined by RANGE. If RANGE == 0x00 then the behavior of the trace unit is constrained unpredictable. That is, the trace unit might or might not consider any instructions to be in a branch broadcasting region.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**RANGE<0>, bit [0], for m = 0 to 7**

Address range field.

Selects which Address Range Comparators are in use with branch broadcasting.
<table>
<thead>
<tr>
<th>RANGE&lt;\m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The address range that Address Range Comparator m defines, is not selected.</td>
</tr>
<tr>
<td>0b1</td>
<td>The address range that Address Range Comparator m defines, is selected.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m \( \geq \) TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

## Accessing the TRCBBCTLR

Must be programmed if TRCCONFIGR.BB == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

**Bits [63:12]**

Reserved, RES0.

**THRESHOLD, bits [11:0]**

Sets the threshold value for instruction trace cycle counting.

The minimum threshold value that can be programmed into THRESHOLD is given in TRCIDR3.CCITMIN. If the THRESHOLD value is smaller than the value in TRCIDR3.CCITMIN then the behavior is **CONSTRAINED UNPREDICTABLE**. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

Writing a value of zero when TRCCONFIGR.CCI is set to enable instruction trace cycle counting, results in **CONSTRAINED UNPREDICTABLE** behavior. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the TRCCCCTLR**

Must be programmed if TRCCONFIGR.CCI == 0b1.

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

MRS <Xt>, TRCCCCTLR

TRCCIDCCTLR0, Context Identifier Comparator Control Register 0

The TRCCIDCCTLR0 characteristics are:

**Purpose**

Contains Context identifier mask values for the TRCCIDCVR<n> registers, for n = 0 to 3.

**Configuration**

AArch64 System register TRCCIDCCTLR0 bits [31:0] are architecturally mapped to External register TRCCIDCCTL0[31:0].

This register is present only when ETE is implemented, TRCIDR4.NUMCIDC > 0x0 and TRCIDR2.CIDSIZE > 0b00000. Otherwise, direct accesses to TRCCIDCCTL0 are UNDEFINED.

**Attributes**

TRCCIDCCTLR0 is a 64-bit register.

**Field descriptions**

The TRCCIDCCTLR0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| COMP3<m>, bit [m+24] | COMP2<m>, bit [m+16] | COMP1<m>, bit [m+8] | COMP0<m>, bit [m] | RES0 |

**Bits [63:32]**

Reserved, RES0.

**COMP3<m>, bit [m+24], for m = 0 to 7**

When TRCIDR4.NUMCIDC > 3:

TRCCIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR3. Each bit in this field corresponds to a byte in TRCCIDCVR3.

<table>
<thead>
<tr>
<th>COMP3&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR2.CIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**COMP2<m>, bit [m+16], for m = 0 to 7**
When TRCIDR4.NUMCIDC > 2:

TRCCIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR2. Each bit in this field corresponds to a byte in TRCCIDCVR2.

<table>
<thead>
<tr>
<th>COMP2&lt;\text{m}&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCCIDCVR2([m\times8+7):(m\times8)]</td>
</tr>
<tr>
<td></td>
<td>when it performs the Context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCCIDCVR2([m\times8+7):(m\times8)]</td>
</tr>
<tr>
<td></td>
<td>when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is res0 if \(m \geq \text{TRCIDR2}.\text{CIDSIZE}\).

On a Trace unit reset, this field resets to an architecturally unknown value.

Otherwise:

Reserved, res0.

COMP1<\text{m}>, bit \([m+8]\), for \(m = 0\) to 7

When TRCIDR4.NUMCIDC > 1:

TRCCIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR1. Each bit in this field corresponds to a byte in TRCCIDCVR1.

<table>
<thead>
<tr>
<th>COMP1&lt;\text{m}&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCCIDCVR1([m\times8+7):(m\times8)]</td>
</tr>
<tr>
<td></td>
<td>when it performs the Context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCCIDCVR1([m\times8+7):(m\times8)]</td>
</tr>
<tr>
<td></td>
<td>when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is res0 if \(m \geq \text{TRCIDR2}.\text{CIDSIZE}\).

On a Trace unit reset, this field resets to an architecturally unknown value.

Otherwise:

Reserved, res0.

COMP0<\text{m}>, bit \([m]\), for \(m = 0\) to 7

When TRCIDR4.NUMCIDC > 0:

TRCCIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR0. Each bit in this field corresponds to a byte in TRCCIDCVR0.

<table>
<thead>
<tr>
<th>COMP0&lt;\text{m}&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCCIDCVR0([m\times8+7):(m\times8)]</td>
</tr>
<tr>
<td></td>
<td>when it performs the Context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCCIDCVR0([m\times8+7):(m\times8)]</td>
</tr>
<tr>
<td></td>
<td>when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is res0 if \(m \geq \text{TRCIDR2}.\text{CIDSIZE}\).

On a Trace unit reset, this field resets to an architecturally unknown value.

Otherwise:

Reserved, res0.
Accessing the TRCCIDCCTRLR0

If software uses the TRCCIDCVR<n> registers, for n = 0 to 3, then it must program this register.

If software sets a mask bit to 0b1 then it must program the relevant byte in TRCCIDCVR<n> to 0x00.

If any bit is 0b1 and the relevant byte in TRCCIDCVR<n> is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINTED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINTED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

MRS <Xt>, TRCCIDCCTRLR0

TRCCIDCVR<n>, Context Identifier Comparator Value Registers <n>, n = 0 - 7

The TRCCIDCVR<n> characteristics are:

Purpose

Contains a Context identifier value.

Configuration

AArch64 System register TRCCIDCVR<n> bits [63:0] are architecturally mapped to External register TRCCIDCVR<n>[63:0].

This register is present only when ETE is implemented and TRCIDR4.NUMCIDC > n. Otherwise, direct accesses to TRCCIDCVR<n> are UNDEFINED.

Attributes

TRCCIDCVR<n> is a 64-bit register.

Field descriptions

The TRCCIDCVR<n> bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| VALUE | VALUE |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

VALUE, bits [63:0]

Context identifier value. The width of this field is indicated by TRCIDR2.CIDSIZE. Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Context identifier is zero until the PE updates the Context identifier.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCCIDCVR<n>

Must be programmed if any of the following are true:

- TRCRSCTRLR<a>.GROUP == 0b0110 and TRCRSCTRLR<a>.CID[n] == 0b1.
- TRCACATR<a>.CONTEXTTYPE == 0b01 or 0b11 and TRCACATR<a>.CONTEXT == n.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

The TRCCLAIMCLR characteristics are:

**Purpose**

In conjunction with TRCCLAIMSET, provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information see the CoreSight Architecture Specification.

**Configuration**

AArch64 System register TRCCLAIMCLR bits [31:0] are architecturally mapped to External register TRCCLAIMCLR[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCCLAIMCLR are **UNDEFINED**.

**Attributes**

TRCCLAIMCLR is a 64-bit register.

**Field descriptions**

The TRCCLAIMCLR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | CLR<m>, bit [m] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**Bits [63:32]**

Reserved, RES0.

**CLR<m>, bit [m], for m = 0 to 31**

Claim Tag Clear: Indicates the current status of the Claim Tag bit m, and is used to clear Claim Tag bit m to 0b0.

<table>
<thead>
<tr>
<th>CLR&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>On a read: Claim Tag bit m is not set.</td>
</tr>
<tr>
<td></td>
<td>On a write: Ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>On a read: Claim Tag bit m is set.</td>
</tr>
<tr>
<td></td>
<td>On a write: Clear Claim tag bit m to 0b0.</td>
</tr>
</tbody>
</table>

The number of Claim Tag bits implemented is indicated in TRCCLAIMSET.

On a Trace unit reset, this field resets to 0.

**Accessing the TRCCLAIMCLR**

  end
TRCCNTCTRL<n>, Counter Control Register <n>, n = 0 - 3

The TRCCNTCTRL<n> characteristics are:

Purpose

Controls the operation of Counter <n>.

Configuration

AArch64 System register TRCCNTCTRL<n> bits [31:0] are architecturally mapped to External register TRCCNTCTRL<n>[31:0].

This register is present only when ETE is implemented and TRCIDR5.NUMCNTR > n. Otherwise, direct accesses to TRCCNTCTRL<n> are UNDEFINED.

Attributes

TRCCNTCTRL<n> is a 64-bit register.

Field descriptions

The TRCCNTCTRL<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:18</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>17</td>
<td>CNTCHAIN, bit [17]</td>
</tr>
<tr>
<td>0b0</td>
<td>The Counter does not decrement when a reload event for Counter &lt;n-1&gt; occurs.</td>
</tr>
<tr>
<td>0b1</td>
<td>Counter &lt;n&gt; decrements when a reload event for Counter &lt;n-1&gt; occurs. This concatenates Counter &lt;n&gt; and Counter &lt;n-1&gt;, to provide a larger count value.</td>
</tr>
</tbody>
</table>

CNTCHAIN is not implemented for TRCCNTCTRL0 and TRCCNTCTRL2.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RLDSELF, bit [16]

Controls whether a reload event occurs for the Counter, when the Counter reaches zero.
### RLDEVENT_TYPE, bit [15]

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes a reload event for Counter <n>.

#### RLDEVENT_TYPE, Meaning

<table>
<thead>
<tr>
<th>RLDEVENT_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector. TRCCNTCTL&lt;n&gt;.RLDEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCCNTCTL&lt;n&gt;.RLDEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTL&lt;n&gt;.RLDEVENT.SEL[4] is RES0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

### Bits [14:13]

Reserved, RES0.

### RLDEVENT_SEL, bits [12:8]

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTL<n>.RLDEVENT.TYPE controls whether TRCCNTCTL<n>.RLDEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes a reload event for Counter <n>.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

### CNTEVENT_TYPE, bit [7]

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes Counter <n> to decrement.

#### CNTEVENT_TYPE, Meaning

<table>
<thead>
<tr>
<th>CNTEVENT_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector: TRCCNTCTL&lt;n&gt;.CNTEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors: TRCCNTCTL&lt;n&gt;.CNTEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTL&lt;n&gt;.CNTEVENT.SEL[4] is RES0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Bits [6:5]

Reserved, RES0.

CNEVENT_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTLR<n>.CNEVENT.TYPE controls whether TRCCNTCTLR<n>.CNEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes Counter <n> to decrement.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCCNTCTLR<n>

Must be programmed if TRCRSCTL<e>.GROUP == 0b0010 and TRCRSCTL<e>.COUNTERS[n] == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

The TRCCNTVR<n> characteristics are:

**Purpose**

This sets or returns the value of Counter <n>.

**Configuration**

AArch64 System register TRCCNTVR<n> bits [31:0] are architecturally mapped to External register TRCCNTVR<n>[31:0].

This register is present only when ETE is implemented and TRCIDR5.NUMCNTR > n. Otherwise, direct accesses to TRCCNTVR<n> are UNDEFINED.

**Attributes**

TRCCNTVR<n> is a 64-bit register.

**Field descriptions**

The TRCCNTVR<n> bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    | RES0 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [63:16]**

Reserved, RES0.

**VALUE, bits [15:0]**

Contains the count value of Counter.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCCNTVR<n>**

Must be programmed if TRCRSCTL<a>.GROUP == 0b0010 and TRCRSCTL<a>.COUNTERS[n] == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings:

```plaintext
MRS <Xt>, TRCCNTVR<n>
```

TRCDEVARCH, Device Architecture Register

The TRCDEVARCH characteristics are:

**Purpose**

Provides discovery information for the component.

For additional information see the CoreSight Architecture Specification.

**Configuration**

AArch64 System register TRCDEVARCH bits [31:0] are architecturally mapped to External register TRCDEVARCH[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCDEVARCH are UNDEFINED.

**Attributes**

TRCDEVARCH is a 64-bit register.

**Field descriptions**

The TRCDEVARCH bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>ARCHITECT</th>
<th>PRESENT</th>
<th>REVISION</th>
<th>ARCHVER</th>
<th>ARCHPART</th>
</tr>
</thead>
<tbody>
<tr>

TRCEVENTCTL1R, Event Control 1 Register

The TRCEVENTCTL1R characteristics are:

Purpose

Controls the behavior of the ETEEvents that TRCEVENTCTL0R selects.

Configuration

AArch64 System register TRCEVENTCTL1R bits [31:0] are architecturally mapped to External register TRCEVENTCTL1R[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCEVENTCTL1R are UNDEFINED.

Attributes

TRCEVENTCTL1R is a 64-bit register.

Field descriptions

The TRCEVENTCTL1R bit assignments are:

| 63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32 |
|-----------------------------------------------|-----------------------------------------------|
| Reserved, RES0                                | Reserved, RES0                                |

LPOVERRIDE, bit [12]

When TRCIDR5.LPOVERRIDE == 0b1:

Low-power Override Mode select.

<table>
<thead>
<tr>
<th>LPOVERRIDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace unit Low-power Override Mode is not enabled. That is, the trace unit is permitted to enter low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace unit Low-power Override Mode is enabled. That is, entry to a low-power state does not affect the trace unit resources or trace generation.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

ATB, bit [11]

When TRCIDR5.ATBTRIG == 0b1:

AMBA Trace Bus (ATB) trigger enable.
If a CoreSight ATB interface is implemented then when ETEEvent 0 occurs the trace unit sets:

- ATID == 0x7D.
- ATDATA to the value of TRCTRACEIDR.

If the width of ATDATA is greater than the width of TRCTRACEIDR.TRACEID then the trace unit zeros the upper ATDATA bits.

If ETEEvent 0 is programmed to occur based on program execution, such as an Address Comparator, the ATB trigger might not be inserted into the ATB stream at the same time as any trace generated by that program execution is output by the trace unit. Typically, the generated trace might be buffered in a trace unit which means that the ATB trigger would be output before the associated trace is output.

If ETEEvent 0 is asserted multiple times in close succession, the trace unit is required to generate an ATB trigger for the first assertion, but might ignore one or more of the subsequent assertions. Arm recommends that the window in which ETEEvent 0 is ignored is limited only by the time taken to output an ATB trigger.

<table>
<thead>
<tr>
<th>ATB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ATB trigger is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>ATB trigger is enabled.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

Bits [10:4]

Reserved, RES0.

**INSTEN<m>, bit [m], for m = 0 to 3**

Event element control.

<table>
<thead>
<tr>
<th>INSTEN&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit does not generate an Event element m.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit generates an Event element m.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= the number indicated by TRCIDR0.NUMEVENT.

**Accessing the TRCEVENTCTL1R**

Must be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

<table>

  else
    TRCEVENTCTL1R = X[t];
TRCEXTINSELR<n>, External Input Select Register <n>, n = 0 - 3

The TRCEXTINSELR<n> characteristics are:

**Purpose**

Use this to set, or read, which External Inputs are resources to the trace unit.

**Configuration**

AArch64 System register TRCEXTINSELR<n> bits [31:0] are architecturally mapped to External register TRCEXTINSELR<n>[31:0].

This register is present only when ETE is implemented and TRCIDR5.NUMEXTINSEL > n. Otherwise, direct accesses to TRCEXTINSELR<n> are **UNDEFINED**.

**Attributes**

TRCEXTINSELR<n> is a 64-bit register.

**Field descriptions**

The TRCEXTINSELR<n> bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | evtCount |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:16]**

Reserved, RES0.

**evtCount, bits [15:0]**

PMU event to select.

The event number as defined by the Arm ARM.

Software must program this field with a PMU event that is supported by the PE being programmed.

There are three ranges of PMU event numbers:

- PMU event numbers in the range 0x0000 to 0x003F are common architectural and microarchitectural events.
- PMU event numbers in the range 0x0040 to 0x00FF are Arm recommended common architectural and microarchitectural PMU events.
- PMU event numbers in the range 0x00C0 to 0x03FF are **IMPLEMENTATION DEFINED** PMU events.

If evtCount is programmed to a PMU event that is reserved or not supported by the PE, the behavior depends on the PMU event type:

- For the range 0x0000 to 0x003F, then the PMU event is not active, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For **IMPLEMENTATION DEFINED** PMU events, it is **UNPREDICTABLE** what PMU event, if any, is counted, and the value returned by a direct or external read of the evtCount field is **UNKNOWN**.

**UNPREDICTABLE** means the PMU event must not expose privileged information.
Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include a PMU event from a set of common implementation defined PMU events, then no PMU event is counted and the value read back on evtCount is the value written.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

### Accessing the TRCEXTINSELR<n>

Must be programmed if any of the following is true: TRCRSCTRLR<a>.GROUP == 0b0000 and TRCRSCTRLR<a>.EXTIN[n] == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

**MRS <Xt>, TRCEXTINSELR<n>**

</tbody>
</table>

**RES0**, bits [63:31]

Reserved, RES0.

**COMTRANS, bit [30]**

Transaction Start element behavior.

<table>
<thead>
<tr>
<th>COMMTRANS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Transaction Start elements are P0 elements.</td>
</tr>
<tr>
<td>0b1</td>
<td>Transaction Start elements are not P0 elements.</td>
</tr>
</tbody>
</table>

**COMMOPT, bit [29]**

Indicates the contents and encodings of Cycle count packets.

<table>
<thead>
<tr>
<th>COMMOPT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Commit mode 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Commit mode 1.</td>
</tr>
</tbody>
</table>

The Commit mode defines the contents and encodings of Cycle Count packets, in particular how Commit elements are indicated by these packets. See the descriptions of these packets for more details.

This bit reads-as-one if TRCIDR0.TRCCCI == 0b1 and TRCIDR8.MAXSPEC == 0x0. This bit reads-as-zero if TRCIDR0.TRCCCI == 0b0.

**TSSIZE, bits [28:24]**

Indicates that the trace unit implements Global timestamping and the size of the timestamp value.
TSSIZE | Meaning
--- | ---
0b00000 | Global timestamping not implemented.
0b01000 | Global timestamping implemented with a 64-bit timestamp value.

All other values are reserved.

This field reads as 0b01000.

**Bits [23:18]**

Reserved, RES0.

TRCEXDATA, bit [17]

When TRCIDR0.TRCDATA != 0b00:

Indicates if the trace unit implements tracing of data transfers for exceptions and exception returns. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

| TRCEXDATA | Meaning |
--- | --- |
0b0 | Tracing of data transfers for exceptions and exception returns not implemented. |
0b1 | Tracing of data transfers for exceptions and exception returns implemented. |

Otherwise:

Reserved, RES0.

**QSUPP, bits [16:15]**

Indicates that the trace unit implements Q element support.

| QSUPP | Meaning |
--- | --- |
0b00 | Q element support is not implemented. |
0b01 | Q element support is implemented, and only supports Q elements with instruction counts. |
0b10 | Q element support is implemented, and only supports Q elements without instruction counts. |
0b11 | Q element support is implemented, and supports:
  - Q elements with instruction counts.
  - Q elements without instruction counts. |

**QFILT, bit [14]**

Indicates if the trace unit implements Q element filtering.

| QFILT | Meaning |
--- | --- |
0b0 | Q element filtering is not implemented. |
0b1 | Q element filtering is implemented. |

If TRCIDR0.QSUPP == 0b00 then this field is 0b0.

**CONDTYPE, bits [13:12]**

When TRCIDR0.TRCCOND == 0b1:

Indicates how conditional instructions are traced. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.
CONDTYPE

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00 Conditional instructions are traced with an indication of whether they pass or fail their condition code check.</td>
</tr>
<tr>
<td>0b01 Conditional instructions are traced with an indication of the APSR condition flags.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Otherwise:**

Reserved, RES0.

**NUMEVENT, bits [11:10]**

When TRCIDR4.NUMRSPAIR == 0b0000:

Indicates the number of ETEEvents implemented.

<table>
<thead>
<tr>
<th>NUMEVENT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The trace unit supports 0 ETEEvents.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When TRCIDR4.NUMRSPAIR != 0b0000:

Indicates the number of ETEEvents implemented.

<table>
<thead>
<tr>
<th>NUMEVENT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The trace unit supports 1 ETEEvent.</td>
</tr>
<tr>
<td>0b01</td>
<td>The trace unit supports 2 ETEEvents.</td>
</tr>
<tr>
<td>0b10</td>
<td>The trace unit supports 3 ETEEvents.</td>
</tr>
<tr>
<td>0b11</td>
<td>The trace unit supports 4 ETEEvents.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

**RETSTACK, bit [9]**

Indicates if the trace unit supports the return stack.

<table>
<thead>
<tr>
<th>RETSTACK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Return stack not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Return stack implemented.</td>
</tr>
</tbody>
</table>

**Bit [8]**

Reserved, RES0.

**TRCCCI, bit [7]**

Indicates if the trace unit implements cycle counting.

<table>
<thead>
<tr>
<th>TRCCCI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting implemented.</td>
</tr>
</tbody>
</table>

This bit reads as 0b1.
TRCCOND, bit [6]

Indicates if the trace unit implements conditional instruction tracing. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures.

<table>
<thead>
<tr>
<th>TRCCOND</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Conditional instruction tracing not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Conditional instruction tracing implemented.</td>
</tr>
</tbody>
</table>

This bit reads as 0b0.

TRCBB, bit [5]

Indicates if the trace unit implements branch broadcasting.

<table>
<thead>
<tr>
<th>TRCBB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Branch broadcasting not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Branch broadcasting implemented.</td>
</tr>
</tbody>
</table>

This bit reads as 0b1.

TRCDATA, bits [4:3]

Indicates if the trace unit implements data tracing. Data tracing is not implemented in ETE and this field is reserved for other trace architectures.

<table>
<thead>
<tr>
<th>TRCDATA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Data tracing not implemented.</td>
</tr>
<tr>
<td>0b11</td>
<td>Data tracing implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b00.

INSTP0, bits [2:1]

Indicates if load and store instructions are P0 instructions. Load and store instructions as P0 instructions is not implemented in ETE and this field is reserved for other trace architectures.

<table>
<thead>
<tr>
<th>INSTP0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Load and store instructions are not P0 instructions.</td>
</tr>
<tr>
<td>0b11</td>
<td>Load and store instructions are P0 instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b00.

Bit [0]

Reserved, RES1.

</tbody>
</table>

Bits [63:32]

Reserved, RES0.

**DESIGNER, bits [31:24]**

Indicates which company designed the trace unit. The permitted values of this field are the same as MIDR_EL1 Implementer.

**Bits [23:16]**

Reserved, RES0.

**Bits [15:12]**

Reserved, RES1.

**TRCARCHMAJ, bits [11:8]**

Major architecture version.

<table>
<thead>
<tr>
<th>TRCARCHMAJ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>If both TRCARCHMAJ and TRCARCHMIN == 0xF then refer to TRCDEVARCH.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b1111.
**TRCARCHMIN, bits [7:4]**

Minor architecture version.

<table>
<thead>
<tr>
<th>TRCARCHMIN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>If both TRCARCHMAJ and TRCARCHMIN == 0xF then refer to TRCDEVARCH.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b1111.

**REVISION, bits [3:0]**

Implementation revision.

Returns an IMPLEMENTATION DEFINED value that identifies the revision of:

- The trace registers.
- The OS Lock registers.

Arm recommends that the initial implementation sets REVISION == 0x0 and the field then increments for any subsequent implementations. However, it is acceptable to omit some values or use another scheme to identify the revision number.

Arm recommends that TRCPIDR2.REVISION == TRCIDR1.REVISION. However, in situations where it is difficult to align these fields, such as with a metal layer fix then it is acceptable to change the REVISION fields independently.

**Accessing the TRCIDR1**

Accesses to this register use the following encodings:

```
MRS <Xt>, TRCIDR1
```

<table>
<thead>
<tr>

TRCIDR10, ID Register 10

The TRCIDR10 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

AArch64 System register TRCIDR10 bits [31:0] are architecturally mapped to External register TRCIDR10[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIDR10 are UNDEFINED.

Attributes

TRCIDR10 is a 64-bit register.

Field descriptions

The TRCIDR10 bit assignments are:

<table>
<thead>
<tr>
<th>Bit  (Hex)</th>
<th>Bit Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td>62</td>
<td>NUMP1KEY</td>
</tr>
</tbody>
</table>

Bits [63:32]

Reserved, RES0.

NUMP1KEY, bits [31:0]

When TRCIDR0.TRCDATA != 0b00:

Indicates the number of P1 right-hand keys. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

Otherwise:

Reserved, RES0.

Accessing the TRCIDR10

Accesses to this register use the following encodings:

</table>

All other values are reserved.

If the PE does not implement EL2 then this field is 0b00000.

If the PE implements EL2 then this field is 0b00100.

**CIDSIZE, bits [9:5]**

Indicates the Context identifier size.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>Context identifier tracing is not supported.</td>
</tr>
<tr>
<td>0b00100</td>
<td>32-bit Context identifier size.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b00100.

**IASIZE, bits [4:0]**

Virtual instruction address size.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00100</td>
<td>Maximum of 32-bit instruction address size.</td>
</tr>
<tr>
<td>0b10100</td>
<td>Maximum of 64-bit instruction address size.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b01000.

**Accessing the TRCIDR2**

Accesses to this register use the following encodings:

MRS <Xt>, TRCIDR2

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

        return TRCIDR2;
endelsif;
TRCIDR3, ID Register 3

The TRCIDR3 characteristics are:

**Purpose**

Returns the base architecture of the trace unit.

**Configuration**

AArch64 System register TRCIDR3 bits [31:0] are architecturally mapped to External register TRCIDR3[31:0]. This register is present only when ETE is implemented. Otherwise, direct accesses to TRCIDR3 are **UNDEFINED**.

**Attributes**

TRCIDR3 is a 64-bit register.

**Field descriptions**

The TRCIDR3 bit assignments are:

**Bits [63:32]**

Reserved, RES0.

**NOOVERFLOW, bit [31]**

Indicates if overflow prevention is implemented.

<table>
<thead>
<tr>
<th>NOOVERFLOW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Overflow prevention is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overflow prevention is implemented.</td>
</tr>
</tbody>
</table>

**NUMPROC[2:0], bits [30:28]**

This field is bits[2:0] of NUMPROC[4:0].

Indicates the number of PEs available for tracing.

<table>
<thead>
<tr>
<th>NUMPROC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>The trace unit can trace one PE.</td>
</tr>
</tbody>
</table>

This field reads as 0b00000.

The NUMPROC field is split as follows:

- NUMPROC[2:0] is TRCIDR3[30:28].
- NUMPROC[4:3] is TRCIDR3[13:12].
SYSSTALL, bit [27]
Indicates if stalling of the PE is permitted.

<table>
<thead>
<tr>
<th>SYSSTALL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stalling of the PE is not permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stalling of the PE is permitted.</td>
</tr>
</tbody>
</table>

The value of this field might be dynamic and change based on system conditions.

If TRCIDR3.STALLCTL == 0b0 then this field is 0b0.

STALLCTL, bit [26]
Indicates if trace unit implements stalling of the PE.

<table>
<thead>
<tr>
<th>STALLCTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stalling of the PE is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stalling of the PE is implemented.</td>
</tr>
</tbody>
</table>

SYNCPR, bit [25]
Indicates if an implementation has a fixed synchronization period.

<table>
<thead>
<tr>
<th>SYNCPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TRCSYNCPR is read-write so software can change the synchronization period.</td>
</tr>
<tr>
<td>0b1</td>
<td>TRCSYNCPR is read-only so the synchronization period is fixed.</td>
</tr>
</tbody>
</table>

This bit reads as 0b0.

TRCERR, bit [24]
Indicates forced tracing of System Error exceptions is implemented.

<table>
<thead>
<tr>
<th>TRCERR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Forced tracing of System Error exceptions is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Forced tracing of System Error exceptions is implemented.</td>
</tr>
</tbody>
</table>

This bit reads as 0b1.

Bit [23]
Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]
Indicates if Non-secure EL2 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL2 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL2 is implemented.</td>
</tr>
</tbody>
</table>

EXLEVEL_NS_EL1, bit [21]
Indicates if Non-secure EL1 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 is implemented.</td>
</tr>
</tbody>
</table>
EXLEVEL_NS_EL0, bit [20]
Indicates if Non-secure EL0 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL0 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL0 is implemented.</td>
</tr>
</tbody>
</table>

EXLEVEL_S_EL3, bit [19]
Indicates if Secure EL3 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure EL3 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure EL3 is implemented.</td>
</tr>
</tbody>
</table>

EXLEVEL_S_EL2, bit [18]
Indicates if Secure EL2 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure EL2 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure EL2 is implemented.</td>
</tr>
</tbody>
</table>

EXLEVEL_S_EL1, bit [17]
Indicates if Secure EL1 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure EL1 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure EL1 is implemented.</td>
</tr>
</tbody>
</table>

EXLEVEL_S_EL0, bit [16]
Indicates if Secure EL0 implemented.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure EL0 is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure EL0 is implemented.</td>
</tr>
</tbody>
</table>

Bits [15:14]
Reserved, RES0.

NUMPROC[4:3], bits [13:12]
This field is bits[4:3] of NUMPROC[4:0].
See NUMPROC[2:0] for the field description.

CCITMIN, bits [11:0]
Indicates the minimum value that can be programmed in TRCCCTL. See TRCCCTL. THRESHOLD.
If TRCIDR0.TRCCCI == 0b1 then the minimum value of this field is 0x001.
If TRCIDR0.TRCCCI == 0b0 then this field is zero.

Accessing the TRCIDR3
Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if CPACR_EL1.TTA == '1' then
    AArch64.SystemAccessTrap(EL1, 0x18);

</tr>
<tr>
<td>The implementation has eight PE Comparator Inputs.</td>
<td>0b1000</td>
</tr>
</tbody>
</table>

All other values are reserved.

### Bits [11:9]

Reserved, RES0.

### SUPPDAC, bit [8]

When TRCIDR4.NUMACPAIRS != 0b0000:

Indicates whether data address comparisons are implemented. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data address comparisons not implemented.</td>
<td>0b0</td>
</tr>
<tr>
<td>Data address comparisons implemented.</td>
<td>0b1</td>
</tr>
</tbody>
</table>

This bit reads as 0b0.

Otherwise:

Reserved, RES0.

### NUMDVC, bits [7:4]

Indicates the number of data value comparators. Data value comparators are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.
NUMDVC

<table>
<thead>
<tr>
<th>Meaning</th>

**Bits [63:31]**

Reserved, RES0.

**NUMCNTR, bits [30:28]**

Indicates the number of Counters that are available for tracing.

<table>
<thead>
<tr>
<th>NUMCNTR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>No Counters are available.</td>
</tr>
<tr>
<td>0b001</td>
<td>One Counter implemented.</td>
</tr>
<tr>
<td>0b010</td>
<td>Two Counters implemented.</td>
</tr>
<tr>
<td>0b011</td>
<td>Three Counters implemented.</td>
</tr>
<tr>
<td>0b100</td>
<td>Four Counters implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If TRCIDR4.NUMRSPAIR == 0b0000 then this field is 0b000.

**NUMSEQSTATE, bits [27:25]**

Indicates if the Sequencer is implemented and the number of Sequencer states that are implemented.

<table>
<thead>
<tr>
<th>NUMSEQSTATE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>The Sequencer is not implemented.</td>
</tr>
<tr>
<td>0b100</td>
<td>Four Sequencer states are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If TRCIDR4.NUMRSPAIR == 0b0000 then this field is 0b000.
Bit [24]
Reserved, RES0.

LPOVERRIDE, bit [23]
Indicates support for Low-power Override Mode.

<table>
<thead>
<tr>
<th>LPOVERRIDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit does not support Low-power Override Mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit supports Low-power Override Mode.</td>
</tr>
</tbody>
</table>

ATBTRIG, bit [22]
Indicates if the implementation can support ATB triggers.

<table>
<thead>
<tr>
<th>ATBTRIG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The implementation does not support ATB triggers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The implementation supports ATB triggers.</td>
</tr>
</tbody>
</table>

If TRCIDR4.NUMRSPAIR == 0b0000 then this field is 0b0.

TRACEIDSIZE, bits [21:16]
Indicates the trace ID width.

<table>
<thead>
<tr>
<th>TRACEIDSIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>The external trace interface is not implemented.</td>
</tr>
<tr>
<td>0b000111</td>
<td>The implementation supports a 7-bit trace ID.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Note that AMBA ATB requires a 7-bit trace ID width.

Bits [15:12]
Reserved, RES0.

NUMEXTINSEL, bits [11:9]
Indicates how many External Input Selector resources are implemented.

<table>
<thead>
<tr>
<th>NUMEXTINSEL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>No External Input Selector resources are available.</td>
</tr>
<tr>
<td>0b001</td>
<td>1 External Input Selector resource is available.</td>
</tr>
<tr>
<td>0b010</td>
<td>2 External Input Selector resources are available.</td>
</tr>
<tr>
<td>0b011</td>
<td>3 External Input Selector resources are available.</td>
</tr>
<tr>
<td>0b100</td>
<td>4 External Input Selector resources are available.</td>
</tr>
</tbody>
</table>

All other values are reserved.

NUMEXTIN, bits [8:0]
Indicates how many External Inputs are implemented.

<table>
<thead>
<tr>
<th>NUMEXTIN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11111111</td>
<td>Unified PMU event selection.</td>
</tr>
</tbody>
</table>

All other values are reserved.

TRCIMSPEC<n>, IMP DEF Register <n>, n = 1 - 7

The TRCIMSPEC<n> characteristics are:

**Purpose**

These registers might return information that is specific to an implementation, or enable features specific to an implementation to be programmed. The product Technical Reference Manual describes these registers.

**Configuration**

AArch64 System register TRCIMSPEC<n> bits [31:0] are architecturally mapped to External register TRCIMSPEC<n>[31:0].

This register is present only when the trace unit implements this OPTIONAL register and ETE is implemented. Otherwise, direct accesses to TRCIMSPEC<n> are UNDEFINED.

**Attributes**

TRCIMSPEC<n> is a 64-bit register.

**Field descriptions**

The TRCIMSPEC<n> bit assignments are:

TRCQCTRL, Q Element Control Register

The TRCQCTRL characteristics are:

Purpose

Controls when Q elements are enabled.

Configuration

AArch64 System register TRCQCTRL bits [31:0] are architecturally mapped to External register TRCQCTRL[31:0].

This register is present only when ETE is implemented and TRCIRQ0.QFILT == 0b1. Otherwise, direct accesses to TRCQCTRL are undefined.

Attributes

TRCQCTRL is a 64-bit register.

Field descriptions

The TRCQCTRL bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:9]</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>[8]</td>
<td>MODE, Selects when Q elements are enabled or disabled.</td>
</tr>
<tr>
<td>[0:7]</td>
<td>RANGE&lt;m&gt;, Specifies the Address Range Comparators to be used for controlling Q elements.</td>
</tr>
</tbody>
</table>

Bits [63:9]

Reserved, RES0.

MODE, bit [8]

Selects whether the Address Range Comparators selected by the RANGE field indicate address ranges where the trace unit is permitted to generate Q elements or address ranges where the trace unit is not permitted to generate Q elements:

<table>
<thead>
<tr>
<th>MODE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exclude mode. The Address Range Comparators selected by the RANGE field indicate address ranges where the trace unit must not generate Q elements. If no ranges are selected, Q elements are permitted across the entire memory map.</td>
</tr>
<tr>
<td>0b1</td>
<td>Include Mode. The Address Range Comparators selected by the RANGE field indicate address ranges where the trace unit can generate Q elements. If all the implemented bits in RANGE are set to 0b0 then Q elements are disabled.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RANGE<m>, bit [m], for m = 0 to 7

Specifies the Address Range Comparators to be used for controlling Q elements.
### TRCQCTLR, Q Element Control Register

<table>
<thead>
<tr>
<th>RANGE&lt;\text{m}&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The address range that Address Range Comparator m defines, is not selected.</td>
</tr>
<tr>
<td>0b1</td>
<td>The address range that Address Range Comparator m defines, is selected.</td>
</tr>
</tbody>
</table>

This bit is \text{RES}0 if m \geq \text{TRCIDR4.NUMACPAIRS}.

On a Trace unit reset, this field resets to an architecturally \text{UNKNOWN} value.

**Accessing the TRCQCTLR**

Must be programmed if \text{TRCCONFIGR.QE} \neq 0b00.

Writes are \text{CONSTRAINED UNPREDICTABLE} if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

**MRS <Xt>, TRCQCTLR**

<table>
<thead>
<tr>
<th>op0</th>

    endif
TRCRSCTRL<n>, Resource Selection Control Register <n>, n = 2 - 31

The TRCRSCTRL<n> characteristics are:

**Purpose**

Controls the selection of the resources in the trace unit.

**Configuration**

AArch64 System register TRCRSCTRL<n> bits [31:0] are architecturally mapped to External register TRCRSCTRL<n>[31:0].

This register is present only when ETE is implemented and ((AArch64-TRCIDR4.NUMRSPAIR + 1) * 2) > n. Otherwise, direct accesses to TRCRSCTRL<n> are **UNDEFINED**.

Resource selector 0 always returns FALSE.

Resource selector 1 always returns TRUE.

Resource selectors are implemented in pairs. Each odd numbered resource selector is part of a pair with the even numbered resource selector that is numbered as one less than it. For example, resource selectors 2 and 3 form a pair.

**Attributes**

TRCRSCTRL<n> is a 64-bit register.

**Field descriptions**

The TRCRSCTRL<n> bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| **RES0** | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**Bits [63:22]**

Reserved, RES0.

**PAIRINV, bit [21]**

For TRCRSCTRL<n>, where n is even, controls whether the combined result from a resource selector pair is inverted.

<table>
<thead>
<tr>
<th>PAIRINV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not invert the combined output of the 2 resource selectors.</td>
</tr>
<tr>
<td>0b1</td>
<td>Invert the combined output of the 2 resource selectors.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**INV, bit [20]**

Controls whether the resource, that GROUP and SELECT selects, is inverted.
INV

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>0b1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do not invert the output of this selector.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Invert the output of this selector.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If:

- A is the register TRCRSCTRL<m> where m is even.
- B is the register TRCRSCTRL<m+1>.

Then the combined output of the 2 resource selectors A and B depends on the value of (A.PAIRINV, A.INV, B.INV) as follows:

- 0b000 -> A and B.
- 0b001 -> RESERVED.
- 0b010 -> not(A) and B.
- 0b011 -> not(A) and not(B).
- 0b100 -> not(A) or not(B).
- 0b101 -> not(A) or B.
- 0b110 -> RESERVED.
- 0b111 -> A or B.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

GROUP, bits [19:16]

Selects a group of resources.

<table>
<thead>
<tr>
<th>GROUP</th>
<th>Meaning</th>
<th>SELECT</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>External Input Selectors.</td>

**Bits [63:16]**

Reserved, RES0.

**B_TYPE, bit [15]**

Chooses the type of Resource Selector.

Backward field. Defines whether the backward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state n+1 to state n. For example, if TRCSEQEVR2.B.SEL == 0x14 then when event 0x14 occurs, the Sequencer moves from state 3 to state 2.

<table>
<thead>
<tr>
<th>B_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector. TRCSEQEVR&lt;n&gt;.B.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCSEQEVR&lt;n&gt;.B.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR&lt;n&gt;.B.SEL[4] is RES0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Bits [14:13]
Reserved, RES0.

B_SEL, bits [12:8]
Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.B.TYPE controls whether TRCSEQEVR<n>.B.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Backward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

F_TYPE, bit [7]
Chooses the type of Resource Selector.

Backward field. Defines whether the forward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state n to state n+1. For example, if TRCSEQEVR1.F.SEL == 0x12 then when event 0x12 occurs, the Sequencer moves from state 1 to state 2.

<table>
<thead>
<tr>
<th>F_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector. TRCSEQEVR&lt;n&gt;.F.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCSEQEVR&lt;n&gt;.F.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR&lt;n&gt;.F.SEL[4] is RES0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]
Reserved, RES0.

F_SEL, bits [4:0]
Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.F.TYPE controls whether TRCSEQEVR<n>.F.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Forward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCSEQEVR<n>

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

**Bits [63:8]**

Reserved, RES0.

**RST_TYPE, bit [7]**

Chooses the type of Resource Selector.

<table>
<thead>
<tr>
<th>RST_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector. TRCSEQRSTEVR.RST.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCSEQRSTEVR.RST.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQRSTEVR.RST.SEL[4] is RES0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [6:5]**

Reserved, RES0.

**RST_SEL, bits [4:0]**

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQRSTEVR.RST.TYPE controls whether TRCSEQRSTEVR.RST_SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.
If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCSEQRSRTEVR**

Must be programmed if TRCRSCTRL<a>.GROUP == 0b0010 and TRCRSCTRL<a>.SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

MRS <Xt>, TRCSEQRSRTEVR

#### Bits [63:25]

Reserved, RES0.

#### RST, bit [24]

Selects the Single-shot Comparator Control mode.

<table>
<thead>
<tr>
<th>RST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Single-shot Comparator Control is in single-shot mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Single-shot Comparator Control is in multi-shot mode.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

#### ARC\(<m>\), bit [\(m+16\)], for \(m = 0\) to 7

Selects one or more Address Range Comparators for Single-shot control.

<table>
<thead>
<tr>
<th>ARC(&lt;m&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Range Comparator (m), is not selected for Single-shot control.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Range Comparator (m), is selected for Single-shot control.</td>
</tr>
</tbody>
</table>

This bit is RES0 if \(m >= \) TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.
SAC\(m\), bit \(m\), for \(m = 0 \text{ to } 15\)

Selects one or more Single Address Comparators for Single-shot control.

<table>
<thead>
<tr>
<th>SAC(m)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Single Address Comparator (m), is not selected for Single-shot control.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Single Address Comparator (m), is selected for Single-shot control.</td>
</tr>
</tbody>
</table>

This bit is \(\text{RES}_0\) if \(m \geq 2 \times \text{TRCIDR4.NUMACPAIRS}\).

On a Trace unit reset, this field resets to an architecturally \text{UNKNOWN} value.

**Accessing the TRCSSCCR\(n\)**

Must be programmed if any \text{TRCRSCTRL\(a\).GROUP} == 0b0011 and \text{TRCRSCTRL\(a\).SINGLE_SHOT}[n] == 0b1.

Writes are \text{CONSTRAINED UNPREDICTABLE} if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

<tbody>
<tr>
<td>0b0</td>
<td>No match has occurred. When the first match occurs, this field takes a value of 0b1. It remains at 0b1 until explicitly modified by a write to this register.</td>
</tr>
</tbody>
</table>
| 0b1    | One or more matches has occurred. If TRCSSCCR<n>.RST == 0b0 then:  
- There is only one match and no more matches are possible.  
- Software must reset this bit to 0b0 to re-enable the Single-shot Comparator Control. |

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**PENDING, bit [30]**

Single-shot pending status. The Single-shot Comparator Control fired while the resources were in the Paused state.
On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

### Bits [29:4]

Reserved, **RES0**.

### PC, bit [3]

PE Comparator Input support. Indicates if the Single-shot Comparator Control supports PE Comparator Inputs.

<table>
<thead>
<tr>
<th>PC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This Single-shot Comparator Control does not support PE Comparator Inputs. Selecting any PE Comparator Inputs using the associated TRCSSPCICR&lt;n&gt; results in <strong>CONSTRAINED UNPREDICTABLE</strong> behavior of the Single-shot Comparator Control resource. The Single-shot Comparator Control might match unexpectedly or might not match.</td>
</tr>
<tr>
<td>0b1</td>
<td>This Single-shot Comparator Control supports PE Comparator Inputs.</td>
</tr>
</tbody>
</table>

Access to this field is **RO**.

### DV, bit [2]

Data value comparator support. Data value comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>DV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This Single-shot Comparator Control does not support data value comparisons.</td>
</tr>
<tr>
<td>0b1</td>
<td>This Single-shot Comparator Control supports data value comparisons.</td>
</tr>
</tbody>
</table>

This bit reads as **0b0**.

Access to this field is **RO**.

### DA, bit [1]

Data Address Comparator support. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>DA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This Single-shot Comparator Control does not support data address comparisons.</td>
</tr>
<tr>
<td>0b1</td>
<td>This Single-shot Comparator Control supports data address comparisons.</td>
</tr>
</tbody>
</table>

This bit reads as **0b0**.

Access to this field is **RO**.

### INST, bit [0]

Instruction Address Comparator support. Indicates if the Single-shot Comparator Control supports instruction address comparisons.
<table>
<thead>
<tr>
<th>INST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This Single-shot Comparator Control does not support instruction address comparisons.</td>
</tr>
<tr>
<td>0b1</td>
<td>This Single-shot Comparator Control supports instruction address comparisons.</td>
</tr>
</tbody>
</table>

This bit reads as 0b1.

Access to this field is **RO**.

### Accessing the TRCSSCSR<n>

Must be programmed if TRCRSCTRL<a> GROUP == 0b0011 and TRCRSCTRL<a> SINGLE_SHOT[n] == 0b1.

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

Reads from this register might return an **UNKNOWN** value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings:

**MRS <Xt>, TRCSSCSR<n>**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

TRCSTALLCTRL, Stall Control Register

The TRCSTALLCTRL characteristics are:

**Purpose**

Enables trace unit functionality that prevents trace unit buffer overflows.

**Configuration**

AArch64 System register TRCSTALLCTRL bits [31:0] are architecturally mapped to External register TRCSTALLCTRL[31:0].

This register is present only when ETE is implemented and TRCIDR3.STALLCTL == 0b1. Otherwise, direct accesses to TRCSTALLCTRL are UNDEFINED.

**Attributes**

TRCSTALLCTRL is a 64-bit register.

**Field descriptions**

The TRCSTALLCTRL bit assignments are:

<table>
<thead>
<tr>
<th>Bit 63</th>
<th>Bit 62</th>
<th>Bit 61</th>
<th>Bit 60</th>
<th>Bit 59</th>
<th>Bit 58</th>

<td>21</td>
<td>20</td>
<td>19</td>
<td>18</td>
<td>17</td>
<td>16</td>
<td>15</td>
<td>14</td>
<td>Reserved, RES0.</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:14]**

Reserved, RES0.

**NOOVERFLOW, bit [13]**

*When TRCIDR3.NOOVERFLOW == 0b1:*

Trace overflow prevention.

<table>
<thead>
<tr>
<th>NOOVERFLOW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace unit buffer overflow prevention is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace unit buffer overflow prevention is enabled.</td>
</tr>
</tbody>
</table>

Note that enabling this feature might cause a significant performance impact.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [12:9]**

Reserved, RES0.
ISTALL, bit [8]

Instruction stall control. Controls if a trace unit can stall the PE when the trace buffer space is less than LEVEL.

<table>
<thead>
<tr>
<th>ISTALL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit must not stall the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit can stall the PE.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

LEVEL, bits [3:0]

Threshold level field. The field can support 16 monotonic levels from 0b0000 to 0b1111.

<table>
<thead>
<tr>
<th>LEVEL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Minimal invasion.</td>
</tr>
<tr>
<td></td>
<td>This setting has a greater risk of a trace unit buffer overflow.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Maximum invasion.</td>
</tr>
<tr>
<td></td>
<td>Reduced risk of a trace unit buffer overflow.</td>
</tr>
</tbody>
</table>

Note that for some implementations, invasion might occur at the minimal invasion level.

It is IMPLEMENTATION DEFINED whether some of the least significant bits are supported. Arm recommends that bits[3:2] are supported.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCSTALLCTRLR

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

MRS <Xt>, TRCSTALLCTRLR

TRCSYNCPR, Synchronization Period Register

The TRCSYNCPR characteristics are:

### Purpose

Controls how often trace protocol synchronization requests occur.

### Configuration

AArch64 System register TRCSYNCPR bits [31:0] are architecturally mapped to External register TRCSYNCPR[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCSYNCPR are UNDEFINED.

### Attributes

TRCSYNCPR is a 64-bit register.

### Field descriptions

The TRCSYNCPR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | Res0 | Peri0 |

Bits [63:5]

Reserved, Res0.

**PERIOD, bits [4:0]**

Defines the number of bytes of trace between each periodic trace protocol synchronization request.
## PERIOD

<table>
<thead>
<tr>
<th>PERIOD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>Trace protocol synchronization is disabled.</td>
</tr>
<tr>
<td>0b01000</td>
<td>Trace protocol synchronization request occurs after $2^8$ bytes of trace.</td>
</tr>
<tr>
<td>0b01001</td>
<td>Trace protocol synchronization request occurs after $2^9$ bytes of trace.</td>
</tr>
<tr>
<td>0b01010</td>
<td>Trace protocol synchronization request occurs after $2^{10}$ bytes of trace.</td>
</tr>
<tr>
<td>0b01011</td>
<td>Trace protocol synchronization request occurs after $2^{11}$ bytes of trace.</td>
</tr>
<tr>
<td>0b01100</td>
<td>Trace protocol synchronization request occurs after $2^{12}$ bytes of trace.</td>
</tr>
<tr>
<td>0b01101</td>
<td>Trace protocol synchronization request occurs after $2^{13}$ bytes of trace.</td>
</tr>
<tr>
<td>0b01110</td>
<td>Trace protocol synchronization request occurs after $2^{14}$ bytes of trace.</td>
</tr>
<tr>
<td>0b01111</td>
<td>Trace protocol synchronization request occurs after $2^{15}$ bytes of trace.</td>
</tr>
<tr>
<td>0b10000</td>
<td>Trace protocol synchronization request occurs after $2^{16}$ bytes of trace.</td>
</tr>
<tr>
<td>0b10001</td>
<td>Trace protocol synchronization request occurs after $2^{17}$ bytes of trace.</td>
</tr>
<tr>
<td>0b10010</td>
<td>Trace protocol synchronization request occurs after $2^{18}$ bytes of trace.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Trace protocol synchronization request occurs after $2^{19}$ bytes of trace.</td>
</tr>
<tr>
<td>0b10100</td>
<td>Trace protocol synchronization request occurs after $2^{20}$ bytes of trace.</td>
</tr>
</tbody>
</table>

Other values are reserved. If a reserved value is programmed into PERIOD, then the behavior of the synchronization period counter is constrained unpredictable and one of the following behaviors occurs:

- No trace protocol synchronization requests are generated by this counter.
- Trace protocol synchronization requests occur at the specified period.
- Trace protocol synchronization requests occur at some other unknown period which can vary.

On a Trace unit reset, this field resets to an architecturally unknown value.

### Accessing the TRCSYNCPR

Must be programmed if TRCIDR3.SYNCPR == 0b0.

Writes are constrained unpredictable if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

**MRS <Xt>, TRCSYNCPR**

<table>

TRCTRACEIDR, Trace ID Register

The TRCTRACEIDR characteristics are:

**Purpose**

Sets the trace ID for instruction trace.

**Configuration**

AArch64 System register TRCTRACEIDR bits [31:0] are architecturally mapped to External register TRCTRACEIDR[31:0].

This register is present only when ETE is implemented. Otherwise, direct accesses to TRCTRACEIDR are **UNDEFINED**.

**Attributes**

TRCTRACEIDR is a 64-bit register.

**Field descriptions**

The TRCTRACEIDR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | TRACEID |

**Bits [63:7]**

Reserved, RES0.

**TRACEID, bits [6:0]**

Trace ID field. Sets the trace ID value for instruction trace. The width of the field is indicated by the value of TRCIDR5.TRACEIDSIZE. Unimplemented bits are RES0.

If an implementation supports AMBA ATB, then:

- The width of the field is 7 bits.
- Writing a reserved trace ID value does not affect behavior of the trace unit but it might cause **UNPREDICTABLE** behavior of the trace capture infrastructure.

See the AMBA ATB Protocol Specification for information about which ATID values are reserved.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the TRCTRACEIDR**

Must be programmed if implemented.

 Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:
MRS <Xt>, TRCTRACEIDR

\[
\begin{array}{cccccc}

**Bits [63:8]**

Reserved, RES0.

**EVENT_TYPE, bit [7]**

When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

<table>
<thead>
<tr>
<th>EVENT_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>A single Resource Selector. TRCTSCTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCTSCTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCTSCTLR.EVENT.SEL[4] is RES0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.
Reserved, RES0.

**EVENT_SEL, bits [4:0]**

*When TRCIDR4.NUMRSPAIR != 0b0000:*

Defines the selected Resource Selector or pair of Resource Selectors. TRCTSCTRL.EVENT.TYPE controls whether TRCTSCTRL.EVENT_SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Accessing the TRCTSCTRL**

Must be programmed if TRCCONFIGR.TS == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

MRS <Xt>, TRCTSCTRL

</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL2 in Non-secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

EXLEVEL_NS_EL1, bit [21]

**When Non-secure EL1 is implemented:**

Filter instruction trace for EL1 in Non-secure state.
### EXLEVEL_NS_EL1, bit [20]

When Non-secure EL1 is implemented:

Filter instruction trace for EL1 in Non-secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL1 in Non-secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL1 in Non-secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### EXLEVEL_NS_EL0, bit [20]

When Non-secure EL0 is implemented:

Filter instruction trace for EL0 in Non-secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL0 in Non-secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL0 in Non-secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### EXLEVEL_S_EL3, bit [19]

When EL3 is implemented:

Filter instruction trace for EL3 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL3 in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL3 in Secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### EXLEVEL_S_EL2, bit [18]

When EL2 is implemented and ARMv8.4-SecEL2 is implemented:

Filter instruction trace for EL2 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL2 in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL2 in Secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

**EXLEVEL_S_EL1, bit [17]**

When Secure EL1 is implemented:

Filter instruction trace for EL1 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL1 in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL1 in Secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**EXLEVEL_S_EL0, bit [16]**

When Secure EL0 is implemented:

Filter instruction trace for EL0 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL0 in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL0 in Secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**Bits [15:12]**

Reserved, RES0.

**TRCERR, bit [11]**

When TRCIDR3.TRCCR == 0b1:

Controls the forced tracing of System Error exceptions.

<table>
<thead>
<tr>
<th>TRCERR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Forced tracing of System Error exceptions is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Forced tracing of System Error exceptions is enabled.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
**TRCRESET, bit [10]**

Controls the forced tracing of PE Resets.

<table>
<thead>
<tr>
<th>TRCRESET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Forced tracing of PE Resets is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Forced tracing of PE Resets is enabled.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**SSSTATUS, bit [9]**

ViewInst start/stop function status.

<table>
<thead>
<tr>
<th>SSSTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stopped State. The ViewInst start/stop function is in the stopped state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Started State. The ViewInst start/stop function is in the started state.</td>
</tr>
</tbody>
</table>

Before software enables the trace unit, it must write to this bit to set the initial state of the ViewInst start/stop function. If the ViewInst start/stop function is not used then set this bit to 0b1. Arm recommends that the value of this bit is set before each trace session begins.

If the trace unit becomes disabled while a start point or stop point is still speculative, then the value of TRCVICTLR.SSSTATUS is **UNKNOWN** and might represent the result of a speculative start point or stop point.

If software which is running on the PE being traced disables the trace unit, either by clearing TRCPBGCTRL.EN or locking the OS Lock, Arm recommends that a DSB and an ISB instruction are executed before disabling the trace unit to prevent any start points or stop points being speculative at the point of disabling the trace unit. This procedure assumes that all start points or stop points occur before the barrier instructions are executed. The procedure does not guarantee that there are no speculative start points or stop points when disabling, although it helps minimize the probability.

This bit is **RES** if TRCIDR4.NUMACPAIRS == 0b0000 and TRCIDR4.NUMPC == 0b0000.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [8]**

Reserved, **RES**0.

**EVENT_TYPE, bit [7]**

When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

<table>
<thead>
<tr>
<th>EVENT_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector. TRCVICTLR.EVENT_SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCVICTLR.EVENT_SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCVICTLR.EVENT_SEL[4] is <strong>RES</strong>0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES**0.
Bits [6:5]

Reserved, RES0.

EVENT_SEL, bits [4:0]

When TRCIDR4.NUMRSPAIR != 0b0000:

Defines the selected Resource Selector or pair of Resource Selectors. TRCVICTLR.EVENT.TYPE controls whether TRCVICTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

When TRCIDR4.NUMRSPAIR == 0b0000:

This field is reserved:

- Bits [4:1] are RES0.
- Bit [0] is RES1.

Otherwise:

Reserved, RES0.

Accessing the TRCVICTLR

Must be programmed.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings:

MRS <Xt>, TRCVICTLR

TRCVIIECTLR, ViewInst Include/Exclude Control Register

The TRCVIIECTLR characteristics are:

**Purpose**

Use this to select, or read, the Address Range Comparators for the ViewInst include/exclude function.

**Configuration**

AArch64 System register TRCVIIECTLR bits [31:0] are architecturally mapped to External register TRCVIIECTLR[31:0].

This register is present only when ETE is implemented and TRCIDR4.NUMACPAIRS > 0b0000. Otherwise, direct accesses to TRCVIIECTLR are UNDEFINED.

**Attributes**

TRCVIIECTLR is a 64-bit register.

**Field descriptions**

The TRCVIIECTLR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td>62</td>
<td>EXCLUDE&lt;(m)), bit ([m+16])</td>
</tr>
<tr>
<td>61</td>
<td>RES0</td>
</tr>
<tr>
<td>60</td>
<td>INCLUDE&lt;(m)&gt;, bit ([m])</td>
</tr>
<tr>
<td>59</td>
<td>RES0</td>
</tr>
<tr>
<td>...</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>
|     | **EXCLUDE<\(m\)>, bit \([m+16]\), for \(m = 0\) to 7** | Selects which Address Range Comparators are in use with the ViewInst exclude function. Each bit represents an Address Range Comparator, so bit[m] controls the selection of Address Range Comparator m.

<table>
<thead>
<tr>
<th>EXCLUDE&lt;(m)&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0)</td>
<td>The address range that Address Range Comparator m defines, is not selected for the ViewInst exclude function.</td>
</tr>
<tr>
<td>(0b1)</td>
<td>The address range that Address Range Comparator m defines, is selected for the ViewInst exclude function.</td>
</tr>
</tbody>
</table>

This bit is \(\text{RES0}\) if \(m \geq \text{TRCIDR4}.\text{NUMACPAIRS}\).

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [15:8]**

Reserved, RES0.
**INCLUDE< m >, bit [ m ], for m = 0 to 7**

Selects which Address Range Comparators are in use with the ViewInst include function.

Each bit represents an Address Range Comparator, so bit [ m ] controls the selection of Address Range Comparator m.

Selecting no comparators for the ViewInst include function indicates that all instructions are included by default.

The ViewInst exclude function then indicates which ranges are excluded.

<table>
<thead>
<tr>
<th>include&lt; m &gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The address range that Address Range Comparator m defines, is not selected for the ViewInst include function.</td>
</tr>
<tr>
<td>0b1</td>
<td>The address range that Address Range Comparator m defines, is selected for the ViewInst include function.</td>
</tr>
</tbody>
</table>

This bit is res0 if m >= TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

### Accessing the TRCVIIECTLR

Must be programmed if TRCIDR4.NUMACPAIRS > 0b0000.

 Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

TRCVISSCTLR, ViewInst Start/Stop Control Register

The TRCVISSCTLR characteristics are:

**Purpose**

Use this to select, or read, the Single Address Comparators for the ViewInst start/stop function.

**Configuration**

AArch64 System register TRCVISSCTLR bits [31:0] are architecturally mapped to External register TRCVISSCTLR[31:0].

This register is present only when ETE is implemented and TRCIDR4.NUMACPAIRS > 0b0000. Otherwise, direct accesses to TRCVISSCTLR are UNDEFINED.

**Attributes**

TRCVISSCTLR is a 64-bit register.

**Field descriptions**

The TRCVISSCTLR bit assignments are:

```
63  62  61  60  59  58  57  56  55  54  53  52  51  50  49  48  47  46  45  44  43  42  41  40  39  38  37  36  35  34  33  32
   RES0
```

**Bits [63:32]**

Reserved, RES0.

**STOP<m>, bit [m+16], for m = 0 to 15**

Selects which Single Address Comparators are in use with ViewInst start/stop function, for the purpose of stopping trace.

<table>
<thead>
<tr>
<th>STOP&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Single Address Comparator m, is not selected as a stop resource.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Single Address Comparator m, is selected as a stop resource.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= 2 x TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**START<m>, bit [m], for m = 0 to 15**

Selects which Single Address Comparators are in use with ViewInst start/stop function, for the purpose of starting trace.

<table>
<thead>
<tr>
<th>START&lt;m&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Single Address Comparator m, is not selected as a start resource.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Single Address Comparator m, is selected as a start resource.</td>
</tr>
</tbody>
</table>
TRCVISSCTRL, ViewInst Start/Stop Control Register

This bit is res0 if m >= 2 × TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCVISSCTRL

Must be programmed if TRCIDR4.NUMACPAIRS > 0b0000.

For any 2 comparators selected for the ViewInst start/stop function, the comparator containing the lower address must be a lower numbered comparator.

Writes are CONstrained UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

</tbody>
</table>

This bit is \texttt{RES0} if \(m \geq \text{T}R\text{CIDR}_2.\text{VMIDSIZE}\).

On a Trace unit reset, this field resets to an architecturally \texttt{UNKNOWN} value.
Otherwise:

Reserved, RES0.

# Accessing the TRCVMIDCCTLR0

If software uses the TRCVMIDCVR<n> registers, where n=0-3, then it must program this register.

If software sets a mask bit to 0b1 then it must program the relevant byte in TRCVMIDCVR<n> to 0x00.

If any bit is 0b1 and the relevant byte in TRCVMIDCVR<n> is not 0x00, the behavior of the Virtual Context Identifier Comparator is **CONSTRAINED UNPREDICTABLE**. In this scenario the comparator might match unexpectedly or might not match.

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10</td>
<td>0b001</td>
<td>0b0011</td>

</table>

This bit is RES0 if \(m \geq \text{TRCIDR2.VMIDSIZE}\).

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**Accessing the TRCVMIDCCTLR1**

If software uses the TRCVMIDCVR<n> registers, where n=4-7, then it must program this register.

If software sets a mask bit to 0b1 then it must program the relevant byte in TRCVMIDCVR<n> to 0x00.

If any bit is 0b1 and the relevant byte in TRCVMIDCVR<n> is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

The TRCVMIDCVR<\text{n}> characteristics are:

**Purpose**

Contains the Virtual Context Identifier Comparator value.

**Configuration**

AArch64 System register TRCVMIDCVR<\text{n}> bits [63:0] are architecturally mapped to External register TRCVMIDCVR<\text{n}>[63:0].

This register is present only when ETE is implemented and TRCIDR4.NUMVMIDC > n. Otherwise, direct accesses to TRCVMIDCVR<\text{n}> are UNDEFINED.

**Attributes**

TRCVMIDCVR<\text{n}> is a 64-bit register.

**Field descriptions**

The TRCVMIDCVR<\text{n}> bit assignments are:

|   | 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|   | VALUE | VALUE |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

**VALUE, bits [63:0]**

Virtual context identifier value. The width of this field is indicated by TRCIDR2.VMIDSIZE. Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Virtual context identifier is zero until the PE updates the Virtual context identifier.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCVMIDCVR<\text{n}>**

Must be programmed if any of the following are true:

- TRCRSCTRLR<\text{a}>, GROUP == 0b0111 and TRCRSCTRLR<\text{a}>, VMID[\text{n}] == 0b1.
- TRCACATR<\text{a}>, CONTEXTTYPE == 0b10 or 0b11 and TRCACATR<\text{a}>, CONTEXT == \text{n}.

</tbody>
</table>

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is implemented and TRFCR_EL2.TS != 0b00.

If ARMv8.6-ECV is implemented, and EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if any of the following are true:
• **CNTHCTL_EL2** ECV is 0.
• **SCR_EL3** ECVEn is 0.
• **HCR_EL2** \((E2H, TGE)\) is \(\{1, 1\}\).

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [4:2]**

Reserved, **RES0**.

**E1TRE, bit [1]**

EL1 Trace Enable.

<table>
<thead>
<tr>
<th>E1TRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace is prohibited at EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace is allowed at EL1.</td>
</tr>
</tbody>
</table>

This field is ignored if `SelfHostedTraceEnabled() == FALSE`.

On a Warm reset, this field resets to 0.

**E0TRE, bit [0]**

EL0 Trace Enable.

<table>
<thead>
<tr>
<th>E0TRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace is prohibited at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace is allowed at EL0.</td>
</tr>
</tbody>
</table>

This field is ignored if any of the following are true:

• `SelfHostedTraceEnabled() == FALSE`.
• EL2 is implemented and enabled in the current Security state and **HCR_EL2** \(TGE\) == 1.

On a Warm reset, this field resets to 0.

TTBR0_EL1, Translation Table Base Register 0 (EL1)

The TTBR0_EL1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL1&0 translation regime, and other information for this translation regime.

Configuration

AArch64 System register TTBR0_EL1 bits [63:0] are architecturally mapped to AArch32 System register TTBR0[63:0].

Attributes

TTBR0_EL1 is a 64-bit register.

Field descriptions

The TTBR0_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ASID | BADDR | CnP |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0. This field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes ARMv8.2-LPA, if the value of TCR_EL1.IPS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z>x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
In an implementation that includes ARMv8.2-TTCNP bit[0] of the stage 1 translation table base address is zero.

**Note**

In an implementation that includes ARMv8.2-LPA a TCR_EL1.IPS value of 0b110, that selects an IPA size of 52 bits, is permitted only when using the 64KB translation granule.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of TCR_EL1.IPS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of TCR_EL1.IPS is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

**Note**

This definition applies:

- To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include ARMv8.2-LPA.

If any TTBR0_EL1[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR0_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL1.T0SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

**CnP, bit [0]**

*When ARMv8.2-TTCNP is implemented:*

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0 | The translation table entries pointed to by TTBR0_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR0_EL1 for other PEs in the Inner Shareable domain. This is not affected by:  
  - The value of TTBR0_EL1.CnP on those other PEs.  
  - The value of the current ASID.  
  - If EL2 is implemented and enabled in the current Security state, the value of the current VMID. |
| 0b1 | The translation table entries pointed to by TTBR0_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1 and all of the following apply:  
  - The translation table entries are pointed to by TTBR0_EL1.  
  - The translation tables relate to the same translation regime.  
  - The ASID is the same as the current ASID.  
  - If EL2 is implemented and enabled in the current Security state, the value of the current VMID. |

This field is permitted to be cached in a TLB.
When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR0_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see ‘CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the TTBR0_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR0_EL1 or TTBR0_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

The TTBR0_EL2 characteristics are:

**Purpose**

When HCR_EL2.E2H is 0, holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

When HCR_EL2.E2H is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL2&0 translation regime, and other information for this translation regime.

**Configuration**

AArch64 System register TTBR0_EL2 bits [47:1] are architecturally mapped to AArch32 System register HTTBR[47:1].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

TTBR0_EL2 is a 64-bit register.

**Field descriptions**

The TTBR0_EL2 bit assignments are:

**ASID, bits [63:48]**

When ARMv8.1-VHE is implemented:

When HCR_EL2.E2H is 0, this field is RES0.

When HCR_EL2.E2H is 1, it holds an ASID for the translation table base address. The TCR_EL2.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**BADDR, bits [47:1]**

Translation table base address, A[47:x] or A[51:x], bits[47:1].

**Note**
Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.

A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes ARMv8.2-LPA, if the value of TCR_EL2.{1}PS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z>=x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes ARMv8.2-TTCNP bit[0] of the stage 1 translation table base address is zero.

Note

In an implementation that includes ARMv8.2-LPA:

- A TCR_EL2.{1}PS value of 0b110, that selects an OA size of 52 bits, is permitted only when using the 64KB translation granule.
- The OA size is specified by:
  - The value of TCR_EL2 PS when the value of HCR_EL2.E2H is 0.
  - The value of TCR_EL2 IPS when the value of HCR_EL2.E2H is 1.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of TCR_EL2.{1}PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of TCR_EL2.{1}PS is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

Note

This definition applies:

- To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include ARMv8.2-LPA.

If any TTBR0_EL2[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR0_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL2.TOSZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.
When ARMv8.2-TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0 | The translation table entries pointed to by TTBR0_EL2 for the current translation regime, and ASID if applicable, are permitted to differ from corresponding entries for TTBR0_EL2 for other PEs in the Inner Shareable domain. This is not affected by:  
  - The value of TTBR0_EL2.CnP on those other PEs.  
  - When the current translation regime is the EL2&0 regime, the value of the current ASID. |
| 0b1 | The translation table entries pointed to by TTBR0_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1 and all of the following apply:  
  - The translation table entries are pointed to by TTBR0_EL2.  
  - The translation tables relate to the same translation regime.  
  - If that translation regime is the EL2&0 regime, the ASID is the same as the current ASID. |

This field is permitted to be cached in a TLB.

**Note**

If the value of the TTBR0_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONTRAINED UNPREDICTABLE behaviors due to caching of control or data values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Accessing the TTBR0_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR0_EL2 or TTBR0_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

The TTBR0_EL3 characteristics are:

## Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL3 translation regime, and other information for this translation regime.

## Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to TTBR0_EL3 are UNDEFINED.

## Attributes

TTBR0_EL3 is a 64-bit register.

### Field descriptions

The TTBR0_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Bit Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-48</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>47-1</td>
<td>BADDR</td>
<td>Translation table base address, A[47:x] or A[51:x].</td>
</tr>
</tbody>
</table>

### Bits [63:48]

Reserved, RES0.

### BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x].

**Note**

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granularity.
- A translation table must be aligned to the size of the table, except that when using translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes ARMv8.2-LPA, if the value of TCR_EL3 PS is 0b110 then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z>x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes ARMv8.2-TTCNP bit[0] of the stage 1 translation table base address is zero.

**Note**
• In an implementation that includes ARMv8.2-LPA a TCR_EL3_P.S value of 0b110, that selects a PA size of 52 bits, is permitted only when using the 64KB translation granule.
• When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of TCR_EL3.P.S is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of TCR_EL3.P.S is not 0b110 then:
• Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
• Register bits[(x-1):1] are RES0.
• If the implementation supports 52-bit PAs and IPAs, then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

**Note**

This definition applies:
• To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
• To any implementation that does not include ARMv8.2-LPA.

If any TTBR0_EL3[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR0_EL3, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:
• Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
• The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL3.T0SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

**CnP, bit [0]**

*When ARMv8.2-TTCNP is implemented:*

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL3 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>

<tbody>
<tr>
<td>0b0</td>
<td>The translation table entries pointed to by TTBR0_EL3, for the current translation regime, are permitted to differ from corresponding entries for TTBR0_EL3 for other PEs in the Inner Shareable domain. This is not affected by the value of TTBR0_EL3.CnP on those other PEs.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>The translation table entries pointed to by TTBR0_EL3 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1 and the translation table entries are pointed to by TTBR0_EL3.</td>
<td></td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

**Note**

If the value of the TTBR0_EL3.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL3s do not point to the same translation table entries the results of translations using TTBR0_EL3 are CONSTRAINED UNPREDICTABLE, see ‘CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**TTBR1_EL1, Translation Table Base Register 1 (EL1)**

The TTBR1_EL1 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL1&0 stage 1 translation regime, and other information for this translation regime.

**Configuration**

AArch64 System register TTBR1_EL1 bits [63:0] are architecturally mapped to AArch32 System register TTBR1[63:0].

**Attributes**

TTBR1_EL1 is a 64-bit register.

**Field descriptions**

The TTBR1_EL1 bit assignments are:

<table>
<thead>
<tr>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**ASID, bits [63:48]**

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

This field resets to an architecturally UNKNOWN value.

**BADDR, bits [47:1]**

Translation table base address, A[47:x] or A[51:x], bits[47:1].

**Note**

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes ARMv8.2-LPA, if the value of TCR_EL1.IPS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z=x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
In an implementation that includes ARMv8.2-TTCNP bit[0] of the stage 1 translation table base address is zero.

**Note**
- In an implementation that includes ARMv8.2-LPA a TCR_EL1 IPS value of 0b110, that selects an IPA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of TCR_EL1 IPS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of TCR_EL1 IPS is not 0b110 then:
- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

**Note**
This definition applies:
- To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include ARMv8.2-LPA.

If any TTBR1_EL1[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR1_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:
- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL1.T1SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

**CnP, bit [0]**

*When ARMv8.2-TTCNP is implemented:*

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0 | The translation table entries pointed to by TTBR1_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR1_EL1 for other PEs in the Inner Shareable domain. This is not affected by:  
  - The value of TTBR1_EL1.CnP on those other PEs.  
  - The value of the current ASID.  
  - If EL2 is implemented and enabled in the current Security state, the value of the current VMID. |
| 0b1 | The translation table entries pointed to by TTBR1_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1 and all of the following apply:  
  - The translation table entries are pointed to by TTBR1_EL1.  
  - The translation tables relate to the same translation regime.  
  - The ASID is the same as the current ASID.  
  - If EL2 is implemented and enabled in the current Security state, the value of the current VMID. |

This field is permitted to be cached in a TLB.
When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

**Note**

If the value of the TTBR1_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see ‘CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values’ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

**Reserved:**

RES0.

**Accessing the TTBR1_EL1**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR1_EL1 or TTBR1_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

TTBR1_EL2, Translation Table Base Register 1 (EL2)

The TTBR1_EL2 characteristics are:

**Purpose**

When HCR_EL2.E2H is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL2&0 translation regime, and other information for this translation regime.

**Note**

When HCR_EL2.E2H is 0, the contents of this register are ignored by the PE, except for a direct read or write of the register.

**Configuration**

This register is present only when ARMv8.1-VHE is implemented. Otherwise, direct accesses to TTBR1_EL2 are **UNDEFINED**.

If EL2 is not implemented, this register is **RES0** from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

TTBR1_EL2 is a 64-bit register.

**Field descriptions**

The TTBR1_EL2 bit assignments are:

</table>

**ASID, bits [63:48]**

An ASID for the translation table base address. The TCR_EL2.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are **RES0**.

This field resets to an architecturally **UNKNOWN** value.

**BADDR, bits [47:1]**

Translation table base address, A[47:x] or A[51:x], bits[47:1].

**Note**

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.
In an implementation that includes ARMv8.2-LPA, if the value of TCR_EL2.IP is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z>x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes ARMv8.2-TTCNP bit[0] of the stage 1 translation table base address is zero.

**Note**

- In an implementation that includes ARMv8.2-LPA a TCR_EL2.IP value of 0b110, that selects an OA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of TCR_EL2.IP is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of TCR_EL2.IP is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

**Note**

This definition applies:

- To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include ARMv8.2-LPA.

If any TTBR1_EL2[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR1_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL2.T1SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

**CnP, bit [0]**

*When ARMv8.2-TTCNP is implemented:*

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1.
CnP | Meaning
---|---
0b0 | The translation table entries pointed to by TTBR1_EL2 for the current ASID are permitted to differ from corresponding entries for TTBR1_EL2 for other PEs in the Inner Shareable domain. This is not affected by:
  - The value of TTBR1_EL2.CnP on those other PEs.
  - The value of the current ASID.
0b1 | The translation table entries pointed to by TTBR1_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1 and all of the following apply:
  - The translation table entries are pointed to by TTBR1_EL2.
  - The ASID is the same as the current ASID.

This field is permitted to be cached in a TLB.

**Note**
- TTBR1_EL2 is accessible only when the value of HCR_EL2.E2H is 1, meaning the current translation regime is the EL2&0 regime.
- If the value of the TTBR1_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**
- Reserved, RES0.

**Accessing the TTBR1_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR1_EL2 or TTBR1_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**Bits [63:11]**

Vector Base Address. Base address of the exception vectors for exceptions taken to EL1.

If the implementation does not support ARMv8.2-LVA, then:

- If tagged addresses are being used, bits [55:48] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.

If the implementation supports ARMv8.2-LVA, then:

- If tagged addresses are being used, bits [55:52] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.

This field resets to an architecturally **UNKNOWN** value.

**Bits [10:0]**

Reserved, **RES0**.

**Accessing the VBAR_EL1**

When **HCR_EL2.E2H** is 1, without explicit synchronization, access from EL3 using the mnemonic VBAR_EL1 or VBAR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**Bits [63:11]**

Vector Base Address. Base address of the exception vectors for exceptions taken to EL3.

If the implementation does not support ARMv8.2-LVA, then:

- If tagged addresses are being used, bits [55:48] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

If the implementation supports ARMv8.2-LVA, then:

- If tagged addresses are being used, bits [55:52] of VBAR_EL3 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR_EL3 must be the same or else the use of the vector address will result in a recursive exception.

This field resets to an architecturally **UNKNOWN** value.

VDISR_EL2, Virtual Deferred Interrupt Status Register

The VDISR_EL2 characteristics are:

**Purpose**

Records that a virtual SError interrupt has been consumed by an ESB instruction executed at EL1.

An indirect write to VDISR_EL2 made by an ESB instruction does not require an explicit synchronization operation for the value written to be observed by a direct read of DISR_EL1 or DISR occurring in program order after the ESB instruction.

**Configuration**

AArch64 System register VDISR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VDISR[31:0].

This register is present only when RAS is implemented. Otherwise, direct accesses to VDISR_EL2 are **UNDEFINED**.

If EL2 is not implemented, this register is **RES0** from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VDISR_EL2 is a 64-bit register.

**Field descriptions**

The VDISR_EL2 bit assignments are:

**When EL1 is using AArch64:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

VMPIDR_EL2, Virtualization Multiprocessor ID Register

The VMPIDR_EL2 characteristics are:

**Purpose**

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by EL1 reads of `MPIDR_EL1`.

**Configuration**

AArch64 System register VMPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register `VMPIDR[31:0]`.

If EL2 is not implemented, reads of this register return the value of the `MPIDR_EL1` and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VMPIDR_EL2 is a 64-bit register.

**Field descriptions**

The VMPIDR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U | U |

**Bits [63:40]**

Reserved, RES0.

**Aff3, bits [39:32]**

Affinity level 3. See the description of VMPIDR_EL2.Aff0 for more information.

Aff3 is not supported in AArch32 state.

This field resets to an architecturally UNKNOWN value.

**Bit [31]**

Reserved, RES1.

**U, bit [30]**

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Processor is part of a multiprocessor system.</td>
</tr>
<tr>
<td>0b1</td>
<td>Processor is part of a uniprocessor system.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.
**Bits [29:25]**

Reserved, RES0.

**MT, bit [24]**

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of VMPIDR_EL2.Aff0 for more information about affinity levels.

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Performance of PEs at the lowest affinity level is largely independent.</td>
</tr>
<tr>
<td>0b1</td>
<td>Performance of PEs at the lowest affinity level is very interdependent.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

**Aff2, bits [23:16]**

Affinity level 2. See the description of VMPIDR_EL2.Aff0 for more information.

This field resets to an architecturally UNKNOWN value.

**Aff1, bits [15:8]**

Affinity level 1. See the description of VMPIDR_EL2.Aff0 for more information.

This field resets to an architecturally UNKNOWN value.

**Aff0, bits [7:0]**

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field resets to an architecturally UNKNOWN value.

**Accessing the VMPIDR_EL2**

Accesses to this register use the following encodings:

```

The VNCR_EL2 characteristics are:

**Purpose**

When ARMv8.4-NV is implemented, holds the base address that is used to define the memory location that is accessed by transformed reads and writes of System registers.

**Configuration**

This register is present only when ARMv8.4-NV is implemented. Otherwise, direct accesses to VNCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VNCR_EL2 is a 64-bit register.

**Field descriptions**

The VNCR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RESS | BADDR |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**RESS, bits [63:53]**

Reserved, Sign extended. If the bits marked as RESS do not all have the same value, then there is a CONSTRAINED UNPREDICTABLE choice between:

- Generating an EL2 translation regime Translation abort on use of the VNCR_EL2 register.
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes other than reading back the register.
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52] for all purposes other than reading back the register.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52].

Where the EL2 translation regime has upper and lower address ranges, bit[52] is used to select between those address ranges to determine if the address space supports more than 48 bits.

**BADDR, bits [52:12]**

Base Address. If the virtual address space for EL2 does not support more than 48 bits, then bits [52:49] are RESS.

When a register read/write is transformed to be a Load or Store, the address of the load/store is to SignOffset(VNCR_EL2.BADDR:Offset<11:0>, 64).

This field resets to an architecturally UNKNOWN value.

**Bits [11:0]**

Reserved, RES0.

VPIDR_EL2, Virtualization Processor ID Register

The VPIDR_EL2 characteristics are:

Purpose

Holds the value of the Virtualization Processor ID. This is the value returned by EL1 reads of \texttt{MIDR_EL1}.

Configuration

AArch64 System register VPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register \texttt{VPIDR[31:0]}.

If EL2 is not implemented, reads of this register return the value of the \texttt{MIDR_EL1}, and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VPIDR_EL2 is a 64-bit register.

Field descriptions

The VPIDR_EL2 bit assignments are:

\begin{tabular}{ccccccccccccc}
\hline
Implementer & Variant & Architecture & PartNum & Revision \\
\end{tabular}

Bits [63:32]

Reserved, RES0.

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

\begin{tabular}{lll}
Hex representation & ASCII representation & Implementer \\
0x41 & A & Arm Limited \\
0x42 & B & Broadcom Corporation \\
0x43 & C & Cavium Inc. \\
0x44 & D & Digital Equipment Corporation \\
0x49 & I & Infineon Technologies AG \\
0x40 & M & Motorola or Freescale Semiconductor Inc. \\
0x4E & N & NVIDIA Corporation \\
0x50 & P & Applied Micro Circuits Corporation \\
0x51 & Q & Qualcomm Inc. \\
0x56 & V & Marvell International Ltd. \\
0x69 & i & Intel Corporation \\
\end{tabular}

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

This field resets to an architecturally \texttt{UNKNOWN} value.
Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field resets to an architecturally UNKNOWN value.

Architecture, bits [19:16]

The permitted values of this field are:

<table>
<thead>
<tr>
<th>Architecture</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Armv4.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Armv4T.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Armv5 (obsolete).</td>
</tr>
<tr>
<td>0b0100</td>
<td>Armv5T.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Armv5TE.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Armv5TEJ.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv6.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Architectural features are individually identified in the ID_* registers, see 'ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K12.3.3.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field resets to an architecturally UNKNOWN value.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

This field resets to an architecturally UNKNOWN value.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

This field resets to an architecturally UNKNOWN value.

VSESR_EL2, Virtual SError Exception Syndrome Register

The VSESR_EL2 characteristics are:

**Purpose**

Provides the syndrome value reported to software on taking a virtual SError interrupt exception to EL1, or on executing an ESB instruction at EL1.

When the virtual SError interrupt is taken to EL1 using AArch64, then the syndrome value is reported in **ESR_EL1**.

When the virtual SError interrupt is taken to EL1 using AArch32, then the syndrome value is reported in **DFSR**. {AET, ExT} and the remainder of **DFSR** is set as defined by VMSAv8-32. For more information, see The AArch32 Virtual Memory System Architecture.

When the virtual SError interrupt is deferred by an ESB instruction, then the syndrome value is written to **VDISR_EL2**.

**Configuration**

AArch64 System register VSESR_EL2 bits [31:0] are architecturally mapped to AArch32 System register **VDFSR[31:0]**.

This register is present only when RAS is implemented. Otherwise, direct accesses to VSESR_EL2 are **UNDEFINED**.

If EL2 is not implemented, this register is **RES0** from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VSESR_EL2 is a 64-bit register.

**Field descriptions**

The VSESR_EL2 bit assignments are:

**When EL1 is using AArch32:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | AET | RES0[ExT] | RES0 |

Bits [63:16]

Reserved, **RES0**.

AET, bits [15:14]

When a virtual SError interrupt is taken to EL1 using AArch32, **DFSR[15:4]** is set to VSESR_EL2.AET.

When a virtual SError interrupt is deferred by an ESB instruction, **VDISR_EL2[15:4]** is set to VSESR_EL2.AET.

This field resets to an architecturally **UNKNOWN** value.
Bit [13]

Reserved, RES0.

ExT, bit [12]

When a virtual SError interrupt is taken to EL1 using AArch32, DFSR[12] is set to VSESR_EL2.ExT.

When a virtual SError interrupt is deferred by an ESB instruction, VDISR_EL2[12] is set to VSESR_EL2.ExT.

This field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

When EL1 is using AArch64:

Bits [63:25]

Reserved, RES0.

IDS, bit [24]

When a virtual SError interrupt is taken to EL1 using AArch64, ESR_EL1[24] is set to VSESR_EL2.IDS.

When a virtual SError interrupt is deferred by an ESB instruction, VDISR_EL2[24] is set to VSESR_EL2.IDS.

This field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

When a virtual SError interrupt is taken to EL1 using AArch64, ESR_EL1[23:0] is set to VSESR_EL2.ISS.

When a virtual SError interrupt is deferred by an ESB instruction, VDISR_EL2[23:0] is set to VSESR_EL2.ISS.

This field resets to an architecturally UNKNOWN value.

If ARMv8.5-GTG is implemented, **ID_AA64MMFR0_EL1**.\{TGran4_2, TGran16_2, TGran64_2\} indicate which granule sizes are supported for Level 2 translation.

If ARMv8.5-GTG is not implemented, **ID_AA64MMFR0_EL1**.\{TGran4, TGran16, TGran64\} indicate which granule sizes are supported.

If the value is programmed to either a reserved value, or a size that has not been implemented, then for all purposes other than read back from this register, the hardware will treat the field as if it has been programmed to an **IMPLEMENTATION DEFINED** choice of the sizes that has been implemented.

It is **IMPLEMENTATION DEFINED** whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally **UNKNOWN** value.

Bits [13:8]

Reserved, **RES0**.

SL0, bits [7:6]

When ARMv8.4-TTST is implemented:

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR_EL2. The meaning of this field depends on the value of VSTCR_EL2.TG0.

<table>
<thead>
<tr>
<th>SL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.</td>
</tr>
<tr>
<td>0b01</td>
<td>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.</td>
</tr>
<tr>
<td>0b10</td>
<td>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.</td>
</tr>
<tr>
<td>0b11</td>
<td>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 3.</td>
</tr>
</tbody>
</table>
All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VSTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR_EL2. The meaning of this field depends on the value of VSTCR_EL2.TG0.

<table>
<thead>
<tr>
<th>SL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.</td>
</tr>
<tr>
<td>0b01</td>
<td>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.</td>
</tr>
<tr>
<td>0b10</td>
<td>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.</td>
</tr>
</tbody>
</table>

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VSTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally **UNKNOWN** value.

**T0SZ, bits [5:0]**

The size offset of the memory region addressed by VSTTBR_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for this field depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

If this field is programmed to a value that is not consistent with the programming of SL0, then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the VSTCR_EL2**

Accesses to this register use the following encodings:

\[
\text{MRS <Xt>, VSTCR_EL2}
\]

VSTTBR_EL2, Virtualization Secure Translation Table Base Register

The VSTTBR_EL2 characteristics are:

**Purpose**

The base register for stage 2 of the Secure EL1&0 translation regime. Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Secure EL1&0 translation regime, and other information for this translation stage.

**Configuration**

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to VSTTBR_EL2 are UNDEFINED. This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VSTTBR_EL2 is a 64-bit register.

**Field descriptions**

The VSTTBR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | BADDR |

Any of the bits in VSTTBR_EL2 are permitted to be cached in a TLB.

**Bits [63:48]**

Reserved, RES0.

**BADDR, bits [47:1]**

Translation table base address, A[47:x] or A[51:x].

**Note**

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granularity.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

If the value of VTCR_EL2 PS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If \( x \geq 6 \) then \( z = x \).
  - Otherwise, \( z = 6 \).
- When \( z > x \) register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
When \( x > 6 \) register bits\([(x-1):6]\) are \( \text{RES0} \).
Register bit[1] is \( \text{RES0} \).
Bits[5:2] of the stage 1 translation table base address are zero.

**Note**

When the value of \text{ID\_AA64MMFR0\_EL1}.\text{PARange} indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of \text{VTCHR\_EL2}.\text{PS} is \( 0b110 \) and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of \text{VTCHR\_EL2}.\text{PS} is not \( 0b110 \) then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are \( \text{RES0} \).
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are \( 0b0000 \).

If any VSTTBR_EL2[47:1] bit that is defined as \( \text{RES0} \) has the value 1 when a translation table walk is performed using VSTTBR_EL2, then the translation table base address might be misaligned, with effects that are \text{CONSTRAINED UNPREDICTABLE}, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how \( x \) is calculated based on the value of VSTCR_EL2.TOSZ, the stage of translation, and the translation granule size.

This field resets to an architecturally \text{UNKNOWN} value.

**CnP, bit [0]**

Common not Private, for stage 2 of the Secure EL1&0 translation regime. In an implementation that includes ARMv8.2-TTCNP, indicates whether each entry that is pointed to by VSTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>( 0b0 )</td>
<td>The translation table entries pointed to by VSTTBR_EL2 are permitted to differ from the entries for VSTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.</td>
</tr>
<tr>
<td>( 0b1 )</td>
<td>The translation table entries pointed to by VSTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.</td>
</tr>
</tbody>
</table>

**Note**

If the value of VSTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VSTTBR_EL2s do not point to the same translation table entries when using the current VMID, then the results of translations using VSTTBR_EL2 are \text{CONSTRAINED UNPREDICTABLE}, see \text{CONSTRAINED UNPREDICTABLE} behaviors due to caching of control or data values on page K1-6254.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally \text{UNKNOWN}.

This field resets to an architecturally \text{UNKNOWN} value.

**Accessing the VSTTBR_EL2**

Accesses to this register use the following encodings:

  else
    VSTTBR_EL2 = X[t];
  end
endif
**VTCR_EL2, Virtualization Translation Control Register**

The VTCR_EL2 characteristics are:

**Purpose**

The control register for stage 2 of the EL1&0 translation regime.

**Configuration**

AArch64 System register VTCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VTCR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VTCR_EL2 is a 64-bit register.

**Field descriptions**

The VTCR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>
<td>Reserved, RES1</td>
</tr>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td>Non-secure stage 2 translation output address space.</td>
</tr>
</tbody>
</table>

Any of the bits in VTCR_EL2 are permitted to be cached in a TLB.

**Bits [63:32]**

Reserved, RES0.

**Bit [31]**

Reserved, RES1.

**NSA, bit [30]**

*When ARMv8.4-SecEL2 is implemented:*

Non-secure stage 2 translation output address space.

<table>
<thead>
<tr>
<th>NSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All stage 2 translations for the Non-secure IPA space of the Secure EL1&amp;0 translation regime access the Secure PA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>All stage 2 translations for the Non-secure IPA space of the Secure EL1&amp;0 translation regime access the Non-secure PA space.</td>
</tr>
</tbody>
</table>

This bit behaves as 1 for all purposes other than reading back the value of the bit when one of the following is true:

- The PE is executing in Non-secure state.
- The value of VTCR_EL2.NSW is 1.
- The value of VSTCR_EL2.SA is 1.

This field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**NSW, bit [29]**

*When ARMv8.4-SecEL2 is implemented:*

Non-secure stage 2 translation table address space.

<table>
<thead>
<tr>
<th>NSW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All stage 2 translation table walks for the Non-secure IPA space</td>

<tr>
<td>0b1</td>
<td>Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [24:23]**

Reserved, RES0.

**HD, bit [22]**

*When ARMv8.1-TTHM is implemented:*

Hardware management of dirty state in stage 2 translations when EL2 is enabled in the current Security state.

<table>
<thead>
<tr>
<th>HD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 2 hardware management of dirty state disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 2 hardware management of dirty state enabled, only if the VTCR_EL2.HA bit is also set to 1.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**HA, bit [21]**

_When ARMv8.1-TTHM is implemented:_

Hardware Access flag update in Non-secure and Secure stage 2 translations when EL2 is enabled in the current Security state.

<table>
<thead>
<tr>
<th>HA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 2 Access flag update disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 2 Access flag update enabled.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

**Bit [20]**

Reserved, RES0.

**VS, bit [19]**

_When ARMv8.1-VMID16 is implemented:_

VMID Size.

<table>
<thead>
<tr>
<th>VS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>8 bit - the upper 8 bits of VTTBR_EL2 and VSTTBR_EL2 are ignored by the hardware, and treated as if they are all zeros, for every purpose except when reading back the register.</td>
</tr>
<tr>
<td>0b1</td>
<td>16 bit - the upper 8 bits of VTTBR_EL2 and VSTTBR_EL2 are used for allocation and matching in the TLB.</td>
</tr>
</tbody>
</table>

If the implementation only supports an 8-bit VMID, this field is RES0.

This field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**PS, bits [18:16]**

Physical address Size for the Second Stage of translation.

<table>
<thead>
<tr>
<th>PS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>32 bits, 4GB.</td>
</tr>
<tr>
<td>0b001</td>
<td>36 bits, 64GB.</td>
</tr>
<tr>
<td>0b010</td>
<td>40 bits, 1TB.</td>
</tr>
<tr>
<td>0b011</td>
<td>42 bits, 4TB.</td>
</tr>
<tr>
<td>0b100</td>
<td>44 bits, 16TB.</td>
</tr>
<tr>
<td>0b101</td>
<td>48 bits, 256TB.</td>
</tr>
<tr>
<td>0b110</td>
<td>52 bits, 4PB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.
The value \texttt{0b110} is permitted only if ARMv8.2-LPA is implemented and the translation granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not \texttt{0b110} or a value treated as \texttt{0b110}, then bits[51:48] of every translation table base address for the stage of translation controlled by VTCR_EL2 are \texttt{0b0000}.

This field resets to an architecturally \textit{UNKNOWN} value.

\textbf{TG0, bits [15:14]}

Granule size for the \texttt{VTTBR_EL2}.

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If ARMv8.5-GTG is implemented, \texttt{ID_AA64MMFR0_EL1}.\{TGran4_2, TGran16_2, TGran64_2\} indicate which granule sizes are supported for Level 2 translation.

If ARMv8.5-GTG is not implemented, \texttt{ID_AA64MMFR0_EL1}.\{TGran4, TGran16, TGran64\} indicate which granule sizes are supported.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an \textit{IMPLEMENTATION DEFINED} choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is \textit{IMPLEMENTATION DEFINED} whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally \textit{UNKNOWN} value.

\textbf{SH0, bits [13:12]}

Shareability attribute for memory associated with translation table walks using \texttt{VTTBR_EL2} or \texttt{VSTTBR_EL2}.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is \textit{CONSTRAINED UNPREDICTABLE}, as described in 'Reserved values in AArch64 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.2.2.

This field resets to an architecturally \textit{UNKNOWN} value.

\textbf{ORGN0, bits [11:10]}

Outer cacheability attribute for memory associated with translation table walks using \texttt{VTTBR_EL2} or \texttt{VSTTBR_EL2}.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally \textit{UNKNOWN} value.

\textbf{IRGN0, bits [9:8]}

Inner cacheability attribute for memory associated with translation table walks using \texttt{VTTBR_EL2} or \texttt{VSTTBR_EL2}.
**IRGN0**

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>Allocate Cacheable.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally **UNKNOWN** value.

**SL0, bits [7:6]**

*When ARMv8.4-TTST is implemented:*

Starting level of the Secure stage 2 translation lookup, controlled by VTCR_EL2. The meaning of this field depends on the value of VTCR_EL2.TG0.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00  If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If</td>
</tr>
<tr>
<td>VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at 3.</td>
</tr>
<tr>
<td>0b01  If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If</td>
</tr>
<tr>
<td>VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at 2.</td>
</tr>
<tr>
<td>0b10  If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If</td>
</tr>
<tr>
<td>VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at 1.</td>
</tr>
<tr>
<td>0b11  If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 3.</td>
</tr>
</tbody>
</table>

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Starting level of the Secure stage 2 translation lookup, controlled by VTCR_EL2. The meaning of this field depends on the value of VTCR_EL2.TG0.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00  If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If</td>
</tr>
<tr>
<td>VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at 3.</td>
</tr>
<tr>
<td>0b01  If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If</td>
</tr>
<tr>
<td>VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at 2.</td>
</tr>
<tr>
<td>0b10  If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If</td>
</tr>
<tr>
<td>VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at 1.</td>
</tr>
</tbody>
</table>

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally **UNKNOWN** value.

**T0SZ, bits [5:0]**

The size offset of the memory region addressed by **VTTBR_EL2**. The region size is \(2^{(64-T0SZ)}\) bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

If this field is programmed to a value that is not consistent with the programming of SL0 then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally **UNKNOWN** value.
Accessing the VTCR_EL2

Any of the bits in VTCR_EL2 are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

VTCR_EL2, Virtualization Translation Control Register
VTTBR_EL2, Virtualization Translation Table Base Register

The VTTBR_EL2 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the EL1&0 translation regime, and other information for this translation regime.

**Configuration**

AArch64 System register VTTBR_EL2 bits [63:0] are architecturally mapped to AArch32 System register VTTBR[63:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VTTBR_EL2 is a 64-bit register.

**Field descriptions**

The VTTBR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>No.</th>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>VMID[15:8]</td>
<td>VMID for the translation table. If EL2 is using AArch32, or if the implementation has an 8-bit VMID, this field is RES0. This field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>56</td>
<td>VMID[7:0]</td>
<td>VMID for the translation table. If EL2 is using AArch32, or if the implementation has an 8-bit VMID, this field is RES0. This field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>48</td>
<td>BADDR</td>
<td>Base address of the translation table for the initial lookup for stage 2 of an address translation in the EL1&amp;0 translation regime, and other information for this translation regime.</td>
</tr>
</tbody>
</table>

**VMID[15:8], bits [63:56]**

When ARMv8.1-VMID16 is implemented and VTCR_EL2.VS == 1:

Extension to VMID[7:0]. See VTTBR_EL2.VMID[7:0] for more details.

If EL2 is using AArch32, or if the implementation has an 8-bit VMID, this field is RES0.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**VMID[7:0], bits [55:48]**

The VMID for the translation table.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- The VTCR_EL2.VS is 0.
- ARMv8.1-VMID16 is not implemented.

This field resets to an architecturally UNKNOWN value.
BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

**Note**
- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes ARMv8.2-LPA, if the value of VTCR_EL2.PS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z>x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes ARMv8.2-TTCNP, bit[0] of the stage 1 translation table base address is zero.

**Note**
- In an implementation that includes ARMv8.2-LPA a VTCR_EL2.PS value of 0b110, that selects a PA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of VTCR_EL2.PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of VTCR_EL2.PS is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

**Note**
- This definition applies:
  - To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
  - To any implementation that does not include ARMv8.2-LPA.

If any VTTBR_EL2[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using VTTBR_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of VTCR_EL2.T0SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.
CnP, bit [0]

When ARMv8.2-TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table entries pointed to by VTTBR_EL2 are permitted to differ from the entries for VTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.</td>
</tr>
<tr>
<td>0b1</td>
<td>The translation table entries pointed to by VTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

**Note**

If the value of VTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBR_EL2s do not point to the same translation table entries when using the current VMID then the results of translations using VTTBR_EL2 are **CONSTRAINED UNPREDICTABLE**, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Accessing the VTTBR_EL2**

Accesses to this register use the following encodings:

**MRS <Xt>, VTTBR_EL2**

```
<table>
<thead>
<tr>

  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  VTTBR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
  VTTBR_EL2 = X[t];
The ZCR_EL1 characteristics are:

**Purpose**

The SVE Control Register for EL1 is used to control aspects of SVE visible at Exception levels EL1 and EL0.

**Configuration**

This register is present only when SVE is implemented. Otherwise, direct accesses to ZCR_EL1 are **UNDEFINED**.

When HCR_EL2. {E2H, TGE} == {1, 1} and EL2 is enabled in the current Security state, the fields in this register have no effect on execution at EL0.

**Attributes**

ZCR_EL1 is a 64-bit register.

**Field descriptions**

The ZCR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-9</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>8-4</td>
<td>Reserved, RAZ/WI</td>
</tr>
<tr>
<td>3-0</td>
<td>LEN, Constrains the scalable vector register length for EL1 and EL0 to (LEN+1)x128 bits</td>
</tr>
</tbody>
</table>

**Accessing the ZCR_EL1**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic ZCR_EL1 or ZCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

ZCR_EL2, SVE Control Register for EL2

The ZCR_EL2 characteristics are:

**Purpose**

The SVE Control Register for EL2 is used to control aspects of SVE visible at Exception levels EL2, EL1, and EL0, when EL2 is enabled in the current Security state.

**Configuration**

This register is present only when SVE is implemented. Otherwise, direct accesses to ZCR_EL2 are **UNDEFINED**.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

ZCR_EL2 is a 64-bit register.

**Field descriptions**

The ZCR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit No.</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-9</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>8-4</td>
<td>Reserved, RAZ/WI.</td>
</tr>
<tr>
<td>3-0</td>
<td>LEN, constrains the scalable vector register length for EL2, EL1, and EL0 to (LEN+1)x128 bits, when EL2 is enabled in the current Security state. For all purposes other than returning the result of a direct read of ZCR_EL2 then this field behaves as if it is set to the minimum of the stored value and the constrained length inherited from more privileged Exception levels in the current Security state, rounded down to the nearest implemented vector length. An indirect read of ZCR_EL2.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization. This field resets to an architecturally <strong>UNKNOWN</strong> value.</td>
</tr>
</tbody>
</table>

**Accessing the ZCR_EL2**

When **HCR_EL2.E2H** is 1, without explicit synchronization, access from EL2 using the mnemonic ZCR_EL2 or ZCR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

ZCR_EL3, SVE Control Register for EL3

The ZCR_EL3 characteristics are:

**Purpose**

The SVE Control Register for EL3 is used to control aspects of SVE visible at all Exception levels.

**Configuration**

This register is present only when SVE is implemented. Otherwise, direct accesses to ZCR_EL3 are UNDEFINED.

**Attributes**

ZCR_EL3 is a 64-bit register.

**Field descriptions**

The ZCR_EL3 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

- **Bits [63:9]**
  - Reserved, RES0.

- **Bits [8:4]**
  - Reserved, RAZ/WI.

- **LEN, bits [3:0]**
  - Constrains the scalable vector register length for all Exception levels to (LEN+1)x128 bits. For all purposes other than returning the result of a direct read of ZCR_EL3 then this field behaves as if rounded down to the nearest implemented vector length.
  - An indirect read of ZCR_EL3.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.
  - This field resets to an architecturally UNKNOWN value.

**Accessing the ZCR_EL3**

Accesses to this register use the following encodings:

MRS <Xt>, ZCR_EL3

ACTLR, Auxiliary Control Register

The ACTLR characteristics are:

**Purpose**

Provides IMPLEMENTATION DEFINED configuration and control options for execution at EL1 and EL0.

**Configuration**

AArch32 System register ACTLR bits [31:0] are architecturally mapped to AArch64 System register $\text{ACTLR\_EL1[31:0]}$.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ACTLR are UNKNOWN.

Some bits might define global configuration settings, and be common to the Secure and Non-secure instances of the register.

**Attributes**

ACTLR is a 32-bit register.

**Field descriptions**

The ACTLR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| IMPLEMENTATION DEFINED, bits [31:0] |

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

**Accessing the ACTLR**

Accesses to this register use the following encodings:

ACTLR2, Auxiliary Control Register 2

The ACTLR2 characteristics are:

**Purpose**

Provides additional space to the ACTLR register to hold IMPLEMENTATION DEFINED trap functionality for execution at EL1 and EL0.

**Configuration**

AArch32 System register ACTLR2 bits [31:0] are architecturally mapped to AArch64 System register ACTLR_EL1[63:32].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ACTLR2 are UNKNOWN.

In Armv8.0 and Armv8.1, it is IMPLEMENTATION DEFINED whether this register is implemented, or whether it causes UNDEFINED exceptions when accessed. The implementation of this register can be detected by examining ID_MMFR4.AC2.

From Armv8.2 this register must be implemented.

**Attributes**

ACTLR2 is a 32-bit register.

**Field descriptions**

The ACTLR2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

AMAIR0, Auxiliary Memory Attribute Indirection Register 0

The AMAIR0 characteristics are:

**Purpose**

When using the Long-descriptor format translation tables for stage 1 translations, provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR0.

**Configuration**

AArch32 System register AMAIR0 bits [31:0] are architecturally mapped to AArch64 System register AMAIR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to AMAIR0 are UNKNOWN.

**Attributes**

AMAIR0 is a 32-bit register.

**Field descriptions**

The AMAIR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

IMPLEMENTATION DEFINED

This register is RES0 in the following cases:

- When an implementation does not provide any IMPLEMENTATION DEFINED memory attributes.
- When the Long-descriptor translation table format is not used.

If EL3 is implemented and is using AArch32:

- AMAIR0(S) gives the value for memory accesses from Secure state.
- AMAIR0(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

Any IMPLEMENTATION DEFINED memory attributes are additional qualifiers for the memory locations and must not change the architected behavior specified by MAIR0 and MAIR1.

In a typical implementation, AMAIR0 and AMAIR1 split into eight one-byte fields, corresponding to the MAIRn.Attr<n> fields, but the architecture does not require them to do so.

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

**Accessing the AMAIR0**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
    UNDEFINED;

AMAIR1, Auxiliary Memory Attribute Indirection Register 1

The AMAIR1 characteristics are:

Purpose

When using the Long-descriptor format translation tables for stage 1 translations, provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR1.

Configuration

AArch32 System register AMAIR1 bits [31:0] are architecturally mapped to AArch64 System register AMAIR_EL1[63:32].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to AMAIR1 are UNKNOWN.

When EL3 is using AArch32, write access to AMAIR1(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Attributes

AMAIR1 is a 32-bit register.

Field descriptions

The AMAIR1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

This register is RES0 in the following cases:

- When an implementation does not provide any IMPLEMENTATION DEFINED memory attributes.
- When the Long-descriptor translation table format is not used.

If EL3 is implemented and is using AArch32:

- AMAIR1(S) gives the value for memory accesses from Secure state.
- AMAIR1(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

Any IMPLEMENTATION DEFINED memory attributes are additional qualifiers for the memory locations and must not change the architected behavior specified by MAIR0 and MAIR1.

In a typical implementation, AMAIR0 and AMAIR1 split into eight one-byte fields, corresponding to the MAIRn.Attr<n> fields, but the architecture does not require them to do so.
