On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL0, bit [8]

When Secure EL0 is implemented:

Secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Secure EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Secure EL0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

CONTEXT, bits [6:4]

Selects a Context Identifier Comparator or Virtual Context Identifier Comparator:
The width of this field is dependent on the maximum number of Context Identifier Comparators or Virtual Context Identifier Comparators implemented. Unimplemented bits are RES0.

If TRCIDR4.NUMCIDC == 0b0000 and TRCIDR4.NUMVMIDC == 0b0000, then this field is RES0.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**CONTEXTTYPE, bits [3:2]**

Controls whether the Address Comparator is dependent on a Context Identifier Comparator, a Virtual Context Identifier Comparator, or both comparisons:

<table>
<thead>
<tr>
<th>CONTEXTTYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The Address Comparator is not dependent on the Context Identifier Comparators or Virtual Context Identifier Comparators.</td>
</tr>
<tr>
<td>0b01</td>
<td>The Address Comparator is dependent on the Context Identifier Comparator that the CONTEXT field specifies. If both the Context Identifier Comparator and the address comparison match, the Address Comparator signals a match.</td>
</tr>
<tr>
<td>0b10</td>
<td>The Address Comparator is dependent on the Virtual Context Identifier Comparator that the CONTEXT field specifies. If both the Virtual Context Identifier Comparator and the address comparison match, the Address Comparator signals a match.</td>
</tr>
<tr>
<td>0b11</td>
<td>The Address Comparator is dependent on the Context Identifier Comparator and Virtual Context Identifier Comparator that the CONTEXT field specifies. If the Context Identifier Comparator, the Virtual Context Identifier Comparator and address comparison all match, the Address Comparator signals a match.</td>
</tr>
</tbody>
</table>

If TRCIDR4.NUMCIDC == 0b0000, then bit [2] is RES0.

If TRCIDR4.NUMVMIDC == 0b0000, then bit [3] is RES0.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [1:0]**

Reserved, RES0.

**Accessing the TRCACATR<n>**

Must be programmed if any of the following are true:

- TRCBBCTRL.RANGE[n/2] == 0b1.
- TCRSCTRL.<a>.GROUP == 0b0100 and TCRSCTRL.<a>.SAC[n] == 0b1.
- TCRSCTRL.<a>.GROUP == 0b0101 and TCRSCTRL.<a>.ARC[n/2] == 0b1.
- TRCVIIECTRL.EXCLUDE[n/2] == 0b1.
- TRCVIIECTRL.INCLUDE[n/2] == 0b1.
- TRCVISSCTRL.START[n] == 0b1.
- TRCVISSCTRL.STOP[n] == 0b1.
- TRCSSCCR.<.ARC[n/2] == 0b1.
- TRCSSCCR.<.SAC[n] == 0b1.
- TRCQCTRL.RANGE[n/2] == 0b1.
Writes are constrained unpredictable if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

The TRCACVR<n> characteristics are:

**Purpose**
Contains the address value.

**Configuration**
AArch64 System register TRCACVR<n> bits [63:0] are architecturally mapped to External register TRCACVR<n>[63:0].

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMACPAIRS * 2 > n. Otherwise, direct accesses to TRCACVR<n> are **UNDEFINED**.

**Attributes**
TRCACVR<n> is a 64-bit register.

**Field descriptions**
The TRCACVR<n> bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**ADDRESS, bits [63:0]**
Address Value.

The Address Comparators can support implementations that use multiple address widths. When the trace unit compares the ADDRESS field with an address that has a width less than this field, then the address must be zero-extended to the ADDRESS field width. The trace unit then compares all implemented bits. For example, in a system that supports both 32-bit and 64-bit addresses, when the PE is in AArch32 state the comparator must zero-extend the 32-bit address and compare against the full 64 bits that are stored in the TRCACVR<n>. This requires that the trace analyzer always programs all implemented bits of the TRCACVR<n>.

The result of writing a value other than all zeros or all ones to ADDRESS at bits[63:P] is an **UNKNOWN** value, where P is defined as the virtual address size supported by the PE.

The result of writing a value of all zeros or all ones to ADDRESS at bits[63:P] is the written value, and a read of the register returns the written value.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the TRCACVR<n>**
Must be programmed if any of the following are true:

- TRCBBCTLR.RANGE[n/2] == 0b1.
- TRCRSCTLR<a>.GROUP == 0b0100 and TRCRSCTLR<a>.SAC[n] == 0b1.
- TRCRSCTLR<a>.GROUP == 0b0101 and TRCRSCTLR<a>.ARC[n/2] == 0b1.
- TRCVIIECTLR.EXCLUDE[n/2] == 0b1.
- TRCVIIECTLR.INCLUDE[n/2] == 0b1.
• **TRCVISSCTLR**.START[n] == 0b1.
• **TRCVISSCTLR**.STOP[n] == 0b1.
• **TRCSSCCR<>.ARC[n/2]** == 0b1.
• **TRCSSCCR<>.SAC[n]** == 0b1.
• **TRCQCTLR**.RANGE[n/2] == 0b1.

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

<tr>
<td>0b11</td>
<td>Implemented and enabled.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b00.

**HID, bits [9:8]**

Hyp Invasive Debug. Indicates whether a separate enable control for EL2 invasive debug features is implemented and enabled.
HID, bits [0:0]

Separate Hyp invasive debug enable not implemented, or EL2 invasive debug features not implemented.
Implemented and disabled.
Implemented and enabled.
All other values are reserved.
This field reads as 0b00.

SNID, bits [7:6]

Secure Non-invasive Debug. Indicates whether Secure non-invasive debug features are implemented and enabled.

SNID Meaning
0b00 Secure non-invasive debug features not implemented.
0b10 Implemented and disabled.
0b11 Implemented and enabled.
All other values are reserved.
When EL3 is implemented, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.
When EL3 is not implemented and the PE is Non-secure, this field reads as 0b00.
When EL3 is not implemented and the PE is Secure, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

SID, bits [5:4]

Secure Invasive Debug. Indicates whether Secure invasive debug features are implemented and enabled.

SID Meaning
0b00 Secure invasive debug features not implemented.
0b10 Implemented and disabled.
0b11 Implemented and enabled.
All other values are reserved.
This field reads as 0b00.

NSNID, bits [3:2]

Non-secure Non-invasive Debug. Indicates whether Non-secure non-invasive debug features are implemented and enabled.

NSNID Meaning
0b00 Non-secure non-invasive debug features not implemented.
0b10 Implemented and disabled.
0b11 Implemented and enabled.
All other values are reserved.
When EL3 is implemented, this field reads as 0b11.
When EL3 is not implemented and the PE is Non-secure, this field reads as 0b11.
When EL3 is not implemented and the PE is Secure, this field reads as 0b00.

NSID, bits [1:0]

Non-secure Invasive Debug. Indicates whether Non-secure invasive debug features are implemented and enabled.
TRCAUTHSTATUS, Authentication Status Register

<table>
<thead>
<tr>
<th>NSID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-secure invasive debug features not implemented.</td>
</tr>
<tr>
<td>0b10</td>
<td>Implemented and disabled.</td>
</tr>
<tr>
<td>0b11</td>
<td>Implemented and enabled.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b00.

### Accessing the TRCAUTHSTATUS

For implementations that support multiple access mechanisms, different access mechanisms can return different values for reads of TRCAUTHSTATUS if the authentication signals have changed and that change has not yet been synchronized by a Context synchronization event. This scenario can happen if, for example, the external debugger view is implemented separately from the system instruction view to allow for separate power domains, and so observes changes on the signals differently.

Accesses to this register use the following encodings:

\[ MRS \langle X_t \rangle, \text{TRCAUTHSTATUS} \]

TRCAUXCTLR, Auxiliary Control Register

The TRCAUXCTLR characteristics are:

**Purpose**

The function of this register is IMPLEMENTATION DEFINED.

**Configuration**

AArch64 System register TRCAUXCTLR bits [31:0] are architecturally mapped to External register TRCAUXCTLR[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCAUXCTLR are UNDEFINED.

**Attributes**

TRCAUXCTLR is a 64-bit register.

**Field descriptions**

The TRCAUXCTLR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>31-0</td>
<td>IMPLEMENTATION DEFINED.</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

On a Trace unit reset, this field resets to 0.

**Accessing the TRCAUXCTLR**

If this register is set to nonzero then it might cause the behavior of a trace unit to contradict this architecture specification. See the documentation of the specific implementation for information about the IMPLEMENTATION DEFINED support for this register.

Accesses to this register use the following encodings:

MRS <Xt>, TRCAUXCTLR

The TRCBBCTRL characteristics are:

**Purpose**

Controls the regions in the memory map where branch broadcasting is active.

**Configuration**

AArch64 System register TRCBBCTRLR bits [31:0] are architecturally mapped to External register TRCBBCTRLR[31:0].

This register is present only when FEAT_ETE is implemented, TRCIDR0.TRCBB == 1 and TRCIDR4.NUMACPAIRS > 0b0000. Otherwise, direct accesses to TRCBBCTRL are UNDEFINED.

**Attributes**

TRCBBCTRLR is a 64-bit register.

**Field descriptions**

The TRCBBCTRLR bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:9]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>MODE, bit [8]</td>
<td></td>
</tr>
<tr>
<td><strong>MODE</strong></td>
<td><strong>Meaning</strong></td>
</tr>
<tr>
<td>0b0</td>
<td>Exclude Mode. Branch broadcasting is not active for instructions in the address ranges defined by TRCBBCTRLR.RANGE. If TRCBBCTRLR.RANGE == 0x0 then branch broadcasting is active for all instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Include Mode. Branch broadcasting is active for instructions in the address ranges defined by TRCBBCTRLR.RANGE. If TRCBBCTRLR.RANGE == 0x0 then the behavior of the trace unit is CONSTRAINED UNPREDICTABLE. That is, the trace unit might or might not consider any instructions to be in a branch broadcasting region.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**RANGE[m], bit [m], for m = 7 to 0**

Address range field.

Selects whether Address Range Comparator <m> is used with branch broadcasting.
<table>
<thead>
<tr>
<th>RANGE[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The address range that Address Range Comparator m defines, is not selected.</td>
</tr>
<tr>
<td>0b1</td>
<td>The address range that Address Range Comparator m defines, is selected.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCBBCTLR**

Must be programmed if TRCCONFIGR.BB == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

TRCCCCTRL, Cycle Count Control Register

The TRCCCCTRL characteristics are:

**Purpose**

Set the threshold value for cycle counting.

**Configuration**

AArch64 System register TRCCCCTRL bits [31:0] are architecturally mapped to External register TRCCCCTRL[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR0.TRCCCI == 1. Otherwise, direct accesses to TRCCCCTRL are UNDEFINED.

**Attributes**

TRCCCCTRL is a 64-bit register.

**Field descriptions**

The TRCCCCTRL bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    | RES0|    |    |    |    |    |    |    | RES0|    |    |    |    |    |    |    |    |    |    |    |    |    |    | THRESHOLD |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0 |

**Bits [63:12]**

Reserved, RES0.

**THRESHOLD, bits [11:0]**

Sets the threshold value for instruction trace cycle counting.

The minimum threshold value that can be programmed into THRESHOLD is given in TRCIDR3.CCITMIN. If the THRESHOLD value is smaller than the value in TRCIDR3.CCITMIN then the behavior is CONSTRAINED UNPREDICTABLE. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

Writing a value of zero when TRCCONFIGR.CCI is set to enable instruction trace cycle counting, results in CONSTRAINED UNPREDICTABLE behavior. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCCCCTRL**

Must be programmed if TRCCONFIGR.CCI == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

<table>

<td>The trace unit ignores TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is res0 if \( m \geq \text{TRCIDR2}.\text{CIDSIZE} \).

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, res0.
Accessing the TRCCIDCCTL0

If software uses the TRCCIDCVR<\text{n}> registers, for \text{n} = 0 to 3, then it must program this register.

If software sets a mask bit to 0b1 then it must program the relevant byte in TRCCIDCVR<\text{n}> to 0x00.

If any bit is 0b1 and the relevant byte in TRCCIDCVR<\text{n}> is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

MRS <\text{Xt}>, TRCCIDCCTL0

The TRCIDCCTRL1 characteristics are:

**Purpose**

Contains Context identifier mask values for the TRCCIDCVR<n> registers, for n = 4 to 7.

**Configuration**

AArch64 System register TRCIDCCTRL1 bits [31:0] are architecturally mapped to External register TRCIDCCTRL1[31:0].

This register is present only when FEAT_ETE is implemented, TRCIDR4.NUMCIDC > 0x4 and TRCIDR2.CIDSIZE > 0b00000. Otherwise, direct accesses to TRCIDCCTRL1 are UNDEFINED.

**Attributes**

TRCIDCCTRL1 is a 64-bit register.

**Field descriptions**

The TRCIDCCTRL1 bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>
<th>55</th>
<th>54</th>
<th>53</th>
</tr>
</thead>
</table>

Bits [63:32]

Reserved, RES0.

**COMP7[<m>], bit [m+24], for m = 7 to 0**

When TRCIDR4.NUMCIDC > 7:

TRCIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCIDCVR7. Each bit in this field corresponds to a byte in TRCIDCVR7.

<table>
<thead>
<tr>
<th>COMP7[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR2.CIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**COMP6[<m>], bit [m+16], for m = 7 to 0**
When TRCIDR4.NUMCIDC > 6:

TRCCIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR6. Each bit in this field corresponds to a byte in TRCCIDCVR6.

<table>
<thead>
<tr>
<th>COMP6[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is res0 if m >= TRCIDR2.CIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, res0.

COMP5[<m>], bit [m+8], for m = 7 to 0

When TRCIDR4.NUMCIDC > 5:

TRCCIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR5. Each bit in this field corresponds to a byte in TRCCIDCVR5.

<table>
<thead>
<tr>
<th>COMP5[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is res0 if m >= TRCIDR2.CIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, res0.

COMP4[<m>], bit [m], for m = 7 to 0

When TRCIDR4.NUMCIDC > 4:

TRCCIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR4. Each bit in this field corresponds to a byte in TRCCIDCVR4.

<table>
<thead>
<tr>
<th>COMP4[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is res0 if m >= TRCIDR2.CIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, res0.
Accessing the TRCCIDCCTL1

If software uses the TRCCIDCVR<n> registers, for n = 4 to 7, then it must program this register.

If software sets a mask bit to 0b1 then it must program the relevant byte in TRCCIDCVR<n> to 0x00.

If any bit is 0b1 and the relevant byte in TRCCIDCVR<n> is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

MRS <Xt>, TRCCIDCCTL1

end;
The TRCCLAIMCLR characteristics are:

**Purpose**

In conjunction with TRCCLAIMSET, provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

**Configuration**

AArch64 System register TRCCLAIMCLR bits [31:0] are architecturally mapped to External register TRCCLAIMCLR[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCLAIMCLR are UNDEFINED.

**Attributes**

TRCCLAIMCLR is a 64-bit register.

**Field descriptions**

The TRCCLAIMCLR bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>
<th>55</th>
<th>54</th>
<th>53</th>
<th>52</th>
<th>51</th>
<th>50</th>
</tr>
</thead>
</table>

**Bits [63:32]**

Reserved, RES0.

**CLR[<m>], bit [m], for m = 31 to 0**

Claim Tag Clear. Indicates the current status of the Claim Tag bit m, and is used to clear Claim Tag bit m to 0b0.

<table>
<thead>
<tr>
<th>CLR[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>On a read: Claim Tag bit m is not set. On a write: Ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>On a read: Claim Tag bit m is set. On a write: Clear Claim tag bit m to 0b0.</td>
</tr>
</tbody>
</table>

The number of Claim Tag bits implemented is indicated in TRCCLAIMSET.

This bit reads-as-zero and ignores writes if m > the number of Claim Tag bits.

On a Trace unit reset, this field resets to 0.

TRCCLAIMSET, Claim Tag Set Register

The TRCCLAIMSET characteristics are:

**Purpose**

In conjunction with TRCCLAIMCLR, provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

**Configuration**

AArch64 System register TRCCLAIMSET bits [31:0] are architecturally mapped to External register TRCCLAIMSET[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCLAIMSET are UNDEFINED.

The number of claim tag bits implemented is IMPLEMENTATION DEFINED. Arm recommends that implementations support a minimum of four claim tag bits, that is, SET[3:0] reads as 0b1111.

**Attributes**

TRCCLAIMSET is a 64-bit register.

**Field descriptions**

The TRCCLAIMSET bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>
<th>55</th>
<th>54</th>
<th>53</th>
<th>52</th>
<th>51</th>
<th>50</th>
</tr>
</thead>
</table>

Bits [63:32]

Reserved, RES0.

**SET[<m>], bit [m], for m = 31 to 0**

Claim Tag Set. Indicates whether Claim Tag bit m is implemented, and is used to set Claim Tag bit m to 0b1.

<table>
<thead>
<tr>
<th>SET[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>

**Bits [63:18]**

Reserved, RES0.

**CNTCHAIN, bit [17]**

For TRCCNTCTLR3 and TRCCNTCTLR1, this bit controls whether the Counter decrements when a reload event occurs for Counter <n-1>.

<table>
<thead>
<tr>
<th>CNTCHAIN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Counter does not decrement when a reload event for Counter &lt;n-1&gt; occurs.</td>
</tr>
<tr>
<td>0b1</td>
<td>Counter &lt;n&gt; decrements when a reload event for Counter &lt;n-1&gt; occurs. This concatenates Counter &lt;n&gt; and Counter &lt;n-1&gt;, to provide a larger count value.</td>
</tr>
</tbody>
</table>

CNTCHAIN is not implemented for TRCCNTCTLR0 and TRCCNTCTLR2.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**RLDSELF, bit [16]**

Controls whether a reload event occurs for the Counter, when the Counter reaches zero.
**RLDSELF**

<table>
<thead>
<tr>
<th>0b0</th>
<th>Normal mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>Self-reload mode.</td>
</tr>
</tbody>
</table>

The Counter is in Normal mode.

The Counter is in Self-reload mode.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**RLDEVENT_TYPE, bit [15]**

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes a reload event for Counter <n>.

<table>
<thead>
<tr>
<th><strong>RLDEVENT_TYPE</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector: TRCCNTCTRL&lt;n&gt;.RLDEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCCNTCTRL&lt;n&gt;.RLDEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTRL&lt;n&gt;.RLDEVENT.SEL[4] is <strong>RES0</strong>.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [14:13]**

Reserved, **RES0**.

**RLDEVENT_SEL, bits [12:8]**

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTRL<n>.RLDEVENT.TYPE controls whether TRCCNTCTRL<n>.RLDEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes a reload event for Counter <n>.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is **UNPREDICTABLE**, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is **UNPREDICTABLE**, and the resource event might fire or might not fire when the resources are not in the Paused state.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**CNTEVENT_TYPE, bit [7]**

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes Counter <n> to decrement.

<table>
<thead>
<tr>
<th><strong>CNTEVENT_TYPE</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector. TRCCNTCTRL&lt;n&gt;.CNTEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCCNTCTRL&lt;n&gt;.CNTEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTRL&lt;n&gt;.CNTEVENT.SEL[4] is <strong>RES0</strong>.</td>
</tr>
</tbody>
</table>
On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [6:5]**

Reserved, `RES0`.

**CNTEVENT_SEL, bits [4:0]**

Defines the selected Resource Selector or pair of Resource Selectors. `TRCCNTCTLR<n>.CNTEVENT.TYPE` controls whether `TRCCNTCTLR<n>.CNTEVENT_SEL` is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes Counter `<n>` to decrement.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is **UNPREDICTABLE**, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is **UNPREDICTABLE**, and the resource event might fire or might not fire when the resources are not in the Paused state.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the TRCCNTCTLR<n>**

Must be programmed if `TRCRSCTRL<a>.GROUP == 0b0010` and `TRCRSCTRL<a>.COUNTERS[n] == 0b1`.

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

TRCCNTRLDVR<n>, Counter Reload Value Register <n>, n = 0 - 3

The TRCCNTRLDVR<n> characteristics are:

**Purpose**

This sets or returns the reload count value for Counter <n>.

**Configuration**

AArch64 System register TRCCNTRLDVR<n> bits [31:0] are architecturally mapped to External register TRCCNTRLDVR<n>[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMCNTR > n. Otherwise, direct accesses to TRCCNTRLDVR<n> are UNDEFINED.

**Attributes**

TRCCNTRLDVR<n> is a 64-bit register.

**Field descriptions**

The TRCCNTRLDVR<n> bit assignments are:

| Bit 63 | Bit 62 | Bit 61 | Bit 60 | Bit 59 | Bit 58 | Bit 57 | Bit 56 | Bit 55 | Bit 54 | Bit 53 | Bit 52 | Bit 51 | Bit 50 | Bit 49 | Bit 48 | Bit 47 | Bit 46 | Bit 45 | Bit 44 | Bit 43 | Bit 42 | Bit 41 | Bit 40 | Bit 39 | Bit 38 | Bit 37 | Bit 36 | Bit 35 | Bit 34 | Bit 33 | Bit 32 |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| RES0   | RES0   | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  | VALUE  |

**Bits [63:16]**

Reserved, RES0.

**VALUE, bits [15:0]**

Contains the reload value for Counter <n>. When a reload event occurs for Counter <n> then the trace unit copies the VALUE<n> field into Counter <n>.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCCNTRLDVR<n>**

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.COUNTERS[n] == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

The TRCDEVARCH characteristics are:

**Purpose**

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

**Configuration**

AArch64 System register TRCDEVARCH bits [31:0] are architecturally mapped to External register TRCDEVARCH[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVARCH are UNDEFINED.

**Attributes**

TRCDEVARCH is a 64-bit register.

**Field descriptions**

The TRCDEVARCH bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**ARCHITECT, bits [31:21]**

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

<table>
<thead>
<tr>
<th>ARCHITECT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01000111011</td>
<td>JEP106 continuation code 0x4, ID code 0x3B. Arm Limited.</td>
</tr>
</tbody>
</table>

Other values are defined by the JEDEC JEP106 standard.

This field reads as 0x23B.

**PRESENT, bit [20]**

DEVARCH Present. Defines that the DEVARCH register is present.

<table>
<thead>
<tr>
<th>PRESENT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Device Architecture information not present.</td>
</tr>
<tr>
<td>0b1</td>
<td>Device Architecture information present.</td>
</tr>
</tbody>
</table>

This bit reads as 0b1.
**REVISION, bits [19:16]**

Revision. Defines the architecture revision of the component.

<table>
<thead>
<tr>
<th>REVISION</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>ETEv1.0, FEAT_ETE</td>
</tr>
<tr>
<td>0b0001</td>
<td>ETEv1.1, FEAT_ETEv1p1</td>
</tr>
</tbody>
</table>

All other values are reserved.

**ARCHVER, bits [15:12]**

Architecture Version. Defines the architecture version of the component.

<table>
<thead>
<tr>
<th>ARCHVER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0101</td>
<td>ETEv1.</td>
</tr>
</tbody>
</table>

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12]. This field reads as 0x5.

**ARCHPART, bits [11:0]**

Architecture Part. Defines the architecture of the component.

<table>
<thead>
<tr>
<th>ARCHPART</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0xA13</td>
<td>Arm PE trace architecture</td>
</tr>
</tbody>
</table>

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0]. This field reads as 0xA13.

TRCEVENTCTL1R, Event Control 1 Register

The TRCEVENTCTL1R characteristics are:

**Purpose**

Controls the behavior of the ETEEvents that TRCEVENTCTL0R selects.

**Configuration**

AArch64 System register TRCEVENTCTL1R bits [31:0] are architecturally mapped to External register TRCEVENTCTL1R[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCEVENTCTL1R are UNDEFINED.

**Attributes**

TRCEVENTCTL1R is a 64-bit register.

**Field descriptions**

The TRCEVENTCTL1R bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>LPOVERRIDE</td>
<td>Low-power Override Mode select.</td>
</tr>
<tr>
<td>1</td>
<td>LPOVERRIDE</td>
<td>Trace unit Low-power Override Mode is enabled. That is, entry to a low-power state does not affect the trace unit resources or trace generation.</td>
</tr>
<tr>
<td>2</td>
<td>LPOVERRIDE</td>
<td>Trace unit Low-power Override Mode is not enabled. That is, the trace unit is permitted to enter low-power state.</td>
</tr>
<tr>
<td>3</td>
<td>ATB</td>
<td>AMBA Trace Bus (ATB) trigger enable.</td>
</tr>
</tbody>
</table>

Bits [63:13]

Reserved, RES0.

LPOVERRIDE, bit [12]

When TRCIDR5.LPOVERRIDE == 1:

Low-power Override Mode select.

<table>
<thead>
<tr>
<th>LPOVERRIDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace unit Low-power Override Mode is not enabled. That is, the trace unit is permitted to enter low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace unit Low-power Override Mode is enabled. That is, entry to a low-power state does not affect the trace unit resources or trace generation.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

ATB, bit [11]

When TRCIDR5.ATBTRIG == 1:

AMBA Trace Bus (ATB) trigger enable.
If a CoreSight ATB interface is implemented then when ETEEvent 0 occurs the trace unit sets:

- ATID == 0x7D.
- ATDATA to the value of TRCTRACEIDR.

If the width of ATDATA is greater than the width of TRCTRACEIDR.TRACEID then the trace unit zeros the upper ATDATA bits.

If ETEEvent 0 is programmed to occur based on program execution, such as an Address Comparator, the ATB trigger might not be inserted into the ATB stream at the same time as any trace generated by that program execution is output by the trace unit. Typically, the generated trace might be buffered in a trace unit which means that the ATB trigger would be output before the associated trace is output.

If ETEEvent 0 is asserted multiple times in close succession, the trace unit is required to generate an ATB trigger for the first assertion, but might ignore one or more of the subsequent assertions. Arm recommends that the window in which ETEEvent 0 is ignored is limited only by the time taken to output an ATB trigger.

<table>
<thead>
<tr>
<th>ATB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ATB trigger is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>ATB trigger is enabled.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

**Bits [10:4]**

Reserved, RES0.

**INSTEN[<m>], bit [m], for m = 3 to 0**

Event element control.

<table>
<thead>
<tr>
<th>INSTEN[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit does not generate an Event element m.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit generates an Event element m.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= the number indicated by TRCIDR0.NUMEVENT.

### Accessing the TRCEVENTCTL1R

Must be programmed.

Writes are CONstrained UNpredictable if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

**MRS <Xt>, TRCEVENTCTL1R**

TRCEXTINSELR<n>, External Input Select Register <n>, n = 0 - 3

The TRCEXTINSELR<n> characteristics are:

**Purpose**

Use this to set, or read, which External Inputs are resources to the trace unit.

The name TRCEXTINSELR is an alias of TRCEXTINSELR0.

**Configuration**

AArch64 System register TRCEXTINSELR<n> bits [31:0] are architecturally mapped to External register TRCEXTINSELR<n>[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMEXTINSEL > n. Otherwise, direct accesses to TRCEXTINSELR<n> are UNDEFINED.

**Attributes**

TRCEXTINSELR<n> is a 64-bit register.

**Field descriptions**

The TRCEXTINSELR<n> bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:16]**

Reserved, RES0.

**evtCount, bits [15:0]**

PMU event to select.

The event number as defined by the Arm ARM.

Software must program this field with a PMU event that is supported by the PE being programmed.

There are three ranges of PMU event numbers:

- PMU event numbers in the range 0x0000 to 0x003F are common architectural and microarchitectural events.
- PMU event numbers in the range 0x0040 to 0x00FF are Arm recommended common architectural and microarchitectural PMU events.
- PMU event numbers in the range 0x00C0 to 0x03FF are IMPLEMENTATION DEFINED PMU events.

If evtCount is programmed to a PMU event that is reserved or not supported by the PE, the behavior depends on the PMU event type:

- For the range 0x0000 to 0x003F, then the PMU event is not active, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED PMU events, it is UNPREDICTABLE what PMU event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.
UNPREDICTABLE means the PMU event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include a PMU event from a set of common IMPLEMENTATION_DEFINED PMU events, then no PMU event is counted and the value read back on evtCount is the value written.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

### Accessing the TRCEXTINSELR<n>

Must be programmed if any of the following is true: TRCRSCTRL<a>.GROUP == 0b0000 and TRCRSCTRL<a>.EXTIN[n] == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10</td>
<td>0b001</td>
<td>0b0000</td>

<td>RES0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:31]**

Reserved, RES0.

**COMMTRANS, bit [30]**

Transaction Start element behavior.

<table>
<thead>
<tr>
<th>COMMTRANS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Transaction Start elements are P0 elements.</td>
</tr>
<tr>
<td>0b1</td>
<td>Transaction Start elements are not P0 elements.</td>
</tr>
</tbody>
</table>

**COMMOPT, bit [29]**

Indicates the contents and encodings of Cycle count packets.

<table>
<thead>
<tr>
<th>COMMOPT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Commit mode 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Commit mode 1.</td>
</tr>
</tbody>
</table>

The Commit mode defines the contents and encodings of Cycle Count packets, in particular how Commit elements are indicated by these packets. See the descriptions of these packets for more details.

This bit reads-as-one if TRCIDR0.TRCCCI == 0b1 and TRCIDR8.MAXSPEC == 0x0. This bit reads-as-zero if TRCIDR0.TRCCCI == 0b0.

**TSSIZE, bits [28:24]**

Indicates that the trace unit implements Global timestamping and the size of the timestamp value.
TSSIZE

<table>
<thead>
<tr>
<th>TSSIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Global timestamping not implemented.</td>
</tr>
<tr>
<td>0b010000</td>
<td>Global timestamping implemented with a 64-bit timestamp value.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b01000.

TSMARK, bit [23]

When FEAT_ETEv1p1 is implemented:

Indicates whether Timestamp Marker elements are generated.

<table>
<thead>
<tr>
<th>TSMARK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timestamp Marker elements are not generated.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timestamp Marker elements are generated.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

Bits [22:18]

Reserved, RES0.

TRCEXDATA, bit [17]

When TRCIDR0.TRCDATA != 0b00:

Indicates if the trace unit implements tracing of data transfers for exceptions and exception returns. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>TRCEXDATA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tracing of data transfers for exceptions and exception returns not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tracing of data transfers for exceptions and exception returns implemented.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

QSUPP, bits [16:15]

Indicates that the trace unit implements Q element support.

<table>
<thead>
<tr>
<th>QSUPP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Q element support is not implemented.</td>
</tr>
<tr>
<td>0b01</td>
<td>Q element support is implemented, and only supports Q elements with instruction counts.</td>
</tr>
<tr>
<td>0b10</td>
<td>Q element support is implemented, and only supports Q elements without instruction counts.</td>
</tr>
<tr>
<td>0b11</td>
<td>Q element support is implemented, and supports:</td>
</tr>
<tr>
<td></td>
<td>• Q elements with instruction counts.</td>
</tr>
<tr>
<td></td>
<td>• Q elements without instruction counts.</td>
</tr>
</tbody>
</table>

QFILT, bit [14]

Indicates if the trace unit implements Q element filtering.
QFILT Element Filtering

<table>
<thead>
<tr>
<th>QFILT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Q element filtering is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Q element filtering is implemented.</td>
</tr>
</tbody>
</table>

If TRCIDR0.QSUPP == 0b00 then this field is 0b0.

**CONDTYPE, bits [13:12]**

When TRCIDR0.TRCCOND == 1:

Indicates how conditional instructions are traced. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>CONDTYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Conditional instructions are traced with an indication of whether they pass or fail their condition code check.</td>
</tr>
<tr>
<td>0b01</td>
<td>Conditional instructions are traced with an indication of the APSR condition flags.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Otherwise:

Reserved, RES0.

**NUMEVENT, bits [11:10]**

When TRCIDR4.NUMRSPAIR == 0b0000:

Indicates the number of ETEEvents implemented.

<table>
<thead>
<tr>
<th>NUMEVENT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The trace unit supports 0 ETEEvents.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When TRCIDR4.NUMRSPAIR != 0b0000:

Indicates the number of ETEEvents implemented.

<table>
<thead>
<tr>
<th>NUMEVENT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The trace unit supports 1 ETEEvent.</td>
</tr>
<tr>
<td>0b01</td>
<td>The trace unit supports 2 ETEEvents.</td>
</tr>
<tr>
<td>0b10</td>
<td>The trace unit supports 3 ETEEvents.</td>
</tr>
<tr>
<td>0b11</td>
<td>The trace unit supports 4 ETEEvents.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

**RETSTACK, bit [9]**

Indicates if the trace unit supports the return stack.

<table>
<thead>
<tr>
<th>RETSTACK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Return stack not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Return stack implemented.</td>
</tr>
</tbody>
</table>

**Bit [8]**

Reserved, RES0.
TRCCI, bit [7]

Indicates if the trace unit implements cycle counting.

<table>
<thead>
<tr>
<th>TRCCI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting implemented.</td>
</tr>
</tbody>
</table>

This bit reads as 0b1.

TRCOND, bit [6]

Indicates if the trace unit implements conditional instruction tracing. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures.

<table>
<thead>
<tr>
<th>TRCOND</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Conditional instruction tracing not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Conditional instruction tracing implemented.</td>
</tr>
</tbody>
</table>

This bit reads as 0b0.

TRCBB, bit [5]

Indicates if the trace unit implements branch broadcasting.

<table>
<thead>
<tr>
<th>TRCBB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Branch broadcasting not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Branch broadcasting implemented.</td>
</tr>
</tbody>
</table>

This bit reads as 0b1.

TRCDATA, bits [4:3]

Indicates if the trace unit implements data tracing. Data tracing is not implemented in ETE and this field is reserved for other trace architectures.

<table>
<thead>
<tr>
<th>TRCDATA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Data tracing not implemented.</td>
</tr>
<tr>
<td>0b11</td>
<td>Data tracing implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b00.

INSTP0, bits [2:1]

Indicates if load and store instructions are P0 instructions. Load and store instructions as P0 instructions is not implemented in ETE and this field is reserved for other trace architectures.

<table>
<thead>
<tr>
<th>INSTP0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Load and store instructions are not P0 instructions.</td>
</tr>
<tr>
<td>0b11</td>
<td>Load and store instructions are P0 instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b00.

Bit [0]

Reserved, RES1.

<td>Virtual context identifier selection not supported. TRCCONFIGR.VMIDOPT is RES1.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If TRCIDR2.VMIDSIZE == 0b00000 then this field is 0b00.

If TRCIDR2.VMIDSIZE != 0b00000 then this field is 0b10.
CCSIZE, bits [28:25]

When TRCIDR0.TRCCI == 1:

Indicates the size of the cycle counter.

<table>
<thead>
<tr>
<th>CCSIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The cycle counter is 12 bits in length.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The cycle counter is 13 bits in length.</td>
</tr>
<tr>
<td>0b0010</td>
<td>The cycle counter is 14 bits in length.</td>

</tr>
<tr>
<td>0b0111</td>
<td>The cycle counter is 19 bits in length.</td>
</tr>
<tr>
<td>0b1000</td>
<td>The cycle counter is 20 bits in length.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Otherwise:

Reserved, RES0.

DVSIZE, bits [24:20]

When TRCIDR0.TRCDATA != 0b00:

Indicates the data value size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>DVSIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>Data value tracing not implemented.</td>
</tr>
<tr>
<td>0b00100</td>
<td>Data value tracing has a maximum of 32-bit data values.</td>
</tr>
<tr>
<td>0b01000</td>
<td>Data value tracing has a maximum of 64-bit data values.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Otherwise:

Reserved, RES0.

DASIZE, bits [19:15]

When TRCIDR0.TRCDATA != 0b00:

Indicates the data address size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>DASIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>Data address tracing not implemented.</td>
</tr>
<tr>
<td>0b00100</td>
<td>Data address tracing has a maximum of 32-bit data addresses.</td>
</tr>
<tr>
<td>0b01000</td>
<td>Data address tracing has a maximum of 64-bit data addresses.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Otherwise:

Reserved, RES0.

VMIDSIZE, bits [14:10]

Indicates the trace unit Virtual context identifier size.
VMIDSIZE | Meaning
---------|----------------------------------
0b00000  | Virtual context identifier tracing is not supported.
0b00001  | 8-bit Virtual context identifier size.
0b00010  | 16-bit Virtual context identifier size.
0b00100  | 32-bit Virtual context identifier size.

All other values are reserved.

If the PE does not implement EL2 then this field is 0b00000.

If the PE implements EL2 then this field is 0b00100.

CIDSIZE, bits [9:5]

Indicates the Context identifier size.

<table>
<thead>
<tr>
<th>CIDSIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>Context identifier tracing is not supported.</td>
</tr>
<tr>
<td>0b00100</td>
<td>32-bit Context identifier size.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b00100.

IASIZE, bits [4:0]

Virtual instruction address size.

<table>
<thead>
<tr>
<th>IASIZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00100</td>
<td>Maximum of 32-bit instruction address size.</td>
</tr>
<tr>
<td>0b01000</td>
<td>Maximum of 64-bit instruction address size.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field reads as 0b01000.

Bits [63:32]

Reserved, RES0.

NOOVERFLOW, bit [31]

Indicates if overflow prevention is implemented.

<table>
<thead>
<tr>
<th>NOOVERFLOW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Overflow prevention is not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overflow prevention is implemented.</td>
</tr>
</tbody>
</table>

NUMPROC, bits [13:12, 30:28]

Indicates the number of PEs available for tracing.

<table>
<thead>
<tr>
<th>NUMPROC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000000</td>
<td>The trace unit can trace one PE.</td>
</tr>
</tbody>
</table>

This field reads as 0b000000.

The NUMPROC field is split as follows:

- NUMPROC[2:0] is TRCIDR3[30:28].
- NUMPROC[4:3] is TRCIDR3[13:12].

SYSSTALL, bit [27]

Indicates if stalling of the PE is permitted.
**SYSSTALL** | **Meaning**  
---|---  
0b0 | Stalling of the PE is not permitted.  
0b1 | Stalling of the PE is permitted.  

The value of this field might be dynamic and change based on system conditions.

If TRCIDR3.STALLCTL == 0b0 then this field is 0b0.

**STALLCTL, bit [26]**

Indicates if trace unit implements stalling of the PE.

| STALLCTL | Meaning  
---|---  
0b0 | Stalling of the PE is not implemented.  
0b1 | Stalling of the PE is implemented.  

**SYNCPR, bit [25]**

Indicates if an implementation has a fixed synchronization period.

| SYNCPR | Meaning  
---|---  
0b0 | TRCSYNCPR is read-write so software can change the synchronization period.  
0b1 | TRCSYNCPR is read-only so the synchronization period is fixed.  

This bit reads as 0b0.

**TRCERR, bit [24]**

Indicates forced tracing of System Error exceptions is implemented.

| TRCERR | Meaning  
---|---  
0b0 | Forced tracing of System Error exceptions is not implemented.  
0b1 | Forced tracing of System Error exceptions is implemented.  

This bit reads as 0b1.

**Bit [23]**

Reserved, RES0.

**EXLEVEL_NS_EL2, bit [22]**

Indicates if Non-secure EL2 implemented.

| EXLEVEL_NS_EL2 | Meaning  
---|---  
0b0 | Non-secure EL2 is not implemented.  
0b1 | Non-secure EL2 is implemented.  

**EXLEVEL_NS_EL1, bit [21]**

Indicates if Non-secure EL1 implemented.

| EXLEVEL_NS_EL1 | Meaning  
---|---  
0b0 | Non-secure EL1 is not implemented.  
0b1 | Non-secure EL1 is implemented.  

**EXLEVEL_NS_EL0, bit [20]**

Indicates if Non-secure EL0 implemented.
EXLEVEL_NS_EL0

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>

Bits [15:14]

Reserved, RES0.

CCITMIN, bits [11:0]

Indicates the minimum value that can be programmed in TRCCCTLR.THRESHOLD.

If TRCIDR0.TRCCCI == 0b1 then the minimum value of this field is 0x001.

If TRCIDR0.TRCCCI == 0b0 then this field is zero.

Accessing the TRCIDR3

Accesses to this register use the following encodings:

The TRCIDR4 characteristics are:

**Purpose**

Returns the tracing capabilities of the trace unit.

**Configuration**

AArch64 System register TRCIDR4 bits [31:0] are architecturally mapped to External register TRCIDR4[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR4 are **UNDEFINED**.

**Attributes**

TRCIDR4 is a 64-bit register.

**Field descriptions**

The TRCIDR4 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No Virtual Context Identifier Comparators are available.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The implementation has one Virtual Context Identifier Comparator.</td>
</tr>
<tr>

<td>0b1001</td>
<td>The implementation has five resource selector pairs.</td>
</tr>
<tr>
<td>0b1100</td>
<td>The implementation has six resource selector pairs.</td>
</tr>
<tr>
<td>0b1010</td>
<td>The implementation has seven resource selector pairs.</td>
</tr>
<tr>
<td>0b1110</td>
<td>The implementation has eight resource selector pairs.</td>
</tr>
<tr>
<td>0b1111</td>
<td>The implementation has nine resource selector pairs.</td>
</tr>
<tr>
<td>0b1011</td>
<td>The implementation has ten resource selector pairs.</td>
</tr>
<tr>
<td>0b1101</td>
<td>The implementation has eleven resource selector pairs.</td>
</tr>
<tr>
<td>0b1111</td>
<td>The implementation has twelve resource selector pairs.</td>
</tr>
<tr>
<td>0b1101</td>
<td>The implementation has thirteen resource selector pairs.</td>
</tr>
<tr>
<td>0b1110</td>
<td>The implementation has fourteen resource selector pairs.</td>
</tr>
<tr>
<td>0b1111</td>
<td>The implementation has fifteen resource selector pairs.</td>
</tr>
<tr>
<td>0b1111</td>
<td>The implementation has sixteen resource selector pairs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**NUMPC, bits [15:12]**

Indicates the number of PE Comparator Inputs that are available for tracing.

<table>
<thead>
<tr>
<th>NUMPC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No PE Comparator Inputs are available.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The implementation has one PE Comparator Input.</td>
</tr>
<tr>
<td>0b0010</td>
<td>The implementation has two PE Comparator Inputs.</td>
</tr>
<tr>
<td>0b0100</td>
<td>The implementation has three PE Comparator Inputs.</td>
</tr>
<tr>
<td>0b0110</td>
<td>The implementation has four PE Comparator Inputs.</td>
</tr>
<tr>
<td>0b1000</td>
<td>The implementation has five PE Comparator Inputs.</td>
</tr>
<tr>
<td>0b1100</td>
<td>The implementation has six PE Comparator Inputs.</td>
</tr>
<tr>
<td>0b1010</td>
<td>The implementation has seven PE Comparator Inputs.</td>
</tr>
<tr>
<td>0b1110</td>
<td>The implementation has eight PE Comparator Inputs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Bits [11:9]**

Reserved, RES0.

**SUPPDAC, bit [8]**

When TRCIDR4.NUMACPAIRS != 0b0000:

Indicates whether data address comparisons are implemented. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>SUPPDAC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Data address comparisons not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Data address comparisons implemented.</td>
</tr>
</tbody>
</table>

This bit reads as 0b0.

Otherwise:

Reserved, RES0.

**NUMDVC, bits [7:4]**

Indicates the number of data value comparators. Data value comparators are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.
NUMDVC

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000 No data value comparators implemented.</td>
</tr>
<tr>
<td>0b0001 One data value comparator implemented.</td>

TRCIMSPEC<n>, IMP DEF Register <n>, n = 1 - 7

The TRCIMSPEC<n> characteristics are:

**Purpose**

These registers might return information that is specific to an implementation, or enable features specific to an implementation to be programmed. The product Technical Reference Manual describes these registers.

**Configuration**

AArch64 System register TRCIMSPEC<n> bits [31:0] are architecturally mapped to External register TRCIMSPEC<n>[31:0].

This register is present only when the trace unit implements this OPTIONAL register and FEAT_ETE is implemented. Otherwise, direct accesses to TRCIMSPEC<n> are **UNDEFINED**.

**Attributes**

TRCIMSPEC<n> is a 64-bit register.

**Field descriptions**

The TRCIMSPEC<n> bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |

TRCQCTL, Q Element Control Register

The TRCQCTL characteristics are:

**Purpose**

Controls when Q elements are enabled.

**Configuration**

AArch64 System register TRCQCTL bits [31:0] are architecturally mapped to External register TRCQCTL[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR0.QFILT == 1. Otherwise, direct accesses to TRCQCTL are UNDEFINED.

**Attributes**

TRCQCTL is a 64-bit register.

**Field descriptions**

The TRCQCTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>62</td>
<td>MODE, bit [8]</td>
</tr>
<tr>
<td>61</td>
<td>Selects whether the Address Range Comparators selected by TRCQCTL.RANGE indicate address ranges where the trace unit is permitted to generate Q elements or address ranges where the trace unit is not permitted to generate Q elements:</td>
</tr>
<tr>
<td>60</td>
<td>MODE</td>
</tr>
<tr>
<td>59</td>
<td>0b0</td>
</tr>
<tr>
<td>58</td>
<td>The Address Range Comparators selected by TRCQCTL.RANGE indicate address ranges where the trace unit must not generate Q elements. If no ranges are selected, Q elements are permitted across the entire memory map.</td>
</tr>
<tr>
<td>57</td>
<td>0b1</td>
</tr>
<tr>
<td>56</td>
<td>The Address Range Comparators selected by TRCQCTL.RANGE indicate address ranges where the trace unit can generate Q elements. If all the implemented bits in RANGE are set to 0b0 then Q elements are disabled.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**RANGE[<m>], bit [m], for m = 7 to 0**

Specifies whether Address Range Comparator <m> controls Q elements.
<table>
<thead>
<tr>
<th>RANGE[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The address range that Address Range Comparator m defines, is not selected.</td>
</tr>
<tr>
<td>0b1</td>
<td>The address range that Address Range Comparator m defines, is selected.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCQCTRLR**

Must be programmed if TRCCONFIGR.QE != 0b00.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

**MRS <Xt>, TRCQCTRLR**

<table>
<thead>
<tr>

end if;
TRCRSCTRL<n>, Resource Selection Control Register <n>, n = 2 - 31

The TRCRSCTRL<n> characteristics are:

**Purpose**

Controls the selection of the resources in the trace unit.

**Configuration**

AArch64 System register TRCRSCTRL<n> bits [31:0] are architecturally mapped to External register TRCRSCTRL<n>[31:0].

This register is present only when FEAT_ETE is implemented and ((AArch64-TRCIDR4.NUMRSPAIR + 1) * 2) > n. Otherwise, direct accesses to TRCRSCTRL<n> are UNDEFINED.

Resource selector 0 always returns FALSE.

Resource selector 1 always returns TRUE.

Resource selectors are implemented in pairs. Each odd numbered resource selector is part of a pair with the even numbered resource selector that is numbered as one less than it. For example, resource selectors 2 and 3 form a pair.

**Attributes**

TRCRSCTRL<n> is a 64-bit register.

**Field descriptions**

The TRCRSCTRL<n> bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | PAIRINV | INV | GROUP | SELECT |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:22]**

Reserved, RES0.

**PAIRINV, bit [21]**

When n is even:

Controls whether the combined result from a resource selector pair is inverted.

<table>
<thead>
<tr>
<th>PAIRINV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not invert the combined output of the 2 resource selectors.</td>
</tr>
<tr>
<td>0b1</td>
<td>Invert the combined output of the 2 resource selectors.</td>
</tr>
</tbody>
</table>

If:

- A is the register TRCRSCTRL<n>.
- B is the register TRCRSCTRL<n+1>.

Then the combined output of the 2 resource selectors A and B depends on the value of (A.PAIRINV, A.INV, B.INV) as follows:
• 0b000 -> A and B.
• 0b001 -> Reserved.
• 0b010 -> not(A) and B.
• 0b011 -> not(A) and not(B).
• 0b100 -> not(A) or not(B).
• 0b101 -> not(A) or B.
• 0b110 -> Reserved.
• 0b111 -> A or B.

On a Trace unit reset, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.

INV, bit [20]

Controls whether the resource, that TRCRSCTRL<n>.GROUP and TRCRSCTRL<n>.SELECT selects, is inverted.

<table>
<thead>
<tr>
<th>INV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not invert the output of this selector.</td>
</tr>
<tr>
<td>0b1</td>
<td>Invert the output of this selector.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally unknown value.

GROUP, bits [19:16]

Selects a group of resources.

<table>
<thead>
<tr>
<th>GROUP</th>
<th>Meaning</th>
<th>SELECT</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>External Input Selectors.</td>
<td>SELECT encoding for External Input Selectors</td>

<td>SELECT encoding for Context Identifier Comparators</td>
</tr>
<tr>
<td>0b0111</td>
<td>Virtual Context Identifier Comparators.</td>
<td>SELECT encoding for Virtual Context Identifier Comparators</td>
</tr>
</tbody>
</table>

All other values are reserved.

On a Trace unit reset, this field resets to an architecturally unknown value.

SELECT, bits [15:0]

Resource Specific Controls. Contains the controls specific to the resource group selected by GROUP, described in the following sections.

**SELECT encoding for External Input Selectors**

```plaintext
  15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0
```
Reserved, RES0.

EXTIN[m], bit [m], for m = 3 to 0

Selects one or more External Inputs.

<table>
<thead>
<tr>
<th>EXTIN[m]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Ignore EXTIN m.</td>
</tr>
<tr>
<td>0b1</td>
<td>Select EXTIN m.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m \(\geq\) TRCIDR5.NUMEXTINSEL.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**SELECT encoding for PE Comparator Inputs**

<table>
<thead>
<tr>
<th>15141312111098</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
</table>

Reserved, RES0.

PECOMP[m], bit [m], for m = 7 to 0

Selects one or more PE Comparator Inputs.

<table>
<thead>
<tr>
<th>PECOMP[m]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Ignore PE Comparator Input m.</td>
</tr>
<tr>
<td>0b1</td>
<td>Select PE Comparator Input m.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m \(\geq\) TRCIDR4.NUMPC.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**SELECT encoding for Counters and Sequencer**

<table>
<thead>
<tr>
<th>15141312111098</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
</tr>
</thead>
</table>

Reserved, RES0.

SEQUENCER[m], bit [m+4], for m = 3 to 0

Sequencer states.

<table>
<thead>
<tr>
<th>SEQUENCER[m]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Ignore Sequencer state m.</td>
</tr>
<tr>
<td>0b1</td>
<td>Select Sequencer state m.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m \(\geq\) TRCIDR5.NUMSEQSTATE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

COUNTERS[m], bit [m], for m = 3 to 0

Counters resources at zero.
**SELECT encoding for Single-shot Comparator Controls**

<table>
<thead>
<tr>
<th>Bits [15:8]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**SINGLE_SHOT[m], bit [m], for m = 7 to 0**

Selects one or more Single-shot Comparator Controls.

<table>
<thead>
<tr>
<th>SINGLE_SHOT[m]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Ignore Single-shot Comparator Control m.</td>
</tr>
<tr>
<td>0b1</td>
<td>Select Single-shot Comparator Control m.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR4.NUMSSCC.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**SELECT encoding for Single Address Comparators**

<table>
<thead>
<tr>
<th>Bits [15:8]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**SAC[m], bit [m], for m = 15 to 0**

Selects one or more Single Address Comparators.

<table>
<thead>
<tr>
<th>SAC[m]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Ignore Single Address Comparator m.</td>
</tr>
<tr>
<td>0b1</td>
<td>Select Single Address Comparator m.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= 2 × TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**SELECT encoding for Address Range Comparators**

<table>
<thead>
<tr>
<th>Bits [15:8]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**ARC[m], bit [m], for m = 7 to 0**

Selects one or more Address Range Comparators.
This bit is RES0 if m >= TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

### SELECT encoding for Context Identifier Comparators

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>15</td>
<td>RES0</td>
</tr>
<tr>
<td>14</td>
<td>CID[7]</td>
</tr>
<tr>
<td>13</td>
<td>CID[6]</td>
</tr>
<tr>
<td>12</td>
<td>CID[5]</td>
</tr>
<tr>

</tr>
<tr>
<td>10</td>
<td>CID[3]</td>
</tr>
<tr>
<td>9</td>
<td>CID[2]</td>
</tr>
<tr>
<td>8</td>
<td>CID[1]</td>
</tr>
<tr>
<td>7</td>
<td>CID[0]</td>
</tr>
</tbody>
</table>

**Bits [15:8]**

Reserved, RES0.

### CID[m], bit [m], for m = 7 to 0

Selects one or more Context Identifier Comparators.

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>Ignore Context Identifier Comparator m.</td>
</tr>
<tr>
<td>6</td>
<td>Select Context Identifier Comparator m.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR4.NUMCIDC.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

### SELECT encoding for Virtual Context Identifier Comparators

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>15</td>
<td>RES0</td>
</tr>
<tr>
<td>14</td>
<td>VMID[7]</td>
</tr>
<tr>
<td>13</td>
<td>VMID[6]</td>
</tr>
<tr>
<td>12</td>
<td>VMID[5]</td>
</tr>
<tr>
<td>11</td>
<td>VMID[4]</td>
</tr>
<tr>
<td>10</td>
<td>VMID[3]</td>
</tr>
<tr>

<td>VMID[2]</td>
</tr>
<tr>
<td>8</td>
<td>VMID[1]</td>
</tr>
<tr>
<td>7</td>
<td>VMID[0]</td>
</tr>
</tbody>
</table>

**Bits [15:8]**

Reserved, RES0.

### VMID[m], bit [m], for m = 7 to 0

Selects one or more Virtual Context Identifier Comparators.

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>Ignore Virtual Context Identifier Comparator m.</td>
</tr>
<tr>
<td>6</td>
<td>Select Virtual Context Identifier Comparator m.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR4.NUMVMIDC.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

### Accessing the TRCRSCTLR<n>

Must be programmed if any of the following are true:

- TRCCNTCTLR<a>.RLDEVENT.TYPE == 0b0 and TRCCNTCTLR<a>.RLDEVENT.SEL == n.
- TRCCNTCTLR<a>.RLDEVENT.TYPE == 0b1 and TRCCNTCTLR<a>.RLDEVENT.SEL == n/2.
- TRCCNTCTLR<a>.CNTEVENT.TYPE == 0b0 and TRCCNTCTLR<a>.CNTEVENT.SEL == n.
- TRCCNTCTLR<a>.CNTEVENT.TYPE == 0b1 and TRCCNTCTLR<a>.CNTEVENT.SEL == n/2.
- TRCEVENTCTL0R.EVENT0.TYPE == 0b0 and TRCEVENTCTL0R.EVENT0.SEL == n.
- TRCEVENTCTL0R.EVENT0.TYPE == 0b1 and TRCEVENTCTL0R.EVENT0.SEL == n/2.
- TRCEVENTCTL0R.EVENT1.TYPE == 0b0 and TRCEVENTCTL0R.EVENT1.SEL == n.
- TRCEVENTCTL0R.EVENT1.TYPE == 0b1 and TRCEVENTCTL0R.EVENT1.SEL == n/2.
• TRCEVENTCTL0R.EVENT2.TYPE == 0b0 and TRCEVENTCTL0R.EVENT2.SEL == n.
• TRCEVENTCTL0R.EVENT2.TYPE == 0b1 and TRCEVENTCTL0R.EVENT2.SEL == n/2.
• TRCEVENTCTL0R.EVENT3.TYPE == 0b0 and TRCEVENTCTL0R.EVENT3.SEL == n.
• TRCEVENTCTL0R.EVENT3.TYPE == 0b1 and TRCEVENTCTL0R.EVENT3.SEL == n/2.
• TRCSEQEVR<->.B.TYPE == 0b0 and TRCSEQEVR<->.B.SEL = n.
• TRCSEQEVR<->.B.TYPE == 0b1 and TRCSEQEVR<->.B.SEL = n/2.
• TRCSEQEVR<->.F.TYPE == 0b0 and TRCSEQEVR<->.F.SEL = n.
• TRCSEQEVR<->.F.TYPE == 0b1 and TRCSEQEVR<->.F.SEL = n/2.
• TRCEORSTEVR.RST.TYPE == 0b0 and TRCEORSTEVR.RST.SEL == n.
• TRCEORSTEVR.RST.TYPE == 0b1 and TRCEORSTEVR.RST.SEL == n/2.
• TRCTSCCTLR.EVENT.TYPE == 0b0 and TRCTSCCTLR.EVENT.SEL == n.
• TRCTSCCTLR.EVENT.TYPE == 0b1 and TRCTSCCTLR.EVENT.SEL == n/2.
• TRCVICTLR.EVENT.TYPE == 0b0 and TRCVICTLR.EVENT.SEL == n.
• TRCVICTLR.EVENT.TYPE == 0b1 and TRCVICTLR.EVENT.SEL == n/2.

Writes are constrained unpredictable if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

TRCRSR, Resources Status Register

The TRCRSR characteristics are:

**Purpose**

Use this to set, or read, the status of the resources.

**Configuration**

AArch64 System register TRCRSR bits [31:0] are architecturally mapped to External register TRCRSR[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCRSR are UNDEFINED.

**Attributes**

TRCRSR is a 64-bit register.

**Field descriptions**

The TRCRSR bit assignments are:

|--------------|------|----|----------|----------|----------|----------|------|----------|----------|----------|----------|

**Bits [63:13]**

Reserved, RES0.

**TA, bit [12]**

Tracing active.

<table>
<thead>
<tr>
<th>TA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tracing is not active.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tracing is active.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**EVENT[<m>], bit [m+8], for m = 3 to 0**

Untraced status of ETEEvents.

<table>
<thead>
<tr>
<th>EVENT[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An ETEEvent[m] has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>An ETEEvent[m] has occurred while the resources were in the Paused state.</td>
</tr>
</tbody>
</table>

This bit is res0 if TRCIDR4.NUMRSPAIR == 0b0 || m > TRCIDR0.NUMEVENT.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [7:4]**

Reserved, RES0.
The sticky status of the External Input Selectors.

<table>
<thead>
<tr>
<th>EXTIN[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An event selected by External Input Selector[m] has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one event selected by External Input Selector[m] has occurred while the resources were in the Paused state.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR5.NUMEXTINSEL.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

### Accessing the TCRSR

Must always be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings:

```
MRS <Xt>, TCRSR
```

<table>
<thead>

    end
TRCSEQEVR<n>, Sequencer State Transition Control Register <n>, n = 0 - 2

The TRCSEQEVR<n> characteristics are:

**Purpose**

Moves the Sequencer state:

- Backwards, from state n+1 to state n when a programmed resource event occurs.
- Forwards, from state n to state n+1 when a programmed resource event occurs.

**Configuration**

AArch64 System register TRCSEQEVR<n> bits [31:0] are architecturally mapped to External register TRCSEQEVR<n>[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQEVR<n> are **UNDEFINED**.

**Attributes**

TRCSEQEVR<n> is a 64-bit register.

**Field descriptions**

The TRCSEQEVR<n> bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |

**Bits [63:16]**

Reserved, RES0.

**B_TYPE, bit [15]**

Chooses the type of Resource Selector.

Backward field. Defines whether the backward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state n+1 to state n. For example, if TRCSEQEVR2.B.SEL == 0x14 then when event 0x14 occurs, the Sequencer moves from state 3 to state 2.

<table>
<thead>
<tr>
<th>B_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector. TRCSEQEVR&lt;n&gt;.B.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCSEQEVR&lt;n&gt;.B.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR&lt;n&gt;.B.SEL[4] is RES0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.
Bits [14:13]

Reserved, RES0.

B_SEL, bits [12:8]

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR\langle n\rangle.B.TYPE controls whether TRCSEQEVR\langle n\rangle.B_SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Backward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

F_TYPE, bit [7]

Chooses the type of Resource Selector.

Backward field. Defines whether the forward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state \( n \) to state \( n+1 \). For example, if TRCSEQEVR1.F_SEL == 0x12 then when event 0x12 occurs, the Sequencer moves from state 1 to state 2.

<table>
<thead>
<tr>
<th>( F_{TYPE} )</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector. TRCSEQEVR\langle n\rangle.F_SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCSEQEVR\langle n\rangle.F_SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR\langle n\rangle.F_SEL[4] is RES0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

F_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR\langle n\rangle.F_TYPE controls whether TRCSEQEVR\langle n\rangle.F_SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Forward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCSEQEVR\langle n\rangle

Must be programmed if TRCRSCTRL\langle a\rangle.GROUP == 0b0010 and TRCRSCTRL\langle a\rangle.SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSEQSTR, Sequencer State Register

The TRCSEQSTR characteristics are:

Purpose

Use this to set, or read, the Sequencer state.

Configuration

AArch64 System register TRCSEQSTR bits [31:0] are architecturally mapped to External register TRCSEQSTR[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQSTR are UNDEFINED.

Attributes

TRCSEQSTR is a 64-bit register.

Field descriptions

The TRCSEQSTR bit assignments are:

<table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRCSEQSTR

Must be programmed if TRCRSCTRL<a>.GROUP == 0b0010 and TRCRSCTRL<a>.SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
   UNDEFINED;
elsif PSTATE.EL == EL1 then
   if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1'" && CPTR_EL3.TTA == '1' then

The TRCSSCCR\(n\) characteristics are:

**Purpose**

Controls the corresponding Single-shot Comparator Control resource.

**Configuration**

AArch64 System register TRCSSCCR\(n\) bits [31:0] are architecturally mapped to External register TRCSSCCR\(n\)[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMSSCC > \(n\). Otherwise, direct accesses to TRCSSCCR\(n\) are **UNDEFINED**.

**Attributes**

TRCSSCCR\(n\) is a 64-bit register.

**Field descriptions**

The TRCSSCCR\(n\) bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:25</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>24</td>
<td>RST, bit [24].</td>
</tr>
<tr>
<td>23:16</td>
<td>ARC([m]), bit [m+16], for m = 7 to 0</td>
</tr>
</tbody>
</table>

**RST, bit [24]**

Selects the Single-shot Comparator Control mode.

<table>
<thead>
<tr>
<th>RST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Single-shot Comparator Control is in single-shot mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Single-shot Comparator Control is in multi-shot mode.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**ARC\([m]\), bit [m+16], for m = 7 to 0**

Selects one or more Address Range Comparators for Single-shot control.

<table>
<thead>
<tr>
<th>ARC([m])</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Range Comparator (m) is not selected for Single-shot control.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Range Comparator (m) is selected for Single-shot control.</td>
</tr>
</tbody>
</table>

This bit is **RES0** if \(m \geq \) TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.
**SAC[^m^], bit [m], for m = 15 to 0**

Selects one or more Single Address Comparators for Single-shot control.

<table>
<thead>
<tr>
<th>SAC[^m^]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Single Address Comparator m, is not selected for Single-shot control.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Single Address Comparator m, is selected for Single-shot control.</td>
</tr>
</tbody>
</table>

This bit is \texttt{RES0} if \( m \geq 2 \times \text{TRCIDR4.NUMACPAIRS} \).

On a Trace unit reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**Accessing the TRCSSCCR<n>**

Must be programmed if any \text{TRCRSCTLR<a>.GROUP} == 0b0011 and \text{TRCRSCTLR<a>.SINGLE_SHOT[n]} == 0b1.

Writes are \texttt{CONSTRAINED UNPREDICTABLE} if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

**MRS \langle Xt\rangle, TRCSSCCR<n>**

<table>

</table>

Bits [63:32]

Reserved, RES0.

**STATUS, bit [31]**

Single-shot Comparator Control status. Indicates if any of the comparators selected by this Single-shot Comparator control have matched. The selected comparators are defined by TRCSSCCR<n>.ARC, TRCSSCCR<n>.SAC, and TRCSSPCICR<n>.PC.

<table>
<thead>
<tr>
<th>STATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No match has occurred. When the first match occurs, this field takes a value of 0b1. It remains at 0b1 until explicitly modified by a write to this register.</td>
</tr>
<tr>
<td>0b1</td>
<td>One or more matches has occurred. If TRCSSCCR&lt;n&gt;.RST == 0b0 then:</td>
</tr>
<tr>
<td></td>
<td>• There is only one match and no more matches are possible.</td>
</tr>
<tr>
<td></td>
<td>• Software must reset this bit to 0b0 to re-enable the Single-shot Comparator Control.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**PENDING, bit [30]**

Single-shot pending status. The Single-shot Comparator Control fired while the resources were in the Paused state.
On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [29:4]**

Reserved, RES0.

**PC, bit [3]**

PE Comparator Input support. Indicates if the Single-shot Comparator Control supports PE Comparator Inputs.

<table>
<thead>
<tr>
<th>PC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This Single-shot Comparator Control does not support PE Comparator Inputs. Selecting any PE Comparator Inputs using the associated TRCSSPCICR&lt;n&gt; results in <strong>CONSTRAINED UNPREDICTABLE</strong> behavior of the Single-shot Comparator Control resource. The Single-shot Comparator Control might match unexpectedly or might not match.</td>
</tr>
<tr>
<td>0b1</td>
<td>This Single-shot Comparator Control supports PE Comparator Inputs.</td>
</tr>
</tbody>
</table>

Access to this field is **RO**.

**DV, bit [2]**

Data value comparator support. Data value comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>DV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This Single-shot Comparator Control does not support data value comparisons.</td>
</tr>
<tr>
<td>0b1</td>
<td>This Single-shot Comparator Control supports data value comparisons.</td>
</tr>
</tbody>
</table>

This bit reads as **0b0**.

Access to this field is **RO**.

**DA, bit [1]**

Data Address Comparator support. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

<table>
<thead>
<tr>
<th>DA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This Single-shot Comparator Control does not support data address comparisons.</td>
</tr>
<tr>
<td>0b1</td>
<td>This Single-shot Comparator Control supports data address comparisons.</td>
</tr>
</tbody>
</table>

This bit reads as **0b0**.

Access to this field is **RO**.

**INST, bit [0]**

Instruction Address Comparator support. Indicates if the Single-shot Comparator Control supports instruction address comparisons.
<table>
<thead>
<tr>
<th>INST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This Single-shot Comparator Control does not support instruction address comparisons.</td>
</tr>
<tr>
<td>0b1</td>
<td>This Single-shot Comparator Control supports instruction address comparisons.</td>
</tr>
</tbody>
</table>

This bit reads as 0b1.

Access to this field is RO.

**Accessing the TRCSSCSR<n>**

Must be programmed if TRCRSCTRL<a>.GROUP == 0b0011 and TRCRSCTRL<a>.SINGLE_SHOT[n] == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings:

MRS <Xt>, TRCSSCSR<n>

**TRCSSPCICR<n>, Single-shot Processing Element Comparator Input Control Register <n>, n = 0 - 7**

The TRCSSPCICR<n> characteristics are:

**Purpose**

Returns the status of the corresponding Single-shot Comparator Control.

**Configuration**

AArch64 System register TRCSSPCICR<n> bits [31:0] are architecturally mapped to External register TRCSSPCICR<n>[31:0].

This register is present only when FEAT_ETE is implemented, TRCIDR4.NUMSSCC > n, TRCIDR4.NUMPC > 0b0000 and TRCSSCSR<n>.PC == 1. Otherwise, direct accesses to TRCSSPCICR<n> are UNDEFINED.

**Attributes**

TRCSSPCICR<n> is a 64-bit register.

**Field descriptions**

The TRCSSPCICR<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:8</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>31:0</td>
<td>PC[m], bit [m], for m = 7 to 0</td>
</tr>
<tr>
<td></td>
<td>Selects one or more PE Comparator Inputs for Single-shot control.</td>
</tr>
<tr>
<td>0b0</td>
<td>The single PE Comparator Input m, is not selected as for Single-shot control.</td>
</tr>
<tr>
<td>0b1</td>
<td>The single PE Comparator Input m, is selected as for Single-shot control.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR4.NUMPC.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCSSPCICR<n>**

Must be programmed if implemented and any TRCRSCTRL<a>.GROUP == 0b0011 and TRCRSCTRL<a>.SINGLE_SHOT[n] == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.
Accesses to this register use the following encodings:

MRS <Xt>, TRCSSPCICR<n>

TRCSTALLCTRL, Stall Control Register

The TRCSTALLCTRL characteristics are:

**Purpose**

Enables trace unit functionality that prevents trace unit buffer overflows.

**Configuration**

AArch64 System register TRCSTALLCTRL bits [31:0] are architecturally mapped to External register TRCSTALLCTRL[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR3.STALLCTL == 1. Otherwise, direct accesses to TRCSTALLCTRL are UNDEFINED.

**Attributes**

TRCSTALLCTRL is a 64-bit register.

**Field descriptions**

The TRCSTALLCTRL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>59</td>
<td>NOOVERFLOW, bit [13]</td>
</tr>
<tr>
<td>52</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>47</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>40</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>34</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>28</td>
<td>RESERVED, RES0</td>
</tr>
<tr>
<td>22</td>
<td>RESERVED, RES0</td>
</tr>
<tr>
<td>16</td>
<td>RESERVED, RES0</td>
</tr>
<tr>
<td>10</td>
<td>RESERVED, RES0</td>
</tr>
<tr>
<td>4</td>
<td>RESERVED, RES0</td>
</tr>
<tr>
<td>0</td>
<td>RESERVED, RES0</td>
</tr>
</tbody>
</table>

**Bits [63:14]**

Reserved, RES0.

**NOOVERFLOW, bit [13]**

When TRCIDR3.NOOVERFLOW == 1:

Trace overflow prevention.

<table>
<thead>
<tr>
<th>NOOVERFLOW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace unit buffer overflow prevention is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace unit buffer overflow prevention is enabled.</td>
</tr>
</tbody>
</table>

Note that enabling this feature might cause a significant performance impact.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [12:9]**

Reserved, RES0.
ISTALL, bit [8]

Instruction stall control. Controls if a trace unit can stall the PE when the trace buffer space is less than LEVEL.

<table>
<thead>
<tr>
<th>ISTALL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit must not stall the PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit can stall the PE.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [7:4]**

Reserved, **RES0**.

**LEVEL, bits [3:0]**

Threshold level field. The field can support 16 monotonic levels from 0b0000 to 0b1111.

The value 0b0000 defines the Minimal invasion level. This setting has a greater risk of a trace unit buffer overflow.

The value 0b1111 defines the Maximum invasion level. This setting has a reduced risk of a trace unit buffer overflow.

Note that for some implementations, invasion might occur at the minimal invasion level.

It is IMPLEMENTATION DEFINED whether some of the least significant bits are supported. Arm recommends that bits[3:2] are supported.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the TRCSTALLCTRLR**

Must be programmed if implemented.

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

TRCSYNCPR, Synchronization Period Register

The TRCSYNCPR characteristics are:

**Purpose**

Controls how often trace protocol synchronization requests occur.

**Configuration**

AArch64 System register TRCSYNCPR bits [31:0] are architecturally mapped to External register TRCSYNCPR[31:0].

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCSYNCPR are UNDEFINED.

**Attributes**

TRCSYNCPR is a 64-bit register.

**Field descriptions**

The TRCSYNCPR bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [63:5]**

Reserved, RES0.

**PERIOD, bits [4:0]**

Defines the number of bytes of trace between each periodic trace protocol synchronization request.
<table>
<thead>
<tr>
<th>PERIOD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000</td>
<td>Trace protocol synchronization is disabled.</td>
</tr>
<tr>
<td>0b01000</td>
<td>Trace protocol synchronization request occurs after $2^8$ bytes of trace.</td>
</tr>
<tr>
<td>0b01001</td>
<td>Trace protocol synchronization request occurs after $2^9$ bytes of trace.</td>
</tr>
<tr>
<td>0b01010</td>
<td>Trace protocol synchronization request occurs after $2^{10}$ bytes of trace.</td>
</tr>
<tr>
<td>0b01011</td>
<td>Trace protocol synchronization request occurs after $2^{11}$ bytes of trace.</td>
</tr>
<tr>
<td>0b01100</td>
<td>Trace protocol synchronization request occurs after $2^{12}$ bytes of trace.</td>
</tr>
<tr>
<td>0b01101</td>
<td>Trace protocol synchronization request occurs after $2^{13}$ bytes of trace.</td>
</tr>
<tr>
<td>0b01110</td>
<td>Trace protocol synchronization request occurs after $2^{14}$ bytes of trace.</td>
</tr>
<tr>
<td>0b01111</td>
<td>Trace protocol synchronization request occurs after $2^{15}$ bytes of trace.</td>
</tr>
<tr>
<td>0b10000</td>
<td>Trace protocol synchronization request occurs after $2^{16}$ bytes of trace.</td>
</tr>
<tr>
<td>0b10001</td>
<td>Trace protocol synchronization request occurs after $2^{17}$ bytes of trace.</td>
</tr>
<tr>
<td>0b10010</td>
<td>Trace protocol synchronization request occurs after $2^{18}$ bytes of trace.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Trace protocol synchronization request occurs after $2^{19}$ bytes of trace.</td>
</tr>
<tr>
<td>0b10100</td>
<td>Trace protocol synchronization request occurs after $2^{20}$ bytes of trace.</td>
</tr>
</tbody>
</table>

Other values are reserved. If a reserved value is programmed into PERIOD, then the behavior of the synchronization period counter is CONSTRAINED UNPREDICTABLE and one of the following behaviors occurs:

- No trace protocol synchronization requests are generated by this counter.
- Trace protocol synchronization requests occur at the specified period.
- Trace protocol synchronization requests occur at some other UNKNOWN period which can vary.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCSYNCP**

Must be programmed if TRCIDR3.SYNCPR == 0b0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

<td></td>
<td></td>
<td></td>
<td></td>
<td>RES0</td>
<td>TRACEID</td>
</tr>
</tbody>
</table>

**Bits [63:7]**

Reserved, RES0.

**TRACEID, bits [6:0]**

Trace ID field. Sets the trace ID value for instruction trace. The width of the field is indicated by the value of TRCIDRS.TRACEIDSIZE. Unimplemented bits are RES0.

If an implementation supports AMBA ATB, then:

- The width of the field is 7 bits.
- Writing a reserved trace ID value does not affect behavior of the trace unit but it might cause UNPREDICTABLE behavior of the trace capture infrastructure.

See the AMBA ATB Protocol Specification for information about which ATID values are reserved.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCTRACEIDR**

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

EVENT_SEL, bits [4:0]
When TRCIDR4.NUMRSPAIR != 0b0000:

Defines the selected Resource Selector or pair of Resource Selectors. TRCTSCTRL.EVENT.TYPE controls whether TRCTSCTRL.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

Accessing the TRCTSCTRL

Must be programmed if TRCCONFIGR.TS == 0b1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

MRS <Xt>, TRCTSCTRL

<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL1 in Non-secure state.</td>
<td></td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**EXLEVEL_NS_EL0, bit [20]**

*When Non-secure EL0 is implemented:*

Filter instruction trace for EL0 in Non-secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL0 in Non-secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL0 in Non-secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**EXLEVEL_S_EL3, bit [19]**

*When EL3 is implemented:*

Filter instruction trace for EL3 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL3 in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL3 in Secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**EXLEVEL_S_EL2, bit [18]**

*When EL2 is implemented and FEAT_SEL2 is implemented:*

Filter instruction trace for EL2 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL2 in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL2 in Secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**EXLEVEL_S_EL1, bit [17]**

When Secure EL1 is implemented:

Filter instruction trace for EL1 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL1 in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL1 in Secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**EXLEVEL_S_EL0, bit [16]**

When Secure EL0 is implemented:

Filter instruction trace for EL0 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit generates instruction trace for EL0 in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit does not generate instruction trace for EL0 in Secure state.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**Bits [15:12]**

Reserved, RES0.

**TRCERR, bit [11]**

When TRCIDR3.TRCERR == 1:

Controls the forced tracing of System Error exceptions.

<table>
<thead>
<tr>
<th>TRCERR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Forced tracing of System Error exceptions is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Forced tracing of System Error exceptions is enabled.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.
**TRCRESET, bit [10]**

Controls the forced tracing of PE Resets.

<table>
<thead>
<tr>
<th>TRCRESET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Forced tracing of PE Resets is disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Forced tracing of PE Resets is enabled.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**SSSTATUS, bit [9]**

ViewInst start/stop function status.

<table>
<thead>
<tr>
<th>SSSTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stopped State.</td>
</tr>
<tr>
<td></td>
<td>The ViewInst start/stop function is in the stopped state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Started State.</td>
</tr>
<tr>
<td></td>
<td>The ViewInst start/stop function is in the started state.</td>
</tr>
</tbody>
</table>

Before software enables the trace unit, it must write to this bit to set the initial state of the ViewInst start/stop function. If the ViewInst start/stop function is not used then set this bit to 0b1. Arm recommends that the value of this bit is set before each trace session begins.

If the trace unit becomes disabled while a start point or stop point is still speculative, then the value of TRCVICTLR.SSSTATUS is **UNKNOWN** and might represent the result of a speculative start point or stop point.

If software which is running on the PE being traced disables the trace unit, either by clearing TRCPRGCTRLR.EN or locking the OS Lock, Arm recommends that a DSB and an ISB instruction are executed before disabling the trace unit to prevent any start points or stop points being speculative at the point of disabling the trace unit. This procedure assumes that all start points or stop points occur before the barrier instructions are executed. The procedure does not guarantee that there are no speculative start points or stop points when disabling, although it helps minimize the probability.

This bit is **RES1** if TRCIDR4.NUMACPAIRS == 0b0000 and TRCIDR4.NUMPC == 0b0000.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [8]**

Reserved, **RES0**.

**EVENT_TYPE, bit [7]**

When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

<table>
<thead>
<tr>
<th>EVENT_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A single Resource Selector. TRCVICTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Boolean-combined pair of Resource Selectors. TRCVICTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCVICTLR.EVENT.SEL[4] is <strong>RES0</strong>.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, **RES0**.
Bits [6:5]

Reserved, RES0.

EVENT_SEL, bits [4:0]

When TRCIDR4.NUMRSPAIR != 0b0000:

Defines the selected Resource Selector or pair of Resource Selectors. TRCVICTLR.EVENT.TYPE controls whether TRCVICTLR.EVENT_SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

When TRCIDR4.NUMRSPAIR == 0b0000:

This field is reserved:
- Bits [4:1] are RES0.
- Bit [0] is RES1.

Otherwise:

Reserved, RES0.

Accessing the TRCVICTLR

Must be programmed.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings:

MRS <Xt>, TRCVICTLR

<table>

TRCVIIECTLR, ViewInst Include/Exclude Control Register

The TRCVIIECTLR characteristics are:

**Purpose**

Use this to select, or read, the Address Range Comparators for the ViewInst include/exclude function.

**Configuration**

AArch64 System register TRCVIIECTLR bits [31:0] are architecturally mapped to External register TRCVIIECTLR[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMACPAIRS > 0b0000. Otherwise, direct accesses to TRCVIIECTLR are UNDEFINED.

**Attributes**

TRCVIIECTLR is a 64-bit register.

**Field descriptions**

The TRCVIIECTLR bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:24]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXCLUDE[m]</td>
<td>The address range that Address Range Comparator m defines, is selected for the ViewInst exclude function.</td>
</tr>
<tr>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Bits [15:8]**

Reserved, RES0.
INCLUDE[<m>], bit [m], for m = 7 to 0

Include Address Range Comparator <m>.

Selects whether Address Range Comparator <m> is in use with the ViewInst include function.

Selecting no comparators for the ViewInst include function indicates that all instructions are included by default.

The ViewInst exclude function then indicates which ranges are excluded.

<table>
<thead>
<tr>
<th>INCLUDE[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The address range that Address Range Comparator m defines, is not selected for the ViewInst include function.</td>
</tr>
<tr>
<td>0b1</td>
<td>The address range that Address Range Comparator m defines, is selected for the ViewInst include function.</td>
</tr>
</tbody>
</table>

This bit is res0 if m >= TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCVIIECTLR**

Must be programmed if TRCIDR4.NUMACPAIRS > 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

*MRS <Xt>, TRCVIIECTLR*

TRCVIPCSSCTLR, ViewInst Start/Stop PE Comparator Control Register

The TRCVIPCSSCTLR characteristics are:

**Purpose**

Use this to select, or read, which PE Comparator Inputs can control the ViewInst start/stop function.

**Configuration**

AArch64 System register TRCVIPCSSCTLR bits [31:0] are architecturally mapped to External register TRCVIPCSSCTLR[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMPC > 0b0000. Otherwise, direct accesses to TRCVIPCSSCTLR are **UNDEFINED**.

**Attributes**

TRCVIPCSSCTLR is a 64-bit register.

**Field descriptions**

The TRCVIPCSSCTLR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>STOP[m]</td>
<td>The PE Comparator Input m, is selected as a stop resource.</td>
</tr>
<tr>
<td>STOP[m]</td>
<td>The PE Comparator Input m, is not selected as a stop resource.</td>
</tr>
</tbody>
</table>

This bit is **RES0** if m >= TRCIDR4.NUMPC.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [15:8]**

Reserved, **RES0**.
START(<m>), bit [m], for m = 7 to 0

Selects whether PE Comparator Input <m> is in use with ViewInst start/stop function, for the purpose of starting trace.

<table>
<thead>
<tr>
<th>START(&lt;m&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The PE Comparator Input m, is not selected as a start resource.</td>
</tr>
<tr>
<td>0b1</td>
<td>The PE Comparator Input m, is selected as a start resource.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR4.NUMPC.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRCVIPCSSCTLR**

Must be programmed if TRCIDR4.NUMPC != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

**MRS <Xt>, TRCVIPCSSCTLR**

The TRCVISSCTL characteristics are:

**Purpose**

Use this to select, or read, the Single Address Comparators for the ViewInst start/stop function.

**Configuration**

AArch64 System register TRCVISSCTL bits [31:0] are architecturally mapped to External register TRCVISSCTL[31:0].

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMACPAIRS > 0b0000. Otherwise, direct accesses to TRCVISSCTL are **UNDEFINED**.

**Attributes**

TRCVISSCTL is a 64-bit register.

**Field descriptions**

The TRCVISSCTL bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>
<th>55</th>
<th>54</th>
<th>53</th>
<th>52</th>
<th>51</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
<td>27</td>
<td>26</td>
<td>25</td>
<td>24</td>
<td>23</td>
<td>22</td>
<td>21</td>
<td>20</td>
<td>19</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**STOP[<m>], bit [m+16], for m = 15 to 0**

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function, for the purpose of stopping trace.

<table>
<thead>
<tr>
<th>STOP[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Single Address Comparator m, is not selected as a stop resource.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Single Address Comparator m, is selected as a stop resource.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= 2 × TRCIDR4.NUMACPAIRS.

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

**START[<m>], bit [m], for m = 15 to 0**

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function, for the purpose of starting trace.

<table>
<thead>
<tr>
<th>START[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Single Address Comparator m, is not selected as a start resource.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Single Address Comparator m, is selected as a start resource.</td>
</tr>
</tbody>
</table>
This bit is `RES0` if \( m \geq 2 \times \text{TRCIDR4.NUMACPAIRS} \).

On a Trace unit reset, this field resets to an architecturally `UNKNOWN` value.

**Accessing the TRCVISSCTLR**

Must be programmed if `TRCIDR4.NUMACPAIRS > 0b0000`.

For any 2 comparators selected for the ViewInst start/stop function, the comparator containing the lower address must be a lower numbered comparator.

Writes are `CONSTRAINED UNPREDICTABLE` if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

\[
\text{MRS <Xt>, TRCVISSCTLR}
\]

TRCVMIDCCTRL0, Virtual Context Identifier Comparator Control Register 0

The TRCVMIDCCTRL0 characteristics are:

**Purpose**

Virtual Context Identifier Comparator mask values for the TRCVMIDCVR<\text{n}> registers, where n=0-3.

**Configuration**

AArch64 System register TRCVMIDCCTRL0 bits [31:0] are architecturally mapped to External register TRCVMIDCCTRL0[31:0].

This register is present only when FEAT_ETE is implemented, TRCIDR4.NUMVMIDC > 0x0 and TRCIDR2.VMIDSIZE > 0b00000. Otherwise, direct accesses to TRCVMIDCCTRL0 are UNDEFINED.

**Attributes**

TRCVMIDCCTRL0 is a 64-bit register.

**Field descriptions**

The TRCVMIDCCTRL0 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>
<th>55</th>
<th>54</th>
<th>53</th>
</tr>
</thead>
</table>

**Bits [63:32]**

Reserved, RES0.

**COMP3[<m>], bit [m+24], for m = 7 to 0**

When TRCIDR4.NUMVMIDC > 3:

TRCVMIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR3. Each bit in this field corresponds to a byte in TRCVMIDCVR3.

<table>
<thead>
<tr>
<th>COMP3[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
COMP2[<m>], bit [m+16], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 2:

TRCVMIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR2. Each bit in this field corresponds to a byte in TRCVMIDCVR2.

<table>
<thead>
<tr>
<th>COMP2[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP1[<m>], bit [m+8], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 1:

TRCVMIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR1. Each bit in this field corresponds to a byte in TRCVMIDCVR1.

<table>
<thead>
<tr>
<th>COMP1[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP0[<m>], bit [m], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 0:

TRCVMIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR0. Each bit in this field corresponds to a byte in TRCVMIDCVR0.

<table>
<thead>
<tr>
<th>COMP0[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**Accessing the TRCVMIDCCTRL0**

If software uses the TRCVMIDCVR<\text{n}> registers, where n=0-3, then it must program this register.

If software sets a mask bit to 0b1 then it must program the relevant byte in TRCVMIDCVR<\text{n}> to 0x00.

If any bit is 0b1 and the relevant byte in TRCVMIDCVR<\text{n}> is not 0x00, the behavior of the Virtual Context Identifier Comparator is **CONSTRAINED UNPREDICTABLE**. In this scenario the comparator might match unexpectedly or might not match.

Writes are **CONSTRAINED UNPREDICTABLE** if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

**MRS <Xt>, TRCVMIDCCTRL0**

<table>

The TRCVMIDCCTRL1 characteristics are:

**Purpose**

Virtual Context Identifier Comparator mask values for the TRCVMIDCVR<n> registers, where n=4-7.

**Configuration**

AArch64 System register TRCVMIDCCTRL1 bits [31:0] are architecturally mapped to External register TRCVMIDCCTRL1[31:0].

This register is present only when FEAT_ETE is implemented, TRCIDR4.NUMVMIDC > 0x4 and TRCIDR2.VMIDSIZE > 0b00000. Otherwise, direct accesses to TRCVMIDCCTRL1 are UNDEFINED.

**Attributes**

TRCVMIDCCTRL1 is a 64-bit register.

**Field descriptions**

The TRCVMIDCCTRL1 bit assignments are:

**Bits [63:32]**

Reserved, RES0.

**COMP7[<m>], bit [m+24], for m = 7 to 0**

When TRCIDR4.NUMVMIDC > 7:

TRCVMIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR7. Each bit in this field corresponds to a byte in TRCVMIDCVR7.

<table>
<thead>
<tr>
<th>COMP7[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is RES0 if m >= TRCIDR2.VMIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
COMP6[<m>], bit [m+16], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 6:

TRCVMIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR6. Each bit in this field corresponds to a byte in TRCVMIDCVR6.

<table>
<thead>
<tr>
<th>COMP6[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is res0 if m >= TRCIDR2.VMIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, res0.

COMP5[<m>], bit [m+8], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 5:

TRCVMIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR5. Each bit in this field corresponds to a byte in TRCVMIDCVR5.

<table>
<thead>
<tr>
<th>COMP5[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is res0 if m >= TRCIDR2.VMIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, res0.

COMP4[<m>], bit [m], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 4:

TRCVMIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR4. Each bit in this field corresponds to a byte in TRCVMIDCVR4.

<table>
<thead>
<tr>
<th>COMP4[&lt;m&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The trace unit includes TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
<tr>
<td>0b1</td>
<td>The trace unit ignores TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.</td>
</tr>
</tbody>
</table>

This bit is res0 if m >= TRCIDR2.VMIDSIZE.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

### Accessing the TRCVMIDCCTLR1

If software uses the TRCVMIDCVR<\text{n}> registers, where \text{n}=4-7, then it must program this register.

If software sets a mask bit to 0\text{b}1 then it must program the relevant byte in TRCVMIDCVR<\text{n}> to 0\text{x}00.

If any bit is 0\text{b}1 and the relevant byte in TRCVMIDCVR<\text{n}> is not 0\text{x}00, the behavior of the Virtual Context Identifier Comparator is constrained unpredictable. In this scenario the comparator might match unexpectedly or might not match.

Writes are constrained unpredictable if the trace unit is not in the Idle state.

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>MRS &lt;\text{x}t&gt;, TRCVMIDCCTLR1</th>
</tr>
</thead>
<tbody>
<tr>
<td>op0</td>
</tr>
<tr>
<td>0b10</td>
</tr>
</tbody>
</table>

TRCVMIDCVR<n>, Virtual Context Identifier Comparator Value Register <n>, n = 0 - 7

The TRCVMIDCVR<n> characteristics are:

**Purpose**
Contains the Virtual Context Identifier Comparator value.

**Configuration**
AArch64 System register TRCVMIDCVR<n> bits [63:0] are architecturally mapped to External register TRCVMIDCVR<n>[63:0].

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMVMIDC > n. Otherwise, direct accesses to TRCVMIDCVR<n> are undefined.

**Attributes**
TRCVMIDCVR<n> is a 64-bit register.

**Field descriptions**
The TRCVMIDCVR<n> bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| VALUE | VALUE |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**VALUE, bits [63:0]**
Virtual context identifier value. The width of this field is indicated by TRCIDR2.VMIDSIZE. Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Virtual context identifier is zero until the PE updates the Virtual context identifier.

On a Trace unit reset, this field resets to an architecturally unknown value.

**Accessing the TRCVMIDCVR<n>**
Must be programmed if any of the following are true:
- TRCRSCTRLR<a>.GROUP == 0b0111 and TRCRSCTRLR<a>.VMID[n] == 0b1.
- TRCACATR<a>.CONTEXTTYPE == 0b10 or 0b11 and TRCACATR<a>.CONTEXT == n.

Accesses to this register use the following encodings:

<table>

The TRFCR_EL1 characteristics are:

**Purpose**

Provides EL1 controls for Trace.

**Configuration**

AArch64 System register TRFCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register TRFCR[31:0].

This register is present only when FEAT_TRF is implemented. Otherwise, direct accesses to TRFCR_EL1 are UNDEFINED.

**Attributes**

TRFCR_EL1 is a 64-bit register.

**Field descriptions**

The TRFCR_EL1 bit assignments are:

![Bit assignments](image)

**Bits [63:7]**

Reserved, RES0.

**TS, bits [6:5]**

Timestamp Control. Controls which timebase is used for trace timestamps.

<table>
<thead>
<tr>
<th>TS</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTPOFF_EL2.</td>
<td>When FEAT_ECV is implemented</td>
</tr>
</tbody>
</table>
| 0b10 | Guest physical timestamp. The traced timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2:  
  - SCR_EL3.ECVEn == 0b0.  
  - CNTHCTL_EL2.ECV == 0b0. | |
| 0b11 | Physical timestamp. The traced timestamp is the physical counter value. | |

All other values are reserved.

This field is ignored by the PE when any of the following are true:

- EL2 is implemented and TRFCR_EL2.TS != 0b00.
- SelfHostedTraceEnabled() == FALSE.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [4:2]**

Reserved, **RES0**.

**E1TRE, bit [1]**

EL1 Trace Enable.

<table>
<thead>
<tr>
<th>E1TRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace is prohibited at EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace is allowed at EL1.</td>
</tr>
</tbody>
</table>

This field is ignored if SelfHostedTraceEnabled() == FALSE.

On a Warm reset, this field resets to 0.

**E0TRE, bit [0]**

EL0 Trace Enable.

<table>
<thead>
<tr>
<th>E0TRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace is prohibited at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace is allowed at EL0.</td>
</tr>
</tbody>
</table>

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is implemented and enabled in the current Security state and **HCR_EL2.TGE == 1**.

On a Warm reset, this field resets to 0.

**Accessing the TRFCR_EL1**

Accesses to this register use the following encodings:

```
MRS <Xt>, TRFCR_EL1
```

<table>

The TRFCR_EL2 characteristics are:

**Purpose**

Provides EL2 controls for Trace.

**Configuration**

AArch64 System register TRFCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HTRFCR[31:0].

This register is present only when FEAT_TRF is implemented. Otherwise, direct accesses to TRFCR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

TRFCR_EL2 is a 64-bit register.

**Field descriptions**

The TRFCR_EL2 bit assignments are:

TTBR0_EL1, Translation Table Base Register 0 (EL1)

The TTBR0_EL1 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL1&0 translation regime, and other information for this translation regime.

**Configuration**

AArch64 System register TTBR0_EL1 bits [63:0] are architecturally mapped to AArch32 System register TTBR0[63:0].

**Attributes**

TTBR0_EL1 is a 64-bit register.

**Field descriptions**

The TTBR0_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ASID | BADDR[47:1] | CnP |

**ASID, bits [63:48]**

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**BADDR[47:1], bits [47:1]**

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL1.T0SZ, the translation stage, and the translation granule size.

**Note**

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of TCR_EL1.IPS is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.
If FEAT_LPA is implemented and the value of TCR_EL1.IPS is \texttt{0b110}, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is \texttt{RES0}.
- When x>6, register bits[(x-1):6] are \texttt{RES0}.

\textbf{Note}

TCR_EL1.IPS==\texttt{0b110} is permitted when:

- FEAT_LPA is implemented and the 64KB translation granule is used.
- FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of \texttt{ID_AA64MMFR0_EL1}.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when TCR_EL1.IPS is \texttt{0b110} and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as \texttt{RES0} has the value 1 when a translation table walk is done using TTBR0_EL1, then the translation table base address might be misaligned, with effects that are \textbf{CONSTRAINED UNPREDICTABLE}, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

On a Warm reset, this field resets to an architecturally \textbf{UNKNOWN} value.

**CnP, bit [0]**

\textbf{When FEAT_TTCNP is implemented:}

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1.

</table>
| 0b0  | The translation table entries pointed to by TTBR0_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR0_EL1 for other PEs in the Inner Shareable domain. This is not affected by:  
  - The value of TTBR0_EL1.CnP on those other PEs.  
  - The value of the current ASID.  
  - If EL2 is implemented and enabled in the current Security state, the value of the current VMID. |
| 0b1  | The translation table entries pointed to by TTBR0_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1 and all of the following apply:  
  - The translation table entries are pointed to by TTBR0_EL1.  
  - The translation tables relate to the same translation regime.  
  - The ASID is the same as the current ASID.  
  - If EL2 is implemented and enabled in the current Security state, the value of the current VMID. |

This field is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

\textbf{Note}

If the value of the TTBR0_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are \textbf{CONSTRAINED}.
UNPREDICTABLE, see ‘CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values’.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Accessing the TTBR0_EL1**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR0_EL1 or TTBR0_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**TTBR0_EL2, Translation Table Base Register 0 (EL2)**

The TTBR0_EL2 characteristics are:

**Purpose**

When \texttt{HCR\_EL2}.E2H is 0, holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

When \texttt{HCR\_EL2}.E2H is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL2&0 translation regime, and other information for this translation regime.

**Configuration**

AArch64 System register TTBR0_EL2 bits [47:1] are architecturally mapped to AArch32 System register \texttt{HTTBR}[47:1].

If EL2 is not implemented, this register is \texttt{RES0} from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

TTBR0_EL2 is a 64-bit register.

**Field descriptions**

The TTBR0_EL2 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| ASID|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
| BADDR[47:1] |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

**ASID, bits [63:48]**

When \texttt{FEAT\_VHE} is implemented:

When \texttt{HCR\_EL2}.E2H is 0, this field is \texttt{RES0}.

When \texttt{HCR\_EL2}.E2H is 1, it holds an ASID for the translation table base address. The \texttt{TCR\_EL2}.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are \texttt{RES0}.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**Otherwise:**

Reserved, \texttt{RES0}.

**BADDR[47:1], bits [47:1]**

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.
Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL2.T0SZ, the translation stage, and the translation granule size.

**Note**

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of TCR_EL2.{I}PS is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If FEAT_LPA is implemented and the value of TCR_EL2.{I}PS is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- When x>6, register bits[(x-1):6] are RES0.

**Note**

The OA size specified by TCR_EL2.{I}PS is determined as follows:

- The value of TCR_EL2.PS when the value of HCR_EL2.E2H is 0.
- The value of TCR_EL2.IPS when the value of HCR_EL2.E2H is 1.

TCR_EL2.{I}PS==0b110 is permitted when:

- FEAT_LPA is implemented and the 64KB translation granule is used.
- FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when TCR_EL2.{I}PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CnP, bit [0]**

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1.
The translation table entries pointed to by TTBR0_EL2 for the current translation regime, and ASID if applicable, are permitted to differ from corresponding entries for TTBR0_EL2 for other PEs in the Inner Shareable domain. This is not affected by:
- The value of TTBR0_EL2.CnP on those other PEs.
- When the current translation regime is the EL2&0 regime, the value of the current ASID.

The translation table entries pointed to by TTBR0_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1 and all of the following apply:
- The translation table entries are pointed to by TTBR0_EL2.
- The translation tables relate to the same translation regime.
- If that translation regime is the EL2&0 regime, the ASID is the same as the current ASID.

This field is permitted to be cached in a TLB.

Note

If the value of the TTBR0_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see ‘CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values’.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

### Accessing the TTBR0_EL2

When **HCR_EL2.E2H** is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR0_EL2 or TTBR0_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```

TTBR0_EL3, Translation Table Base Register 0 (EL3)

The TTBR0_EL3 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL3 translation regime, and other information for this translation regime.

**Configuration**

This register is present only when EL3 is implemented. Otherwise, direct accesses to TTBR0_EL3 are UNDEFINED.

**Attributes**

TTBR0_EL3 is a 64-bit register.

**Field descriptions**

The TTBR0_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td>62</td>
<td>BADDR[47:1]</td>
</tr>
<tr>
<td>31</td>
<td>...</td>
</tr>
</tbody>
</table>

**Bits [63:48]**

Reserved, RES0.

**BADDR[47:1], bits [47:1]**

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL3.T0SZ, the translation stage, and the translation granule size.

**Note**

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of TCR_EL3.PS is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If FEAT_LPA is implemented and the value of TCR_EL3.PS is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- When x>6, register bits[(x-1):6] are RES0.
Note

TCR_EL3 PS==0b110 is permitted when:

- FEAT_LPA is implemented and the 64KB translation granule is used.
- FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when TCR_EL3 PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0_EL3, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL3 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table entries pointed to by TTBR0_EL3, for the current translation regime, are permitted to differ from corresponding entries for TTBR0_EL3 for other PEs in the Inner Shareable domain. This is not affected by the value of TTBR0_EL3.CnP on those other PEs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The translation table entries pointed to by TTBR0_EL3 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1 and the translation table entries are pointed to by TTBR0_EL3.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

Note

If the value of the TTBR0_EL3.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL3s do not point to the same translation table entries the results of translations using TTBR0_EL3 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the TTBR0_EL3

elif PSTATE.EL == EL3 then
  TTBR0_EL3 = X[t];
TTBR1_EL1, Translation Table Base Register 1 (EL1)

The TTBR1_EL1 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL1&0 stage 1 translation regime, and other information for this translation regime.

**Configuration**

AArch64 System register TTBR1_EL1 bits [63:0] are architecturally mapped to AArch32 System register TTBR1[63:0].

**Attributes**

TTBR1_EL1 is a 64-bit register.

**Field descriptions**

The TTBR1_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ASID | BADDR[47:1] | CnP |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**ASID, bits [63:48]**

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**BADDR[47:1], bits [47:1]**

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL1.TISZ, the translation stage, and the translation granule size.

**Note**

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of TCR_EL1.IPS is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.
If FEAT_LPA is implemented and the value of TCR_EL1.IPS is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- When x>6, register bits[(x-1):6] are RES0.

Note

TCR_EL1.IPS==0b110 is permitted when:

- FEAT_LPA is implemented and the 64KB translation granule is used.
- FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when TCR_EL1.IPS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR1_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0   | The translation table entries pointed to by TTBR1_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR1_EL1 for other PEs in the Inner Shareable domain. This is not affected by:
  - The value of TTBR1_EL1.CnP on those other PEs.
  - The value of the current ASID.
  - If EL2 is implemented and enabled in the current Security state, the value of the current VMID. |
| 0b1   | The translation table entries pointed to by TTBR1_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1 and all of the following apply:
  - The translation table entries are pointed to by TTBR1_EL1.
  - The translation tables relate to the same translation regime.
  - The ASID is the same as the current ASID.
  - If EL2 is implemented and enabled in the current Security state, the value of the current VMID. |

This field is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR1_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED.
UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Accessing the TTBR1_EL1**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR1_EL1 or TTBR1_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**TTBR1_EL2, Translation Table Base Register 1 (EL2)**

The TTBR1_EL2 characteristics are:

**Purpose**

When HCR_EL2.E2H is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL2&0 translation regime, and other information for this translation regime.

*Note*

When HCR_EL2.E2H is 0, the contents of this register are ignored by the PE, except for a direct read or write of the register.

**Configuration**

This register is present only when FEAT_VHE is implemented. Otherwise, direct accesses to TTBR1_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

TTBR1_EL2 is a 64-bit register.

**Field descriptions**

The TTBR1_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ASID | **BADDR[47:1]** | **CnP** |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**ASID, bits [63:48]**

An ASID for the translation table base address. The **TCR_EL2**.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**BADDR[47:1], bits [47:1]**

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of **TCR_EL2**.T1SZ, the translation stage, and the translation granule size.

*Note*
A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of TCR_EL2.(1)PS is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If FEAT_LPA is implemented and the value of TCR_EL2.(1)PS is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- When x>6, register bits[(x-1):6] are RES0.

Note

The OA size specified by TCR_EL2.(1)PS is determined as follows:

- The value of TCR_EL2.PS when the value of HCR_EL2.E2H is 0.
- The value of TCR_EL2.IPS when the value of HCR_EL2.E2H is 1.

TCR_EL2.(1)PS==0b110 is permitted when:

- FEAT_LPA is implemented and the 64KB translation granule is used.
- FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of ID_AA64MMFRO_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when TCR_EL2.(1)PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR1_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table entries pointed to by TTBR1_EL2 are the current ASID are permitted to differ from corresponding entries for TTBR1_EL2 for other PEs in the Inner Shareable domain. This is not affected by:</td>
</tr>
<tr>
<td></td>
<td>The value of TTBR1_EL2.CnP on those other PEs.</td>
</tr>
<tr>
<td></td>
<td>The value of the current ASID.</td>
</tr>
<tr>
<td>0b1</td>
<td>The translation table entries pointed to by TTBR1_EL2 for the current ASID are permitted to differ from corresponding entries for TTBR1_EL2 for other PEs in the Inner Shareable domain. This is the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1 and all of the following apply:</td>
</tr>
</tbody>
</table>
Note

- TTBR1_EL2 is accessible only when the value of HCR_EL2.E2H is 1, meaning the current translation regime is the EL2&0 regime.
- If the value of the TTBR1_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are \textit{CONSTRAINED UNPREDICTABLE}, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

On a Warm reset, this field resets to an architecturally \textit{UNKNOWN} value.

\textbf{Otherwise}:

Reserved, RES0.

\textbf{Accessing the TTBR1_EL2}

VBAR_EL2, Vector Base Address Register (EL2)

The VBAR_EL2 characteristics are:

Purpose

Holds the vector base address for any exception that is taken to EL2.

Configuration

AArch64 System register VBAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HVBAR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VBAR_EL2 is a 64-bit register.

Field descriptions

The VBAR_EL2 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |

Vector Base Address. Base address of the exception vectors for exceptions taken to EL2.

Note

If FEAT_LVA is implemented:

- If HCR_EL2.E2H == 0b1:
  - If tagged addresses are being used, bits [55:52] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
  - If tagged addresses are not being used, bits [63:52] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
- If HCR_EL2.E2H == 0b0:
  - If tagged addresses are being used, bits [55:52] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
  - If tagged addresses are not being used, bits [63:52] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.

If FEAT_LVA is not implemented:

- If HCR_EL2.E2H == 0b1:
  - If tagged addresses are being used, bits [55:48] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.

Page 2272
If tagged addresses are not being used, bits [63:48] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.

- If HCR_EL2.E2H == 0b0:
  - If tagged addresses are being used, bits [55:48] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
  - If tagged addresses are not being used, bits [63:48] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [10:0]**

Reserved, RES0.

- If tagged addresses are not being used, bits [63:48] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

If the implementation supports FEAT_LVA, then:

- If tagged addresses are being used, bits [55:52] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [10:0]**

Reserved, RES0.

The VDISR_EL2 characteristics are:

**Purpose**

Records that a virtual SError interrupt has been consumed by an ESB instruction executed at EL1.

An indirect write to VDISR_EL2 made by an ESB instruction does not require an explicit synchronization operation for the value written to be observed by a direct read of DISR_EL1 or DISR occurring in program order after the ESB instruction.

**Configuration**

AArch64 System register VDISR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VDISR[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VDISR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VDISR_EL2 is a 64-bit register.

**Field descriptions**

The VDISR_EL2 bit assignments are:

**When EL1 is using AArch64:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>29</td>
<td>IDS</td>
<td></td>
</tr>
<tr>
<td>28</td>
<td>ISS</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**A, bit [31]**

Set to 1 when an ESB instruction defers a virtual SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [30:25]**

Reserved, RES0.

**IDS, bit [24]**

The value copied from VSESR_EL2.IDS.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
ISS, bits [23:0]

The value copied from \texttt{VSESR\_EL2}.ISS.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{When EL1 is using AArch32 and VDISR\_EL2.LPAE == 0:}

\begin{center}
\begin{tabular}{cccccccccccccccccccccc}
  \hline
\end{tabular}
\end{center}

\textbf{Bits [63:32]}

Reserved, RES0.

\textbf{A, bit [31]}

Set to 1 when an ESB instruction defers a virtual SError interrupt.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{Bits [30:16]}

Reserved, RES0.

\textbf{AET, bits [15:14]}

The value copied from \texttt{VSESR\_EL2}.AET.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{Bit [13]}

Reserved, RES0.

\textbf{ExT, bit [12]}

The value copied from \texttt{VSESR\_EL2}.ExT.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{Bit [11]}

Reserved, RES0.

\textbf{FS, bits [10, 3:0]}

Fault status code. Set to \texttt{0b10110} when an ESB instruction defers a virtual SError interrupt.

\begin{center}
\begin{tabular}{lc}
  FS & Meaning \\
  \hline
  \texttt{0b10110} & Asynchronous SError interrupt. \\

**VMPIDR_EL2, Virtualization Multiprocessor ID Register**

The VMPIDR_EL2 characteristics are:

**Purpose**

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by EL1 reads of MPIDR_EL1.

**Configuration**

AArch64 System register VMPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VMPIDR[31:0].

If EL2 is not implemented, reads of this register return the value of the MPIDR_EL1 and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VMPIDR_EL2 is a 64-bit register.

**Field descriptions**

The VMPIDR_EL2 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0 | RES0 | MT | Aff2 | Aff1 | Aff0 | Aff3 |
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

**Bits [63:40]**

Reserved, RES0.

**Aff3, bits [39:32]**

Affinity level 3. See the description of VMPIDR_EL2.Aff0 for more information.

Aff3 is not supported in AArch32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [31]**

Reserved, RES1.

**U, bit [30]**

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Processor is part of a multiprocessor system.</td>
</tr>
<tr>
<td>0b1</td>
<td>Processor is part of a uniprocessor system.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bits [29:25]  
Reserved, RES0.

MT, bit [24]  
Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of VMPIDR_EL2.Aff0 for more information about affinity levels.

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Performance of PEs at the lowest affinity level is largely independent.</td>
</tr>
<tr>
<td>0b1</td>
<td>Performance of PEs at the lowest affinity level is very interdependent.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Aff2, bits [23:16]  
Affinity level 2. See the description of VMPIDR_EL2.Aff0 for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]  
Affinity level 1. See the description of VMPIDR_EL2.Aff0 for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]  
Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The VNCR_EL2 characteristics are:

**Purpose**

When FEAT_NV2 is implemented, holds the base address that is used to define the memory location that is accessed by transformed reads and writes of System registers.

**Configuration**

This register is present only when FEAT_NV2 is implemented. Otherwise, direct accesses to VNCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VNCR_EL2 is a 64-bit register.

**Field descriptions**

The VNCR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-53</td>
<td>RESS, Reserved, Sign extended. If the bits marked as RESS do not all have the same value, then there is a CONSTRAINED UNPREDICTABLE choice between:</td>
</tr>
<tr>
<td>52-12</td>
<td>BADDR, Base Address. If the virtual address space for EL2 does not support more than 48 bits, then bits [52:49] are RESS.</td>
</tr>
<tr>
<td>11-0</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

Where the EL2 translation regime has upper and lower address ranges, bit[52] is used to select between those address ranges to determine if the address space supports more than 48 bits.

**RESS, bits [63:53]**

Reserved, Sign extended. If the bits marked as RESS do not all have the same value, then there is a CONSTRAINED UNPREDICTABLE choice between:

- Generating an EL2 translation regime Translation abort on use of the VNCR_EL2 register.
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes other than reading back the register.
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52] for all purposes other than reading back the register.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52].

**BADDR, bits [52:12]**

Base Address. If the virtual address space for EL2 does not support more than 48 bits, then bits [52:49] are RESS.

When a register read/write is transformed to be a Load or Store, the address of the load/store is to SignOffset(VNCR_EL2.BADDR:Offset<11:0>, 64).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [11:0]**

Reserved, RES0.

VNCR_EL2, Virtual Nested Control Register
VPIDR_EL2, Virtualization Processor ID Register

The VPIDR_EL2 characteristics are:

**Purpose**

Holds the value of the Virtualization Processor ID. This is the value returned by EL1 reads of `MIDR_EL1`.

**Configuration**

AArch64 System register VPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register `VPIDR[31:0]`.

If EL2 is not implemented, reads of this register return the value of the `MIDR_EL1` and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VPIDR_EL2 is a 64-bit register.

**Field descriptions**

The VPIDR_EL2 bit assignments are:

| Bits [63:32] | Reserved, RES0 |

**Implementer, bits [31:24]**

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

<table>
<thead>
<tr>
<th>Hex representation</th>
<th>ASCII representation</th>
<th>Implementer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x41</td>
<td>A</td>
<td>Arm Limited</td>
</tr>
<tr>
<td>0x42</td>
<td>B</td>
<td>Broadcom Corporation</td>
</tr>
<tr>
<td>0x43</td>
<td>C</td>
<td>Cavium Inc.</td>
</tr>
<tr>
<td>0x44</td>
<td>D</td>
<td>Digital Equipment Corporation</td>
</tr>
<tr>
<td>0x49</td>
<td>I</td>
<td>Infineon Technologies AG</td>
</tr>
<tr>
<td>0x40</td>
<td>M</td>
<td>Motorola or Freescale</td>
</tr>
<tr>
<td>0x4E</td>
<td>N</td>
<td>NVIDIA Corporation</td>
</tr>
<tr>
<td>0x50</td>
<td>P</td>
<td>Applied Micro Circuits Corporation</td>
</tr>
<tr>
<td>0x51</td>
<td>Q</td>
<td>Qualcomm Inc.</td>
</tr>
<tr>
<td>0x56</td>
<td>V</td>
<td>Marvell International Ltd.</td>
</tr>
<tr>
<td>0x69</td>
<td>i</td>
<td>Intel Corporation</td>
</tr>
</tbody>
</table>

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
**Variant, bits [23:20]**

An implementation defined variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Architecture, bits [19:16]**

Architecture version. Defined values are:

<table>
<thead>
<tr>
<th>Architecture</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Armv4.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Armv4T.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Armv5 (obsolete).</td>
</tr>
<tr>
<td>0b0100</td>
<td>Armv5T.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Armv5TE.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Armv5TEJ.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv6.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Architectural features are individually identified in the ID_* registers, see 'ID registers'.</td>
</tr>
</tbody>
</table>

All other values are reserved.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PartNum, bits [15:4]**

An implementation defined primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Revision, bits [3:0]**

An implementation defined revision number for the device.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the VPIDR_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, VPIDR_EL2

<table>
<thead>

**VSESR_EL2, Virtual SError Exception Syndrome Register**

The VSESR_EL2 characteristics are:

**Purpose**

Provides the syndrome value reported to software on taking a virtual SError interrupt exception to EL1, or on executing an ESB instruction at EL1.

When the virtual SError interrupt is taken to EL1 using AArch64, then the syndrome value is reported in ESR_EL1.

When the virtual SError interrupt is taken to EL1 using AArch32, then the syndrome value is reported in DFSR.\{AET, ExT\} and the remainder of DFSR is set as defined by VMSAv8-32. For more information, see The AArch32 Virtual Memory System Architecture.

When the virtual SError interrupt is deferred by an ESB instruction, then the syndrome value is written to VDISR_EL2.

**Configuration**

AArch64 System register VSESR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VDFSR[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VSESR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VSESR_EL2 is a 64-bit register.

**Field descriptions**

The VSESR_EL2 bit assignments are:

**When EL1 is using AArch32:**

**Bits [63:16]**

Reserved, RES0.

**AET, bits [15:14]**

When a virtual SError interrupt is taken to EL1 using AArch32, DFSR[15:4] is set to VSESR_EL2.AET.

When a virtual SError interrupt is deferred by an ESB instruction, VDISR_EL2[15:4] is set to VSESR_EL2.AET.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
VSESR_EL2, Virtual SError Exception Syndrome Register

Bit [13]
Reserved, RES0.

ExT, bit [12]
When a virtual SError interrupt is taken to EL1 using AArch32, DFSR[12] is set to VSESR_EL2.ExT.
When a virtual SError interrupt is deferred by an ESB instruction, VDISR_EL2[12] is set to VSESR_EL2.ExT.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]
Reserved, RES0.

When EL1 is using AArch64:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|

Bits [63:25]
Reserved, RES0.

IDS, bit [24]
When a virtual SError interrupt is taken to EL1 using AArch64, ESR_EL1[24] is set to VSESR_EL2.IDS.
When a virtual SError interrupt is deferred by an ESB instruction, VDISR_EL2[24] is set to VSESR_EL2.IDS.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]
When a virtual SError interrupt is taken to EL1 using AArch64, ESR_EL1[23:0] is set to VSESR_EL2.ISS.
When a virtual SError interrupt is deferred by an ESB instruction, VDISR_EL2[23:0] is set to VSESR_EL2.ISS.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the VSESR_EL2

Accesses to this register use the following encodings:

MRS <Xt>, VSESR_EL2

VSTCR_EL2, Virtualization Secure Translation Control Register

The VSTCR_EL2 characteristics are:

**Purpose**

The control register for stage 2 of the Secure EL1&0 translation regime.

**Configuration**

This register is present only when FEAT_SEL2 is implemented. Otherwise, direct accesses to VSTCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VSTCR_EL2 is a 64-bit register.

**Field descriptions**

The VSTCR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | RES1 | RES0 | TA | RES0 | TG0 | RES0 | SL0 | T0SZ | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 |

Any of the bits in VSTCR_EL2 are permitted to be cached in a TLB.

**Bits [63:34]**

Reserved, RES0.

**SL2, bit [33]**

*When FEAT_LPA2 is implemented:*

Starting level of the Secure stage 2 translation lookup controlled by VSTCR_EL2.

If VTCR_EL2.DS == 1, then VSTCR_EL2.SL2, in combination with VSTCR_EL2.SL0, gives encodings for the Secure stage 2 translation table walk initial lookup level.

If VTCR_EL2.DS == 0, then VSTCR_EL2.SL2 is RES0.

If the translation granule size is not 4KB, then this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.
Bit [32]
Reserved, RES0.

Bit [31]
Reserved, RES1.

SA, bit [30]
Secure stage 2 translation output address space.

<table>
<thead>
<tr>
<th>SA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All stage 2 translations for the Secure IPA space access the Secure PA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>All stage 2 translations for the Secure IPA space access the Non-secure PA space.</td>
</tr>
</tbody>
</table>

When the value of VSTCR_EL2.SW is 1, this bit behaves as 1 for all purposes other than reading back the value of the bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

SW, bit [29]
Secure stage 2 translation address space.

<table>
<thead>
<tr>
<th>SW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All stage 2 translation table walks for the Secure IPA space are to the Secure PA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>All stage 2 translation table walks for the Secure IPA space are to the Non-secure PA space.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [28:16]
Reserved, RES0.

TG0, bits [15:14]
Secure stage 2 granule size for VSTTBR_EL2.

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If FEAT_GTG is implemented, ID_AA64MMFR0_EL1.TGran4_2, TGran16_2, TGran64_2 indicate which granule sizes are supported for Level 2 translation.

If FEAT_GTG is not implemented, ID_AA64MMFR0_EL1.TGran4, TGran16, TGran64 indicate which granule sizes are supported.

If the value is programmed to either a reserved value, or a size that has not been implemented, then for all purposes other than read back from this register, the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bits [13:8]

Reserved, RES0.

SL0, bits [7:6]

When FEAT_TTST is implemented:

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR_EL2. The meaning of this field depends on the value of VSTCR_EL2.TG0.

<table>
<thead>
<tr>
<th>SL0</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b00 | If VSTCR_EL2.TG0 is 0b00 (4KB granule):  
• If FEAT_LPA2 is not implemented, start at level 2.  
• If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 2.  
• If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b1, start at level -1.  
If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3. |
| 0b01 | If VSTCR_EL2.TG0 is 0b00 (4KB granule):  
• If FEAT_LPA2 is not implemented, start at level 1.  
• If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 1.  
• If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 01 and VSTCR_EL2.SL2 == 1 is reserved.  
If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2. |
| 0b10 | If VSTCR_EL2.TG0 is 0b00 (4KB granule):  
• If FEAT_LPA2 is not implemented, start at level 0.  
• If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 0.  
• If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 10 and VSTCR_EL2.SL2 == 1 is reserved.  
If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1. |
| 0b11 | If VSTCR_EL2.TG0 is 0b00 (4KB granule):  
• If FEAT_LPA2 is not implemented, start at level 3.  
• If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 3.  
• If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 11 and VSTCR_EL2.SL2 == 1 is reserved.  
If VSTCR_EL2.TG0 is 0b10 (16KB granule) and FEAT_LPA2 is implemented, start at level 0. |

If this field is programmed to a value that is not consistent with the programming of VSTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR_EL2. The meaning of this field depends on the value of VSTCR_EL2.TG0.
### VSTCR_EL2, Virtualization Secure Translation Control Register

<table>
<thead>
<tr>
<th>SL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.</td>
</tr>
<tr>
<td>0b01</td>
<td>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.</td>
</tr>
<tr>
<td>0b10</td>
<td>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.</td>
</tr>
</tbody>
</table>

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VSTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

#### T0SZ, bits [5:0]

The size offset of the memory region addressed by `VSTTBR_EL2`. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for this field depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

If this field is programmed to a value that is not consistent with the programming of SL0, then a stage 2 level 0 Translation fault is generated.

**Note**

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing the VSTCR_EL2

Accesses to this register use the following encodings:

VSTTBR_EL2, Virtualization Secure Translation Table Base Register

The VSTTBR_EL2 characteristics are:

**Purpose**

The base register for stage 2 of the Secure EL1&0 translation regime. Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Secure EL1&0 translation regime, and other information for this translation stage.

**Configuration**

This register is present only when FEAT_SEL2 is implemented. Otherwise, direct accesses to VSTTBR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VSTTBR_EL2 is a 64-bit register.

**Field descriptions**

The VSTTBR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>RES0</td>
</tr>
<tr>
<td>31-47</td>
<td>BADDR</td>
</tr>
</tbody>
</table>

Any of the bits in VSTTBR_EL2 are permitted to be cached in a TLB.

**Bits [63:48]**

Reserved, RES0.

**BADDR, bits [47:1]**

Translation table base address, A[47:x] or A[51:x].

**Note**

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes FEAT_LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

If the value of VTCR_EL2.PS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z>x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
• When \( x > 6 \) register bits\((x-1):6\) are \( \text{RES0} \).
• Register bit[1] is \( \text{RES0} \).
• Bits[5:2] of the stage 1 translation table base address are zero.

**Note**

When the value of \( \text{ID-AA64MMFR0-EL1}.\text{PARange} \) indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the Effective value of \( \text{VTCR-EL2}.PS \) is \( 0b110 \) and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of \( \text{VTCR-EL2}.PS \) is not \( 0b110 \) then:

• Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
• Register bits[1:x-1] are \( \text{RES0} \).
• If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are \( 0b0000 \).

If any VSTTBR_EL2[47:1] bit that is defined as \( \text{RES0} \) has the value 1 when a translation table walk is performed using VSTTBR_EL2, then the translation table base address might be misaligned, with effects that are CONstrained UNPredictable, and must be one of the following:

• Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
• The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how \( x \) is calculated based on the value of \( \text{VTCR-EL2}.T0SZ \), the stage of translation, and the translation granule size.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CnP, bit [0]**

Common not Private, for stage 2 of the Secure EL1&0 translation regime. In an implementation that includes FEAT_TTCNP, indicates whether each entry that is pointed to by VSTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table entries pointed to by VSTTBR_EL2 are permitted to differ from the entries for VSTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.</td>
</tr>
<tr>
<td>0b1</td>
<td>The translation table entries pointed to by VSTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.</td>
</tr>
</tbody>
</table>

**Note**

If the value of VSTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VSTTBR_EL2s do not point to the same translation table entries when using the current VMID, then the results of translations using VSTTBR_EL2 are CONstrained UNPredictable, see 'CONstrained UNPredictable behaviors due to caching of control or data values'.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the VSTTBR_EL2**

Accesses to this register use the following encodings:
MRS <Xt>, VSTTBR_EL2

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if HaveEL(EL3) && SCR_EL3.NS == '1' then
        UNDEFINED;

            end if
else

VTCR_EL2, Virtualization Translation Control Register

The VTCR_EL2 characteristics are:

**Purpose**

The control register for stage 2 of the EL1&0 translation regime.

**Configuration**

AArch64 System register VTCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VTCR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VTCR_EL2 is a 64-bit register.

**Field descriptions**

The VTCR_EL2 bit assignments are:

```
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | SL2 | DS | RES1 | NSA | NSW | HWU62 | HWU61 | HWU60 | HWU59 | RES0 | HD | RES0 | VS | PS | TG0 | SH0 | ORG0 | RG0 | SL0 | T0SZ |
```

Any of the bits in VTCR_EL2 are permitted to be cached in a TLB.

**Bits [63:34]**

Reserved, RES0.

**SL2, bit [33]**

*When FEAT_LPA2 is implemented:*

Starting level of the stage 2 translation lookup controlled by VTCR_EL2.

If VTCR_EL2.DS == 1, then VTCR_EL2.SL2, in combination with VTCR_EL2.SL0, gives encodings for the stage 2 translation table walk initial lookup level.

If VTCR_EL2.DS == 0, then VTCR_EL2.SL2 is RES0.

If the translation granule size is not 4KB, then this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
When FEAT_LPA2 is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 2 of the EL1&0 translation regime.

<table>
<thead>
<tr>
<th>DS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bits[49:48] of translation descriptors are RES0. Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware. The minimum value of VTCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 2 level 0 translation table fault. Output address[51:48] is 0000.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bits[49:48] of translation descriptors hold output address[49:48]. Bits[9:8] in translation descriptors hold output address[51:50]. The shareability information of block and page descriptors for cacheable locations is determined by VTCR_EL2.SH0. The minimum value of VTCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 2 level 0 translation table fault. The minimum value of VSTCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.</td>
</tr>
</tbody>
</table>

**Note**
As FEAT_LPA must be implemented if VTCR_EL2.DS == 1, the minimum values of VTCR_EL2.T0SZ and VSTCR_EL2.T0SZ are 12, as determined by that extension.

For the TLBI range instructions affecting IPA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 00.

**Note**
This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**Bit [31]**
Reserved, RES1.

**NSA, bit [30]**
When FEAT_SEL2 is implemented:

Non-secure stage 2 translation output address space.
### NSA

<table>
<thead>
<tr>
<th>NSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All stage 2 translations for the Non-secure IPA space of the Secure EL1&amp;0 translation regime access the Secure PA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>All stage 2 translations for the Non-secure IPA space of the Secure EL1&amp;0 translation regime access the Non-secure PA space.</td>
</tr>
</tbody>
</table>

This bit behaves as 1 for all purposes other than reading back the value of the bit when one of the following is true:

- The PE is executing in Non-secure state.
- The value of VTCR_EL2.NSW is 1.
- The value of VSTCR_EL2.SA is 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.

#### NSW, bit [29]

**When FEAT_SEL2 is implemented:**

Non-secure stage 2 translation table address space.

<table>
<thead>
<tr>
<th>NSW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All stage 2 translation table walks for the Non-secure IPA space of the Secure EL1&amp;0 translation regime are to the Secure PA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>All stage 2 translation table walks for the Non-secure IPA space of the Secure EL1&amp;0 translation regime are to the Non-secure PA space.</td>
</tr>
</tbody>
</table>

When the PE is executing in Non-secure state, this bit behaves as 1 for all purposes other than reading back the value of the bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.

#### HWU62, bit [28]

**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU62</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.
HWU61, bit [27]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates \texttt{IMPLEMENTATION DEFINED} hardware use of bit[61] of the stage 2 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU61</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for a \texttt{IMPLEMENTATION DEFINED} purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for a \texttt{IMPLEMENTATION DEFINED} purpose.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates \texttt{IMPLEMENTATION DEFINED} hardware use of bit[60] of the stage 2 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU60</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for a \texttt{IMPLEMENTATION DEFINED} purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for a \texttt{IMPLEMENTATION DEFINED} purpose.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates \texttt{IMPLEMENTATION DEFINED} hardware use of bit[59] of the stage 2 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU59</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for a \texttt{IMPLEMENTATION DEFINED} purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for a \texttt{IMPLEMENTATION DEFINED} purpose.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

Otherwise:

Reserved, RES0.
Bits [24:23]
Reserved, RES0.

HD, bit [22]
When FEAT_HAFDBS is implemented:
Hardware management of dirty state in stage 2 translations when EL2 is enabled in the current Security state.

<table>
<thead>
<tr>
<th>HD</th>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 2 hardware management of dirty state disabled.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 2 hardware management of dirty state enabled, only if the VTCR_EL2.HA bit is also set to 1.</td>
<td></td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

HA, bit [21]
When FEAT_HAFDBS is implemented:
Hardware Access flag update in Non-secure and Secure stage 2 translations when EL2 is enabled in the current Security state.

<table>
<thead>
<tr>
<th>HA</th>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 2 Access flag update disabled.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 2 Access flag update enabled.</td>
<td></td>
</tr>
</tbody>
</table>

Otherwise:
Reserved, RES0.

Bit [20]
Reserved, RES0.

VS, bit [19]
When FEAT_VMID16 is implemented:
VMID Size.

<table>
<thead>
<tr>
<th>VS</th>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>8 bit - the upper 8 bits of VTTBR_EL2 and VSTTBR_EL2 are ignored by the hardware, and treated as if they are all zeros, for every purpose except when reading back the register.</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>16 bit - the upper 8 bits of VTTBR_EL2 and VSTTBR_EL2 are used for allocation and matching in the TLB.</td>
<td></td>
</tr>
</tbody>
</table>

If the implementation only supports an 8-bit VMID, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
**PS, bits [18:16]**

Physical address Size for the Second Stage of translation.

<table>
<thead>
<tr>
<th>PS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>32 bits, 4GB.</td>
</tr>
<tr>
<td>0b01</td>
<td>36 bits, 64GB.</td>
</tr>
<tr>
<td>0b10</td>
<td>40 bits, 1TB.</td>
</tr>
<tr>
<td>0b11</td>
<td>42 bits, 4TB.</td>
</tr>
<tr>
<td>0b100</td>
<td>44 bits, 16TB.</td>
</tr>
<tr>
<td>0b101</td>
<td>48 bits, 256TB.</td>
</tr>
<tr>
<td>0b110</td>
<td>52 bits, 4PB.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by VTCR_EL2 are 0b0000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TG0, bits [15:14]**

Granule size for the VTTBR_EL2.

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If FEAT_GTG is implemented, ID_AA64MMFR0_EL1.{TGran4_2, TGran16_2, TGran64_2} indicate which granule sizes are supported for Level 2 translation.

If FEAT_GTG is not implemented, ID_AA64MMFR0_EL1.{TGran4, TGran16, TGran64} indicate which granule sizes are supported.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using VTTBR_EL2 or VSTTBR_EL2.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using `VTTBR_EL2` or `VSTTBR_EL2`.

<table>

</tr>
<tr>
<td></td>
<td>Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

SL0, bits [7:6]

When `FEAT_TTST` is implemented:

Starting level of the stage 2 translation lookup, controlled by `VTCR_EL2`. The meaning of this field depends on the value of `VTCR_EL2.TG0`. 

VTCR_EL2, Virtualization Translation Control Register
### SL0

<table>
<thead>
<tr>
<th>SL0</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b00 | If VTCR_EL2.TG0 is 0b00 (4KB granule):  
   - If FEAT_LPA2 is not implemented, start at level 2.  
   - If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 2.  
   - If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b1, start at level 1.  
   - If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.  
| 0b01 | If VTCR_EL2.TG0 is 0b00 (4KB granule):  
   - If FEAT_LPA2 is not implemented, start at level 1.  
   - If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 1.  
   - If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == 01 and VTCR_EL2.SL2 == 1 is reserved.  
   - If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.  
| 0b10 | If VTCR_EL2.TG0 is 0b00 (4KB granule):  
   - If FEAT_LPA2 is not implemented, start at level 0.  
   - If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 0.  
   - If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == 10 and VTCR_EL2.SL2 == 1 is reserved.  
   - If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.  
| 0b11 | If VTCR_EL2.TG0 is 0b00 (4KB granule):  
   - If FEAT_LPA2 is not implemented, start at level 3.  
   - If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 3.  
   - If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == 11 and VTCR_EL2.SL2 == 1 is reserved.  
   - If VTCR_EL2.TG0 is 0b10 (16KB granule) and FEAT_LPA2 is implemented, start at level 0.  

If this field is programmed to a value that is not consistent with the programming of VTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Starting level of the stage 2 translation lookup, controlled by VTCR_EL2. The meaning of this field depends on the value of VTCR_EL2.TG0.

<table>
<thead>
<tr>
<th>SL0</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b00 | If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.  
| 0b01 | If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.  
| 0b10 | If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.  

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**T0SZ, bits [5:0]**

The size offset of the memory region addressed by VTTBR_EL2. The region size is $2^{(64-T0SZ)}$ bytes.
The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

If this field is programmed to a value that is not consistent with the programming of SL0, then a stage 2 level 0 Translation fault is generated.

---

**Note**

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing the VTCR_EL2

Any of the bits in VTCR_EL2 are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

**MRS <Xt>, VTCR_EL2**

VTTBR_EL2, Virtualization Translation Table Base Register

The VTTBR_EL2 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the EL1&0 translation regime, and other information for this translation regime.

**Configuration**

AArch64 System register VTTBR_EL2 bits [63:0] are architecturally mapped to AArch32 System register VTTBR[63:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

VTTBR_EL2 is a 64-bit register.

**Field descriptions**

The VTTBR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**VMID, bits [63:48]**

**VMID encoding when FEAT_VMID16 is implemented or (VTCR_EL2.VS == 1 or AArch32 is supported at any Exception level)**

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| VMID |

**VMID, bits [15:0]**

The VMID for the translation table.

If EL2 is using AArch32, or if the implementation has an 8-bit VMID, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VMID encoding when FEAT_VMID16 is not implemented or (VTCR_EL2.VS == 0 or the implementation only supports execution in AArch64 state)**

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | VMID |
Bits [15:8]

Reserved, RES0.

VMID, bits [7:0]

The VMID for the translation table.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- The VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes FEAT_LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes FEAT_LPA, if the value of VTCR_EL2.PS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- When z>x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes FEAT_TTCNP, bit[0] of the stage 1 translation table base address is zero.

Note

- In an implementation that includes FEAT_LPA a VTCR_EL2.PS value of 0b110, that selects a PA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the Effective value of VTCR_EL2.PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of VTCR_EL2.PS is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

Note

This definition applies:

- To an implementation that includes FEAT_LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include FEAT_LPA.
If any VTTBR_EL2[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using VTTBR_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of VTCR_EL2.T0SZ, the stage of translation, and the translation granule size.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table entries pointed to by VTTBR_EL2 are permitted to differ from the entries for VTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.</td>
</tr>
<tr>
<td>0b1</td>
<td>The translation table entries pointed to by VTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

Note

If the value of VTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBR_EL2s do not point to the same translation table entries when using the current VMID then the results of translations using VTTBR_EL2 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the VTTBR_EL2

ZCR_EL1, SVE Control Register for EL1

The ZCR_EL1 characteristics are:

Purpose

The SVE Control Register for EL1 is used to control aspects of SVE visible at Exception levels EL1 and EL0.

Configuration

This register is present only when FEAT_SVE is implemented. Otherwise, direct accesses to ZCR_EL1 are UNDEFINED.

When HCR_EL2.{E2H, TGE} == {1, 1} and EL2 is enabled in the current Security state, the fields in this register have no effect on execution at EL0.

Attributes

ZCR_EL1 is a 64-bit register.

</tbody>
</table>

Bits [63:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Effective Scalable Vector Length.

Constrains the scalable vector register length for EL1 and EL0 to (LEN+1)x128 bits.

For all purposes other than returning the result of a direct read of ZCR_EL1, this field behaves as if:

- It is set to the minimum of the stored value and the constrained length inherited from more privileged Exception levels in the current Security state.
- It is rounded down to the nearest implemented vector length.

An indirect read of ZCR_EL1.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the ZCR_EL1

When `HCR_EL2.E2H` is 1, without explicit synchronization, access from EL3 using the mnemonic ZCR_EL1 or ZCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

\[
\begin{array}{cccccc}
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
0b11 & 0b000 & 0b0001 & 0b0010 & 0b000 \\
\end{array}
\]

ZCR_EL2, SVE Control Register for EL2

The ZCR_EL2 characteristics are:

**Purpose**

The SVE Control Register for EL2 is used to control aspects of SVE visible at Exception levels EL2, EL1, and EL0, when EL2 is enabled in the current Security state.

**Configuration**

This register is present only when FEAT_SVE is implemented. Otherwise, direct accesses to ZCR_EL2 are **UNDEFINED**.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

ZCR_EL2 is a 64-bit register.

**Field descriptions**

The ZCR_EL2 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0 | RES0 | RAZ/WI | LEN |

**Bits [63:9]**

Reserved, RES0.

**Bits [8:4]**

Reserved, RAZ/WI.

**LEN, bits [3:0]**

Effective Scalable Vector Length.

Constrains the scalable vector register length for EL2, EL1, and EL0 to (LEN+1)x128 bits, when EL2 is enabled in the current Security state.

For all purposes other than returning the result of a direct read of ZCR_EL2, this field behaves as if:

- It is set to the minimum of the stored value and the constrained length inherited from more privileged Exception levels in the current Security state.

- It is rounded down to the nearest implemented vector length.

An indirect read of ZCR_EL2.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Accessing the ZCR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic ZCR_EL2 or ZCR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

ACTLR, Auxiliary Control Register

The ACTLR characteristics are:

**Purpose**

Provides IMPLEMENTATION DEFINED configuration and control options for execution at EL1 and EL0.

**Configuration**

AArch32 System register ACTLR bits [31:0] are architecturally mapped to AArch64 System register ACTLR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ACTLR are UNDEFINED.

Some bits might define global configuration settings, and be common to the Secure and Non-secure instances of the register.

**Attributes**

ACTLR is a 32-bit register.

**Field descriptions**

The ACTLR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ACTLR**

Accesses to this register use the following encodings:

ACTLR2, Auxiliary Control Register 2

The ACTLR2 characteristics are:

**Purpose**

Provides additional space to the ACTLR register to hold IMPLEMENTATION DEFINED trap functionality for execution at EL1 and EL0.

**Configuration**

AArch32 System register ACTLR2 bits [31:0] are architecturally mapped to AArch64 System register ACTLR_EL1[63:32].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ACTLR2 are UNDEFINED.

In Armv8.0 and Armv8.1, it is IMPLEMENTATION DEFINED whether this register is implemented, or whether it causes UNDEFINED exceptions when accessed. The implementation of this register can be detected by examining ID_MMFR4.AC2.

From Armv8.2 this register must be implemented.

**Attributes**

ACTLR2 is a 32-bit register.

**Field descriptions**

The ACTLR2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

ADFSR, Auxiliary Data Fault Status Register

The ADFSR characteristics are:

**Purpose**

Provides additional IMPLEMENTATION DEFINED fault status information for Data Abort exceptions taken to EL1 modes, and EL3 modes when EL3 is implemented and is using AArch32.

**Configuration**

AArch32 System register ADFSR bits [31:0] are architecturally mapped to AArch64 System register `AFSR0_EL1[31:0]`.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ADFSR are UNDEFINED.

**Attributes**

ADFSR is a 32-bit register.

**Field descriptions**

The ADFSR bit assignments are:

AIDR, Auxiliary ID Register

The AIDR characteristics are:

**Purpose**

Provides IMPLEMENTATION DEFINED identification information.

The value of this register must be used in conjunction with the value of MIDR.

**Configuration**

AArch32 System register AIDR bits [31:0] are architecturally mapped to AArch64 System register AIDR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to AIDR are UNDEFINED.

**Attributes**

AIDR is a 32-bit register.

**Field descriptions**

The AIDR bit assignments are:

<table>

AIFSR, Auxiliary Instruction Fault Status Register

The AIFSR characteristics are:

**Purpose**

Provides additional IMPLEMENTATION DEFINED fault status information for Prefetch Abort exceptions taken to EL1 modes, and EL3 modes when EL3 is implemented and is using AArch32.

**Configuration**

AArch32 System register AIFSR bits [31:0] are architecturally mapped to AArch64 System register AFSR1_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to AIFSR are UNDEFINED.

AMAIR0, Auxiliary Memory Attribute Indirection Register 0

The AMAIR0 characteristics are:

**Purpose**

When using the Long-descriptor format translation tables for stage 1 translations, provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR0.

**Configuration**

AArch32 System register AMAIR0 bits [31:0] are architecturally mapped to AArch64 System register AMAIR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to AMAIR0 are UNDEFINED.

**Attributes**

AMAIR0 is a 32-bit register.

**Field descriptions**

The AMAIR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

This register is RES0 in the following cases:

- When an implementation does not provide any IMPLEMENTATION DEFINED memory attributes.
- When the Long-descriptor translation table format is not used.

If EL3 is implemented and is using AArch32:

- AMAIR0(S) gives the value for memory accesses from Secure state.
- AMAIR0(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

Any IMPLEMENTATION DEFINED memory attributes are additional qualifiers for the memory locations and must not change the architected behavior specified by MAIR0 and MAIR1.

In a typical implementation, AMAIR0 and AMAIR1 split into eight one-byte fields, corresponding to the MAIRn.Attr<n> fields, but the architecture does not require them to do so.

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

AMAIR1, Auxiliary Memory Attribute Indirection Register 1

The AMAIR1 characteristics are:

**Purpose**

When using the Long-descriptor format translation tables for stage 1 translations, provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR1.

**Configuration**

AArch32 System register AMAIR1 bits [31:0] are architecturally mapped to AArch64 System register AMAIR_EL1[63:32].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to AMAIR1 are UNDEFINED.

When EL3 is using AArch32, write access to AMAIR1(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

**Attributes**

AMAIR1 is a 32-bit register.

**Field descriptions**

The AMAIR1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |   |   |   |   |   |   |

This register is RES0 in the following cases:

- When an implementation does not provide any IMPLEMENTATION DEFINED memory attributes.
- When the Long-descriptor translation table format is not used.

If EL3 is implemented and is using AArch32:

- AMAIR1(S) gives the value for memory accesses from Secure state.
- AMAIR1(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

Any IMPLEMENTATION DEFINED memory attributes are additional qualifiers for the memory locations and must not change the architected behavior specified by MAIR0 and MAIR1.

In a typical implementation, AMAIR0 and AMAIR1 split into eight one-byte fields, corresponding to the MAIRn.Attr<n> fields, but the architecture does not require them to do so.

**IMPLEMENTATION DEFINED, bits [31:0]**

AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

**Purpose**

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both the architected and the auxiliary counter groups.

**Configuration**

AArch32 System register AMCFGR bits [31:0] are architecturally mapped to AArch64 System register AMCFGR_EL0[31:0].

AArch32 System register AMCFGR bits [31:0] are architecturally mapped to External register AMCFGR[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR are UNDEFINED.

**Attributes**

AMCFGR is a 32-bit register.

**Field descriptions**

The AMCFGR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| NCG | RES0 | HDBG | RAZ | SIZE | N |

**NCG, bits [31:28]**

Defines the number of counter groups.

The number of implemented counter groups is defined as [AMCFGR.NCG + 1].

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of 0b0000. Otherwise, this field has a value of 0b0001.

**Bits [27:25]**

Reserved, RES0.

**HDBG, bit [24]**

Halt-on-debug supported.

From Armv8, this feature must be supported, and so this bit is 0b1.

<table>
<thead>
<tr>
<th>HDBG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AMCR.HDBG is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>AMCR.HDBG is read/write.</td>
</tr>
</tbody>
</table>
**Bits [23:14]**

Reserved, RAZ.

**SIZE, bits [13:8]**

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the Activity Monitors Extension is defined as \([\text{AMCFGR.SIZE} + 1]\).

From Armv8, the counters are 64-bit, and so this field is 0b111111.

---

**Note**

Software also uses this field to determine the spacing of counters in the memory-map. From Armv8, the counters are at doubleword-aligned addresses.

---

**N, bits [7:0]**

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is defined as \([\text{AMCFGR.N} + 1]\).

**Accessing the AMCFGR**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} \ <\text{coproc}, \{#}\text{<opc1>}, \ <\text{Rt}, \ <\text{CRn}, \ <\text{CRm}\{, \{#}\text{<opc2>}}\}
\]

Page 2356
The AMCGCR characteristics are:

**Purpose**

Provides information on the number of activity monitor event counters implemented within each counter group.

**Configuration**

AArch32 System register AMCGCR bits [31:0] are architecturally mapped to AArch64 System register AMCGCR_EL0[31:0].

AArch32 System register AMCGCR bits [31:0] are architecturally mapped to External register AMCGCR[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCGCR are UNDEFINED.

**Attributes**

AMCGCR is a 32-bit register.

**Field descriptions**

The AMCGCR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | CG1NC | CG0NC |

**Bits [31:16]**

Reserved, RES0.

**CG1NC, bits [15:8]**

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In an implementation that includes FEAT_AMUv1, the permitted range of values is 0 to 16.

**CG0NC, bits [7:0]**

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

In an implementation that includes FEAT_AMUv1, the value of this field is 4.

**Accessing the AMCGCR**

Accesses to this register use the following encodings:

AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

**Purpose**

Disable control bits for the architected activity monitors event counters, AMEVCNTR0\(n\).

**Configuration**

AArch32 System register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR0_EL0[31:0].

AArch32 System register AMCNTENCLR0 bits [31:0] are architecturally mapped to External register AMCNTENCLR0[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are UNDEFINED.

**Attributes**

AMCNTENCLR0 is a 32-bit register.

**Field descriptions**

The AMCNTENCLR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>P15</td>
</tr>
<tr>
<td>29</td>
<td>P14</td>
</tr>
<tr>
<td>28</td>
<td>P13</td>
</tr>
<tr>
<td>27</td>
<td>P12</td>

<td>P1</td>
</tr>
<tr>
<td>15</td>
<td>P0</td>
</tr>
</tbody>
</table>

Reserved, RES0.

P\(<n>\), bit [n], for n = 15 to 0

Activity monitor event counter disable bit for AMEVCNTR0\(<n>\).

Bits [31:16] are RES0. Bits [15:N] are RAZ/WI. N is the value in AMCGCR.CG0NC.

Possible values of each bit are:

<table>
<thead>
<tr>
<th>P(&lt;n&gt;)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that AMEVCNTR0(&lt;n&gt;) is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that AMEVCNTR0(&lt;n&gt;) is enabled. When written, disables AMEVCNTR0(&lt;n&gt;).</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are UNDEFINED.

**Attributes**

AMCNTENCLR1 is a 32-bit register.

**Field descriptions**

The AMCNTENCLR1 bit assignments are:

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |
```

**Bits [31:16]**

Reserved, RES0.

**P<n>**, bit [n], for n = 15 to 0

Activity monitor event counter disable bit for AMEVCNTR1<n>.

Bits [31:16] are RES0. Bits [15:N] are RAZ/WI. N is the value in AMCGCR_EL0.CG1NC.

Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that AMEVCNTR1&lt;n&gt; is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that AMEVCNTR1&lt;n&gt; is enabled. When written, disables AMEVCNTR1&lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

**Accessing the AMCNTENCLR1**

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENCLR1 are UNDEFINED.

**Note**
The number of auxiliary activity monitor event counters implemented is zero exactly when `AMCFGR.NCG == 0b0000`.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} \text{ <coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>\}, \{#<opc2>\}}
\]

<table>
<thead>
<tr>

**Bits [31:16]**

Reserved, RES0.

**P<n>, bit [n], for n = 15 to 0**

Activity monitor event counter enable bit for AMEVCNTR1<n>.

Bits [31:16] are RES0. Bits [15:N] are RAZ/WI. N is the value in AMCGCR.CG1NC.

Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that AMEVCNTR1&lt;n&gt; is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that AMEVCNTR1&lt;n&gt; is enabled. When written, enables AMEVCNTR1&lt;n&gt;.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to 0.

**Accessing the AMCNTENSET1**

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENSET1 are UNDEFINED.

**Note**
The number of auxiliary activity monitor counters implemented is zero when `AMCFG.R.NCG == 0b0000`.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{#<\text{opc2}>\}\}
\]

AMCR, Activity Monitors Control Register

The AMCR characteristics are:

**Purpose**

Global control register for the activity monitors implementation. AMCR is applicable to both the architected and the auxiliary counter groups.

**Configuration**

AArch32 System register AMCR bits [31:0] are architecturally mapped to AArch64 System register `AMCR_EL0[31:0]`.

AArch32 System register AMCR bits [31:0] are architecturally mapped to External register `AMCR[31:0]`.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCR are `UNDEFINED`.

**Attributes**

AMCR is a 32-bit register.

**Field descriptions**

The AMCR bit assignments are:

<table>

AMEVCNTR0<n>, Activity Monitors Event Counter Registers 0, n = 0 - 15

The AMEVCNTR0<n> characteristics are:

**Purpose**

Provides access to the architected activity monitor event counters.

**Configuration**

AArch32 System register AMEVCNTR0<n> bits [63:0] are architecturally mapped to AArch64 System register AMEVCNTR0<n>_EL0[63:0].

AArch32 System register AMEVCNTR0<n> bits [63:0] are architecturally mapped to External register AMEVCNTR0<n>[63:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0<n> are UNDEFINED.

**Attributes**

AMEVCNTR0<n> is a 64-bit register.

**Field descriptions**

The AMEVCNTR0<n> bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**ACNT, bits [63:0]**

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If FEAT_AMUv1p1 is implemented, HCR_EL2.AMVOFFEN is 1, SCR_EL3.AMVOFFEN is 1, HCR_EL2.{E2H, TGE} is not {1,1}, and EL2 is using AArch64 and is implemented in the current Security state, access to these registers at EL0 or EL1 return (PCount<63:0> - AMEVCNTRVOFF0<n>_EL2[63:0]).

PCount is the physical count returned when AMEVNCNT0<n> is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to 0.

**Accessing the AMEVCNTR0<n>**

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVCNTR0<n> are UNDEFINED.

**Note**
AMCGCR.CG0NC identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

**ACNT, bits [63:0]**

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If FEAT_AMUv1p1 is implemented, HCR_EL2.AMVOFFEN is 1, SCR_EL3.AMVOFFEN is 1, HCR_EL2.{E2H, TGE} is not {1,1}, EL2 is using AArch64 and is implemented in the current Security state, and AMCR_EL0.CG1RZ is 0, reads to these registers at EL0 or EL1 return (PCount<63:0> - AMEVCNTRVOFF1<n>_EL2<63:0>).

PCount is the physical count returned when AMEVCNTR1<n> is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to 0.

**Accessing the AMEVCNTR1<n>**

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVCNTR1<n> are UNDEFINED.

**Note**
AMCGCR.CG1NC identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings:

AMEVTYPER0\(<n>\), Activity Monitors Event Type Registers 0, \(n = 0 - 15\)

The AMEVTYPER0\(<n>\) characteristics are:

**Purpose**

Provides information on the events that an architected activity monitor event counter AMEVCNTR0\(<n>\) counts.

**Configuration**

AArch32 System register AMEVTYPER0\(<n>\) bits [31:0] are architecturally mapped to AArch64 System register AMEVTYPER0\(<n>_EL0[31:0] .

AArch32 System register AMEVTYPER0\(<n>\) bits [31:0] are architecturally mapped to External register AMEVTYPER0\(<n>[31:0] .

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0\(<n>\) are UNDEFINED.

**Attributes**

AMEVTYPER0\(<n>\) is a 32-bit register.

**Field descriptions**

The AMEVTYPER0\(<n>\) bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0                        | evtCount                  |

**Bits [31:16]**

Reserved, RES0.

**evtCount, bits [15:0]**

Event to count. The event number of the event that is counted by the architected activity monitor event counter AMEVCNTR0\(<n>\). The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

<table>
<thead>
<tr>
<th>evtCount</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0011</td>
<td>Processor frequency cycles</td>
<td>When ( n = 0 )</td>
</tr>
<tr>
<td>0x4004</td>
<td>Constant frequency cycles</td>
<td>When ( n = 1 )</td>
</tr>
<tr>
<td>0x0008</td>
<td>Instructions retired</td>
<td>When ( n = 2 )</td>
</tr>
<tr>
<td>0x4005</td>
<td>Memory stall cycles</td>
<td>When ( n = 3 )</td>
</tr>
</tbody>
</table>

**Accessing the AMEVTYPER0\(<n>\)**

If \(<n>\) is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVTYPER0\(<n>\) are UNDEFINED.

---

**Note**
AMCGCR.CG0NC identifies the number of architected activity monitor event counters.

**Field descriptions**

The AMEVTYPER1<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | evtCount |

**Bits [31:16]**

Reserved, RES0.

**evtCount, bits [15:0]**

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter AMEVCNTR1<n>.

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter AMEVCNTR1<n>, then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

The event counted by AMEVCNTR1<n> might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.

If the corresponding counter AMEVCNTR1<n> is enabled, writes to this register have UNPREDICTABLE results.

**Accessing the AMEVTYPER1<n>**

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVTYPER1<n> are UNDEFINED.
**Note**

`AMCGCR.CG1NC` identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

AMUSERENR, Activity Monitors User Enable Register

The AMUSERENR characteristics are:

**Purpose**

Global user enable register for the activity monitors. Enables or disables EL0 access to the activity monitors. AMUSERENR is applicable to both the architected and the auxiliary counter groups.

**Configuration**

AArch32 System register AMUSERENR bits [31:0] are architecturally mapped to AArch64 System register AMUSERENR_EL0[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMUSERENR are UNDEFINED.

**Attributes**

AMUSERENR is a 32-bit register.

**Field descriptions**

The AMUSERENR bit assignments are:

<table>

APSR, Application Program Status Register

The APSR characteristics are:

**Purpose**

Hold program status and control information.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to APSR are UNDEFINED.

**Attributes**

APSR is a 32-bit register.

**Field descriptions**

The APSR bit assignments are:

<table>

_N, bit [31]_

Negative condition flag. Set to bit[31] of the result of the last flag-setting instruction. If the result is regarded as a two's complement signed integer, then N is set to 1 if the result was negative, and N is set to 0 if the result was positive or zero.

_Z, bit [30]_

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

_C, bit [29]_

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

_V, bit [28]_

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

_Q, bit [27]_

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

**Bits [26:20]**

Reserved, RES0.
GE, bits [19:16]
Greater than or Equal flags, for parallel addition and subtraction.

Bits [15:5]
Reserved, RES0.

Bit [4]
Reserved, RES1.

Bits [3:0]
Reserved, RES0.

It is permitted that, on a read of APSR:
- Bit[22] returns the value of PSTATE.PAN
- Bit[9] returns the value of PSTATE.E.
- Bit[4:0] returns the value of PSTATE.M[4:0]

Note
This is an exception to the general rule that an UNKNOWN field must not return information that cannot be obtained, at the current Privilege level, by an architected mechanism.

For more information see 'The Application Program Status Register, APSR'.

Accessing the APSR
APSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions.
ATS12NSOPR, Address Translate Stages 1 and 2 Non-secure Only PL1 Read

The ATS12NSOPR characteristics are:

**Purpose**

Performs stage 1 and 2 address translations as defined for PL1 and the Non-secure state, with permissions as if reading from the given virtual address.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ATS12NSOPR are **UNDEFINED**.

**Attributes**

ATS12NSOPR is a 32-bit System instruction.

**Field descriptions**

The ATS12NSOPR input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Input address for translation**

Input address for translation. The resulting address can be read from the **PAR**.

This System instruction takes a VA as input. The resulting address is the PA that is the output address of the stage 2 translation.

**Executing the ATS12NSOPR instruction**

Accesses to this instruction use the following encodings:

MCR{<c>{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}}</coproc>

ATS12NSOPW, Address Translate Stages 1 and 2 Non-secure Only PL1 Write

The ATS12NSOPW characteristics are:

**Purpose**

Performs stage 1 and 2 address translations as defined for PL1 and the Non-secure state, with permissions as if writing to the given virtual address.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ATS12NSOPW are UNDEFINED.

**Attributes**

ATS12NSOPW is a 32-bit System instruction.

**Field descriptions**

The ATS12NSOPW input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

The ATS1CUW characteristics are:

**Purpose**

Performs stage 1 address translation as defined for PL0 and the current Security state, with permissions as if writing to the given virtual address.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ATS1CUW are UNDEFINED.

**Attributes**

ATS1CUW is a 32-bit System instruction.

**Field descriptions**

The ATS1CUW input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Input address for translation</td>
</tr>
<tr>
<td>0</td>
<td>Input address for translation</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Input address for translation. The resulting address can be read from the PAR.

This System instruction takes a VA as input. If EL2 is implemented and enabled in the current Security state, the resulting address is the IPA that is the output address of the stage 1 translation. Otherwise, the resulting address is a PA.

**Executing the ATS1CUW instruction**

Accesses to this instruction use the following encodings:

\[
\text{MCR\{<c>\}{<q>} <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>\{, \{#\}<opc2>\}}
\]

<table>
<thead>

ATS1HR, Address Translate Stage 1 Hyp mode Read

The ATS1HR characteristics are:

**Purpose**

Performs stage 1 address translation as defined for PL2 and the Non-secure state, with permissions as if reading from the given virtual address.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ATS1HR are UNDEFINED.

**Attributes**

ATS1HR is a 32-bit System instruction.

**Field descriptions**

The ATS1HR input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [31:0]**

Input address for translation. The resulting address can be read from the PAR. This System instruction takes a VA as input. The resulting address is the PA that is the output address of the translation.

**Executing the ATS1HR instruction**

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings:

\[
\text{MCR\{<c>\}{<q>} <coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>{, \{#<opc2>}}}\]

<table>

ATS1HW, Address Translate Stage 1 Hyp mode Write

The ATS1HW characteristics are:

**Purpose**

Performs stage 1 address translation as defined for PL2 and the Non-secure state, with permissions as if writing to the given virtual address.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ATS1HW are undefined.

**Attributes**

ATS1HW is a 32-bit System instruction.

**Field descriptions**

The ATS1HW input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31–0</td>
<td>Input address for translation</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Input address for translation. The resulting address can be read from the PAR.

This System instruction takes a VA as input. The resulting address is the PA that is the output address of the translation.

**Executing the ATS1HW instruction**

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is constrained unpredictable, and one of the following behaviors must occur:

- The instruction is undefined.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{<c>\}\{<q>\} \{<coproc>, \#<opc1>, \langle Rt \rangle, \langle CRn \rangle, \langle CRm \rangle\}, \{\#<opc2>\}
\]

<table>

elsif PSTATE.EL == EL3 then
    ATS1HW(R[t]);
BPIALL, Branch Predictor Invalidate All

The BPIALL characteristics are:

**Purpose**

Invalidate all entries from branch predictors.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to BPIALL are UNDEFINED.

In an implementation where the branch predictors are architecturally invisible, this instruction can execute as a NOP.

**Attributes**

BPIALL is a 32-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by \(<Rt>\) is ignored.

**Executing the BPIALL instruction**

The PE ignores the value of \(<Rt>\). Software does not have to write a value to this register before issuing this instruction.

When \(\text{HCR.FB} = 1\), at Non-secure EL1 this instruction executes as a BPIALLIS.

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{<c>\}\{<q>\} \text{coproc}, \{#\}<\text{opc1}>, <Rt>, <\text{CRn}>, <\text{CRm}>\{, \{#\}<\text{opc2}>\}
\]

<table>

CCSIDR, Current Cache Size ID Register

The CCSIDR characteristics are:

**Purpose**

Provides information about the architecture of the currently selected cache.

When FEAT_CCIDX is implemented, this register is used in conjunction with CCSIDR2.

**Configuration**

AArch32 System register CCSIDR bits [31:0] are architecturally mapped to AArch64 System register CCSIDR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CCSIDR are UNDEFINED.

The implementation includes one CCSIDR for each cache that it can access. CSSELR and the Security state select which Cache Size ID Register is accessible.

**Attributes**

CCSIDR is a 32-bit register.

**Field descriptions**

The CCSIDR bit assignments are:

**When FEAT_CCIDX is implemented:**

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0 |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |
|       |   Associativity   |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |
|       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |

**Note**

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

**Bits [31:24]**

Reserved, RES0.

**Associativity, bits [23:3]**

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

**LineSize, bits [2:0]**

(Log$_2$(Number of bytes in cache line)) - 4. For example:

For a line length of 16 bytes: Log$_2$(16) = 4, LineSize entry = 0. This is the minimum line length.
For a line length of 32 bytes: \( \log_2(32) = 5 \), LineSize entry = 1.

**Otherwise:**

|   | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|   | **UNKNOWN** | **NumSets** | **Associativity** | **LineSize** |

**Note**

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

**Bits [31:28]**

Reserved, **UNKNOWN**.

**NumSets, bits [27:13]**

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

**Associativity, bits [12:3]**

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

**LineSize, bits [2:0]**

\( \log_2(\text{Number of bytes in cache line}) - 4 \). For example:

For a line length of 16 bytes: \( \log_2(16) = 4 \), LineSize entry = 0. This is the minimum line length.

For a line length of 32 bytes: \( \log_2(32) = 5 \), LineSize entry = 1.

**Accessing the CCSIDR**

If **CSSEL.R** Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR the behavior is **CONSTRAINED UNPREDICTABLE**, and can be one of the following:

- The CCSIDR read is treated as NOP.
- The CCSIDR read is **UNDEFINED**.
- The CCSIDR read returns an **UNKNOWN** value.

Accesses to this register use the following encodings:

\[\text{MRC}\{<c>\}{<q}> \text{<coproc>}, \{#\}<opc1>, <Rt>, <CRn>, <CRm>\{, \{#\}<opc2>\}\]

  else
    return CCSIDR2;
elsif PSTATE.EL == EL2 then
  return CCSIDR2;
elsif PSTATE.EL == EL3 then
  return CCSIDR2;
CFPRCTX, Control Flow Prediction Restriction by Context

The CFPRCTX characteristics are:

**Purpose**

Control Flow Prediction Restriction by Context applies to all Control Flow Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, control flow prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

**Note**

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level and FEAT_SPECRES is implemented. Otherwise, direct accesses to CFPRCTX are **undefined**.

**Attributes**

CFPRCTX is a 32-bit System instruction.

**Field descriptions**

The CFPRCTX input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td><strong>RES0</strong></td>
</tr>
<tr>
<td>27</td>
<td><strong>GVMID</strong></td>
</tr>
<tr>
<td>26</td>
<td><strong>EL</strong></td>
</tr>
<tr>
<td>20</td>
<td><strong>VMID</strong></td>
</tr>
<tr>
<td>19</td>
<td><strong>RES0</strong></td>
</tr>
<tr>
<td>18</td>
<td><strong>GASID</strong></td>
</tr>
<tr>
<td>17</td>
<td><strong>ASID</strong></td>
</tr>
</tbody>
</table>

**Bits [31:28]**

Reserved, **RES0**.

**GVMID, bit [27]**

Execution of this instruction applies to all VMIDs or a specified VMID.

<table>
<thead>
<tr>
<th>VMID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified VMID for an EL0 or EL1 target execution context.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all VMIDs for an EL0 or EL1 target execution context.</td>
</tr>
</tbody>
</table>
For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

**NS, bit [26]**

Security State.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure state.</td>
</tr>
</tbody>
</table>

If the instruction is executed in Non-secure state, this field has an Effective value of 1.

**EL, bits [25:24]**

Exception Level. Indicates the Exception level of the target execution context.

<table>
<thead>
<tr>
<th>EL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>EL0.</td>
</tr>
<tr>
<td>0b01</td>
<td>EL1.</td>
</tr>
<tr>
<td>0b10</td>
<td>EL2.</td>
</tr>
<tr>
<td>0b11</td>
<td>EL3.</td>
</tr>
</tbody>
</table>

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

**VMID, bits [23:16]**

Only applies when bit[27] is 0 and the target execution context is either:

- EL1.
- EL0 when (HCR_EL2.E2H==0 or HCR_EL2.TGE==0) or EL2 is using AArch32 state.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==0 or HCR_EL2.TGE==0 or ELUsingAArch32(EL2)), this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==1 and HCR_EL2.TGE==1 and !ELUsingAArch32(EL2)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

**Bits [15:9]**

Reserved, RES0.

**GASID, bit [8]**

Execution of this instruction applies to all ASIDs or a specified ASID.

<table>
<thead>
<tr>
<th>GASID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified ASID for an EL0 target execution context.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all ASID for an EL0 target execution context.</td>
</tr>
</tbody>
</table>

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field is treated as 0.
**ASID, bits [7:0]**

Only applies for an EL0 target execution context and when bit[8] is 0.

Otherwise, this field is `RES0`.

When the instruction is executed at EL0, this field is treated as the current ASID.

### Executing the CFPRCTX instruction

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{\langle c\rangle}\{\langle q\rangle}\ \langle\text{coproc}\rangle, \{\#\langle\text{opc1}\rangle, <\text{Rt}\rangle, <\text{CRn}\rangle, <\text{CRm}\rangle, \{\#\langle\text{opc2}\rangle\}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0111</td>
<td>0b0111</td>
<td>0b100</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
  if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '1') && SCTL_EL1.EnRCTX == '0' then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
      AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    else
      AArch64.AArch32SystemAccessTrap(EL1, 0x03);
  elsif EL2Enabled() && SCTL_EL1.EnRCTX == '0' then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
      AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL1) && HCR_EL2.TGE == '1' then
      AArch64.AArch32SystemAccessTrap(EL1, 0x03);
    else
      UNDEFINED;
  elsif EL2Enabled() && !ELUsingAArch32(EL1) && HCR_EL2.<E2H,TGE> == '1' then
    AArch64.AArch32SystemAccessTrap(EL1, 0x03);
  elseif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T7 == '1' then
      AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL1) && HCR_EL2.<E2H,TGE> == '1' then
      AArch64.AArch32SystemAccessTrap(EL1, 0x03);
    else
      CFPRCTX(R[t]);
  elsif PSTATE.EL == EL2 then
    CFPRCTX(R[t]);
  elsif PSTATE.EL == EL3 then
    CFPRCTX(R[t]);
The CLIDR characteristics are:

**Purpose**

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architectured cache maintenance instructions that operate by set.way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

**Configuration**

AArch32 System register CLIDR bits [31:0] are architecturally mapped to AArch64 System register CLIDR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CLIDR are UNDEFINED.

**Attributes**

CLIDR is a 32-bit register:

**Field descriptions**

The CLIDR bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ICB</td>
<td>LoU</td>
</tr>
<tr>
<td>LoC</td>
<td>LoUIS</td>
</tr>
<tr>
<td>Ctype7</td>
<td>Ctype6</td>
</tr>
<tr>
<td>Ctype5</td>
<td>Ctype4</td>
</tr>
<tr>
<td>Ctype3</td>
<td>Ctype2</td>
</tr>
<tr>
<td>Ctype1</td>
<td></td>
</tr>
</tbody>
</table>

**ICB, bits [31:30]**

Inner cache boundary. This field indicates the boundary for caching Inner Cacheable memory regions.

The possible values are:

<table>
<thead>
<tr>
<th>ICB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Not disclosed by this mechanism.</td>
</tr>
<tr>
<td>0b01</td>
<td>L1 cache is the highest Inner Cacheable level.</td>
</tr>
<tr>
<td>0b10</td>
<td>L2 cache is the highest Inner Cacheable level.</td>
</tr>
<tr>
<td>0b11</td>
<td>L3 cache is the highest Inner Cacheable level.</td>
</tr>
</tbody>
</table>

**LoU, bits [29:27]**

Level of Unification Uniprocessor for the cache hierarchy.

**Note**

When FEAT_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

**LoC, bits [26:24]**

Level of Coherence for the cache hierarchy.
LoUIS, bits [23:21]

Level of Unification Inner Shareable for the cache hierarchy.

Note

When FEAT_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

Ctype<n>, bits [3(n-1)+2:3(n-1)], for n = 7 to 1

Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are:

<table>
<thead>
<tr>
<th>Ctype&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>No cache.</td>
</tr>
<tr>
<td>0b001</td>
<td>Instruction cache only.</td>
</tr>
<tr>
<td>0b010</td>
<td>Data cache only.</td>
</tr>
<tr>
<td>0b011</td>
<td>Separate instruction and data caches.</td>
</tr>
<tr>
<td>0b100</td>
<td>Unified cache.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of 000, no caches that can be managed using the architected cache maintenance instructions that operate by set/way exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of 000, the values of Ctype4 to Ctype7 must be ignored.

Accessing the CLIDR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b001</td>
<td>0b000</td>
<td>0b000</td>
<td>0b001</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then

    elsif PSTATE.EL == EL2 then
        return CLIDR;
    elsif PSTATE.EL == EL3 then
        return CLIDR;
The CNTFRQ characteristics are:

**Purpose**

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

**Configuration**

AArch32 System register CNTFRQ bits [31:0] are architecturally mapped to AArch64 System register CNTFRQ_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTFRQ are UNDEFINED.

**Attributes**

CNTFRQ is a 32-bit register.

**Field descriptions**

The CNTFRQ bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Clock frequency</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Clock frequency. Indicates the system counter clock frequency, in Hz.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTFRQ**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>

The CNTHCTL characteristics are:

**Purpose**

Controls the generation of an event stream from the physical counter, and access from Non-secure EL1 modes to the physical counter and the Non-secure EL1 physical timer.

**Configuration**

AArch32 System register CNTHCTL bits [31:0] are architecturally mapped to AArch64 System register CNTHCTL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTHCTL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

CNTHCTL is a 32-bit register.

**Field descriptions**

The CNTHCTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>EVNTIS</td>
</tr>
<tr>
<td>29</td>
<td>RES0</td>
</tr>
<tr>
<td>28</td>
<td>EVNTI</td>
</tr>
<tr>
<td>27</td>
<td>EVTDIR</td>
</tr>
<tr>
<td>26</td>
<td>EVTEN</td>
</tr>
<tr>
<td>25</td>
<td>PL1PCEN</td>
</tr>
<tr>
<td>24</td>
<td>PL1PCTEN</td>
</tr>
</tbody>
</table>

**Bits [31:18]**

Reserved, RES0.

**EVNTIS, bit [17]**

When FEAT_ECV is implemented:

Controls the scale of the generation of the event stream.

<table>
<thead>
<tr>
<th>EVNTIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CNTHCTL.EVNTI field applies to CNTPCT[15:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>The CNTHCTL.EVNTI field applies to CNTPCT[23:8].</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [16:8]**

Reserved, RES0.
EVNTI, bits [7:4]

Selects which bit of the counter register CNTPCT is the trigger for the event stream generated from that counter, when that stream is enabled.

If FEAT_ECV is implemented, and CNTHCTL.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register CNTPCT is the trigger.

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the counter register CNTPCT trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

<table>
<thead>
<tr>
<th>EVNTDIR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A 0 to 1 transition of the trigger bit triggers an event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A 1 to 0 transition of the trigger bit triggers an event.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from the counter register CNTPCT:

<table>
<thead>
<tr>
<th>EVNTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disables the event stream.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enables the event stream.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL1PCEN, bit [1]

Traps Non-secure EL0 and EL1 accesses to the physical timer registers to Hyp mode.

<table>
<thead>
<tr>
<th>PL1PCEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL0 and EL1 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL are trapped to Hyp mode, unless the it is trapped by CNTKCTL.PL0PTEN.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL1PCTEN, bit [0]

Traps Non-secure EL0 and EL1 accesses to the physical counter register to Hyp mode.

<table>
<thead>
<tr>
<th>PL1PCTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL0 and EL1 accesses to the CNTPCT are trapped to Hyp mode, unless it is trapped by CNTKCTL.PL0PCTEN.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the CNTHCTL

</tr>
<tr>
<td>28</td>
<td>ENABLE</td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is **UNKNOWN**.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>
For more information, see the description of the ISTATUS bit.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally **UNKNOWN** value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from **CNTHP_TVAL** continues to count down.

---

**Note**

Disabling the output signal might be a power-saving option.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Accessing the CNTHP_CTL**

Accesses to this register use the following encodings:

CNTHP_CVAL, Counter-timer Hyp Physical CompareValue register

The CNTHP_CVAL characteristics are:

**Purpose**

Holds the compare value for the Hyp mode physical timer.

**Configuration**

AArch32 System register CNTHP_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTHP_CVAL_EL2[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTHP_CVAL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

CNTHP_CVAL is a 64-bit register.

**Field descriptions**

The CNTHP_CVAL bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**CompareValue, bits [63:0]**

Holds the EL2 physical timer CompareValue.

When CNTHP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHP_CTL.ISTATUS is set to 1.
- If CNTHP_CTL.IMASK is 0, an interrupt is generated.

When CNTHP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTHP_CVAL**

The CNTHP_TVAL characteristics are:

**Purpose**

Holds the timer value for the Hyp mode physical timer.

**Configuration**

AArch32 System register CNTHP_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTHP_TVAL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTHP_TVAL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

CNTHP_TVAL is a 32-bit register.

**Field descriptions**

The CNTHP_TVAL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| TimerValue

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHP_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHP_CTL.ENABLE is 1, the value returned is (CNTHP_CVAL - CNTPCT).

On a write of this register, CNTHP_CVAL is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CNTHP_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHP_CTL.ISTATUS is set to 1.
- If CNTHP_CTL.IMASK is 0, an interrupt is generated.

When CNTHP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

    CNTP_TVAL = R[t];
The CNTHPS_CTL characteristics are:

**Purpose**

Provides AArch32 access from EL0 to the Secure EL2 physical timer.

**Configuration**

AArch32 System register CNTHPS_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTHPS_CTL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_CTL are **undefined**.

**Attributes**

CNTHPS_CTL is a 32-bit register.

**Field descriptions**

The CNTHPS_CTL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ISTATUS | IMASK | ENABLE |

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the CNTHPS_CTL.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the CNTHPS_CTL.ENABLE bit is 0, the ISTATUS field is **unknown**.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from **CNTTHPS_TVAL_EL2** continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTTHPS_CTL**

This register is accessed using the encoding for **CNTP_CTL**.

Accesses to this register use the following encodings:

\[
\text{MRC\{<c>\}{<q>} \text{ <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}}}
\]

The CNTHPS_CVAL characteristics are:

**Purpose**

Provides AArch32 access from EL0 to the compare value for the Secure EL2 physical timer.

**Configuration**

AArch32 System register CNTHPS_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTHPS_CVAL_EL2[63:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_CVAL are UNDEFINED.

**Attributes**

CNTHPS_CVAL is a 64-bit register.

**Field descriptions**

The CNTHPS_CVAL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>CompareValue</td>
</tr>
<tr>
<td>62</td>
<td></td>
</tr>
<tr>
<td>61</td>
<td></td>
</tr>
<tr>
<td>...</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**CompareValue, bits [63:0]**

Holds the EL2 physical timer CompareValue.

When CNTHPS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHPS_CTL_EL2.ISTATUS is set to 1.
- If CNTHPS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHPS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTHPS_CVAL**

This register is accessed using the encoding for CNTP_CVAL.

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.TGE == '1') then
    if EL1Enabled() && HCR_EL1.TGE == '1' then
      AArch64.AArch32SystemAccessTrap(EL1, 0x04);
    else
      AArch64.AArch32SystemAccessTrap(EL2, 0x04);
    endif
  else
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
      AArch64.AArch32SystemAccessTrap(EL2, 0x04);
    elseif ELUsingAArch32(EL2) && CNTHCTL.PL0PTEN == '0' then
      AArch32.TakeHypTrapException(0x00);
    else
      UNDEFINED;
    endif
  endif
endif

if PSTATE.EL == EL1 then
  if !ELUsingAArch32(EL3) then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
      AArch64.AArch32SystemAccessTrap(EL2, 0x04);

      endif
    endif
  endif
endif
The CNTHPS_TVAL characteristics are:

**Purpose**

Provides AArch32 access from EL0 to the timer value for the Secure EL2 physical timer.

**Configuration**

AArch32 System register CNTHPS_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTHPS_TVAL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_TVAL are UNDEFINED.

**Attributes**

CNTHPS_TVAL is a 32-bit register.

**Field descriptions**

The CNTHPS_TVAL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>

</table>

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHPS_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHPS_CTL_EL2.ENABLE is 1, the value returned is (CNTHPS_CVAL_EL2 - CNTPCT_EL0).

On a write of this register, CNTHPS_CVAL_EL2 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHPS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTHPS_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHPS_CTL_EL2.ISTATUS is set to 1.
- If CNTHPS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHPS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTHPS_TVAL**

This register is accessed using the encoding for CNTP_TVAL.

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  if !ELUsingAArch32(EL1) && !EL2Enabled() && HCR_EL2.TGE == '11' && CNTKCTL_EL1.EL0PTEN == '0' then

      CNTP_TVAL = R[t];
  else
    CNTP_TVAL = R[t];
  endif
endif
CNTHV_CTL, Counter-timer Virtual Timer Control register (EL2)

The CNTHV_CTL characteristics are:

**Purpose**

Provides AArch32 access to the control register for the EL2 virtual timer.

**Configuration**

AArch32 System register CNTHV_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTHV_CTL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_CTL are UNDEFINED.

**Attributes**

CNTHV_CTL is a 32-bit register.

**Field descriptions**

The CNTHV_CTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>30</td>
<td>ISTATUS</td>
</tr>
<tr>
<td>29</td>
<td>IMASK</td>
</tr>
<tr>
<td>28</td>
<td>ENABLE</td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.
ENABLE, bit [0]

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHV_TVAL continues to count down.

**Note**
Disabling the output signal might be a power-saving option.

---

**Accessing the CNTHV_CTL**

This register is accessed using the encoding for CNTV_CTL.

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b1110</td>
<td>0b0011</td>
<td>0b001</td>
</tr>
</tbody>
</table>

The CNTH_CVAL characteristics are:

**Purpose**

Provides AArch32 access to the compare value for the EL2 virtual timer.

**Configuration**

AArch32 System register CNTH_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTH_CVAL_EL2[63:0].

This register is present only when FEAT_VHE is implemented. Otherwise, direct accesses to CNTH_CVAL are UNDEFINED.

**Attributes**

CNTH_CVAL is a 64-bit register.

**Field descriptions**

The CNTH_CVAL bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**CompareValue, bits [63:0]**

Holds the EL2 virtual timer CompareValue.

When CNTH_CTL ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTH_CTL.ISTATUS is set to 1.
- If CNTH_CTL.IMASK is 0, an interrupt is generated.

When CNTH_CTL ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

**Accessing the CNTH_CVAL**

Accesses to this register use the following encodings:

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

<table>

The CNTHV_TVAL characteristics are:

**Purpose**

Provides AArch32 access to the timer value for the EL2 virtual timer.

**Configuration**

AArch32 System register CNTHV_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTHV_TVAL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_TVAL are **UNDEFINED**.

**Attributes**

CNTHV_TVAL is a 32-bit register.

**Field descriptions**

The CNTHV_TVAL bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     | TimerValue |

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHV_CTL.ENABLE is 0, the value returned is **UNKNOWN**.
- If CNTHV_CTL.ENABLE is 1, the value returned is (CNTHV_CVAL - CNTVCT).

On a write of this register, CNTHV_CVAL is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CNTHV_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHV_CTL.ISTATUS is set to 1.
- If CNTHV_CTL.IMASK is 0, an interrupt is generated.

When CNTHV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.

**Accessing the CNTHV_TVAL**

This register is accessed using the encoding for CNTV_TVAL.

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && CNTKCTL_EL1.EL0VTEN == '0' then
    AArch64.AArch32SystemAccessTrap(EL1, 0x03);
  else
    AArch64.AArch32SystemAccessTrap(EL1, 0x03);
  endif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elseif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.<E2H,TGE> == '11' && CNTHCTL_EL2.EL0VTEN == '0' then

        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.<E2H,TGE> == '11' && CNTHCTL_EL2.EL1TVT == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
        elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.<E2H,TGE> == '11' && SCR_EL3.NS == '0' && IsFeatureImplemented(FEAT_SEL2) then
            CNTHVS_TVAL_EL2 = R[t];
        elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.<E2H,TGE> == '11' && SCR_EL3.NS == '1' then
            CNTHV_TVAL_EL2 = R[t];
        else
            CNTV_TVAL = R[t];
        endif
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && !ELUsingAArch32(EL2) && CNTHCTL_EL2.EL1TVT == '1' then
            AArch64.AArch32SystemAccessTrap(EL2, 0x03);
        else
            CNTV_TVAL = R[t];
        endif
    elsif PSTATE.EL == EL2 then
        CNTV_TVAL = R[t];
    elsif PSTATE.EL == EL3 then
        CNTV_TVAL = R[t];
The CNTHVS_CTL characteristics are:

**Purpose**

Provides AArch32 access from EL0 to the Secure EL2 virtual timer.

**Configuration**

AArch32 System register CNTHVS_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTHVS_CTL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_CTL are undefined.

**Attributes**

CNTHVS_CTL is a 32-bit register.

**Field descriptions**

The CNTHVS_CTL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ISTATUS | IMASK | ENABLE |

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0\b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0\b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is unknown.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0\b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0\b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.
ENABLE, bit [0]

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from `CNTHVS_TVAL` continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

### Accessing the CNTHVS_CTL

This register is accessed using the encoding for `CNTV_CTL`.

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b1110</td>
<td>0b0011</td>
<td>0b001</td>
</tr>
</tbody>
</table>

```c

**CompareValue, bits [63:0]**

Holds the EL2 virtual timer CompareValue.

When CNTHVS_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHVS_CTL.ISTATUS is set to 1.
- If CNTHVS_CTL.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

**Accessing the CNTHVS_CVAL**

This register is accessed using the encoding for CNTV_CVAL.

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>Source</th>
<th>CRm</th>
<th>opc1</th>
</tr>
</thead>
</table>
| MRRC{<c>}{<q>} | coproc | }{#|opc1>, {#, <Rt>, <Rt2>, <CRm>}}

end
CNTHVS_TVAL, Counter-timer Secure Virtual Timer TimerValue Register (EL2)

The CNTHVS_TVAL characteristics are:

**Purpose**

Provides AArch32 access to the timer value for the Secure EL2 virtual timer.

**Configuration**

AArch32 System register CNTHVS_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTHVS_TVAL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_TVAL are UNDEFINED.

**Attributes**

CNTHVS_TVAL is a 32-bit register.

**Field descriptions**

The CNTHVS_TVAL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    | TimerValue |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHVS_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHVS_CTL.ENABLE is 1, the value returned is (CNTHVS_CVAL - CNTVCT).

On a write of this register, CNTHVS_CVAL is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHVS_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CNTHVS_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHVS_CTL.ISTATUS is set to 1.
- If CNTHVS_CTL.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.

**Accessing the CNTHVS_TVAL**

This register is accessed using the encoding for CNTV_TVAL.

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && CNTKCTL_EL1.EL0VTEN == '0' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);

        if EL2Enabled() && !ELUsingAArch32(EL2) && CNTHCTL_EL2.EL1TVT == '1' then
            AArch64.AArch32SystemAccessTrap(EL2, 0x03);
        else
            CNTV_TVAL = R[t];
    elsif PSTATE.EL == EL2 then
        CNTV_TVAL = R[t];
    elsif PSTATE.EL == EL3 then
        CNTV_TVAL = R[t];
    end

The CNTKCTL characteristics are:

**Purpose**

Controls the generation of an event stream from the virtual counter, and access from EL0 modes to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

**Configuration**

AArch32 System register CNTKCTL bits [31:0] are architecturally mapped to AArch64 System register CNTKCTL_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTKCTL are UNDEFINED.

**Attributes**

CNTKCTL is a 32-bit register.

**Field descriptions**

The CNTKCTL bit assignments are:

<table>
<thead>
<tr>

<th>05</th>
<th>04</th>
<th>03</th>
<th>02</th>
<th>01</th>
<th>00</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>EVNTIS</td>
<td>RES0</td>
<td>PL0PTEN</td>
<td>PL0VTEN</td>
<td>EVNT</td>
<td>EVNTDIREVNTEN</td>
<td>PLOVCTEN</td>
<td>PLOPCTEN</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:18]**

Reserved, RES0.

**EVNTIS, bit [17]**

When FEAT_ECV is implemented:

Controls the scale of the generation of the event stream.

<table>
<thead>
<tr>
<th>EVNTIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CNTKCTL.EVNT field applies to CNTVCT[15:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>The CNTKCTL.EVNT field applies to CNTVCT[23:8].</td>
</tr>
</tbody>
</table>

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [16:10]**

Reserved, RES0.
PL0PTEN, bit [9]

Traps PL0 accesses to the physical timer registers to Undefined mode.

<table>
<thead>
<tr>
<th>PL0PTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PL0 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL registers are trapped to Undefined mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL0VTEN, bit [8]

Traps PL0 accesses to the virtual timer registers to Undefined mode.

<table>
<thead>
<tr>
<th>PL0VTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PL0 accesses to the CNTV_CTL, CNTV_CVAL, and CNTV_TVAL registers are trapped to Undefined mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]

Selects which bit of the counter register CNTVCT is the trigger for the event stream generated from that counter, when that stream is enabled.

If FEAT_ECV is implemented, and CNTKCTL.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register CNTVCT.

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the counter register CNTVCT trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

<table>
<thead>
<tr>
<th>EVNTDIR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>A 0 to 1 transition of the trigger bit triggers an event.</td>
</tr>
<tr>
<td>0b1</td>
<td>A 1 to 0 transition of the trigger bit triggers an event.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from the counter register CNTVCT:

<table>
<thead>
<tr>
<th>EVNTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disables the event stream.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enables the event stream.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL0VCTEN, bit [1]

Traps PL0 accesses to the frequency register and virtual counter register to Undefined mode.

<table>
<thead>
<tr>
<th>PL0VCTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PL0 accesses to the CNTVCT are trapped to Undefined mode.</td>
</tr>
<tr>
<td></td>
<td>PL0 accesses to the CNTFRQ register are trapped to Undefined mode, if CNTKCTL.PL0PCTEN is also 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PL0PCTEN, bit [0]**

Traps PL0 accesses to the frequency register and physical counter register to Undefined mode.

<table>
<thead>
<tr>
<th>PL0PCTEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PL0 accesses to the <strong>CNTPCT</strong> are trapped to Undefined mode. PL0 accesses to the <strong>CNTFRQ</strong> register are trapped to Undefined mode, if <strong>CNTKCTL</strong>.PL0VCTEN is also 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTKCTL**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b1100</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

```
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  return CNTKCTL;
elsif PSTATE.EL == EL2 then
  return CNTKCTL;
elsif PSTATE.EL == EL3 then
  return CNTKCTL;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b1100</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

```
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  CNTKCTL = R[t];
elsif PSTATE.EL == EL2 then
  CNTKCTL = R[t];
elsif PSTATE.EL == EL3 then
  CNTKCTL = R[t];
```
The CNTP_CTL characteristics are:

**Purpose**

Control register for the EL1 physical timer.

**Configuration**

AArch32 System register CNTP_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTP_CTL_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTP_CTL are **UNDEFINED**.

**Attributes**

CNTP_CTL is a 32-bit register.

**Field descriptions**

The CNTP_CTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit positions</th>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-3</td>
<td>RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>2</td>
<td>ISTATUS</td>
<td>The status of the timer.</td>
</tr>
<tr>
<td>1</td>
<td>IMASK</td>
<td>Timer interrupt mask bit.</td>
</tr>
<tr>
<td>0</td>
<td>ENABLE</td>
<td>The timer condition is met.</td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is **UNKNOWN**.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.
On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from \texttt{CNTP_TVAL} continues to count down.

\underline{Note}

Disabling the output signal might be a power-saving option.

On a Warm reset, this field resets to 0.

**Accessing the CNTP_CTL**

Accesses to this register use the following encodings:

\texttt{MRC\{<c>\}{<q>} \langle coproc \rangle, \{#\}<opc1>, \langle Rt \rangle, \langle CRn \rangle, \langle CRm \rangle, \{#\}<opc2>}

\begin{center}

The CNTP_CVAL characteristics are:

**Purpose**

Holds the compare value for the EL1 physical timer.

**Configuration**

AArch32 System register CNTP_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTP_CVAL_EL0[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTP_CVAL are UNDEFINED.

**Attributes**

CNTP_CVAL is a 64-bit register.

**Field descriptions**

The CNTP_CVAL bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| CompareValue |
| CompareValue |

**CompareValue, bits [63:0]**

Holds the EL1 physical timer CompareValue.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTP_CVAL**

Accesses to this register use the following encodings:

CNTP_TVAL, Counter-timer Physical Timer TimerValue register

The CNTP_TVAL characteristics are:

**Purpose**

Holds the timer value for the EL1 physical timer.

**Configuration**

AArch32 System register CNTP_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTP_TVAL_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTP_TVAL are undefined.

**Attributes**

CNTP_TVAL is a 32-bit register.

**Field descriptions**

The CNTP_TVAL bit assignments are:

<table>

</tr>
</tbody>
</table>

**TimerValue, bits [31:0]**

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL.ENABLE is 0, the value returned is **UNKNOWN**.
- If CNTP_CTL.ENABLE is 1, the value returned is (CNTP_CVAL - CNTPCT).

On a write of this register, CNTP_CVAL is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CNTP_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTP_TVAL**

Accesses to this register use the following encodings:
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

CNTPCT, Counter-timer Physical Count register

The CNTPCT characteristics are:

Purpose

Holds the 64-bit physical count value.

Configuration

AArch32 System register CNTPCT bits [63:0] are architecturally mapped to AArch64 System register CNTPCT_EL0[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTPCT are UNDEFINED.

All reads to the CNTPCT occur in program order relative to reads to CNTPCTSS or CNTPCT.

Attributes

CNTPCT is a 64-bit register.

Field descriptions

CNTPCTSS, Counter-timer Self-Synchronized Physical Count register

The CNTPCTSS characteristics are:

**Purpose**

Holds the 64-bit physical count value.

**Configuration**

AArch32 System register CNTPCTSS bits [63:0] are architecturally mapped to AArch64 System register CNTPCTSS_EL0[63:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_ECV is implemented. Otherwise, direct accesses to CNTPCTSS are **UNDEFINED**.

All reads to the CNTPCTSS occur in program order relative to reads to CNTPCT or CNTPCTSS.

This register is a self-synchronised view of the CNTPCT counter, and cannot be read speculatively.

**Attributes**

CNTPCTSS is a 64-bit register.

**Field descriptions**

The CNTPCTSS bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Self-Synchronized Physical count value</td>
</tr>
<tr>

  return CNTPCTSS;
elsif PSTATE.EL == EL3 then
  return CNTPCTSS;
CNTV_CTL, Counter-timer Virtual Timer Control register

The CNTV_CTL characteristics are:

**Purpose**

Control register for the virtual timer.

**Configuration**

AArch32 System register CNTV_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTV_CTL_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTV_CTL are UNDEFINED.

**Attributes**

CNTV_CTL is a 32-bit register.

**Field descriptions**

The CNTV_CTL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0    |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| RES0 | ISTATUS | IMASK | ENABLE |

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<table>
<thead>
<tr>
<th>ISTATUS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer condition is not met.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer condition is met.</td>
</tr>
</tbody>
</table>

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>IMASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer interrupt is not masked by the IMASK bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer interrupt is masked by the IMASK bit.</td>
</tr>
</tbody>
</table>

For more information, see the description of the ISTATUS bit.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

<table>
<thead>
<tr>
<th>ENABLE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timer disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timer enabled.</td>
</tr>
</tbody>
</table>

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TVAL continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

On a Warm reset, this field resets to 0.

**Accessing the CNTV_CTL**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>

CNTV_CVAL, Counter-timer Virtual Timer CompareValue register

The CNTV_CVAL characteristics are:

**Purpose**

Holds the compare value for the virtual timer.

**Configuration**

AArch32 System register CNTV_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTV_CVAL_EL0[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTV_CVAL are **UNDEFINED**.

**Attributes**

CNTV_CVAL is a 64-bit register.

**Field descriptions**

The CNTV_CVAL bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**CompareValue, bits [63:0]**

Holds the EL1 virtual timer CompareValue.

When **CNTV_CTL** ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- **CNTV_CTL**.ISTATUS is set to 1.
- If **CNTV_CTL**.IMASK is 0, an interrupt is generated.

When **CNTV_CTL**.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are **RES0**.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTV_CVAL**

Accesses to this register use the following encodings:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
if PSTATE.EL == EL0 then

CNTV_TVAL, Counter-timer Virtual Timer TimerValue register

The CNTV_TVAL characteristics are:

**Purpose**

Holds the timer value for the virtual timer.

**Configuration**

AArch32 System register CNTV_TVAL bits [31:0] are architecturally mapped to AArch64 System register CNTV_TVAL_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTV_TVAL are **UNDEFINED**.

**Attributes**

CNTV_TVAL is a 32-bit register.

**Field descriptions**

The CNTV_TVAL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| TimerValue |

**TimerValue, bits [31:0]**

The TimerValue view of the virtual timer.

On a read of this register:

- If CNTV_CTL.ENABLE is 0, the value returned is **UNKNOWN**.
- If CNTV_CTL.ENABLE is 1, the value returned is (CNTV_CVAL - CNTVCT).

On a write of this register, CNTV_CVAL is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CNTP_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- If CNTV_CTL.IMASK is 0, an interrupt is generated.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTV_TVAL**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && CNTKCTL_EL1.EL0VTEN == '0' then

The CNTVCT characteristics are:

**Purpose**

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value minus the virtual offset visible in CNTVOFF.

**Configuration**

AArch32 System register CNTVCT bits [63:0] are architecturally mapped to AArch64 System register CNTVCT_EL0[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTVCT are UNDEFINED.

The value of this register is the same as the value of CNTPCT in the following conditions:

- When EL2 is not implemented.
- When EL2 is implemented and is using AArch64, HCR_EL2, {E2H, TGE} is {1, 1}, and this register is read from Non-secure EL0.

All reads to the CNTVCT occur in program order relative to reads to CNTVCTSS or CNTVCT.

**Attributes**

CNTVCT is a 64-bit register.

**Field descriptions**

The CNTVCT bit assignments are:

CNTVOFF, Counter-timer Virtual Offset register

The CNTVOFF characteristics are:

**Purpose**

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in CNTPCT and the virtual count value visible in CNTVCT.

**Configuration**

AArch32 System register CNTVOFF bits [63:0] are architecturally mapped to AArch64 System register CNTVOFF_EL2[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTVOFF are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3 and the virtual counter uses a fixed virtual offset of zero.

**Note**

When EL2 is implemented and is using AArch64, if HCR_EL2.{E2H, TGE} is \{1, 1\}, the virtual counter uses a fixed virtual offset of zero when CNTVCT is read from Non-secure EL0.

**Attributes**

CNTVOFF is a 64-bit register.

**Field descriptions**

The CNTVOFF bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Virtual offset</td>
</tr>
<tr>
<td>62</td>
<td>Virtual offset</td>
</tr>
<tr>
<td>31</td>
<td>Virtual offset</td>
</tr>
<tr>
<td>30</td>
<td>Virtual offset</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Virtual offset.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTVOFF**

Accesses to this register use the following encodings:

\[\text{MRRC}\{<c>\}\{<q>\} <\text{coproc}>\{\#<\text{opc1}>\}, <\text{Rt}>, <\text{Rt2}>, <\text{CRm}>\]

<table>

    return CNTVOFF;

MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
CONTEXTIDR, Context ID Register

The CONTEXTIDR characteristics are:

**Purpose**

Identifies the current Process Identifier and, when using the Short-descriptor translation table format, the Address Space Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

**Configuration**

AArch32 System register CONTEXTIDR bits [31:0] are architecturally mapped to AArch64 System register CONTEXTIDR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CONTEXTIDR are **UNDEFINED**.

The register format depends on whether address translation is using the Long-descriptor or the Short-descriptor translation table format.

**Attributes**

CONTEXTIDR is a 32-bit register.

**Field descriptions**

The CONTEXTIDR bit assignments are:

**When TTBCR.EAE == 0:**

endif
CPACR, Architectural Feature Access Control Register

The CPACR characteristics are:

**Purpose**

Controls access to trace, and to Advanced SIMD and floating-point functionality from EL0, EL1, and EL3.

In an implementation that includes EL2, the CPACR has no effect on instructions executed at EL2.

**Configuration**

AArch32 System register CPACR bits [31:0] are architecturally mapped to AArch64 System register CPACR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CPACR are UNDEFINED.

Bits in the NSACR control Non-secure access to the CPACR fields. See the field descriptions for more information.

**Note**

In the register field descriptions, controls are described as applying at specified Privilege levels. This is because, in Secure state, a PL1 control:

- Applies to execution in a Secure EL3 mode when EL3 is using AArch32.
- Applies to execution in a Secure EL1 mode when EL3 is using AArch64.

See ‘Security state, Exception levels, and AArch32 execution privilege’.

**Attributes**

CPACR is a 32-bit register.

**Field descriptions**

The CPACR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ASE| DIS| RES| 0 | TR| C| | | | | | | | | | | | | | | | | | | | | | | | | | | | |

ASEDIS, bit [31]

Disables PL0 and PL1 execution of Advanced SIMD instructions.

<table>
<thead>
<tr>
<th>ASEDIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control permits execution of Advanced SIMD instructions at PL0 and PL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>All instruction encodings that are Advanced SIMD instruction encodings, but are not also floating-point instruction encodings, are UNDEFINED at PL0 and PL1.</td>
</tr>
</tbody>
</table>

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSASEDIS is 1, this field behaves as RAO/WI in Non-secure state, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.
For the list of instructions affected by this field, see 'Controls of Advanced SIMD operation that do not apply to floating-point operation'.

See the description of CPACR.cp10 for a list of other controls that can disable or trap execution of Advanced SIMD instructions in AArch32 state.

On a Warm reset, this field resets to 0.

**Bits [30:29]**

Reserved, RESO.

**TRCDIS, bit [28]**

Traps PL0 and PL1 System register accesses to all implemented trace registers to Undefined mode.

<table>
<thead>
<tr>
<th>TRCDIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on PL0 and PL1 System register accesses to trace registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>PL0 and PL1 System register accesses to all implemented trace registers are trapped to Undefined mode.</td>
</tr>
</tbody>
</table>

If the implementation does not include a PE trace unit, or does not include a System register interface to the PE trace unit registers, this field is RES0. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSTRCDIS is 1, this field behaves as RAO/WI in Non-secure state, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

**Note**

- The ETMv4 architecture and ETE do not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4 or FEAT_ETE, EL0 accesses to the trace registers are UNDEFINED.
- The Arm architecture does not provide traps on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [27:24]**

Reserved, RES0.

**cp11, bits [23:22]**

The value of this field is ignored. If this field is programmed with a different value to the cp10 field then this field is UNKNOWN on a direct read of the CPACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In Non-secure state, if EL3 is implemented and is using AArch32, when the value of NSACR.cp10 is 0, this field behaves as RAZ/WI, regardless of its actual value.

On a Warm reset, this field resets to 0.

**cp10, bits [21:20]**

Defines the access rights for the floating-point and Advanced SIMD functionality. Possible values of the field are:
The floating-point and Advanced SIMD features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

Note

The CPACR has no effect on floating-point and Advanced SIMD accesses from PL2. These can be disabled by the HCPTR.TCP10 field.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In Non-secure state, if EL3 is implemented and is using AArch32, when the value of NSACR.cp10 is 0, this field behaves as RAZ/WI, regardless of its actual value.

Execution of floating-point and Advanced SIMD instructions in AArch32 state can be disabled or trapped by the following controls:

- CPACR.cp10, or, if executing at EL0, CPACR_EL1.FPEN.
- FPEXC.EN.
- If executing in Non-secure state:
  - HCPTR.TCP10, or if EL2 is using AArch64, CPTR_EL2.TFP.
  - NSACR.cp10, or if EL3 is using AArch64, CPTR_EL3.TFP.
- For Advanced SIMD instructions only:
  - CPACR.ASEDIS.
  - If executing in Non-secure state, HCPTR.TASE and NSACR.NSTRCDIS.

See the descriptions of the controls for more information.

On a Warm reset, this field resets to 0.

**Bits [19:0]**

Reserved, RES0.

**Accessing the CPACR**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{#<\text{opc2}>\}\}

      AArch64.AArch32SystemAccessTrap(EL3, 0x03);
    endif
  else
    CPACR = R[t];
  endif
elsif PSTATE.EL == EL3 then
  CPACR = R[t];
The CPPRCTX characteristics are:

### Purpose

Cache Prefetch Prediction Restriction by Context applies to all Cache Allocation Resources that predict cache allocations based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, cache prefetch prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction applies to all:

- Instruction caches.
- Data caches.
- TLB prefetching hardware used by the executing PE that applies to the supplied context or contexts.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

#### Note

This instruction does not require the invalidation of Cache Allocation Resources so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

### Configuration

This instruction is present only when AArch32 is supported at any Exception level and FEAT_SPECRES is implemented. Otherwise, direct accesses to CPPRCTX are **UNDEFINED**.

### Attributes

CPPRCTX is a 32-bit System instruction.

### Field descriptions

The CPPRCTX input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>27</td>
<td>GVMID</td>
<td>VMID</td>
</tr>
<tr>
<td>15</td>
<td>EL</td>
<td>VMID</td>
</tr>
<tr>
<td>12</td>
<td>ASID</td>
<td>VMID</td>
</tr>
<tr>
<td>10</td>
<td>RES0</td>
<td>reserved, RES0</td>
</tr>
<tr>
<td>8</td>
<td>ASID</td>
<td>VMID</td>
</tr>
<tr>
<td>6</td>
<td>GASID</td>
<td>VMID</td>
</tr>
<tr>
<td>4</td>
<td>ASID</td>
<td>VMID</td>
</tr>
<tr>
<td>2</td>
<td>ASID</td>
<td>VMID</td>
</tr>
<tr>
<td>0</td>
<td>ASID</td>
<td>VMID</td>
</tr>
</tbody>
</table>

#### Bits [31:28]

Reserved, RES0.

#### GVMID, bit [27]

Execution of this instruction applies to all VMIDs or a specified VMID.
GVMID

<table>
<thead>
<tr>
<th>GVMID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified VMID for an EL0 or EL1 target execution context.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all VMIDs for an EL0 or EL1 target execution context.</td>
</tr>
</tbody>
</table>

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

NS, bit [26]

Security State.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure state.</td>
</tr>
</tbody>
</table>

If the instruction is executed in Non-secure state, this field is treated as 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

<table>
<thead>
<tr>
<th>EL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>EL0.</td>
</tr>
<tr>
<td>0b01</td>
<td>EL1.</td>
</tr>
<tr>
<td>0b10</td>
<td>EL2.</td>
</tr>
<tr>
<td>0b11</td>
<td>EL3.</td>
</tr>
</tbody>
</table>

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

VMID, bits [23:16]

Only applies when bit[27] is 0 and the target execution context is either:

- EL1.
- EL0 when \((\text{HCR_EL2.E2H==0 or HCR_EL2.TGE==0})\) or EL2 is using AArch32 state.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and \((\text{HCR_EL2.E2H==0 or HCR_EL2.TGE==0 or ELUsingAArch32(EL2)})\), this field is treated as the current VMID.

When the instruction is executed at EL0 and \((\text{HCR_EL2.E2H==1 and HCR_EL2.TGE==1 and !ELUsingAArch32(EL2)})\), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

Bits [15:9]

Reserved, RES0.

GASID, bit [8]

Execution of this instruction applies to all ASIDs or a specified ASID.

<table>
<thead>
<tr>
<th>GASID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified ASID for an EL0 target execution context.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all ASID for an EL0 target execution context.</td>
</tr>
</tbody>
</table>
For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

**ASID, bits [7:0]**

Only applies for an EL0 target execution context and when bit[8] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

**Executing the CPPRCTX instruction**

Accesses to this instruction use the following encodings:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>

  elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T7 == '1' then
    AArch32.TakeHypTrapException(0x03);
  elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x03);
  else
    CPPRCTX(R[t]);
  endif
endif

if PSTATE.EL == EL2 then
  CPPRCTX(R[t]);
endif

if PSTATE.EL == EL3 then
  CPPRCTX(R[t]);
endif
CPSR, Current Program Status Register

The CPSR characteristics are:

**Purpose**

Holds PE status and control information.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CPSR are **UNDEFINED**.

**Attributes**

CPSR is a 32-bit register.

**Field descriptions**

The CPSR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| N  | Z  | C  | V  | Q  | RES0 | SSBS | PAND | TRES0 | GE | RES0 | E  | A  | I  | F  | RES0 | RES1 | M |

**N, bit [31]**

Negative condition flag. Set to bit[31] of the result of the last flag-setting instruction. If the result is regarded as a two's complement signed integer, then N is set to 1 if the result was negative, and N is set to 0 if the result was positive or zero.

**Z, bit [30]**

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

**C, bit [29]**

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

**V, bit [28]**

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

**Q, bit [27]**

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

**Bits [26:24]**

Reserved, RES0.

**SSBS, bit [23]**

Reserved.
When FEAT_SSBS is implemented:

Speculative Store Bypass Safe.

Prohibits speculative loads or stores which might practically allow a cache timing side channel.

A cache timing side channel might be exploited where a load or store uses an address that is derived from a register that is being loaded from memory using a load instruction speculatively read from a memory location. If PSTATE.SSBS is enabled, the address derived from the load instruction might be from earlier in the coherence order than the latest store to that memory location with the same virtual address.

<table>
<thead>
<tr>
<th>SSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hardware is not permitted to load or store speculatively in the manner described.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hardware is permitted to load or store speculatively in the manner described.</td>
</tr>
</tbody>
</table>

The value of this bit is usually set to the value described by the SCTLR.DSSBS bit on exceptions to any mode except Hyp mode, and the value described by HSCTLR.DSSBS on exceptions to Hyp mode.

On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never.

<table>
<thead>
<tr>
<th>PAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation system is the same as Armv8.0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Disables privileged read and write accesses to addresses accessible at EL0.</td>
</tr>
</tbody>
</table>

The value of this bit is usually preserved on taking an exception, except in the following situations:

- When the target of the exception is EL1, and the value of the SCTLR.SPAN bit for the current Security state is 0, this bit is set to 1.
- When the target of the exception is EL3, from Secure state, and the value of the Secure SCTLR.SPAN is 0, this bit is set to 1.
- When the target of the exception is EL3, from Non-secure state, this bit is set to 0 regardless of the value of the Secure SCTLR.SPAN bit.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing.
For certain data processing instructions, the instruction
All cryptographic instructions. These instructions are:
The values of the NZCV flags.
The values of the data supplied in any of its
The timing of every load and store instruction is insensitive
takes a time which is independent of:
- The values of the data supplied in any of its
- The values of the NZCV flags.
For certain data processing instructions, the response of
the instruction to asynchronous exceptions does not vary
based on:
- The values of the data supplied in any of its
- The values of the NZCV flags.

The data processing instructions affected by this bit are:

- All cryptographic instructions. These instructions are:
  - AESD, AESE, AESIMC, AESMC, SHA1C, SHA1H, SHA1M, SHA1P, SHA1SU0, SHA1SU1, SHA256H, SHA256H2,
    SHA256SU0, and SHA256SU1.

- A subset of those instructions which use the general-purpose register file. For these instructions, the effects of
  CPSR.DIT apply only if they do not use R15 as either their source or destination and pass their condition
  execution check. The instructions are:
    - BFI, BFC, CLZ, CMN, CMP, MLA, MLAS, MLS, MOVT, MUL, MULS, NOP, PKHBT, PKHTB, RBIT, REV, REV16, REVSH,
      RRX, SADD16, SADDB, SAXB, SBFX, SHADD16, SHADDB, SHASX, HSHA, HSUB16, HSUBB, SMLAL**, SMLAW*,
      SMLD*, SMLA*, SMMLA*, SMUL*, SSAX, SSUB16, SSUBB, SXTAB*, SXTAH, SXTB*, SXTL, TEQ, TEST, UADD*, UASX,
      UBFX, UHADD*, UHASX, UHSAB, UHSUB*, UMAAL, UMLAL, UMLAS, UMUL, UMULL, USADAB, USAX, USUB*, UXTAB*,
      UXTAH, UXTB*, UXTL, AD (register-shifted register), ADCS (register-shifted register), ADD (register-shifted register),
      ADDS (register-shifted register), AND (register-shifted register), ANDS (register-shifted register), ASR (register-shifted register),
      ASRS (register-shifted register), BIC (register-shifted register), BICS (register-shifted register), EOR (register-shifted register),
      EORS (register-shifted register), LSL (register-shifted register), LSLS (register-shifted register), LSRS (register-shifted register),
      MOV (register-shifted register), MOVN (register-shifted register), MVN (register-shifted register), MVNS (register-shifted register),
      MVNS (register-shifted register), ORR (register-shifted register), ORRS (register-shifted register), ROR (register-shifted register),
      ROR (register-shifted register), ROR (register-shifted register), RS (register-shifted register), RSCS (register-shifted register),
      SBC (register-shifted register), SBC (register-shifted register), SUBC (register-shifted register), SUBS (register-shifted register).

- A subset of those instructions which use the general-purpose register file. For these instructions, the effects of
  CPSR.DIT do not depend on these instructions passing their condition execution check. These instructions are:
    - ADC (immediate), ADC (register), ADCS (immediate), ADCS (register), ADD (immediate), ADD (register),
      ADDS (immediate), ADDS (register), AND (immediate), AND (register), ANDS (immediate), ANDS (register),
      ASR (immediate), ASR (register), ASRS (immediate), ASRS (register), BIC (immediate), BIC (register),
      BICS (immediate), BICS (register), EOR (immediate), EOR (register), EORS (immediate), EORS (register),
      LSL (immediate), LSL (register), LSLS (immediate), LSLS (register), LSRS (immediate), LSRS (register),
      MOV (immediate), MOV (register), MOVN (immediate), MOVN (register), MVNS (register), MVNS (register),
      ORR (immediate), ORR (register), ORRS (register), ORRS (register), ROR (immediate), ROR (register), RORS (immediate),
      RORS (register), RS (immediate), RS (register), RSBS (immediate), RSBS (register), RSC (immediate), RSC (register),
      RSCS (register), RSCS (register), SBC (immediate), SBC (register), SBCS (immediate), SBCS (register),
      SUB (immediate), SUB (register), SUBS (immediate), and SUBS (register).

- A subset of those instructions which use the SIMD&FP register file. For these instructions, the effects of
  CPSR.DIT apply only if they pass their condition execution check. These instructions are:
    - CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, CRC32CW, VABA*, VABD*, VABS, VACGE, VACGT, VACLE,
      VACL, VADD (integer), VADDDN, VADDL, VADDW, VADD, VBIC, VBIF, VBIT, VBSL, VCEG, VCGT, VCLE, VCLS,
      VCLT, VCLZ, VCHM, VCMP, VCMP, VCNT, VTUP, VEOR, VEXT, VHADD, VHSUB, VMAX (integer), VMIN (integer), VMLA
      (integer), VMLAL, VMLS (integer), VMLSL, VMOV, VMVOL, VMOVN, VMUL (integer and polynomial), VMULL
      (integer and polynomial), VMVN, VNEG, VORN, VORR, VPADAL, VPADD (integer), VPADDL, VPMAX (integer),

The architecture makes no statement about the timing properties of any instructions.

The architecture requires that:
- The timing of every load and store instruction is insensitive to the value of the data being loaded or stored.
- For certain data processing instructions, the instruction takes a time which is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- For certain data processing instructions, the response of the instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
On a Warm reset, this field resets to 0.

Otherwise:
Reserved, RES0.

Bit [20]
Reserved, RES0.

GE, bits [19:16]
Greater than or Equal flags, for parallel addition and subtraction.

Bits [15:10]
Reserved, RES0.

E, bit [9]
Endianness state bit. Controls the load and store endianness for data accesses:

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Little-endian operation</td>
</tr>
<tr>
<td>0b1</td>
<td>Big-endian operation</td>
</tr>
</tbody>
</table>

Instruction fetches ignore this bit.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

A, bit [8]
SError interrupt mask bit. The possible values of this bit are:

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exception not masked.</td>
</tr>
<tr>
<td>0b1</td>
<td>Exception masked.</td>
</tr>
</tbody>
</table>

I, bit [7]
IRQ mask bit. The possible values of this bit are:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exception not masked.</td>
</tr>
<tr>
<td>0b1</td>
<td>Exception masked.</td>
</tr>
</tbody>
</table>
F, bit [6]

FIQ mask bit. The possible values of this bit are:

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exception not masked.</td>
</tr>
<tr>
<td>0b1</td>
<td>Exception masked.</td>
</tr>
</tbody>
</table>

Bit [5]

Reserved, RES0.

Bit [4]

Reserved, RES1.

M, bits [3:0]

Current PE mode. Possible values are:

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ.</td>

<tr>
<td>0b0010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Monitor.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b1010</td>
<td>Hyp.</td>
</tr>
<tr>
<td>0b1011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b1111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Accessing the CPSR

CPSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions.
The CSSEL characteristics are:

**Purpose**

Selects the current Cache Size ID Register, **CCSIDR**, by specifying the required cache level and the cache type, which is either instruction cache or data cache.

If FEAT_CCIDX is implemented, CSSEL also selects the current **CCSIDR2**.

**Configuration**

AArch32 System register CSSEL bits [31:0] are architecturally mapped to AArch64 System register **CSSEL_EL1[31:0]**.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CSSEL are **UNDEFINED**.

**Attributes**

CSSEL is a 32-bit register.

**Field descriptions**

The CSSEL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-4</td>
<td>Reserved, RES0</td>
<td>Level [3:1]</td>
</tr>
</tbody>
</table>

**Bits [31:4]**

Reserved, RES0.

**Level, bits [3:1]**

Cache level of required cache. Permitted values are:

<table>
<thead>
<tr>
<th>Level</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Level 1 cache.</td>
</tr>
<tr>
<td>0b001</td>
<td>Level 2 cache.</td>
</tr>
<tr>
<td>0b010</td>
<td>Level 3 cache.</td>
</tr>
<tr>
<td>0b011</td>
<td>Level 4 cache.</td>
</tr>
<tr>
<td>0b100</td>
<td>Level 5 cache.</td>
</tr>
<tr>
<td>0b101</td>
<td>Level 6 cache.</td>
</tr>
<tr>
<td>0b110</td>
<td>Level 7 cache.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If CSSEL.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSEL is **UNKNOWN**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**InD, bit [0]**

Instruction not Data bit. Permitted values are:
### InD Meaning

| 0b0 | Data or unified cache. |
| 0b1 | Instruction cache. |

If CSSELR.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR is **UNKNOWN**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing the CSSELR

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>; \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>; \{#\}<\text{opc2}> \

CTR, Cache Type Register

The CTR characteristics are:

**Purpose**

Provides information about the architecture of the caches.

**Configuration**

AArch32 System register CTR bits [31:0] are architecturally mapped to AArch64 System register CTR_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CTR are UNDEFINED.

**Attributes**

CTR is a 32-bit register.

**Field descriptions**

The CTR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES1</td>
</tr>
<tr>
<td>30</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>29</td>
<td>DIC</td>
</tr>
<tr>
<td>28</td>
<td>IDC</td>
</tr>
<tr>
<td>27</td>
<td>CWG</td>
</tr>
<tr>
<td>26</td>
<td>ERG</td>
</tr>
<tr>
<td>25</td>
<td>DminLine</td>
</tr>
<tr>
<td>24</td>
<td>L1Ip</td>
</tr>
<tr>
<td>23</td>
<td>RES0</td>
</tr>
<tr>
<td>22</td>
<td>IminLine</td>
</tr>
</tbody>
</table>

**DIC, bit [29]**

Instruction cache invalidation requirements for data to instruction coherence.

<table>
<thead>
<tr>
<th>DIC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction cache invalidation to the Point of Unification is required for data to instruction coherence.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction cache invalidation to the Point of Unification is not required for data to instruction coherence.</td>
</tr>
</tbody>
</table>

**IDC, bit [28]**

Data cache clean requirements for instruction to data coherence. The meaning of this bit is:

<table>
<thead>
<tr>
<th>IDC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Data cache clean to the Point of Unification is required for instruction to data coherence, unless CLIDR.LoC == 0b000 or (CLIDR.LoUIS == 0b000 &amp; CLIDR.LoUU == 0b000).</td>
</tr>
<tr>
<td>0b1</td>
<td>Data cache clean to the Point of Unification is not required for instruction to data coherence.</td>
</tr>
</tbody>
</table>
CWG, bits [27:24]

Cache writeback granule. \( \log_2 \) of the number of words of the maximum size of memory that can be overwritten as a result of the eviction of a cache entry that has had a memory location in it modified.

A value of \( \text{0b0000} \) indicates that this register does not provide Cache writeback granule information and either:

- The architectural maximum of 512 words (2KB) must be assumed.
- The Cache writeback granule can be determined from maximum cache line size encoded in the Cache Size ID Registers.

Values greater than \( \text{0b1001} \) are reserved.

Arm recommends that an implementation that does not support cache write-back implements this field as \( \text{0b0001} \). This applies, for example, to an implementation that supports only write-through caches.

ERG, bits [23:20]

Exclusives reservation granule. \( \log_2 \) of the number of words of the maximum size of the reservation granule that has been implemented for the Load-Exclusive and Store-Exclusive instructions.

The use of the value \( \text{0b0000} \) is deprecated.

The value \( \text{0b0001} \) and values greater than \( \text{0b1001} \) are reserved.

DminLine, bits [19:16]

\( \log_2 \) of the number of words in the smallest cache line of all the data caches and unified caches that are controlled by the PE.

L1Ip, bits [15:14]

Level 1 instruction cache policy. Indicates the indexing and tagging policy for the L1 instruction cache. Possible values of this field are:

<table>
<thead>
<tr>
<th>L1Ip</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>VMID aware Physical Index, Physical tag (VPIPT)</td>
</tr>
<tr>
<td>0b01</td>
<td>ASID-tagged Virtual Index, Virtual Tag (AIVIVT)</td>
</tr>
<tr>
<td>0b10</td>
<td>Virtual Index, Physical Tag (VIPT)</td>
</tr>
<tr>
<td>0b11</td>
<td>Physical Index, Physical Tag (PIPT)</td>
</tr>
</tbody>
</table>

The value \( \text{0b00} \) is permitted only in an implementation that includes FEAT_VPIPT, otherwise the value is reserved.

The value \( \text{0b01} \) is not permitted in Armv8.

Bits [13:4]

Reserved, RES0.

IminLine, bits [3:0]

\( \log_2 \) of the number of words in the smallest cache line of all the instruction caches that are controlled by the PE.

Accessing the CTR

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} \text{<coproc>}, \{#\text{<opc1>}, \text{<Rt>}, \text{<CRn>}, \text{<CRm>}, \{#\text{<opc2>}}
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0000</td>
<td>0b001</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);

    elsif PSTATE.EL == EL2 then
        return CTR;
elsif PSTATE.EL == EL3 then
    return CTR;
DACR, Domain Access Control Register

The DACR characteristics are:

**Purpose**

Defines the access permission for each of the sixteen memory domains.

**Configuration**

AArch32 System register DACR bits [31:0] are architecturally mapped to AArch64 System register DACR32_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DACR are UNDEFINED.

This register has no function when TTBCR.EAE is set to 1, to select the Long-descriptor translation table format.

**Attributes**

DACR is a 32-bit register.

**Field descriptions**

The DACR bit assignments are:

<table>
<thead>
<tr>
<th>D&lt;n&gt;, bits [2n+1:2n], for n = 15 to 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>D15</td>
</tr>
<tr>
<td>-----</td>
</tr>
<tr>
<td>D&lt;n&gt;</td>
</tr>
<tr>
<td>0b00</td>
</tr>
<tr>
<td>0b01</td>
</tr>
<tr>
<td>0b11</td>
</tr>
</tbody>
</table>

The value 0b10 is reserved.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DACR**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>

DBGAUTHSTATUS, Debug Authentication Status register

The DBGAUTHSTATUS characteristics are:

**Purpose**

Provides information about the state of the implementation defined authentication interface for debug.

**Configuration**

AArch32 System register DBGAUTHSTATUS bits [31:0] are architecturally mapped to AArch64 System register `DBGAUTHSTATUS_EL1[31:0]`.

AArch32 System register DBGAUTHSTATUS bits [31:0] are architecturally mapped to External register `DBGAUTHSTATUS_EL1[31:0]`.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGAUTHSTATUS are undefined.

This register is required in all implementations.

**Attributes**

DBGAUTHSTATUS is a 32-bit register.

**Field descriptions**

The DBGAUTHSTATUS bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| RES0 |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

**Bits [31:8]**

Reserved, RES0.

**SNID, bits [7:6]**

When `FEAT_Debugv8p4` is implemented:

Secure Non-Invasive Debug.

This field has the same value as DBGAUTHSTATUS.SID.

**Otherwise:**

Secure Non-Invasive Debug.

<table>
<thead>
<tr>
<th>SNID</th>

end if
DBGBCR<n>, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n> characteristics are:

**Purpose**

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGBVR<n>. If EL2 is implemented and this breakpoint supports Context matching, DBGBVR<n> can be associated with a Breakpoint Extended Value Register DBGBXVR<n> for VMID matching.

**Configuration**

AArch32 System register DBGBCR<n> bits [31:0] are architecturally mapped to AArch64 System register DBGBCR<n>_EL1[31:0].

AArch32 System register DBGBCR<n> bits [31:0] are architecturally mapped to External register DBGBCR<n>_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGBCR<n> are UNDEFINED.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

**Attributes**

DBGBCR<n> is a 32-bit register.

**Field descriptions**

The DBGBCR<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | BT | LBN | SSC | HMC | RES0 | BAS | RES0 | PMC | E |

When the E field is zero, all the other fields in the register are ignored.

**Bits [31:24]**

Reserved, RES0.

**BT, bits [23:20]**

Breakpoint Type. Possible values are:
<table>
<thead>
<tr>
<th>BT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Unlinked instruction address match. <code>DBGBVR&lt;n&gt;</code> is the address of an instruction.</td>

</tr>
<tr>
<td>0b1111</td>
<td>As 0b1110 with linking enabled.</td>
</tr>
</tbody>
</table>

For more information on Breakpoints and their constraints, see 'Breakpoint exceptions' and 'Reserved DBGBCR<n>.BT values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>.E is 0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields.

For more information, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' and 'Reserved DBGBCR<n>.{SSC, HMC, PMC} values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the SSC, bits [15:14] description.
For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [12:9]**

Reserved, RES0.

**BAS, bits [8:5]**

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Match instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0011</td>

<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1111</td>
<td>DBGVR&lt;n&gt;</td>
<td>Use for A32 instructions</td>
</tr>
</tbody>
</table>

All other values are reserved. For more information, see 'Reserved DBGCR<n>.BAS values'.

For more information on using the BAS field in address mismatch breakpoints, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [4:3]**

Reserved, RES0.

**PMC, bits [2:1]**

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGCR<n>.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**E, bit [0]**

Enable breakpoint DBGVR<n>. Possible values are:
**Meaning**

<table>
<thead>
<tr>
<th>E</th>
</tr>
</thead>
</table>
| 0b0 | Breakpoint disabled.  
| 0b1 | Breakpoint enabled.  

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

DBGBVR\(n\), Debug Breakpoint Value Registers, \(n = 0\) - 15

The DBGBVR\(n\) characteristics are:

**Purpose**

Holds a value for use in breakpoint matching, either the virtual address of an instruction or a context ID. Forms breakpoint \(n\) together with control register DBGBCR\(n\). If EL2 is implemented and this breakpoint supports Context matching, DBGBVR\(n\) can be associated with a Breakpoint Extended Value Register DBGBXVR\(n\) for VMID matching.

**Configuration**

AArch32 System register DBGBVR\(n\) bits [31:0] are architecturally mapped to AArch64 System register DBGBVR\(n\)_EL1[31:0].

AArch32 System register DBGBVR\(n\) bits [31:0] are architecturally mapped to External register DBGBVR\(n\)_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGBVR\(n\) are **UNDEFINED**.

How this register is interpreted depends on the value of DBGBCR\(n\).BT.

- When DBGBCR\(n\).BT is 0b0\_0\_0\_, this register holds a virtual address.
- When DBGBCR\(n\).BT is 0b\_xx1\_x\_, this register holds a Context ID.

For other values of DBGBCR\(n\).BT, this register is **RES0**.

Some breakpoints might not support Context ID comparison. For more information, see the description of the DBGDIDR_CTX_CMPs field.

If breakpoint \(n\) is not implemented then accesses to this register are **UNDEFINED**.

**Attributes**

DBGBVR\(n\) is a 32-bit register.

**Field descriptions**

The DBGBVR\(n\) bit assignments are:

**When DBGBCR\(n\).BT == 0b0\_0\_0\_:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| **VA[31:2]** | RES0 |

**VA[31:2], bits [31:2]**

Bits[31:2] of the address value for comparison.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [1:0]**

Reserved, **RES0**.
When DBGBCR<n>.BT == 0b001x:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ContextID |

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against CONTEXTIDR_EL2 when all of the following are true:

- FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented.
- HCR_EL2.\{E2H, TGE\} is \{1,1\}.
- The PE is executing at EL0.
- EL2 is using AArch64 and is enabled in the current Security state.

Otherwise, the value is compared against CONTEXTIDR.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>.BT == 0b101x and EL2 is implemented:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ContextID |

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>.BT == 0bx11x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ContextID |

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGBVR<n>

The DBGBXVR<n> characteristics are:

**Purpose**

Holds a value for use in breakpoint matching, to support VMID matching. Used in conjunction with a control register DBGBCR<n> and a value register DBGBVR<n>, where EL2 is implemented and breakpoint n supports Context matching.

**Configuration**

AArch32 System register DBGBXVR<n> bits [31:0] are architecturally mapped to AArch64 System register DBGBVR<n>_EL1[63:32].

AArch32 System register DBGBXVR<n> bits [31:0] are architecturally mapped to External register DBGBVR<n>_EL1[63:32].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGBXVR<n> are UNDEFINED.

How this register is interpreted depends on the value of DBGBCR<n>.BT.

- When DBGBCR<n>.BT is 0b10xx, this register holds a VMID.
- When DBGBCR<n>.BT is 0b11xx, this register holds a Context ID.

For other values of DBGBCR<n>.BT, this register is RES0.

Accesses to this register are UNDEFINED in any of the following cases:

- Breakpoint n is not implemented.
- Breakpoint n does not support Context matching.
- EL2 is not implemented.

For more information, see the description of the DBGDIDR.CTX_CMPs field.

**Attributes**

DBGBXVR<n> is a 32-bit register.

**Field descriptions**

The DBGBXVR<n> bit assignments are:

**When DBGBCR<n>.BT == 0b10xx and EL2 is implemented:**

<table>

</table>

**Bits [31:16]**

Reserved, RES0.
VMID[15:8], bits [15:8]

When FEAT_VMID16 is implemented and VTCR_EL2.VS == 1:

- Extension to VMID[7:0]. See VMID[7:0] for more details.
- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

- Reserved, **RES0**.

VMID[7:0], bits [7:0]

VMID value for comparison. The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

When DBGBCR<n>.BT == 0b11xx and EL2 is implemented:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ContextID2 |

ContextID2, bits [31:0]

When FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented:

- Context ID value for comparison against CONTEXTIDR_EL2.
- On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

- Reserved, **RES0**.

DBGCLAIMCLR, Debug CLAIM Tag Clear register

The DBGCLAIMCLR characteristics are:

**Purpose**

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

---

**Note**

CLAIM tags are typically used for communication between the debugger and target software.

---

Used in conjunction with the DBGCLAIMSET register.

**Configuration**

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMCLR_EL1[31:0].

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to External register DBGCLAIMCLR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGCLAIMCLR are **UNDEFINED**.

An implementation must include eight CLAIM tag bits.

**Attributes**

DBGCLAIMCLR is a 32-bit register.

**Field descriptions**

The DBGCLAIMCLR bit assignments are:

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
<th>RAZ/SBZ CLAIM</th>
</tr>
</thead>
</table>

**Bits [31:8]**

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

**CLAIM, bits [7:0]**

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

On a Cold reset, this field resets to 0.
Accessing the DBGCLAIMCLR

Accesses to this register use the following encodings:

\[
\text{MCR}\{<c>\}{<q>} \text{ <coproc>, \#<opc1>, <Rt>, <CRn>, <CRm>, \#<opc2>}
\]

DBGDCINT, DCC Interrupt Enable Register

The DBGDCINT characteristics are:

**Purpose**

Enables interrupt requests to be signaled based on the DCC status flags.

**Configuration**

AArch32 System register DBGDCINT bits [31:0] are architecturally mapped to AArch64 System register MDCCINT_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDCINT are UNDEFINED.

**Attributes**

DBGDCINT is a 32-bit register.

**Field descriptions**

The DBGDCINT bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>RX, DCC interrupt request enable control for DTRRX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.</td>
</tr>
<tr>
<td>29</td>
<td>TX, DCC interrupt request enable control for DTRTX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.</td>
</tr>
</tbody>
</table>

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the value of this bit.

On a Warm reset, this field resets to 0.
Bits [28:0]

Reserved, RES0.

Accessing the DBGDCCINT

The DBGDEVID characteristics are:

**Purpose**

Adds to the information given by the DBGDIDR by describing other features of the debug implementation.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDEVID are UNDEFINED.

This register is required in all implementations.

**Attributes**

DBGDEVID is a 32-bit register.

**Field descriptions**

The DBGDEVID bit assignments are:

```
<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-28</td>
<td>CIDMask</td>
</tr>
<tr>
<td>27-24</td>
<td>AuxRegs</td>
</tr>
<tr>
<td>23-20</td>
<td>DoubleLock</td>
</tr>
<tr>
<td>19-16</td>
<td>VirtExtns</td>
</tr>
<tr>
<td>15-12</td>
<td>VectorCatch</td>
</tr>
<tr>
<td>11-8</td>
<td>BPAddrMask</td>
</tr>
<tr>
<td>7-4</td>
<td>WPAddrMask</td>
</tr>
<tr>
<td>3-0</td>
<td>PCSample</td>
</tr>
</tbody>
</table>
```

**CIDMask, bits [31:28]**

Indicates the level of support for the Context ID matching breakpoint masking capability. Defined values are:

<table>
<thead>
<tr>
<th>CIDMask</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Context ID masking is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Context ID masking is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved. The value of this for Armv8 is 0b0000.

**AuxRegs, bits [27:24]**

Indicates support for Auxiliary registers. Permitted values for this field are:

<table>
<thead>
<tr>
<th>AuxRegs</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for External Debug Auxiliary Control Register, EDACR</td>
</tr>
</tbody>
</table>

All other values are reserved.

**DoubleLock, bits [23:20]**

OS Double Lock implemented. Defined values are:

<table>
<thead>
<tr>
<th>DoubleLock</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>OS Double Lock is not implemented. DBGOSDLR is RAZ/WI,</td>
</tr>
<tr>
<td>0b0001</td>
<td>OS Double Lock is implemented. DBGOSDLR is RW.</td>
</tr>
</tbody>
</table>

FEAT_DoubleLock implements the functionality identified by the value 0b0001.
VirtExtns, bits [19:16]

Indicates whether EL2 is implemented. Defined values are:

<table>
<thead>
<tr>
<th>VirtExtns</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL2 is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL2 is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

VectorCatch, bits [15:12]

Defines the form of Vector Catch exception implemented. Defined values are:

<table>
<thead>
<tr>
<th>VectorCatch</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Address matching Vector Catch exception</td>
</tr>
<tr>
<td></td>
<td>implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Exception matching Vector Catch exception</td>
</tr>
<tr>
<td></td>
<td>implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

BPAddrMask, bits [11:8]

Indicates the level of support for the instruction address matching breakpoint masking capability. Defined values are:

<table>
<thead>
<tr>
<th>BPAddrMask</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Breakpoint address masking might be implemented. If</td>
</tr>
<tr>
<td></td>
<td>not implemented, DBGBCR&lt;n&gt;[28:24] is RAZ/WI.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Breakpoint address masking is implemented.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Breakpoint address masking is not implemented.</td>
</tr>
<tr>
<td></td>
<td>DBGBCR&lt;n&gt;[28:24] is RES0.</td>
</tr>
</tbody>
</table>

All other values are reserved. The value of this for Armv8 is 0b1111.

WPAddrMask, bits [7:4]

Indicates the level of support for the data address matching watchpoint masking capability. Defined values are:

<table>
<thead>
<tr>
<th>WPAddrMask</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Watchpoint address masking might be implemented. If</td>
</tr>
<tr>
<td></td>
<td>not implemented, DBGWCR&lt;n&gt;.MASK (Address mask) is RAZ/WI.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Watchpoint address masking is implemented.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Watchpoint address masking is not implemented.</td>
</tr>
<tr>
<td></td>
<td>DBGWCR&lt;n&gt;.MASK (Address mask) is RES0.</td>
</tr>
</tbody>
</table>

All other values are reserved. The value of this for Armv8 is 0b0001.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers. Defined values are:

<table>
<thead>
<tr>
<th>PCSample</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PC Sample-based Profiling Extension is not implemented in the external</td>
</tr>
<tr>
<td></td>
<td>debug registers space.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Only EDPCSR and EDCIDSR are implemented. This option is only permitted</td>
</tr>
<tr>
<td></td>
<td>if EL3 and EL2 are not implemented.</td>
</tr>
<tr>
<td>0b0011</td>
<td>EDPCSR, EDCIDSR, and EDVIDSR are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.
Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID PCSample.

## Accessing the DBGDEVID

Accesses to this register use the following encodings:

\[
\text{MRC}\{c\}\{q\} \left\langle \text{coproc}, \{#\text{opc1}\}, \text{<Rt>}, \text{<CRn>}, \text{<CRm>}, \{#\text{opc2}\} \right\rangle
\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1110</td>
<td>0b000</td>
<td>0b0111</td>
<td>0b0010</td>
<td>0b111</td>
</tr>
</tbody>
</table>

```makefile
if PSTATE.EL == EL0 then

    return DBGDEVID;
  end
elsif PSTATE.EL == EL3 then
  return DBGDEVID;
```

DBGDEVID1, Debug Device ID register 1

The DBGDEVID1 characteristics are:

**Purpose**

Adds to the information given by the DBGDIDR by describing other features of the debug implementation.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDEVID1 are UNDEFINED.

This register is required in all implementations.

**Attributes**

DBGDEVID1 is a 32-bit register.

**Field descriptions**

The DBGDEVID1 bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
| RES0|     |     |     |     |     |     | PCSROffset |

**Bits [31:4]**

Reserved, RES0.

**PCSROffset, bits [3:0]**

This field indicates the offset applied to PC samples returned by reads of EDPCSR. Permitted values of this field in Armv8 are:

<table>
<thead>
<tr>
<th>PCSROffset</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EDPCSR is not implemented. Samples have no offset applied and do not sample the instruction set state in AArch32 state.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EDPCSR implemented. Samples have no offset applied and do not sample the instruction set state in AArch32 state.</td>
</tr>
</tbody>
</table>

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

**Note**

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

**Accessing the DBGDEVID1**

Accesses to this register use the following encodings:
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>

The characteristics of the DBGDIDR register are:

**Purpose**

Specifies which version of the Debug architecture is implemented, and some features of the debug implementation.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDIDR are **UNDEFINED**.

If EL1 cannot use AArch32 then the implementation of this register is **OPTIONAL** and deprecated.

**Attributes**

DBGDIDR is a 32-bit register.

**Field descriptions**

The DBGDIDR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| WRPs | BRPs | CTX_CMPs | Version | RES1 | nSUHD_imp | RES0 | SE_imp | RES0 |

**WRPs, bits [31:28]**

The number of watchpoints implemented, minus 1.

Permitted values of this field are from 0b0001 for 2 implemented watchpoints, to 0b1111 for 16 implemented watchpoints.

The value of 0b0000 is reserved.

If AArch64 is implemented, this field has the same value as **ID_AA64DFR0_EL1.WRPs**.

**BRPs, bits [27:24]**

The number of breakpoints implemented, minus 1.

Permitted values of this field are from 0b0001 for 2 implemented breakpoint, to 0b1111 for 16 implemented breakpoints.

The value of 0b0000 is reserved.

If AArch64 is implemented, this field has the same value as **ID_AA64DFR0_EL1.BRPs**.

**CTX_CMPs, bits [23:20]**

The number of breakpoints that can be used for Context matching, minus 1.

Permitted values of this field are from 0b0000 for 1 Context matching breakpoint, to 0b1111 for 16 Context matching breakpoints.

The Context matching breakpoints must be the highest addressed breakpoints. For example, if six breakpoints are implemented and two are Context matching breakpoints, they must be breakpoints 4 and 5.

If AArch64 is implemented, this field has the same value as **ID_AA64DFR0_EL1.CTX_CMPs**.
### Version, bits [19:16]

The Debug architecture version. Defined values are:

<table>
<thead>
<tr>
<th>Version</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Armv6, v6 Debug architecture.</td>
</tr>
<tr>
<td>0b0010</td>

</tr>
<tr>
<td>0b1001</td>
<td>Armv8.4, v8.4 Debug architecture.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In any Armv8 implementation, the values 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted.

- If FEAT_VHE is not implemented, the only permitted value is 0b0110.
- In an Armv8.0 implementation, the value 0b1000 or higher is not permitted.

### Bit [15]

Reserved, RES1.

### nSUHD_imp, bit [14]

In Armv7-A, was Secure User Halting Debug not implemented.

The value of this bit must match the value of the SE_imp bit.

### Bit [13]

Reserved, RES0.

### SE_imp, bit [12]

EL3 implemented. The meanings of the values of this bit are:

<table>
<thead>
<tr>
<th>SE_imp</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL3 not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL3 implemented.</td>
</tr>
</tbody>
</table>

The value of this bit must match the value of the nSUHD_imp bit.

### Bits [11:0]

Reserved, RES0.

### Accessing the DBGIDDR

Arm deprecates any access to this register from EL0.

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1" && !ELUsingAArch32(EL3) && MDCR_EL3.TDA == '1' then

The DBGDRAR characteristics are:

**Purpose**

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Armv8 deprecates any use of this register.

**Configuration**

AArch32 System register DBGDRAR bits [63:0] are architecturally mapped to AArch64 System register MDRAR_EL1[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDRAR are UNDEFINED.

DBGDRAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

**Attributes**

DBGDRAR is a 64-bit register.

**Bits [63:48]**

Reserved, RES0.

**ROMADDR[47:12], bits [47:12]**

Bits[47:12] of the ROM table physical address.

If the physical address size in bits (PASize) is less than 48 then the register bits corresponding to ROMADDR [47:PASize] are RES0.

Bits [11:0] of the ROM table physical address are zero.

Arm strongly recommends that bits ROMADDR[(PASize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

If DBGDRAR.Valid == 0b00, then this field is UNKNOWN.
Bits [11:2]

Reserved, RES0.

Valid, bits [1:0]

This field indicates whether the ROM Table address is valid.

<table>
<thead>
<tr>
<th>Valid</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>ROM Table address is not valid. Software must ignore ROMADDR.</td>
</tr>
<tr>
<td>0b11</td>
<td>ROM Table address is valid.</td>
</tr>
</tbody>
</table>

Other values are reserved.

DBGDSAR, Debug Self Address Register

The DBGDSAR characteristics are:

**Purpose**

In earlier versions of the Arm Architecture, this register defines the offset from the base address defined in DBGDRAR of the physical base address of the debug registers for the PE. Armv8 deprecates any use of this register.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDSAR are **UNDEFINED**.

DBGDSAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

If EL1 cannot use AArch32 then the implementation of this register is **OPTIONAL** and deprecated.

**Attributes**

DBGDSAR is a 64-bit register.

**Field descriptions**

The DBGDSAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-2</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>1-0</td>
<td>Reserved, RAZ.</td>
</tr>
</tbody>
</table>

**Accessing the DBGDSAR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

**DBGDSCRext, Debug Status and Control Register, External View**

The DBGDSCRext characteristics are:

**Purpose**

Main control register for the debug implementation.

**Configuration**

AArch32 System register DBGDSCRext bits [31:0] are architecturally mapped to AArch64 System register MDSCR_EL1[31:0].

AArch32 System register DBGDSCRext bits [15:2] are architecturally mapped to AArch32 System register DBGDSCRint[15:2].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDSCRext are **UNDEFINED**.

This register is required in all implementations.

**Attributes**

DBGDSCRext is a 32-bit register.

**Field descriptions**

The DBGDSCRext bit assignments are:

**TFO, bit [31]**

When FEAT_TRF is implemented:

Trace Filter override. Used for save/restore of EDSCR.TFO.

When the OS Lock is unlocked, DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.

When the OS Lock is locked, DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.TFO. Reads and writes of this bit are indirect accesses to EDSCR.TFO.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is **RW**.
- When DBGOSLSR.OSLK == 0, access to this field is **RO**.

**Otherwise:**

Reserved, RES0.

**RXfull, bit [30]**

DTRRX full. Used for save/restore of EDSCR.RXfull.
When \texttt{DBGOSLSR.OSLK} == 0, software must treat this bit as UNK/SBZP.

When \texttt{DBGOSLSR.OSLK} == 1, this bit holds the value of \texttt{EDSCR.RXfull}. Reads and writes of this bit are indirect accesses to \texttt{EDSCR.RXfull}.

Arm deprecates use of this bit other than for save/restore. Use \texttt{DBGDSRint} to access the DTRRX full status.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When \texttt{DBGOSLSR.OSLK} == 1, access to this field is \textbf{RW}.
- When \texttt{DBGOSLSR.OSLK} == 0, access to this field is \textbf{RO}.

\textbf{TXfull, bit [29]}

DTRTX full. Used for save/restore of \texttt{EDSCR.TXfull}.

When \texttt{DBGOSLSR.OSLK} == 0, software must treat this bit as UNK/SBZP.

When \texttt{DBGOSLSR.OSLK} == 1, this bit holds the value of \texttt{EDSCR.TXfull}. Reads and writes of this bit are indirect accesses to \texttt{EDSCR.TXfull}.

Arm deprecates use of this bit other than for save/restore. Use \texttt{DBGDSRint} to access the DTRTX full status.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When \texttt{DBGOSLSR.OSLK} == 1, access to this field is \textbf{RW}.
- When \texttt{DBGOSLSR.OSLK} == 0, access to this field is \textbf{RO}.

\textbf{Bit [28]}

Reserved, RES0.

\textbf{RXO, bit [27]}

Used for save/restore of \texttt{EDSCR.RXO}.

When \texttt{DBGOSLSR.OSLK} == 0, software must treat this bit as UNK/SBZP.

When \texttt{DBGOSLSR.OSLK} == 1, this bit holds the value of \texttt{EDSCR.RXO}. Reads and writes of this bit are indirect accesses to \texttt{EDSCR.RXO}.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When \texttt{DBGOSLSR.OSLK} == 1, access to this field is \textbf{RW}.
- When \texttt{DBGOSLSR.OSLK} == 0, access to this field is \textbf{RO}.

\textbf{TXU, bit [26]}

Used for save/restore of \texttt{EDSCR.TXU}.

When \texttt{DBGOSLSR.OSLK} == 0, software must treat this bit as UNK/SBZP.

When \texttt{DBGOSLSR.OSLK} == 1, this bit holds the value of \texttt{EDSCR.TXU}. Reads and writes of this bit are indirect accesses to \texttt{EDSCR.TXU}.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When \texttt{DBGOSLSR.OSLK} == 1, access to this field is \textbf{RW}.
- When \texttt{DBGOSLSR.OSLK} == 0, access to this field is \textbf{RO}.
Bits [25:24]
Reserved, RES0.

INTdis, bits [23:22]
Used for save/restore of EDSCR.INTdis.

When DBGOSLR.OSLK == 0, this field is RO, and software must treat it as UNK/SBZP.

When DBGOSLR.OSLK == 1, this field is RW and holds the value of EDSCR.INTdis. Reads and writes of this field are indirect accesses to EDSCR.INTdis.

The architectured behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:
- When DBGOSLR.OSLK == 1, access to this field is RW.
- When DBGOSLR.OSLK == 0, access to this field is RO.

TDA, bit [21]
Used for save/restore of EDSCR.TDA.

When DBGOSLR.OSLK == 0, software must treat this bit as UNK/SBZP.

When DBGOSLR.OSLK == 1, this bit holds the value of EDSCR.TDA. Reads and writes of this bit are indirect accesses to EDSCR.TDA.

The architectured behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:
- When DBGOSLR.OSLK == 1, access to this field is RW.
- When DBGOSLR.OSLK == 0, access to this field is RO.

Bit [20]
Reserved, RES0.

SC2, bit [19]
When FEAT_PCSRv8 is implemented, FEAT_VHE is implemented and FEAT_PCSRv8p2 is not implemented:

Used for save/restore of EDSCR.SC2.

When DBGOSLR.OSLK == 0, software must treat this bit as UNK/SBZP.

When DBGOSLR.OSLK == 1, this bit holds the value of EDSCR.SC2. Reads and writes of this bit are indirect accesses to EDSCR.SC2.

Accessing this field has the following behavior:
- When DBGOSLR.OSLK == 1, access to this field is RW.
- When DBGOSLR.OSLK == 0, access to this field is RO.

Otherwise:
Reserved, RES0.

NS, bit [18]
Non-secure status. Returns the inverse of IsSecure().
Arm deprecates use of this field.

Access to this field is **RO**.

### SPNIddis, bit [17]

**When EL3 is implemented:**

Secure privileged profiling disabled status bit.

<table>
<thead>
<tr>
<th>SPNIddis</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Profiling allowed in Secure privileged modes.</td>
</tr>
<tr>
<td>0b1</td>
<td>Profiling prohibited in Secure privileged modes.</td>
</tr>
</tbody>
</table>

This field reads as 0 if any of the following applies, and reads as 1 otherwise:

- FEAT_Debugv8p2 is not implemented and ExternalSecureNoninvasiveDebugEnabled() returns TRUE.
- EL3 is using AArch32 and the value of `SDCR`.SPME is 1.
- EL3 is using AArch64 and the value of `MDCR_EL3`.SPME is 1.

Arm deprecates use of this field.

Access to this field is **RO**.

**Otherwise:**

Reserved, RES0.

### SPIDdis, bit [16]

**When EL3 is implemented:**

Secure privileged AArch32 invasive self-hosted debug disabled status bit. The value of this bit depends on the value of `SDCR`.SPD and the pseudocode function AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled().

<table>
<thead>
<tr>
<th>SPIDdis</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Self-hosted debug enabled in Secure privileged AArch32 modes.</td>
</tr>
<tr>
<td>0b1</td>
<td>Self-hosted debug disabled in Secure privileged AArch32 modes.</td>
</tr>
</tbody>
</table>

This bit reads as 1 if any of the following is true and reads as 0 otherwise:

- EL3 is using AArch32 and `SDCR`.SPD has the value 0b10.
- EL3 is using AArch64 and `MDCR_EL3`.SPD32 has the value 0b10.
- EL3 is using AArch32, `SDCR`.SPD has the value 0b00, and AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled() returns FALSE.
- EL3 is using AArch64, `MDCR_EL3`.SPD32 has the value 0b00, and AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled() returns FALSE.

Arm deprecates use of this field.

Access to this field is **RO**.

**Otherwise:**

Reserved, RES0.

### MDBGen, bit [15]

Monitor debug events enable. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.
Breakpoint, Watchpoint, and Vector Catch exceptions disabled.

Breakpoint, Watchpoint, and Vector Catch exceptions enabled.

On a Warm reset, this field resets to 0.

**HDE, bit [14]**

Used for save/restore of EDSCR.HDE.

When DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.

When DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.HDE. Reads and writes of this bit are indirect accesses to EDSCR.HDE.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is RW.
- When DBGOSLSR.OSLK == 0, access to this field is RO.

**Bit [13]**

Reserved, RES0.

**UDCCdis, bit [12]**

Traps EL0 accesses to the DCC registers to Undefined mode.

<table>
<thead>
<tr>
<th>UDCCdis</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 accesses to the DBGDSCRint, DBGDTRRXint, DBGDTRTXint, DBGDIDR, DBGDSAR, and DBGDRAR are trapped to Undefined mode.</td>
</tr>
</tbody>
</table>

**Note**

All accesses to these registers are trapped, including LDC and STC accesses to DBGDTRTXint and DBGDTRRXint, and MRRC accesses to DBGDSAR and DBGDRAR.

Traps of EL0 accesses to the DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

On a Warm reset, this field resets to 0.

**Bits [11:7]**

Reserved, RES0.

**ERR, bit [6]**

Used for save/restore of EDSCR.ERR.

When DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.

When DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.ERR. Reads and writes of this bit are indirect accesses to EDSCR.ERR.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:
When DBGOSLSR.OSLK == 1, access to this field is **RW**.
When DBGOSLSR.OSLK == 0, access to this field is **RO**.

**MOE, bits [5:2]**

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

<table>
<thead>
<tr>
<th>MOE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Breakpoint.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Software breakpoint (BKPT) instruction.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Vector catch.</td>
</tr>
<tr>
<td>0b1010</td>
<td>Watchpoint.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [1:0]**

Reserved, **RES0**.

**Accessing the DBGDSRext**

Individual fields within this register might have restricted accessibility when the OS lock is unlocked, **DBGOSLSR.OSLK == 0**. See the field descriptions for more detail.

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1110</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0010</td>
<td>0b010</td>
</tr>
</tbody>
</table>

The DBGDSCRint characteristics are:

**Purpose**

Main control register for the debug implementation. This is an internal, read-only view.

**Configuration**

AArch32 System register DBGDSCRint bits [30:29] are architecturally mapped to AArch64 System register MDCCSR_EL0[30:29].

AArch32 System register DBGDSCRint bits [15:2] are architecturally mapped to AArch32 System register DBGDSCRext[15:2].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDSCRint are **UNDEFINED**.

This register is required in all implementations.

DBGDSCRint.{NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE} are **UNKNOWN** when the register is accessed at EL0. However, although these values are not accessible at EL0 by instructions that are neither **UNPREDICTABLE** nor return **UNKNOWN** values, it is permissible for an implementation to return the values of DBGDSCRext.{NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE} for these fields at EL0.

It is also permissible for an implementation to return the same values as defined for a read of DBGDSCRint at EL1 or above. (This is the case even if the implementation does not support AArch32 at EL1 or above.)

**Attributes**

DBGDSCRint is a 32-bit register.

**Field descriptions**

NS, bit [18]

Non-secure status.

Read-only view of the equivalent bit in the `DBGDSCRext`. Arm deprecates use of this field.

SPNIDdis, bit [17]

Secure privileged non-invasive debug disable.

Read-only view of the equivalent bit in the `DBGDSCRext`. Arm deprecates use of this field.

SPIDdis, bit [16]

Secure privileged invasive debug disable.

Read-only view of the equivalent bit in the `DBGDSCRext`. Arm deprecates use of this field.

MDBGen, bit [15]

Monitor debug events enable.

Read-only view of the equivalent bit in the `DBGDSCRext`.

Bits [14:13]

Reserved, RES0.

UDCCdis, bit [12]

User mode access to Debug Communications Channel disable.

Read-only view of the equivalent bit in the `DBGDSCRext`. Arm deprecates use of this field.

Bits [11:6]

Reserved, RES0.

MOE, bits [5:2]

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

DBGDTRRXext, Debug OS Lock Data Transfer Register, Receive, External View

The DBGDTRRXext characteristics are:

**Purpose**

Used for save/restore of DBGDTRRXint. It is a component of the Debug Communications Channel.

**Configuration**

AArch32 System register DBGDTRRXext bits [31:0] are architecturally mapped to AArch64 System register OSDTRRX_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDTRRXext are UNDEFINED.

**Attributes**

DBGDTRRXext is a 32-bit register.

**Field descriptions**

The DBGDTRRXext bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

*Update DTRRX without side-effect*

**Bits [31:0]**

Update DTRRX without side-effect.

Writes to this register update the value in DTRRX and do not change RXfull.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DBGDTRRXext**

Arm deprecates reads and writes of DBGDTRRXext through the System register interface when the OS Lock is unlocked, DBGOSLSR.OSLK == 0.

Accesses to this register use the following encodings:

MRC<(<c>){<q>}, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

    endif
The DBGDTRRXint characteristics are:

**Purpose**

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communications Channel.

**Configuration**

AArch32 System register DBGDTRRXint bits [31:0] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0].

AArch32 System register DBGDTRRXint bits [31:0] are architecturally mapped to External register DBGDTRRX_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDTRRXint are UNDEFINED.

**Attributes**

DBGDTRRXint is a 32-bit register.

**Field descriptions**

The DBGDTRRXint bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [31:0]**

Update DTRRX.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DBGDTRRXint**

Data can be stored to memory from this register using STC.

Accesses to this register use the following encodings:

\[
\text{MRC}\{\langle c\rangle}\{\langle q\rangle\} \langle \text{coproc}\rangle, \{\langle \#\rangle\langle \text{opc1}\rangle\}, \langle \text{Rt}\rangle, \langle \text{CRn}\rangle, \langle \text{CRm}\rangle, \{\langle \#\rangle\langle \text{opc2}\rangle\}
\]

| coproc | opc1 | CRn | CRm | opc2 |

    endif
The DBGDTRTXext characteristics are:

**Purpose**

Used for save/restore of DBGDTRTXint. It is a component of the Debug Communication Channel.

**Configuration**

AArch32 System register DBGDTRTXext bits [31:0] are architecturally mapped to AArch64 System register OSDTRTX_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDTRTXext are UNDEFINED.

**Attributes**

DBGDTRTXext is a 32-bit register.

**Field descriptions**

The DBGDTRTXext bit assignments are:

<table>
<thead>
<tr>
<th>Bit (31:0)</th>
<th>Field description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>Return DTRTX without side-effect</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

- Return DTRTX without side-effect.
- Reads of this register return the value in DTRTX and do not change TXfull.
- Writes of this register update the value in DTRTX and do not change TXfull.
- For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DBGDTRTXext**

Arm deprecates reads and writes of DBGDTRTXext through the System register interface when the OS Lock is unlocked, DBGOSLSR.OSLK == 0.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

DBGDTRTXint, Debug Data Transfer Register, Transmit

The DBGDTRTXint characteristics are:

**Purpose**

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communication Channel.

**Configuration**

AArch32 System register DBGDTRTXint bits [31:0] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0].

AArch32 System register DBGDTRTXint bits [31:0] are architecturally mapped to External register DBGDTRTX_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDTRTXint are UNDEFINED.

**Attributes**

DBGDTRTXint is a 32-bit register.

**Field descriptions**

The DBGDTRTXint bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [31:0]**

Return DTRTX.

Writes to this register:

- If TXfull is set to 1, set DTRTX to UNKNOWN.
- If TXfull is set to 0, update the value in DTRTX.

After the write, TXfull is set to 1.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DBGDTRTXint**

Data can be loaded from memory into this register using 'LDC (immediate)' and 'LDC (literal)'.

Accesses to this register use the following encodings:

\[
\text{MCR} \{<c>\}{<q>} \text{ <coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>, \{#<opc2>\}}
\]

| coproc | opc1 | CRn | CRm | opc2 |

DBGOSLAR, Debug OS Lock Access Register

The DBGOSLAR characteristics are:

**Purpose**

Provides a lock for the debug registers. The OS Lock also disables some debug exceptions and debug events.

**Configuration**

AArch32 System register DBGOSLAR bits [31:0] are architecturally mapped to AArch64 System register OSLAR_EL1[31:0].

AArch32 System register DBGOSLAR bits [31:0] are architecturally mapped to External register OSLAR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGOSLAR are **UNDEFINED**.

**Attributes**

DBGOSLAR is a 32-bit register.

**Field descriptions**

The DBGOSLAR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**OSLA, bits [31:0]**

OS Lock Access. Writing the value 0xC5ACCE55 to the DBGOSLAR sets the OS lock to 1. Writing any other value sets the OS lock to 0.

Use **DBGOSLRSR.OSLK** to check the current status of the lock.

**Accessing the DBGOSLAR**

Accesses to this register use the following encodings:

\[
\text{MCR}\{<c>\}{<q>}\ {<\text{coproc}>, \{<opc1>, <Rt>, <CRn>, <CRm>{, \{<opc2>\}}}\\
\]

DBGOSLSR, Debug OS Lock Status Register

The DBGOSLSR characteristics are:

**Purpose**

Provides status information for the OS Lock.

**Configuration**

AArch32 System register DBGOSLSR bits [31:0] are architecturally mapped to AArch64 System register OLSR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGOSLSR are **UNDEFINED**.

The OS Lock status is also visible in the external debug interface through EDPRSR.

**Attributes**

DBGOSLSR is a 32-bit register.

**Field descriptions**

The DBGOSLSR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Res0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Bits [31:4]**

Reserved, Res0.

**OSLM, bits [3, 0]**

OS lock model implemented. Identifies the form of OS save and restore mechanism implemented.

<table>
<thead>
<tr>
<th>OSLM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>OS Lock not implemented.</td>
</tr>
<tr>
<td>0b10</td>
<td>OS Lock implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

The OSLM field is split as follows:

- OSLM[1] is DBGOSLSR[3].
- OSLM[0] is DBGOSLSR[0].

**nTT, bit [2]**

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

**OSLK, bit [1]**

OS Lock Status. The possible values are:
The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

On a Cold reset, this field resets to 1.

Accessing the DBGOSLSR

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}\{<q>\} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{#\}<\text{opc2}>\}
\]

        elsif PSTATE.EL == EL3 then
            return DBGOSLSR;
DBGPRCR, Debug Power Control Register

The DBGPRCR characteristics are:

**Purpose**

Controls behavior of the PE on powerdown request.

**Configuration**

AArch32 System register DBGPRCR bits [31:0] are architecturally mapped to AArch64 System register DBGPRCR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGPRCR are **UNDEFINED**.

Bit [0] of this register is mapped to EDPBCR.CORENPDRQ, bit [0] of the external view of this register.

The other bits in these registers are not mapped to each other.

**Attributes**

DBGPRCR is a 32-bit register.

**Field descriptions**

The DBGPRCR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | CORENPDRQ |

**Bits [31:1]**

Reserved, RES0.

**CORENPDRQ, bit [0]**

When **FEAT_DoPD** is implemented:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the **IMPLEMENTATION DEFINED** nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

<table>
<thead>
<tr>
<th>CORENPDRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the system responds to a powerdown request, it powers down Core power domain.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.</td>
</tr>
</tbody>
</table>

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is **IMPLEMENTATION DEFINED** whether this bit is reset to the Cold reset value on exit from an **IMPLEMENTATION DEFINED** software-visible retention state. For more information about retention states see 'Core power domain power states'.

**Note**
Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is set to an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

Otherwise:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

<table>
<thead>
<tr>
<th>CORENPDREQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the system responds to a powerdown request, it powers down Core power domain.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.</td>
</tr>
</tbody>
</table>

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPRCR.COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, this field resets to the value in EDPRCR.COREPURQ.

Accessing the DBGPRCR

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

**NSF, bit [31]**

FIQ vector catch enable in Non-secure state.

The exception vector offset is 0x1C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NSI, bit [30]**

IRQ vector catch enable in Non-secure state.

The exception vector offset is 0x18.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [29]**

Reserved, RES0.

**NSD, bit [28]**

Data Abort vector catch enable in Non-secure state.

The exception vector offset is 0x10.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**NSP, bit [27]**

Prefetch Abort vector catch enable in Non-secure state.
The exception vector offset is **0x0C**.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**NSS, bit [26]**

Supervisor Call (SVC) vector catch enable in Non-secure state.
The exception vector offset is **0x08**.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**NSU, bit [25]**

Undefined Instruction vector catch enable in Non-secure state.
The exception vector offset is **0x04**.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [24:16]**

Reserved, **RES0**.

**MF, bit [15]**

FIQ vector catch enable in Monitor mode.
The exception vector offset is **0x1C**.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**MI, bit [14]**

IRQ vector catch enable in Monitor mode.
The exception vector offset is **0x18**.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [13]**

Reserved, **RES0**.

**MD, bit [12]**

Data Abort vector catch enable in Monitor mode.
The exception vector offset is **0x10**.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**MP, bit [11]**

Prefetch Abort vector catch enable in Monitor mode.
The exception vector offset is 0x0C.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**MS, bit [10]**

Secure Monitor Call (SMC) vector catch enable in Monitor mode.
The exception vector offset is 0x08.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [9:8]**

Reserved, RES0.

**SF, bit [7]**

FIQ vector catch enable in Secure state.
The exception vector offset is 0x1C.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SI, bit [6]**

IRQ vector catch enable in Secure state.
The exception vector offset is 0x18.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [5]**

Reserved, RES0.

**SD, bit [4]**

Data Abort vector catch enable in Secure state.
The exception vector offset is 0x10.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SP, bit [3]**

Prefetch Abort vector catch enable in Secure state.
The exception vector offset is 0x0C.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SS, bit [2]**

Supervisor Call (SVC) vector catch enable in Secure state.
The exception vector offset is 0x08.
On a Warm reset, this field resets to an architecturally UNKNOWN value.
SU, bit [1]

Undefined Instruction vector catch enable in Secure state.

The exception vector offset is 0x04.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Bit [0]

Reserved, RES0.

**When EL3 is implemented and EL3 is using AArch64:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

F, bit [7]
FIQ vector catch enable.
The exception vector offset is 0x1C.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [6]
IRQ vector catch enable.
The exception vector offset is 0x18.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]
Reserved, RES0.

D, bit [4]
Data Abort vector catch enable.
The exception vector offset is 0x10.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

P, bit [3]
Prefetch Abort vector catch enable.
The exception vector offset is 0x0C.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [2]
Supervisor Call (SVC) vector catch enable.
The exception vector offset is 0x08.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [1]
Undefined Instruction vector catch enable.
The exception vector offset is 0x04.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [0]**

Reserved, RES0.

**Accessing the DBGVCR**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{#\}<\text{opc2}>\}
\]

DBGWCR<\text{n}>, Debug Watchpoint Control Registers, \text{n} = 0 - 15

The DBGWCR<\text{n}> characteristics are:

**Purpose**

Holds control information for a watchpoint. Forms watchpoint \text{n} together with value register DBGWVR<\text{n}>.

**Configuration**

AArch32 System register DBGWCR<\text{n}> bits [31:0] are architecturally mapped to AArch64 System register DBGWCR<\text{n}> EL1[31:0].

AArch32 System register DBGWCR<\text{n}> bits [31:0] are architecturally mapped to External register DBGWCR<\text{n}> EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGWCR<\text{n}> are UNDEFINED.

If watchpoint \text{n} is not implemented then accesses to this register are UNDEFINED.

**Attributes**

DBGWCR<\text{n}> is a 32-bit register.

**Field descriptions**

The DBGWCR<\text{n}> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | MASK | RES0 | WT | LBN | SSC | HMC | BAS | LSC | PAC | E |

When the E field is zero, all the other fields in the register are ignored.

**Bits [31:29]**

Reserved, RES0.

**MASK, bits [28:24]**

Address mask. Only objects up to 2GB can be watched using a single mask.

<table>
<thead>
<tr>
<th>MASK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>No mask.</td>
</tr>
<tr>
<td>0b000001</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b000010</td>
<td>Reserved.</td>
</tr>
</tbody>
</table>

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00000000000000000000000000000000 (32 address bits) to 0b11111110000000000000000000000000 (32 address bits) to 0b00000000000000000000000000000000 (3 address bits) to 0x7FFFFFFF mask for address).
On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [23:21]**

Reserved, RES0.

**WT, bit [20]**

Watchpoint type. Possible values are:

<table>
<thead>
<tr>
<th>WT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Unlinked data address match.</td>
</tr>
<tr>
<td>0b1</td>
<td>Linked data address match.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions', and 'Reserved DBGBCR<n>.{SSC, HMC, PMC} values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**BAS, bits [12:5]**

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n> is being watched.

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0bxxxxxx1</td>
<td>Match byte at DBGWVR&lt;n&gt;</td>
</tr>
<tr>
<td>0bxxxxx1x</td>
<td>Match byte at DBGWVR&lt;n&gt;+1</td>
</tr>
<tr>
<td>0bxxxx1xx</td>
<td>Match byte at DBGWVR&lt;n&gt;+2</td>
</tr>
<tr>
<td>0bxxxx1xxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+3</td>
</tr>
</tbody>
</table>

In cases where DBGWVR<n> addresses a double-word:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description, if DBGWVR&lt;n&gt;[2] == 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0bxxxx1xxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+4</td>
</tr>
<tr>
<td>0bxx1xxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+5</td>
</tr>
<tr>
<td>0bx1xxxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+6</td>
</tr>
<tr>
<td>0b1xxxxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+7</td>
</tr>
</tbody>
</table>

The valid values for BAS are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>.BAS values'.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**LSC, bits [4:3]**

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

<table>
<thead>
<tr>
<th>LSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>Match instructions that load from a watchpointed address.</td>
</tr>
<tr>
<td>0b10</td>
<td>Match instructions that store to a watchpointed address.</td>
</tr>
<tr>
<td>0b11</td>
<td>Match instructions that load from or store to a watchpointed address.</td>
</tr>
</tbody>
</table>

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**PAC, bits [2:1]**

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**E, bit [0]**

Enable watchpoint n. Possible values are:

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Watchpoint disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Watchpoint enabled.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the DBGWCR<n>**

DBGWFAR, Debug Watchpoint Fault Address Register

The DBGWFAR characteristics are:

**Purpose**

Previously returned information about the address of the instruction that accessed a watchpointed address. Is now deprecated and RES0.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGWFAR are UNDEFINED.

**Attributes**

DBGWFAR is a 32-bit register.

**Field descriptions**

The DBGWFAR bit assignments are:

```
+----+----+----+----+----+----+----+----+----+----+----+----+----+----+----+----+----+----+----+----+----+----+----+----+----+----+----+----+----+----+----+----+
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

else
  DBGWFAR = R[t];

DBGWFAR, Debug Watchpoint Fault Address Register
DBGWVR<n>, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n> characteristics are:

**Purpose**

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>.

**Configuration**

AArch32 System register DBGWVR<n> bits [31:0] are architecturally mapped to AArch64 System register DBGWVR<n>_EL1[31:0].

AArch32 System register DBGWVR<n> bits [31:0] are architecturally mapped to External register DBGWVR<n>_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGWVR<n> are UNDEFINED.

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

**Attributes**

DBGWVR<n> is a 32-bit register.

**Field descriptions**

The DBGWVR<n> bit assignments are:

| Bit 31 | Bit 30 | Bit 29 | Bit 28 | Bit 27 | Bit 26 | Bit 25 | Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9 | Bit 8 | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| VA     | RES0   |

**VA, bits [31:2]**

Bits[31:2] of the address value for comparison.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [1:0]**

Reserved, RES0.

**Accessing the DBGWVR<n>**

Accesses to this register use the following encodings:

DCCIMVAC, Data Cache line Clean and Invalidate by VA to PoC

The DCCIMVAC characteristics are:

**Purpose**

Clean and Invalidate data or unified cache line by virtual address to PoC.

**Configuration**

AArch32 System instruction DCCIMVAC performs the same function as AArch64 System instruction DCIVAC.

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DCCIMVAC are UNDEFINED.

**Attributes**

DCCIMVAC is a 32-bit System instruction.

**Field descriptions**

The DCCIMVAC input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

DCCISW, Data Cache line Clean and Invalidate by Set/Way

The DCCISW characteristics are:

**Purpose**

Clean and Invalidate data or unified cache line by set/way.

**Configuration**

AArch32 System instruction DCCISW performs the same function as AArch64 System instruction DCISW. This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DCCISW are UNDEFINED.

**Attributes**

DCCISW is a 32-bit System instruction.

**Field descriptions**

The DCCISW input value bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     | SetWay | Level | RES0 |

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = \log_2(\text{ASSOCIATIVITY}), L = \log_2(\text{LINELEN}), B = (L + S), S = \log_2(\text{NSETS}).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.

**Executing the DCCISW instruction**

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
The instruction performs cache maintenance on one of:
- No cache lines.
- A single arbitrary cache line.
- Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

\[

DCIMVAC, Data Cache line Invalidate by VA to PoC

The DCIMVAC characteristics are:

**Purpose**

Invalidate data or unified cache line by virtual address to PoC.

**Configuration**

AArch32 System instruction DCIMVAC performs the same function as AArch64 System instruction DC IVAC.

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DCIMVAC are UNDEFINED.

**Attributes**

DCIMVAC is a 32-bit System instruction.

**Field descriptions**

The DCIMVAC input value bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**Virtual address to use**

Virtual address to use. No alignment restrictions apply to this VA.

**Executing the DCIMVAC instruction**

It is IMPLEMENTATION DEFINED whether, when this instruction is executed, it can generate a watchpoint. If this instruction can generate a watchpoint this is prioritized in the same way as other watchpoints.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'AArch32 data cache maintenance instructions (DC*)'.

Accesses to this instruction use the following encodings:

MCR<<c>>{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>

DCISW, Data Cache line Invalidate by Set/Way

The DCISW characteristics are:

**Purpose**

Invalidate data or unified cache line by set/way.

**Configuration**

AArch32 System instruction DCISW performs the same function as AArch64 System instruction DCISW.

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DCISW are **UNDEFINED**.

**Attributes**

DCISW is a 32-bit System instruction.

**Field descriptions**

The DCISW input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | SetWay |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | Level |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |

**SetWay, bits [31:4]**

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = Log2(ASSOCIATIVITY), L = Log2(LINELEN), B = (L + S), S = Log2(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

**Level, bits [3:1]**

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

**Bit [0]**

Reserved, RES0.

**Executing the DCISW instruction**

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is **UNDEFINED**
- The instruction performs cache maintenance on one of:
  - No cache lines.
A single arbitrary cache line.

Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{<c>\}{<q>} \text{<coproc>, } \text{<#<opc1>, <Rt>, <CRn>, <CRm>{, <#<opc2>}}\]

The DFAR characteristics are:

**Purpose**

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception.

**Configuration**

AArch32 System register DFAR bits [31:0] are architecturally mapped to AArch64 System register FAR_EL1[31:0].

AArch32 System register DFAR bits [31:0] (S) are architecturally mapped to AArch32 System register HDFAR[31:0] when EL2 is implemented, EL3 is implemented and the highest implemented Exception level is using AArch32 state.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DFAR are UNDEFINED.

**Attributes**

DFAR is a 32-bit register.

**Field descriptions**

The DFAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

The DFSR characteristics are:

**Purpose**

Holds status information about the last data fault.

**Configuration**

AArch32 System register DFSR bits [31:0] are architecturally mapped to AArch64 System register \texttt{ESR_EL1[31:0]}.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DFSR are UNDEFINED.

The current translation table format determines which format of the register is used.

**Attributes**

DFSR is a 32-bit register.

**Field descriptions**

The DFSR bit assignments are:

**When TTBCR.EAE == 0:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td><strong>FnV</strong></td>
</tr>
<tr>
<td>29</td>
<td><strong>AET</strong></td>
</tr>
<tr>
<td>28</td>
<td>CME</td>
</tr>
<tr>
<td>27</td>
<td>ExT</td>
</tr>
<tr>
<td>26</td>
<td>WnR</td>
</tr>
<tr>
<td>25</td>
<td><strong>LPAE</strong></td>
</tr>
<tr>
<td>24</td>
<td><strong>FS[4]</strong></td>
</tr>
<tr>
<td>23</td>
<td><strong>RES0</strong></td>
</tr>
<tr>
<td>22</td>
<td><strong>Domain</strong></td>
</tr>
<tr>
<td>21</td>
<td><strong>FS[3]</strong></td>
</tr>
</tbody>
</table>

**Bits [31:17]**

Reserved, RES0.

**FnV, bit [16]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>DFAR</strong> is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td><strong>DFAR</strong> is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Data Abort exceptions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**AET, bits [15:14]**

**When FEAT_RAS is implemented:**

Asynchronous Error Type. When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception. Possible values are:
DFSR, Data Fault Status Register

### AET

<table>
<thead>
<tr>
<th>AET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Uncontainable (UC).</td>
</tr>
<tr>
<td>0b01</td>
<td>Unrecoverable state (UEU).</td>
</tr>
<tr>
<td>0b10</td>
<td>Restartable state (UEO).</td>
</tr>
<tr>
<td>0b11</td>
<td>Recoverable state (UER).</td>
</tr>
</tbody>
</table>

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other aborts.

In the event of multiple errors taken as a single SError interrupt exception, the overall PE error state is reported.

#### Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### CM, bit [13]

Cache maintenance fault. For synchronous faults, this bit indicates whether a cache maintenance instruction generated the fault. The possible values of this bit are:

<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort not caused by execution of a cache maintenance instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by execution of a cache maintenance instruction, or on an address translation.</td>
</tr>
</tbody>
</table>

On a synchronous Data Abort on a translation table walk, this bit is UNKNOWN.

On an asynchronous fault, this bit is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### WnR, bit [11]

Write not Read bit. Indicates whether the abort was caused by a write or a read instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort caused by a read instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by a write instruction.</td>
</tr>
</tbody>
</table>

For faults on the cache maintenance and address translation System instructions in the (coproc== 0b1111) encoding space this bit always returns a value of 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**FS, bits [10, 3:0]**

Fault status bits. Possible values of FS[4:0] are:

<table>
<thead>
<tr>
<th>FS</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00001</td>
<td>Alignment fault.</td>
<td></td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>0b01011</td>
<td>Domain fault, level 2.</td>
<td></td>
</tr>
<tr>
<td>0b01100</td>
<td>Synchronous External abort, on translation table walk, level 1.</td>
<td></td>
</tr>
<tr>
<td>0b01101</td>
<td>Permission fault, level 1.</td>
<td></td>
</tr>
<tr>
<td>0b01110</td>
<td>Synchronous External abort, on translation table walk, level 2.</td>
<td></td>
</tr>
<tr>
<td>0b01111</td>
<td>Permission fault, level 2.</td>
<td></td>
</tr>
<tr>
<td>0b10000</td>
<td>TLB conflict abort.</td>
<td></td>
</tr>
<tr>
<td>0b10100</td>
<td>IMPLEMENTATION DEFINED fault (Lockdown fault).</td>
<td></td>
</tr>
<tr>
<td>0b10101</td>
<td>IMPLEMENTATION DEFINED fault (Unsupported Exclusive access fault).</td>
<td></td>
</tr>
<tr>
<td>0b10110</td>
<td>SError interrupt.</td>
<td></td>
</tr>
<tr>
<td>0b11000</td>
<td>SError interrupt, from a parity or ECC error on memory access.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
<tr>
<td>0b11001</td>
<td>Synchronous parity or ECC error on memory access, not on translation table walk.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
<tr>
<td>0b11100</td>
<td>Synchronous parity or ECC error on translation table walk, level 1.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
<tr>
<td>0b11110</td>
<td>Synchronous parity or ECC error on translation table walk, level 2.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
</tbody>
</table>

All other values are reserved.

For more information about the lookup level associated with a fault, see ‘The level associated with MMU faults on a Short-descr iptor translation table lookup’.

The FS field is split as follows:

- FS[4] is DFSR[10].
- FS[3:0] is DFSR[3:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Using the Short-descriptor translation table formats.</td>
</tr>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table formats.</td>
</tr>
</tbody>
</table>

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bit [8]

Reserved, RES0.

Domain, bits [7:4]

The domain of the fault address.

Arm deprecates any use of this field, see 'The Domain field in the DFSR'.

This field is UNKNOWN for certain faults where the DFSR is updated and reported using the Short-descriptor FSR encodings, see 'Validity of Domain field on faults that update the DFSR when using the Short-descriptor encodings'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

<td>0b1</td>
<td>DFAR is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Data Abort exceptions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

AET, bits [15:14]

When FEAT_RAS is implemented:

Asynchronous Error Type. When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception. Possible values are:

<table>
<thead>
<tr>
<th>AET</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Uncontainable (UC).</td>
</tr>
<tr>
<td>0b01</td>
<td>Unrecoverable state (UEU).</td>
</tr>
<tr>
<td>0b10</td>
<td>Restartable state (UEO).</td>
</tr>
<tr>
<td>0b11</td>
<td>Recoverable state (UER).</td>
</tr>
</tbody>
</table>

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other aborts.

In the event of multiple errors taken as a single SError interrupt exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**CM, bit [13]**

Cache maintenance fault. For synchronous faults, this bit indicates whether a cache maintenance instruction generated the fault. The possible values of this bit are:

<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort not caused by execution of a cache maintenance instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by execution of a cache maintenance instruction.</td>
</tr>
</tbody>
</table>

On a synchronous Data Abort on a translation table walk, this bit is **UNKNOWN**.

On an asynchronous fault, this bit is **UNKNOWN**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ExT, bit [12]**

External abort type. This bit can be used to provide an **IMPLEMENTATION DEFINED** classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is **RES0**.

For aborts other than External aborts this bit always returns 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**WnR, bit [11]**

Write not Read bit. Indicates whether the abort was caused by a write or a read instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort caused by a read instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by a write instruction.</td>
</tr>
</tbody>
</table>

For faults on the cache maintenance and address translation System instructions in the (coproc==0b1111) encoding space this bit always returns a value of 1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [10]**

Reserved, RES0.

**LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Using the Short-descriptor translation table formats.</td>
</tr>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table formats.</td>
</tr>
</tbody>
</table>

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [8:6]**

Reserved, RES0.
**STATUS, bits [5:0]**

Fault status bits. Possible values of this field are:

<table>
<thead>
<tr>
<th>STATUS</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Address size fault in translation table base register.</td>
<td></td>
</tr>
<tr>
<td>0b000001</td>
<td>Address size fault, level 1.</td>
<td></td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td>0b010111</td>
<td>Synchronous External abort on translation table walk, level 3</td>
<td></td>
</tr>
<tr>
<td>0b011000</td>
<td>Synchronous parity or ECC error on memory access, not on translation table walk.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
<tr>
<td>0b011001</td>
<td>Asynchronous SError interrupt, from a parity or ECC error on memory access.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
<tr>
<td>0b011101</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 1.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
<tr>
<td>0b011110</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 2.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
<tr>
<td>0b011111</td>
<td>Synchronous parity or ECC error on memory access on translation table walk, level 3.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
<tr>
<td>0b100001</td>
<td>Alignment fault.</td>
<td></td>
</tr>
<tr>
<td>0b100010</td>
<td>Debug exception.</td>
<td></td>
</tr>
<tr>
<td>0b110000</td>
<td>TLB conflict abort.</td>
<td></td>
</tr>
<tr>
<td>0b110100</td>
<td>IMPLEMENTATION DEFINED fault (Lockdown).</td>
<td></td>
</tr>
<tr>
<td>0b111010</td>
<td>IMPLEMENTATION DEFINED fault (Unsupported Exclusive access).</td>
<td></td>
</tr>
</tbody>
</table>

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the DFSR**

Accesses to this register use the following encodings:

DISR, Deferred Interrupt Status Register

The DISR characteristics are:

**Purpose**
Records that an SError interrupt has been consumed by an ESB instruction.

**Configuration**
AArch32 System register DISR bits [31:0] are architecturally mapped to AArch64 System register DISR_EL1[31:0] when the highest implemented Exception level is using AArch64.

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to DISR are UNDEFINED.

**Attributes**
DISR is a 32-bit register.

**Field descriptions**
The DISR bit assignments are:

**When the ESB instruction is executed at EL2:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| A  | RES0 | AET | EA | RES0 | DFSC  |

A, bit [31]
Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:12]
Reserved, RES0.

AET, bits [11:10]
Asynchronous Error Type. See the description of HSR.AET for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]
External abort Type. See the description of HSR.EA for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]
Reserved, RES0.
DFSC, bits [5:0]

Fault Status Code. See the description of HSR.DFSC for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

When the ESB instruction is executed at EL0 or EL1 and where TTBCR.EAE == 0:

<table>
<thead>
<tr>

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

Asynchronous Error Type. See the description of DFSR.AET for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

External abort Type. See the description of DFSR.ExT for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault Status Code. See the description of DFSR.FS for an SError interrupt.

The FS field is split as follows:

- FS[4] is DISR[10].
- FS[3:0] is DISR[3:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

<table>

#### STATUS, bits [5:0]

Fault Status Code. See the description of **DFSR**.FS for an SError interrupt.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Accessing the DISR

An indirect write to DISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR occurring in program order after the ESB instruction.

DISR is RAZ/WI if EL3 is implemented, the PE is in Non-debug state, and any of the following apply:

- EL3 is using AArch64, \( \text{SCR.EA} == 1 \), and any of the following apply:
  - The PE is executing at EL2.
  - The PE is executing at EL1 and \((\text{SCR.NS} == 0 \&\& \text{SCR.EEL2} == 0) || \text{HCR.ELO.AMO} == 0)\).
- EL3 is using AArch32, \( \text{SCR.EA} == 1 \), and any of the following apply:
  - The PE is executing at EL2.
  - The PE is executing at EL1 and \((\text{SCR.NS} == 0 || \text{HCR.AMO} == 0)\).

Accesses to this register use the following encodings:

\[
\text{MRC\{<c>\}{<q> \{#\}<opc1>, \{#\}<Rt>, \{#\}<CRn>, \{#\}<CRm\}{, \{#\}<opc2>}}
\]

<table>

DLR, Debug Link Register

The DLR characteristics are:

**Purpose**

In Debug state, holds the address to restart from.

**Configuration**

AArch32 System register DLR bits [31:0] are architecturally mapped to AArch64 System register DLR_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DLR are UNDEFINED.

**Attributes**

DLR is a 32-bit register.

**Field descriptions**

The DLR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>

   DLR = R[t];
DSPSR, Debug Saved Program Status Register

The DSPSR characteristics are:

**Purpose**

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

**Configuration**

AArch32 System register DSPSR bits [31:0] are architecturally mapped to AArch64 System register DSPSR_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DSPSR are UNDEFINED.

**Attributes**

DSPSR is a 32-bit register.

**Field descriptions**

The DSPSR bit assignments are:

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
N  Z  C  V  Q  IT[1:0]  DIT  SSBS  PAN  S  IL  GE  IT[7:2]  E  A  I  F  T  M[4:0]
```

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Q, bit [27]
Overflow or saturation flag. Set to the value of PSTATE.Q on entering Debug state, and copied to PSTATE.Q on exiting Debug state.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**
If-Then. Set to the value of PSTATE.IT[1:0] on entering Debug state, and copied to PSTATE.IT[1:0] on exiting Debug state.
On exiting Debug state DSPSR.IT must contain a value that is valid for the instruction being returned to.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DIT, bit [24]**
*When FEAT_DIT is implemented:*
Data Independent Timing. Set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*
Reserved, RES0.

**SSBS, bit [23]**
*When FEAT_SSBS is implemented:*
Speculative Store Bypass. Set to the value of PSTATE.SSBS on entering Debug state, and copied to PSTATE.SSBS on exiting Debug state.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*
Reserved, RES0.

**PAN, bit [22]**
*When FEAT_PAN is implemented:*
Privileged Access Never. Set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*
Reserved, RES0.

**SS, bit [21]**
Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on entering Debug state, and copied to PSTATE.GE on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on entering Debug state, and copied to PSTATE.IT[7:2] on exiting Debug state.

DSPSR.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on entering Debug state, and copied to PSTATE.E on exiting Debug state.

If the implementation does not support big-endian operation, DSPSR.E is RES0. If the implementation does not support little-endian operation, DSPSR.E is RES1. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DSPSR.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, DSPSR.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on entering Debug state, and copied to PSTATE.T on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on entering Debug state, and copied to PSTATE.M[4:0] on exiting Debug state.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor</td>
</tr>
<tr>

<td>Hyp</td>
</tr>
<tr>
<td>0b11101</td>
<td>Undefined</td>
</tr>
<tr>
<td>0b11111</td>
<td>System</td>
</tr>
</tbody>
</table>

Other values are reserved. If DSPSR.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the DSPSR

Accesses to this register use the following encodings:

DTLBIALL, Data TLB Invalidate All

The DTLBIALL characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from data TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
  - Would be required for the EL1&0 translation regime.
  - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the Non-secure PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DTLBIALL are **UNDEFINED**.

**Attributes**

DTLBIALL is a 32-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

**Executing the DTLBIALL instruction**

Accesses to this instruction use the following encodings:

\[
\text{MCR}\{<c>\}\{<q>\} <\text{coproc}>, \{#\}\{\text{opc1}\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}\}, \{#\}\{\text{opc2}\}\
\]

<table>

elsif PSTATE.EL == EL2 then
  DTLBIALL();
elsif PSTATE.EL == EL3 then
  DTLBIALL();
DTLBIASID, Data TLB Invalidate by ASID match

The DTLBIASID characteristics are:

### Purpose

Invalidate all cached copies of translation table entries from data TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

### Configuration

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DTLBIASID are **UNDEFINED**.

### Attributes

DTLBIASID is a 32-bit System instruction.

### Field descriptions

The DTLBIASID input value bit assignments are:

<table>
<thead>
<tr>

  else
    DTLBIASID(R[t]);
elsif PSTATE.EL == EL2 then
  DTLBIASID(R[t]);
elsif PSTATE.EL == EL3 then
  DTLBIASID(R[t]);
The DTLBIMVA characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from data TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DTLBIMVA are **undefined**.

**Attributes**

DTLBIMVA is a 32-bit System instruction.

**Field descriptions**

The DTLBIMVA input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T8 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLB == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TTLB == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        DTLBIMVA(R[t]);
    endif
elsif PSTATE.EL == EL2 then
    DTLBIMVA(R[t]);
elsif PSTATE.EL == EL3 then
    DTLBIMVA(R[t]);
endif
The DVPRCTX characteristics are:

**Purpose**

Data Value Prediction Restriction by Context applies to all Data Value Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, data value prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

**Note**

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

**Configuration**

This instruction is present only when AArch32 is supported at any Exception level and FEAT_SPECRES is implemented. Otherwise, direct accesses to DVPRCTX are UNDEFINED.

**Attributes**

DVPRCTX is a 32-bit System instruction.

**Field descriptions**

The DVPRCTX input value bit assignments are:

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|
| RES0     | GVMID    | EL       | VMID     | RES0     | GASID    | ASID     |
```

**Bits [31:28]**

Reserved, RES0.

**GVMID, bit [27]**

Execution of this instruction applies to all VMIDs or a specified VMID.

<table>
<thead>
<tr>
<th>GVMID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified VMID for an EL0 or EL1 target execution context.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all VMIDs for an EL0 or EL1 target execution context.</td>
</tr>
</tbody>
</table>
For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

**NS, bit [26]**

Security State.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure state.</td>
</tr>
</tbody>
</table>

If the instruction is executed in Non-secure state, this field has an Effective value of 1.

**EL, bits [25:24]**

Exception Level. Indicates the Exception level of the target execution context.

<table>
<thead>
<tr>
<th>EL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>EL0.</td>
</tr>
<tr>
<td>0b01</td>
<td>EL1.</td>
</tr>
<tr>
<td>0b10</td>
<td>EL2.</td>
</tr>
<tr>
<td>0b11</td>
<td>EL3.</td>
</tr>
</tbody>
</table>

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

**VMID, bits [23:16]**

Only applies when bit[27] is 0 and the target execution context is either:

- EL1.
- EL0 when \( \text{HCR\_EL2}\(\).E2H==0 \) or \( \text{HCR\_EL2}\(\).TGE==0 \) or EL2 is using AArch32 state.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and \( \text{HCR\_EL2}\(\).E2H==0 \) or \( \text{HCR\_EL2}\(\).TGE==0 \) or ELUsingAArch32(EL2),
this field is treated as the current VMID.

When the instruction is executed at EL0 and \( \text{HCR\_EL2}\(\).E2H==1 \) and \( \text{HCR\_EL2}\(\).TGE==1 \) and !ELUsingAArch32(EL2),
this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

**Bits [15:9]**

Reserved, RES0.

**GASID, bit [8]**

Execution of this instruction applies to all ASIDs or a specified ASID.

<table>
<thead>
<tr>
<th>GASID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Applies to specified ASID for an EL0 target execution context.</td>
</tr>
<tr>
<td>0b1</td>
<td>Applies to all ASID for an EL0 target execution context.</td>
</tr>
</tbody>
</table>

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.
ASID, bits [7:0]

Only applies for an EL0 target execution context and when bit[8] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

## Executing the DVPRCTX instruction

Accesses to this instruction use the following encodings:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>

ELR_hyp, Exception Link Register (Hyp mode)

The ELR_hyp characteristics are:

**Purpose**

When taking an exception to Hyp mode, holds the address to return to.

**Configuration**

AArch32 System register ELR_hyp bits [31:0] are architecturally mapped to AArch64 System register `ELR_EL2[31:0]`. This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ELR_hyp are UNDEFINED.

**Attributes**

ELR_hyp is a 32-bit register.

**Field descriptions**

The ELR_hyp bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

Return address.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ELR_hyp**

ELR_hyp is accessible only at Hyp mode and Monitor mode.

Accesses to this register use the following encodings:

\[
\text{MRS}\{<c>\}{<q>}\ <Rd>, \ \text{ELR}\_\text{hyp}
\]

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>0b1110</td>
</tr>
</tbody>
</table>

\[
\text{MSR}\{<c>\}{<q>}\ \text{ELR}\_\text{hyp}, \ <Rn>
\]

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>0b1</td>
<td>0b1110</td>
</tr>
</tbody>
</table>
ERRIDR, Error Record ID Register

The ERRIDR characteristics are:

**Purpose**

Defines the highest numbered index of the error records that can be accessed through the Error Record System registers.

**Configuration**

AArch32 System register ERRIDR bits [31:0] are architecturally mapped to AArch64 System register `ERRIDR_EL1[31:0]`.

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRIDR are *undefined*.

**Attributes**

ERRIDR is a 32-bit register.

**Field descriptions**

The ERRIDR bit assignments are:

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | NUM |

**Bits [31:16]**

Reserved, RES0.

**NUM, bits [15:0]**

Highest numbered index of the records that can be accessed through the Error Record System registers plus one. Zero indicates that no records can be accessed through the Error Record System registers.

Each implemented record is owned by a node. A node might own multiple records.

**Accessing the ERRIDR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>

ERRSELR, Error Record Select Register

The ERRSELR characteristics are:

**Purpose**

Selects an error record to be accessed through the Error Record System registers.

**Configuration**

AArch32 System register ERRSELR bits [31:0] are architecturally mapped to AArch64 System register ERRSELR_EL1[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRSELR are UNDEFINED.

If ERRIDR indicates that zero error records are implemented, then it is IMPLEMENTATION_DEFINED whether ERRSELR is UNDEFINED or RES0.

**Attributes**

ERRSELR is a 32-bit register.

**Field descriptions**

The ERRSELR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | SEL |

**Bits [31:16]**

Reserved, RES0.

**SEL, bits [15:0]**

Selects the error record accessed through the ERX registers.

For example, if ERRSELR.SEL is set to 0x0004, then direct reads and writes of ERXSTATUS access ERR4STATUS.

If ERRSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then all of the following apply:

- The value read back from ERRSELR.SEL is UNKNOWN.
- One of the following occurs:
  - An UNKNOWN error record is selected.
  - The ERX* registers are RAZ/WI.
  - ERX* register reads and writes are NOPs.
  - ERX* register reads and writes are UNDEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ERRSELR**

Accesses to this register use the following encodings:

\[
\text{MRC\{<c>\}{<q>}} \ <\text{coproc}, \ {#}\{<\text{opc1}\}, \ <\text{Rt}, \ <\text{CRn}, \ <\text{CRm}\{, \ {#}\{<\text{opc2}\}}\}
\]

    endif;
ERXADDR, Selected Error Record Address Register

The ERXADDR characteristics are:

**Purpose**

Accesses bits [31:0] of `ERR<n>ADDR` for the error record <n> selected by `ERRSELR.SEL`.

**Configuration**

AArch32 System register ERXADDR bits [31:0] are architecturally mapped to AArch64 System register `ERXADDR_EL1[31:0]`.

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXADDR are UNDEFINED.

**Attributes**

ERXADDR is a 32-bit register.

**Field descriptions**

The ERXADDR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [31:0]**

ERXADDR accesses bits [31:0] of `ERR<n>ADDR`, where <n> is the value in `ERRSELR.SEL`.

**Accessing the ERXADDR**

If `ERRIDR.NUM == 0x0000` or `ERRSELR.SEL` is set to a value greater than or equal to `ERRIDR.NUM`, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXADDR is RAZ/WI.
- Direct reads and writes of ERXADDR are NOPs.
- Direct reads and writes of ERXADDR are UNDEFINED.

`ERR<n>ADDR` describes additional constraints that also apply when `ERR<n>ADDR` is accessed through ERXADDR.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}, \#<\text{opc1}>, \text{<Rt>, <CRn}, <\text{CRm}, \#<\text{opc2}>}
\]

ERXADDR2, Selected Error Record Address Register 2

The ERXADDR2 characteristics are:

Purpose

Accesses bits [63:32] of **ERR<n>ADDR** for the error record <n> selected by **ERRSELR**.SEL.

Configuration

AArch32 System register ERXADDR2 bits [31:0] are architecturally mapped to AArch64 System register **ERXADDR_EL1[63:32]**.

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXADDR2 are **UNDEFINED**.

Attributes

ERXADDR2 is a 32-bit register.

Field descriptions

The ERXADDR2 bit assignments are:

**Bits [63:32]** of **ERR<n>ADDR**

Bits [31:0]

ERXADDR2 accesses bits [63:32] of **ERR<n>ADDR**, where <n> is the value in **ERRSELR**.SEL.

Accessing the ERXADDR2

If **ERRIDR** NUM == 0x0000 or **ERRSELR**.SEL is set to a value greater than or equal to **ERRIDR**.NUM, then one of the following occurs:

- An **UNKNOWN** error record is selected.
- ERXADDR2 is RAZ/WI.
- Direct reads and writes of ERXADDR2 are NOPs.
- Direct reads and writes of ERXADDR2 are **UNDEFINED**.

**ERR<n>ADDR** describes additional constraints that also apply when **ERR<n>ADDR** is accessed through ERXADDR2.

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

ERXCTLR, Selected Error Record Control Register

The ERXCTLR characteristics are:

**Purpose**

Accesses bits [31:0] of ERR<n>CTRL for the error record <n> selected by ERRSELR.SEL.

**Configuration**

AArch32 System register ERXCTLR bits [31:0] are architecturally mapped to AArch64 System register ERXCTLR_EL1[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXCTLR are UNDEFINED.

**Attributes**

ERXCTLR is a 32-bit register.

**Field descriptions**

The ERXCTLR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|Bits [31:0] of ERR<n>CTRL|

**Bits [31:0]**

ERXCTLR accesses bits [31:0] of ERR<n>CTRL, where <n> is the value in ERRSELR.SEL.

**Accessing the ERXCTLR**

If ERRDR.NUM == 0x0000 or ERRSELR.SEL is set to a value greater than or equal to ERRDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXCTLR is RAZ/WI.
- Direct reads and writes of ERXCTLR are NOPs.
- Direct reads and writes of ERXCTLR are UNDEFINED.

If ERRSELR.SEL is not the index of the first error record owned by a node, then ERR<n>CTRL[31:0] is not present, meaning reads and writes of ERXCTLR are RES0.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

ERXCTRL2, Selected Error Record Control Register 2

The ERXCTRL2 characteristics are:

**Purpose**

Accesses bits [63:32] of ERR<n>CTRL for the error record <n> selected by ERRSELR.SEL.

**Configuration**

AArch32 System register ERXCTRL2 bits [31:0] are architecturally mapped to AArch64 System register ERXCTRL_EL1[63:32].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXCTRL2 are UNDEFINED.

**Attributes**

ERXCTRL2 is a 32-bit register.

**Field descriptions**

The ERXCTRL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Bits [63:32] of ERR&lt;n&gt;CTRL</td>
</tr>
<tr>
<td>30-0</td>
<td>ERR&lt;n&gt;CTRL, where &lt;n&gt; is the value in ERRSELR.SEL.</td>
</tr>
</tbody>
</table>

**Accessing the ERXCTRL2**

If ERRIDR.NUM == 0x0000 or ERRSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXCTRL2 is RAZ/WI.
- Direct reads and writes of ERXCTRL2 are NOPs.
- Direct reads and writes of ERXCTRL2 are UNDEFINED.

If ERRSELR.SEL is not the index of the first error record owned by a node, then ERR<n>CTRL[63:32] is not present, meaning reads and writes of ERXCTRL2 are RES0.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

ERXMISC0, Selected Error Record Miscellaneous Register 0

The ERXMISC0 characteristics are:

**Purpose**

Accesses bits [31:0] of ERR<\text{n}>MISC0 for the error record \(<n>\) selected by ERRSELR.SEL.

**Configuration**

AArch32 System register ERXMISC0 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC0_EL1[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC0 are UNDEFINED.

**Attributes**

ERXMISC0 is a 32-bit register.

**Field descriptions**

The ERXMISC0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bits [31:0] of ERR<\text{n}>MISC0 |

**Bits [31:0]**

ERXMISC0 accesses bits [31:0] of ERR<\text{n}>MISC0, where \(<n>\) is the value in ERRSELR.SEL.

**Accessing the ERXMISC0**

If ERRIDR.NUM == 0x0000 or ERRSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC0 is RAZ/WI.
- Direct reads and writes of ERXMISC0 are NOPs.
- Direct reads and writes of ERXMISC0 are UNDEFINED.

ERR<\text{n}>MISC0 describes additional constraints that also apply when ERR<\text{n}>MISC0 is accessed through ERXMISC0.

ERXMISC1, Selected Error Record Miscellaneous Register 1

The ERXMISC1 characteristics are:

Purpose

Accesses bits [63:32] of ERR<n>MISC0 for the error record <n> selected by ERRSELR_SEL.

Configuration

AArch32 System register ERXMISC1 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC0_EL1[63:32].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC1 are UNDEFINED.

Attributes

ERXMISC1 is a 32-bit register.

Field descriptions

The ERXMISC1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:32] of ERR&lt;n&gt;MISC0</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
</tr>
</tbody>
</table>

Bits [31:0]

ERXMISC1 accesses bits [63:32] of ERR<n>MISC0, where <n> is the value in ERRSELR_SEL.

Accessing the ERXMISC1

If ERRIDR_NUM == 0x0000 or ERRSELR_SEL is set to a value greater than or equal to ERRIDR_NUM, then one of the following occurs:

* An UNKNOWN error record is selected.
* ERXMISC1 is RAZ/WI.
* Direct reads and writes of ERXMISC1 are NOPs.
* Direct reads and writes of ERXMISC1 are UNDEFINED.

ERR<n>MISC0 describes additional constraints that also apply when ERR<n>MISC0 is accessed through ERXMISC1.

Accesses to this register use the following encodings:

MRC{<c>}{<q>}, <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

The ERXMISC2 characteristics are:

**Purpose**

Accesses bits [31:0] of ERR\textsubscript{\textless\textgreater}MISC1 for the error record \textless\textgreater selected by ERRSELR.SEL.

**Configuration**

AArch32 System register ERXMISC2 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC\textsubscript{1_EL1}[31:0].

This register is present only when FEAT\textsubscript{RAS} is implemented. Otherwise, direct accesses to ERXMISC2 are UNDEFINED.

**Attributes**

ERXMISC2 is a 32-bit register.

**Field descriptions**

The ERXMISC2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bits [31:0] of ERR\textsubscript{\textless\textgreater}MISC1 |

**Bits [31:0]**

ERXMISC2 accesses bits [31:0] of ERR\textsubscript{\textless\textgreater}MISC1, where \textless\textgreater is the value in ERRSELR.SEL.

**Accessing the ERXMISC2**

If ERRIDR.NUM == 0x0000 or ERRSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC2 is RAZWI.
- Direct reads and writes of ERXMISC2 are NOPs.
- Direct reads and writes of ERXMISC2 are UNDEFINED.

ERR\textsubscript{\textless\textgreater}MISC1 describes additional constraints that also apply when ERR\textsubscript{\textless\textgreater}MISC1 is accessed through ERXMISC2.

Accesses to this register use the following encodings:

ERXMISC3, Selected Error Record Miscellaneous Register 3

The ERXMISC3 characteristics are:

**Purpose**

Accesses bits [63:32] of ERR<n>MISC1 for the error record <n> selected by ERRELR.SEL.

**Configuration**

AArch32 System register ERXMISC3 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC1_EL1[63:32].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC3 are UNDEFINED.

**Attributes**

ERXMISC3 is a 32-bit register.

**Field descriptions**

The ERXMISC3 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [31:0]**

ERXMISC3 accesses bits [63:32] of ERR<n>MISC1, where <n> is the value in ERRELR.SEL.

**Accessing the ERXMISC3**

If ERRIDR.NUM == 0x0000 or ERRELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC3 is RAZ/WI.
- Direct reads and writes of ERXMISC3 are NOPs.
- Direct reads and writes of ERXMISC3 are UNDEFINED.

ERR<n>MISC1 describes additional constraints that also apply when ERR<n>MISC1 is accessed through ERXMISC3.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#<opc1>, <Rt>, <CRn>, CRm}{, {#<opc2>}}

ERXMISC4, Selected Error Record Miscellaneous Register 4

The ERXMISC4 characteristics are:

**Purpose**

Accesses bits [31:0] of ERR<n>MISC2 for the error record <n> selected by ERRELR.SEL.

**Configuration**

AArch32 System register ERXMISC4 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC2_EL1[31:0].

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC4 are UNDEFINED.

**Attributes**

ERXMISC4 is a 32-bit register.

**Field descriptions**

The ERXMISC4 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

Bits [31:0] of ERR<n>MISC2

**Bits [31:0]**

ERXMISC4 accesses bits [31:0] of ERR<n>MISC2, where <n> is the value in ERRELR.SEL.

**Accessing the ERXMISC4**

If ERRIDR.NUM == 0x0000 or ERRELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC4 is RAZ/WI.
- Direct reads and writes of ERXMISC4 are NOPs.
- Direct reads and writes of ERXMISC4 are UNDEFINED.

ERR<n>MISC2 describes additional constraints that also apply when ERR<n>MISC2 is accessed through ERXMISC4.

Accesses to this register use the following encodings:

The ERXMISC6 characteristics are:

**Purpose**

Accesses bits [31:0] of ERR<n>MISC3 for the error record <n> selected by ERSEL<BR>.SEL.

**Configuration**

AArch32 System register ERXMISC6 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC3_EL1[31:0].

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC6 are UNDEFINED.

**Attributes**

ERXMISC6 is a 32-bit register.

**Field descriptions**

The ERXMISC6 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bits [31:0] of ERR<n>MISC3 |

**Bits [31:0]**

ERXMISC6 accesses bits [31:0] of ERR<n>MISC3, where <n> is the value in ERSEL<BR>.SEL.

**Accessing the ERXMISC6**

If ERR<BR>.NUM == 0x0000 or ERSEL<BR>.SEL is set to a value greater than or equal to ERR<BR>.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC6 is RAZ/WI.
- Direct reads and writes of ERXMISC6 are NOPs.
- Direct reads and writes of ERXMISC6 are UNDEFINED.

ERR<n>MISC3 describes additional constraints that also apply when ERR<n>MISC3 is accessed through ERXMISC6.

Accesses to this register use the following encodings:

ERXMISC7, Selected Error Record Miscellaneous Register 7

The ERXMISC7 characteristics are:

**Purpose**

Accesses bits [63:32] of ERR\textsubscript{<n>\textasciitilde MISC3} for the error record \textit{<n>} selected by ERRSELR.SEL.

**Configuration**

AArch32 System register ERXMISC7 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC3\textsubscript{EL1[63:32]}.

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC7 are **UNDEFINED**.

**Attributes**

ERXMISC7 is a 32-bit register.

**Field descriptions**

The ERXMISC7 bit assignments are:

| Bits [63:32] of ERR\textsubscript{<n>\textasciitilde MISC3} |
|-----------------|-----------------|-----------------|-----------------|-----------------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   | 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| 0b1111 | 0b0000 | 0b0101 | 0b0101 | 0b111 |

**Bits [31:0]**

ERXMISC7 accesses bits [63:32] of ERR\textsubscript{<n>\textasciitilde MISC3}, where \textit{<n>} is the value in ERRSELR.SEL.

**Accessing the ERXMISC7**

If ERRIDR.NUM == 0x0000 or ERRSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:
- An **UNKNOWN** error record is selected.
- ERXMISC7 is RAZ/WI.
- Direct reads and writes of ERXMISC7 are NOPs.
- Direct reads and writes of ERXMISC7 are **UNDEFINED**.

ERR\textsubscript{<n>\textasciitilde MISC3} describes additional constraints that also apply when ERR\textsubscript{<n>\textasciitilde MISC3} is accessed through ERXMISC7.

Accesses to this register use the following encodings:

```

The FCSEIDR characteristics are:

**Purpose**

Identifies whether the Fast Context Switch Extension (FCSE) is implemented.

From Armv8, the FCSE is not implemented, so this register is RAZ/WI. Software can access this register to determine that the implementation does not include the FCSE.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to FCSEIDR are UNDEFINED.

**Attributes**

FCSEIDR is a 32-bit register.

**Field descriptions**

The FCSEIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Bit Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>RAZ/WI</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Reserved, RAZ/WI.

**Accessing the FCSEIDR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>

end if
FPEXC, Floating-Point Exception Control register

The FPEXC characteristics are:

**Purpose**

Provides a global enable for the implemented Advanced SIMD and floating-point functionality, and reports floating-point status information.

**Configuration**

AArch32 System register FPEXC bits [31:0] are architecturally mapped to AArch64 System register FPEXC32_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to FPEXC are undefined.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

**Attributes**

FPEXC is a 32-bit register.

**Field descriptions**

The FPEXC bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| EX | EN | DE | EX | FP2V | VV | TFV | RES0 | VECITR | DF | RES0 | XF | UFF | OFF | DZF | IOF | |

**EX, bit [31]**

Exception bit. From Armv8, this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally unknown value.

**EN, bit [30]**

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMSR accesses to the FPEXC or FPSID.
- VMRS accesses from the FPEXC, FPSID, MVFR0, MVFR1, or MVFR2.

<table>
<thead>
<tr>
<th>EN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to the FPSCR, and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are undefined at all Exception levels.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels.</td>
</tr>
</tbody>
</table>

Execution of floating-point and Advanced SIMD instructions in AArch32 state can be disabled or trapped by the following controls:

- CPACR.cp10, or, if executing at EL0, CPACR_EL1.FPEN.
- FPEXC.EN.
- If executing in Non-secure state:
  - HCPTR.TCP10, or if EL2 is using AArch64, CPTR_EL2.TFP.
  - NSACR.cp10, or if EL3 is using AArch64, CPTR_EL3.TFP.
- For Advanced SIMD instructions only:
If executing in Non-secure state, \texttt{HCPTR.TASE} and \texttt{NSACR.NSTRDIS}.

See the descriptions of the controls for more information.

\underline{Note}

When executing at EL0 using AArch32:

- If EL1 is using AArch64 then behavior is as if the value of FPEXC.EN is 1.
- If EL2 is using AArch64 and enabled in the current Security state, and the value of \texttt{HCR_EL2.\{RW, TGE\}} is \{1, 1\}, then the behavior is as if the value of FPEXC.EN is 1.
- If EL2 is using AArch64 and enabled in the current Security state, and the value of \texttt{HCR_EL2.\{RW, TGE\}} is \{0, 1\}, then it is \texttt{IMPLEMENTATION DEFINED} whether the behavior is:
  - As if the value of FPEXC.EN is 1.
  - Determined by the value of FPEXC.EN, as described in this field description. However, Arm deprecates using the value of FPEXC.EN to determine behavior.

On a Warm reset, this field resets to 0.

\textbf{DEX, bit [29]}

Defined synchronous exception on floating-point execution.

This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function \texttt{ExecutingCP10or11Instr()} returning TRUE. This field also indicates whether the FPEXC.TFV field is valid.

The meaning of this bit is:

<table>
<thead>
<tr>
<th>DEX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function \texttt{ExecutingCP10or11Instr()}. If FPEXC.TFV is RW then it is invalid and \texttt{UNKNOWN}. If FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and \texttt{UNKNOWN}.</td>
</tr>
<tr>
<td>0b1</td>
<td>The exception was generated during the execution of an unallocated encoding. FPEXC.TFV is valid and indicates the cause of the exception.</td>
</tr>
</tbody>
</table>

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the \texttt{FPSCR.\{Stride, Len\}} fields as RAZ, this bit is \texttt{RES0}.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{FP2V, bit [28]}

\texttt{FPINST2} instruction valid bit. From Armv8, this bit is \texttt{RES0}.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{VV, bit [27]}

\texttt{VECITR} valid bit. From Armv8, this bit is \texttt{RES0}.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.
TFV, bit [26]

Trapped Fault Valid bit. Valid only when the value of FPEXC.DEX is 1. When valid, it indicates the cause of the exception and therefore whether the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are valid.

<table>
<thead>
<tr>
<th>TFV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNMUL, VSQRT, or VSUB instruction when one or both of FPSCR. {Stride, Len} was non-zero. If the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are RW then they are invalid and UNKNOWN.</td>
</tr>
<tr>
<td>0b1</td>
<td>FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.</td>
</tr>
</tbody>
</table>

This bit returns a status value and ignores writes.

When the value of FPEXC.DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On an implementation that supports the trapping of floating-point exceptions and implements FPSCR. {Stride, Len} as RAZ, this bit is RAO/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [25:11]

Reserved, RES0.

VECITR, bits [10:8]

Vector iteration count. From Armv8, this field is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while FPSCR.IDE was 1:

<table>
<thead>
<tr>
<th>IDF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Input Denormal exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Input Denormal exception has occurred.</td>
</tr>
</tbody>
</table>

Input Denormal exceptions can occur only when FPSCR.FZ is 1.

Note

A half-precision floating-point value that is flushed to zero because the value of FPSCR.FZ16 is 1 does not generate an Input Denormal exception.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.
IXF, bit [4]

Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while FPSCR.IXE was 1:

<table>
<thead>
<tr>
<th>IXF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Inexact exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Inexact exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while FPSCR.UFE was 1:

<table>
<thead>
<tr>
<th>UFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Underflow exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Underflow exception has occurred.</td>
</tr>
</tbody>
</table>

Underflow trapped exceptions can occur:

- On half-precision data-processing instructions only when FPSCR.FZ16 is 0.
- Otherwise only when FPSCR.FZ is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while FPSCR.OFE was 1:

<table>
<thead>
<tr>
<th>OFF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Overflow exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Overflow exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while FPSCR.DZE was 1:

<table>
<thead>
<tr>
<th>DZF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Divide by Zero exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Divide by Zero exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.
When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and **UNKNOWN**.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IOF, bit [0]**

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while **FPSCR.IOE** was 1:

<table>
<thead>
<tr>
<th>IOF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Invalid Operation exception has not occurred.</td>
</tr>
<tr>
<td>0b1</td>
<td>Invalid Operation exception has occurred.</td>
</tr>
</tbody>
</table>

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and **UNKNOWN**.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the FPEXC**

Accesses to this register use the following encodings:

\[
\text{VMRS} \{<c>\} \{<q>\} \text{<Rt>, <spec_reg>}
\]

<table>

**FPSCR, Floating-Point Status and Control Register**

The FPSCR characteristics are:

**Purpose**

Provides floating-point system status information and control.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to FPSCR are UNDEFINED.

The named fields in this register map to the equivalent fields in the AArch64 FPCR and FPSR.

It is IMPLEMENTATION DEFINED whether the Len and Stride fields can be programmed to non-zero values, which will cause some AArch32 floating-point instruction encodings to be UNDEFINED, or whether these fields are RAZ.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

**Attributes**

FPSCR is a 32-bit register.

**Field descriptions**

The FPSCR bit assignments are:

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
N  Z  C  V  QC  AHP  D  N  F  Z  R  Mode  Stride  FZ16  Len  IDE  RES0  IXE  UFE  OFE  DZE  IOE  DCRES0  IXC  UFC  OFC  DZC  IOC
```

**N, bit [31]**

Negative condition flag. This is updated by floating-point comparison operations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero condition flag. This is updated by floating-point comparison operations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry condition flag. This is updated by floating-point comparison operations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow condition flag. This is updated by floating-point comparison operations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
QC, bit [27]

Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since 0 was last written to this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

AHP, bit [26]

Alternative half-precision control bit:

<table>
<thead>
<tr>
<th>AHP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IEEE half-precision format selected.</td>
</tr>
<tr>
<td>0b1</td>
<td>Alternative half-precision format selected.</td>
</tr>
</tbody>
</table>

This bit is used only for conversions between half-precision floating-point and other floating-point formats.

The data-processing instructions added as part of the FEAT_FP16 extension always use the IEEE half-precision format, and ignore the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

DN, bit [25]

Default NaN mode control bit:

<table>
<thead>
<tr>
<th>DN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>NaN operands propagate through to the output of a floating-point operation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any operation involving one or more NaNs returns the Default NaN.</td>
</tr>
</tbody>
</table>

The value of this bit controls only scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the Default NaN setting, regardless of the value of the DN bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

FZ, bit [24]

Flush-to-zero mode control bit:

<table>
<thead>
<tr>
<th>FZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.</td>
</tr>
<tr>
<td>0b1</td>
<td>Flush-to-zero mode enabled.</td>
</tr>
</tbody>
</table>

The value of this bit controls only scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the Flush-to-zero setting, regardless of the value of the FZ bit.

This bit has no effect on half-precision calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

RMode, bits [23:22]

Rounding Mode control field. The encoding of this field is:

<table>
<thead>
<tr>
<th>RMode</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Round to Nearest (RN) mode.</td>
</tr>
<tr>
<td>0b01</td>
<td>Round towards Plus Infinity (RP) mode.</td>
</tr>
<tr>
<td>0b10</td>
<td>Round towards Minus Infinity (RM) mode.</td>
</tr>
<tr>
<td>0b11</td>
<td>Round towards Zero (RZ) mode.</td>
</tr>
</tbody>
</table>

The specified rounding mode is used by almost all scalar floating-point instructions. Advanced SIMD arithmetic always uses the Round to Nearest setting, regardless of the value of the RMode bits.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Stride, bits [21:20]**

It is IMPLEMENTATION DEFINED whether this field is RW or RAZ.

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are UNDEFINED. The instruction pseudocode identifies these instructions.

Arm strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**FZ16, bit [19]**

When FEAT_FP16 is implemented:

Flush-to-zero mode control bit on half-precision data-processing instructions:

<table>
<thead>
<tr>
<th>FZ16</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.</td>
</tr>
<tr>
<td>0b1</td>
<td>Flush-to-zero mode enabled.</td>
</tr>
</tbody>
</table>

The value of this bit applies to both scalar and Advanced SIMD floating-point half-precision calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Len, bits [18:16]**

It is IMPLEMENTATION DEFINED whether this field is RW or RAZ.

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are UNDEFINED. The instruction pseudocode identifies these instructions.

Arm strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IDE, bit [15]**

Input Denormal floating-point exception trap enable.

<table>
<thead>
<tr>
<th>IDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untrapped exception handling selected. If the floating-point exception occurs, the IDC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IDC bit.</td>
</tr>
</tbody>
</table>

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**Bits [14:13]**

Reserved, RES0.

**IXE, bit [12]**

Inexact floating-point exception trap enable.

<table>
<thead>
<tr>
<th>IXE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untrapped exception handling selected. If the floating-point exception occurs, the IXC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IXC bit.</td>
</tr>
</tbody>
</table>

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**UFE, bit [11]**

Underflow floating-point exception trap enable.

<table>
<thead>
<tr>
<th>UFE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untrapped exception handling selected. If the floating-point exception occurs, the UFC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs and Flush-to-zero is not enabled, the PE does not update the UFC bit.</td>
</tr>
</tbody>
</table>

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**OFE, bit [10]**

Overflow floating-point exception trap enable.

<table>
<thead>
<tr>
<th>OFE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untrapped exception handling selected. If the floating-point exception occurs, the OFC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the OFC bit.</td>
</tr>
</tbody>
</table>

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DZE, bit [9]**

Divide by Zero floating-point exception trap enable.
**DZE, bit [10]**

Untrapped exception handling selected. If the floating-point exception occurs, the DZE bit is set to 1.

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untrapped exception handling selected. If the floating-point exception occurs, the DZE bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the DZE bit.</td>
</tr>
</tbody>
</table>

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IOE, bit [8]**

Invalid Operation floating-point exception trap enable.

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Untrapped exception handling selected. If the floating-point exception occurs, the IOC bit is set to 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IOC bit.</td>
</tr>
</tbody>
</table>

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IDC, bit [7]**

Input Denormal cumulative floating-point exception bit. This bit is set to 1 to indicate that the Input Denormal floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IDE bit.

Advanced SIMD instructions set this bit if the Input Denormal floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IDE bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [6:5]**

Reserved, RES0.

**IXC, bit [4]**

Inexact cumulative floating-point exception bit. This bit is set to 1 to indicate that the Inexact floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IXE bit.

Advanced SIMD instructions set this bit if the Inexact floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IXE bit.

The criteria for the Inexact floating-point exception to occur are different in Flush-to-zero mode. For details, see 'Flush-to-zero'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
UFC, bit [3]

Underflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Underflow floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the UFE bit.

Advanced SIMD instructions set this bit if the Underflow floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, if FPSCR.UFE is 0 or if Flush-to-zero is enabled.

The criteria for the Underflow floating-point exception to occur are different in Flush-to-zero mode. For details, see 'Flush-to-zero'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFC, bit [2]

Overflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Overflow floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the OFE bit.

Advanced SIMD instructions set this bit if the Overflow floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the OFE bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZC, bit [1]

Divide by Zero cumulative floating-point exception bit. This bit is set to 1 to indicate that the Divide by Zero floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the DZE bit.

Advanced SIMD instructions set this bit if the Divide by Zero floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the DZE bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOC, bit [0]

Invalid Operation cumulative floating-point exception bit. This bit is set to 1 to indicate that the Invalid Operation floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IOE bit.

Advanced SIMD instructions set this bit if the Invalid Operation floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IOE bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the FPSCR

Accesses to this register use the following encodings:

\[
\text{VMRS}\{<c>\}{<q}> <Rt>, <\text{spec\_reg}>
\]

<table>

The FPSID characteristics are:

**Purpose**

Provides top-level information about the floating-point implementation.

This register largely duplicates information held in the MIDR. Arm deprecates use of it.

**Configuration**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to FPSID are UNDEFINED.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

**Attributes**

FPSID is a 32-bit register.

**Field descriptions**

The FPSID bit assignments are:

<table>
<thead>
<tr>

</tbody>
</table>

**Implementer, bits [31:24]**

Implementer codes are the same as those used for the MIDR.

For an implementation by Arm this field is 0x41, the ASCII code for A.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SW, bit [23]**

Software bit. Defined values are:

<table>
<thead>
<tr>
<th>SW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The implementation provides a hardware implementation of the floating-point instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>The implementation supports only software emulation of the floating-point instructions.</td>
</tr>
</tbody>
</table>

In Armv8-A, the only permitted value is 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Subarchitecture, bits [22:16]**

Subarchitecture version number. For an implementation by Arm, defined values are:
### Subarchitecture

<table>
<thead>
<tr>
<th>Subarchitecture</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00000000</td>
<td>VFPv1 architecture with an IMPLEMENTATION DEFINED subarchitecture.</td>
</tr>
<tr>
<td>0b00000001</td>
<td>VFPv2 architecture with Common VFP subarchitecture v1.</td>
</tr>
<tr>
<td>0b00000010</td>
<td>VFPv3 architecture, or later, with Common VFP subarchitecture v2. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers.</td>
</tr>
<tr>
<td>0b00000011</td>
<td>VFPv3 architecture, or later, with Null subarchitecture. The entire floating-point implementation is in hardware, and no software support code is required. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers. This value can be used only by an implementation that does not support the trap enable bits in the FPSCR.</td>
</tr>
<tr>

<td>VFPv3 architecture, or later, with Common VFP subarchitecture v3, and support for trap enable bits in FPSCR. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers.</td>
</tr>
</tbody>
</table>

For a subarchitecture designed by Arm the most significant bit of this field, register bit[22], is 0. Values with a most significant bit of 0 that are not listed here are reserved.

When the subarchitecture designer is not Arm, the most significant bit of this field, register bit[22], must be 1. Each implementer must maintain its own list of subarchitectures it has designed, starting at subarchitecture version number 0x40.

In Armv8-A, the permitted values are 0b0000011 and 0b0000100.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### PartNum, bits [15:8]

An IMPLEMENTATION DEFINED part number for the floating-point implementation, assigned by the implementer.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Variant, bits [7:4]

An IMPLEMENTATION DEFINED variant number. Typically, this field distinguishes between different production variants of a single product.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the floating-point implementation.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

HAMAIR0, Hyp Auxiliary Memory Attribute Indirection Register 0

The HAMAIR0 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED memory attributes for the memory attribute encodings defined by HMAIR0. These IMPLEMENTATION DEFINED attributes can only provide additional qualifiers for the memory attribute encodings, and cannot change the memory attributes defined in HMAIR0.

Configuration

AArch32 System register HAMAIR0 bits [31:0] are architecturally mapped to AArch64 System register AMAIR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HAMAIR0 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HAMAIR0 is a 32-bit register.

Field descriptions

The HAMAIR0 bit assignments are:

|   | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**HCPT, Hyp Architectural Feature Trap Register**

The HCPT characteristics are:

**Purpose**

Controls:

- Trapping to Hyp mode of Non-secure access, at EL1 or EL0, to trace, and to Advanced SIMD and floating-point functionality.
- Hyp mode access to trace, and to Advanced SIMD and floating-point functionality.

**Note**

Accesses to this functionality:

- From Non-secure modes other than Hyp mode are also affected by settings in the CPACR and NSACR.
- From Hyp mode are also affected by settings in the NSACR.

Exceptions generated by the CPACR and NSACR controls are higher priority than those generated by the HCPT controls.

**Configuration**

AArch32 System register HCPT bits [31:0] are architecturally mapped to AArch64 System register CPTR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HCPT are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HCPT is a 32-bit register.

**Field descriptions**

The HCPT bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>TCPAC</th>
<th>TAM</th>
<th>RES0</th>
<th>TTA</th>
<th>RES0</th>
<th>TASE</th>
<th>RES0</th>
<th>TCP11</th>
<th>TCP10</th>
<th>RES1</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>TCPAC</td>
<td>TAM</td>
<td>RES0</td>
<td>TTA</td>
<td>RES0</td>
<td>TASE</td>
<td>RES0</td>
<td>TCP11</td>
<td>TCP10</td>
<td>RES1</td>
</tr>
</tbody>
</table>

**TCPAC, bit [31]**

Traps Non-secure EL1 accesses to the CPACR to Hyp mode.

<table>
<thead>
<tr>
<th>TCPAC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses to the CPACR are trapped to Hyp mode.</td>
</tr>
</tbody>
</table>

**Note**

The CPACR is not accessible at EL0.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.
TAM, bit [30]

When FEAT_AMUv1 is implemented:

Trap Activity Monitor access. Traps Non-secure EL1 and EL0 accesses to all Activity Monitor registers to EL2.

<table>
<thead>
<tr>
<th>TAM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses from Non-secure EL1 and EL0 to Activity Monitor registers are not trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses from Non-secure EL1 and EL0 to Activity Monitor registers are trapped to Hyp mode.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [29:21]

Reserved, RES0.

TTA, bit [20]

Traps Non-secure System register accesses to all implemented trace registers to Hyp mode.

<table>
<thead>
<tr>
<th>TTA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any Non-secure System register access to an implemented trace register is trapped to Hyp mode, unless the access is trapped to EL1 by a CPACR or NSACR control, or the access is from Non-secure EL0 and the definition of the register in the appropriate trace architecture specification indicates that the register is not accessible from EL0. A trapped instruction generates:</td>
</tr>
<tr>
<td></td>
<td>• A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.</td>
</tr>
<tr>
<td></td>
<td>• An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.</td>
</tr>
</tbody>
</table>

If the implementation does not include a PE trace unit, or does not include a System register interface to the PE trace unit registers, it is IMPLEMENTATION DEFINED whether this bit:

• Is RES0.  
• Is RES1.  
• Can be written from Hyp mode, and from Secure Monitor mode when SCR.NS is 1.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSTRCDIS is 1, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

Note

• The ETMv4 architecture and ETE do not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4 or FEAT_ETE, EL0 accesses to the trace registers are UNDEFINED, and a resulting Undefined Instruction exception is higher priority than a HCPTR.TTA Hyp Trap exception.  
• The Arm architecture does not provide traps on trace register accesses through the optional memory-mapped debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.
Bits [19:16]

Reserved, RES0.

TASE, bit [15]

Traps Non-secure execution of Advanced SIMD instructions to Hyp mode when the value of HCPTR.TCP10 is 0.

<table>
<thead>
<tr>
<th>TASE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the value of HCPTR.TCP10 is 0, any attempt to execute an Advanced SIMD instruction in Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a CPACR or NSACR control. A trapped instruction generates:</td>
</tr>
<tr>
<td></td>
<td>• A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.</td>
</tr>
<tr>
<td></td>
<td>• An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.</td>
</tr>
</tbody>
</table>

When the value of HCPTR.TCP10 is 1, the value of this field is ignored.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, then it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSASEDIS is 1, in Non-secure state this field behaves as RAO/WI, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

For the list of instructions affected by this field, see ‘Controls of Advanced SIMD operation that do not apply to floating-point operation’.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Bit [14]

Reserved, RES0.

Bits [13:12]

Reserved, RES1.

TCP11, bit [11]

The value of this field is ignored. If this field is programmed with a different value to the TCP10 bit then this field is UNKNOWN on a direct read of the HCPTR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

If EL3 is implemented and is using AArch32, and the value of NSACR.cp10 is 0, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TCP10, bit [10]

Trap Non-secure accesses to Advanced SIMD and floating-point functionality to Hyp mode:
Meaning

<table>
<thead>
<tr>
<th>TCP10</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>
| 0b1   | Any attempted access to Advanced SIMD and floating-point functionality from Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a CPACR or NSACR control. A trapped instruction generates:
  - A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.
  - An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode. |

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPXID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is res1.

If EL3 is implemented and is using AArch32, and the value of NSACR.cp10 is 0, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Bits [9:0]

Reserved, res1.

### Accessing the HCPTR

**Bit [31]**

Reserved, RES0.

**TRVM, bit [30]**

Trap Reads of Virtual Memory controls. Traps Non-secure EL1 reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state.

The registers for which read accesses are trapped are as follows:

SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AFIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.

<table>
<thead>
<tr>
<th>TRVM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 read accesses to the specified Virtual Memory controls are trapped to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**HCD, bit [29]**

When EL3 is not implemented:

HVC instruction disable. Disables Non-secure EL1 and EL2 execution of HVC instructions, when EL2 is enabled in the current Security state.
HCR, Hyp Configuration Register

<table>
<thead>
<tr>
<th>HCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>HVC instruction execution is enabled at EL2 and EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>HVC instructions are <strong>UNDEFINED</strong> at EL2 and Non-secure EL1. The Undefined Instruction exception is taken to the Exception level at which the HVC instruction is executed.</td>
</tr>
</tbody>
</table>

**Note**

HVC instructions are always **UNDEFINED** at EL0.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [28]**

Reserved, RES0.

**TGE, bit [27]**

Trap General Exceptions, from Non-secure EL0.

<table>
<thead>
<tr>
<th>TGE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on execution at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>When EL2 is not enabled in the current Security state, this control has no effect on execution at EL0. When EL2 is enabled in the current Security state, then:</td>
</tr>
<tr>
<td></td>
<td>• All exceptions that would be routed to EL1 are routed to EL2.</td>
</tr>
<tr>
<td></td>
<td>• The SCTLR.M bit is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR.</td>
</tr>
<tr>
<td></td>
<td>• The HCR.{FMO, IMO, AMO} bits are treated as being 1 for all purposes other than returning the result of a direct read of HCR.</td>
</tr>
<tr>
<td></td>
<td>• All virtual interrupts are disabled.</td>
</tr>
<tr>
<td></td>
<td>• Any <strong>IMPLEMENTATION DEFINED</strong> mechanisms for signaling virtual interrupts are disabled.</td>
</tr>
<tr>
<td></td>
<td>• An exception return to EL1 is treated as an illegal exception return.</td>
</tr>
<tr>
<td></td>
<td>• Monitor mode execution of an MSR or CPS instruction that changes PSTATE.M to a Non-secure EL1 mode is an illegal change to PSTATE.M. For more information see ‘Illegal changes to PSTATE.M’.</td>
</tr>
</tbody>
</table>

Also, when HCR.TGE is 1:

- If EL3 is using AArch32, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing SCR.NS from 0 to 1 results in SCR.NS remaining as 0.
- The HDCR.{TDRA, TDOSA, TDA, TDE} bits are ignored and treated as being 1 other than for the purpose of a direct read of HDCR.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TVM, bit [26]**

Trap Virtual Memory controls. Traps Non-secure EL1 writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state.

The registers for which write accesses are trapped are as follows:

SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFS, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.
### TVM, bit [25]

This control does not cause any instructions to be trapped.

Non-secure EL1 write accesses to the specified virtual memory control registers are trapped to EL2.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### TTLB, bit [25]

Trap TLB maintenance instructions. Traps Non-secure EL1 execution of a TLBI instruction to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- TLBIALL, TLBIMVAI, TLBIAISID, TLBIMVAAI, TLBIMVALI, TLBIMVAI, ITLBIMAL, ITLBIMVA, ITLBIASID.
- DTLBIALL, DTLBIMVA, DTLBIAISID, TLBLALL, TLBIMVA, TLBIAISD, TLBIMVA, TLBIMVAL.

### TPU, bit [24]

Trap cache maintenance instructions that operate to the Point of Unification. Traps Non-secure EL1 execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- ICIMVAU, ICIALLU, ICIALLUi, DCCMV Au.

### Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

### TPC, bit [23]

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps Non-secure EL1 execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- DCIMVA, DCCIMVA, DCCMVAC.

### Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.
**TPC**

| **Meaning** |  
|---|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2. |

If the Point of Coherency is before any level of data cache, it is **IMPLEMENTATION DEFINED** whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TSW, bit [22]**

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps Non-secure EL1 execution of those cache maintenance instructions by set/way to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- **DCISW**, **DCCSW**, **DCCISW**.

**Note**

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always **UNDEFINED** at EL0.

| **Meaning** |  
|---|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2. |

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TAC, bit [21]**

Trap Auxiliary Control Registers. Traps Non-secure EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, from both Execution states.

This applies to the following register accesses:

- **ACTLR** and, if implemented, **ACTLR2**.

| **Meaning** |  
|---|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL1 accesses to the specified registers are trapped to EL2. |

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TIDCP, bit [20]**

Trap **IMPLEMENTATION DEFINED** functionality. Traps Non-secure EL1 accesses to the encodings for **IMPLEMENTATION DEFINED** System Registers to EL2, when EL2 is enabled in the current Security state.

MCR and MRC instructions accessing the following encodings:

- All coproc==p15, CRn==c9, Opcode1 = {0-7}, CRm == {c0-c2, c5-c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c10, Opcode1 =={0-7}, CRm == {c0, c1, c4, c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c11, Opcode1=={0-7}, CRm == {c0-c8, c15}, opcode2 == {0-7}.

When HCR.TIDCP is set to 1, it is **IMPLEMENTATION DEFINED** whether any of this functionality accessed from Non-secure EL0 is trapped to EL2. Otherwise, it is **UNDEFINED** and the PE takes an Undefined Instruction exception to Non-secure Undefined mode.
HCR, Hyp Configuration Register

<table>
<thead>
<tr>
<th>TIDCP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses to the specified System register encodings for IMPLEMENTATION DEFINED functionality are trapped to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TSC, bit [19]**

Trap SMC instructions. Traps Non-secure EL1 execution of SMC instructions to Hyp mode.

<table>
<thead>
<tr>
<th>TSC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt to execute an SMC instruction at Non-secure EL1 is trapped to Hyp mode, regardless of the value of SCR.SCD.</td>
</tr>
</tbody>
</table>

The Armv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

**Note**
- This trap is only implemented if the implementation includes EL3.
- SMC instructions are always UNDEFINED at PL0.
- This bit traps execution of the SMC instruction. It is not a routing control for the SMC exception. Hyp Trap exceptions and SMC exceptions have different preferred return addresses.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TID3, bit [18]**

Trap ID group 3. Traps Non-secure EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state as follows:

- VMRS access to MVFR0, MVFR1, and MVFR2, reported using EC syndrome value 0x08, unless access is also trapped by HCPTR which takes priority.
- MRC access to the following registers are reported using EC syndrome value 0x03:
  - ID_PFR0, ID_PFR1, ID_PFR2, ID_DFR0, ID_AFR0, ID_MMFR0, ID_MMFR1, ID_MMFR2, ID_MMFR3, ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.
  - If FEAT_FGT is implemented:
    - ID_MMFR4 and ID_MMFR5 are trapped to EL2.
    - ID_ISAR6 is trapped to EL2.
    - ID_DFR1 is trapped to EL2.
    - This field traps all MRC accesses to registers in the following range that are not already mentioned in this field description: coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.
  - If FEAT_FGT is not implemented:
    - ID_MMFR4 and ID_MMFR5 are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_MMFR4 or ID_MMFR5 are trapped.
    - ID_ISAR6 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_ISAR6 are trapped to EL2.
    - ID_DFR1 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_DFR1 are trapped to EL2.
    - Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps MRC accesses to registers not already mentioned, with coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}. 

Page 2795
TID3, bit [17]

This control does not cause any instructions to be trapped.

The specified Non-secure EL1 read accesses to ID group 3 registers are trapped to EL2.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TID2, bit [17]

Trap ID group 2. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

- Non-secure EL1 and EL0 reads of the **CTR**, **CCSIDR**, **CCSIDR2**, **CLIDR**, and **CSSELR**.
- Non-secure EL1 and EL0 writes to the **CSSELR**.

TID2

| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | The specified Non-secure EL1 and EL0 accesses to ID group 2 registers are trapped to EL2. |

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TID1, bit [16]

Trap ID group 1. Traps Non-secure EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state:

**TCMTR**, **TLBTR**, **REVIDR**, **AIDR**.

TID1

| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | The specified Non-secure EL1 read accesses to ID group 1 registers are trapped to EL2. |

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TID0, bit [15]

Trap ID group 0. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

- Non-secure EL1 reads of the **JIDR** and **FPSID**.
- If the **JIDR** is RAZ from Non-secure EL0, Non-secure EL0 reads of the **JIDR**.

Note

- It is IMPLEMENTATION DEFINED whether the **JIDR** is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0 then the Undefined Instruction exception takes precedence over this trap.
- The **FPSID** is not accessible at EL0.
- Writes to the **FPSID** are ignored, and not trapped by this control.

TID0

| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | The specified Non-secure EL1 read accesses to ID group 0 registers are trapped to EL2. |

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TWE, bit [14]

Traps Non-secure EL0 and EL1 execution of WFE instructions to EL2, when EL2 is enabled in the current Security state.

TWE

| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Any attempt to execute a WFE instruction at Non-secure EL0 or EL1 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by **SCTLr** nTWE. |
The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

---

**Note**

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

---

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TWI, bit [13]**

Traps Non-secure EL0 and EL1 execution of WFI instructions to EL2, when EL2 is enabled in the current Security state.

<table>
<thead>
<tr>
<th>TWI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>01</td>
<td>Any attempt to execute a WFI instruction at Non-secure EL0 or EL1 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTL.nTWI.</td>
</tr>
</tbody>
</table>

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

---

**Note**

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

---

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**DC, bit [12]**

Default Cacheability.

<table>
<thead>
<tr>
<th>DC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>This control has no effect on the Non-secure EL1&amp;0 translation regime.</td>
</tr>
</tbody>
</table>
| 01  | In Non-secure state:  

  - The SCTL.M field behaves as 0 for all purposes other than a direct read of the value of the field.  
  - The HCR.VM field behaves as 1 for all purposes other than a direct read of the value of the field.  
  - The memory type produced by the first stage of the EL1&0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate. |

This field has no effect on the EL2 and EL3 translation regimes.

This field is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**BSU, bits [11:10]**

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from Non-secure EL1 or Non-secure EL0:
<table>
<thead>
<tr>
<th>BSU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>No effect.</td>
</tr>
<tr>
<td>0b01</td>
<td>Inner Shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Full system.</td>
</tr>
</tbody>
</table>

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**FB, bit [9]**

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from Non-secure EL1:

- BPIALL
- TLBIALL
- TLBIMVA
- TLBIMVA
- TLBIMVAA
- ICIALLU
- TLBIMVAL
- TLBIMVAAL

<table>
<thead>
<tr>
<th>FB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This field has no effect on the operation of the specified instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>When one of the specified instruction is executed at Non-secure EL1, the instruction is broadcast within the Inner Shareable shareability domain.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**VA, bit [8]**

Virtual SError interrupt exception.

<table>
<thead>
<tr>
<th>VA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This mechanism is not making a virtual SError interrupt pending.</td>
</tr>
<tr>
<td>0b1</td>
<td>A virtual SError interrupt is pending because of this mechanism.</td>
</tr>
</tbody>
</table>

The virtual SError interrupt is enabled only when the value of HCR.{TGE, AMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**VI, bit [7]**

Virtual IRQ exception.

<table>
<thead>
<tr>
<th>VI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This mechanism is not making a virtual IRQ pending.</td>
</tr>
<tr>
<td>0b1</td>
<td>A virtual IRQ is pending because of this mechanism.</td>
</tr>
</tbody>
</table>

The virtual IRQ is enabled only when the value of HCR.{TGE, IMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**VF, bit [6]**

Virtual FIQ exception.

<table>
<thead>
<tr>
<th>VF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This mechanism is not making a virtual FIQ pending.</td>
</tr>
<tr>
<td>0b1</td>
<td>A virtual FIQ is pending because of this mechanism.</td>
</tr>
</tbody>
</table>

The virtual FIQ is enabled only when the value of HCR.{TGE, FMO} is {0, 1}.
The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**AMO, bit [5]**

SError interrupt Mask Override. When this bit is set to 1, it overrides the effect of PSTATE.A, and enables virtual exception signaling by the VA bit.

If the value of HCR.TGE is 0, then virtual SError interrupts are enabled in Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.AMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**IMO, bit [4]**

IRQ Mask Override. When this bit is set to 1, it overrides the effect of PSTATE.I, and enables virtual exception signaling by the VI bit.

If the value of HCR.TGE is 0, then Virtual IRQ interrupts are enabled in the Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.IMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**FMO, bit [3]**

FIQ Mask Override. When this bit is set to 1, it overrides the effect of PSTATE.F, and enables virtual exception signaling by the VF bit.

If the value of HCR.TGE is 0, then Virtual FIQ interrupts are enabled in the Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.FMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**PTW, bit [2]**

Protected Table Walk. In the Non-secure PL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs then the value of this bit determines the behavior:

<table>
<thead>
<tr>
<th>PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.</td>
</tr>
<tr>
<td>0b1</td>
<td>The memory access generates a stage 2 Permission fault.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**SWIO, bit [1]**

Set/Way Invalidation Override. Causes Non-secure EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way.

<table>
<thead>
<tr>
<th>SWIO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the operation of data cache invalidate by set/way instructions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.</td>
</tr>
</tbody>
</table>
When this bit is set to 1, DCISW performs the same invalidation as a DCCISW instruction.

As a result of changes to the behavior of DCISW, this bit is redundant in Armv8. This bit can be implemented as RES1.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**VM, bit [0]**

Virtualization enable. Enables stage 2 address translation for the Non-secure EL1&0 translation regime.

<table>
<thead>
<tr>
<th>VM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1&amp;0 stage 2 address translation disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1&amp;0 stage 2 address translation enabled.</td>
</tr>
</tbody>
</table>

If the HCR.DC bit is set to 1, then the behavior of the PE when executing in a Non-secure mode other than Hyp mode is consistent with HCR.VM being 1, regardless of the actual value of HCR.VM, other than the value returned by an explicit read of HCR.VM.

When the value of this bit is 1, data cache invalidate instructions executed at Non-secure EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR.SWIO bit.

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Accessing the HCR**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b0001</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

    else
        HCR = R[t];

HCR2, Hyp Configuration Register 2

The HCR2 characteristics are:

**Purpose**

Provides additional configuration controls for virtualization.

**Configuration**

AArch32 System register HCR2 bits [31:0] are architecturally mapped to AArch64 System register HCR_EL2[63:32].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HCR2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HCR2 is a 32-bit register.

**Field descriptions**

The HCR2 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | TTLBIS | RES0 | TOCU | RES0 | TICAB | TID4 | RES0 | MIOCNCE | TEA | TERR | RES0 | ID | CD |

**Bits [31:23]**

Reserved, RES0.

**TTLBIS, bit [22]**

When FEAT_EVT is implemented:

Trap TLB maintenance instructions that operate on the Inner Shareable domain. Traps execution of the following TLB maintenance instructions at EL1 to EL2:

**TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVAAIS, TLBIMVALIS, TLBIMVAALIS**

<table>
<thead>
<tr>
<th>TTLBIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 execution of the specified TLB maintenance instructions is trapped to EL2.</td>
</tr>
</tbody>
</table>

When FEAT_VHE and the value of HCR_EL2 (E2H, TGE) is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

Otherwise:

Reserved, RES0.

**Bit [21]**

Reserved, RES0.
TOCU, bit [20]

When FEAT_EVT is implemented:

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions at EL1 or EL0 using AArch64, and at EL1 using AArch32, to EL2.

This applies to the following instructions:

- When Non-secure EL0 is using AArch64, **IC** **IVAU**, **DC CVAU**. However, if the value of **SCTRL_EL1**.UCI is 0 these instructions are **UNDEFINED** at EL0 and any resulting exception is higher priority than this trap to EL2.
- When EL1 is using AArch64, **IC IVAU**, **IC IALLU**, **DC CVAU**.
- When Non-secure EL1 is using AArch32, **ICIMVAU**, **ICIALLU**, **DCCMVAU**.

**Note**

An exception generated because an instruction is **UNDEFINED** at EL0 is higher priority than this trap to EL2. In addition:

- **IC IALLUIS** and **IC IALLU** are always **UNDEFINED** at EL0 using AArch64.
- **ICIMVAU**, **ICIALLU**, **ICIALLUIS**, and **DCCMVAU** are always **UNDEFINED** at EL0 using AArch32.

<table>
<thead>
<tr>
<th>TOCU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure execution of the specified cache maintenance</td>
</tr>
<tr>
<td></td>
<td>instructions is trapped to EL2.</td>
</tr>
</tbody>
</table>

If the Point of Unification is before any level of data cache, it is **IMPLEMENTATION DEFINED** whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is **IMPLEMENTATION DEFINED** whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of **HCR_EL2**.(E2H, TGE) is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

**Otherwise:**

Reserved, RES0.

Bit [19]

Reserved, RES0.

TICAB, bit [18]

When FEAT_EVT is implemented:

Trap **ICIALLUIS** cache maintenance instructions. Traps execution of those cache maintenance instructions at EL1 to EL2.

This applies to the following instructions:

**ICIALLUIS**.

<table>
<thead>
<tr>
<th>TICAB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 execution of the specified cache maintenance</td>
</tr>
<tr>
<td></td>
<td>instructions is trapped to EL2.</td>
</tr>
</tbody>
</table>

If the Point of Unification is before any level of instruction cache, it is **IMPLEMENTATION DEFINED** whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.
When FEAT_VHE and the value of HCR_EL2.E2H, TGE is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

Otherwise:

Reserved, RES0.

TID4, bit [17]

When FEAT_EVT is implemented:

Trap ID group 4. Traps the following register accesses to EL2:

- EL1 reads of CCSIDR, CCSIDR2, CLIDR, and CSSELR.
- EL1 writes to CSSELR.

<table>
<thead>
<tr>
<th>TID4</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>The specified Non-secure EL1 and EL0 accesses to ID group 4 registers are trapped to EL2.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented and the value of HCR_EL2.E2H, TGE is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

Otherwise:

Reserved, RES0.

Bits [16:7]

Reserved, RES0.

MIOCNCE, bit [6]

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the Non-secure PL1&0 translation regime.

<table>
<thead>
<tr>
<th>MIOCNCE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For the Non-secure PL1&amp;0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there must be no loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.</td>
</tr>
<tr>
<td>0b1</td>
<td>For the Non-secure PL1&amp;0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there might be a loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.</td>
</tr>
</tbody>
</table>

For more information, see ‘Mismatched memory attributes’.

This field can be implemented as RAZ/WI.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

TEA, bit [5]

When FEAT_RAS is implemented:

Route synchronous External abort exceptions from EL0 and EL1 to EL2.
<table>
<thead>
<tr>
<th>TEA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not route synchronous External abort exceptions from Non-secure EL0 and EL1 to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Route synchronous External abort exceptions from Non-secure EL0 and EL1 to EL2, if not routed to EL3.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TERR, bit [4]**

When FEAT_RAS is implemented:

Trap Error record accesses from EL1 to EL2. Trap accesses to the following registers from EL1 to EL2:

- ERRIDR
- ERRSELR
- ERXADDR
- ERXADDR2
- ERXCTRLR
- ERXCTRLR2
- ERXFR
- ERXFR2
- ERXMISC0
- ERXMISC1
- ERXMISC2
- ERXMISC3
- ERXSTATUS

When FEAT_RASv1p1 is implemented, ERXMISC4, ERXMISC5, ERXMISC6, and ERXMISC7.

<table>
<thead>
<tr>
<th>TERR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to the specified registers from EL1 generate a Trap exception to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [3:2]**

Reserved, RES0.

**ID, bit [1]**

Stage 2 Instruction access cacheability disable. For the Non-secure PL1&0 translation regime, when HCR.VM==1, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

<table>
<thead>
<tr>
<th>ID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on stage 2 of the Non-secure PL1&amp;0 translation regime.</td>
</tr>
<tr>
<td>0b1</td>
<td>For the Non-secure PL1&amp;0 translation regime, forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.</td>
</tr>
</tbody>
</table>

This bit has no effect on the EL2 translation regime.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**CD, bit [0]**

Stage 2 Data access cacheability disable. When HCR.VM==1, this forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable for the Non-secure PL1&0 translation regime.
This bit has no effect on the EL2 translation regime.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### Accessing the HCR2

Accesses to this register use the following encodings:

**MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}**

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b0001</td>
<td>0b0001</td>
<td>0b100</td>
</tr>
</tbody>
</table>

```plaintext
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
    AArch32.TakeHypTrapException(0x03);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  return HCR2;
elsif PSTATE.EL == EL3 then
  if SCR.NS == '0' then
    UNDEFINED;
  else
    return HCR2;
endif
```

**MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}**

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b0001</td>
<td>0b0001</td>
<td>0b100</td>
</tr>
</tbody>
</table>

```plaintext
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
    AArch32.TakeHypTrapException(0x03);
  else

elsif PSTATE.EL == EL3 then
  if SCR.NS == '0' then
    UNDEFINED;
  else
    HCR2 = R[t];
endif
```
HDCR, Hyp Debug Control Register

The HDCR characteristics are:

**Purpose**

Controls the trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to functions provided by the debug and trace architectures and the Performance Monitors Extension.

**Configuration**

AArch32 System register HDCR bits [31:0] are architecturally mapped to AArch64 System register MDCR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HDCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3, and other than for a direct read of the register, the PE behaves as if HDCR.HPMN == PMCR.N.

**Attributes**

HDCR is a 32-bit register.

**Field descriptions**

The HDCR bit assignments are:

```
|   | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|   | RES0 | HPMFZO | MTPME | TDCC | HLP | RES0 | HCCD | RES0 | TTRF | RES0 | HPMD | RES0 | TDA | TDOAS | TDAT | DE | HPMET | TPM | TPMCR |
```

**Bits [31:30]**

Reserved, RES0.

**HPMFZO, bit [29]**

When FEAT_PMUv3p7 is implemented:

Hyp Performance Monitors Freeze-on-overflow. Stop event counters on overflow.

<table>
<thead>
<tr>
<th>HPMFZO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not freeze on overflow.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counters do not count when PMOVSR[(PMCR.N-1):HDCR.HPMN] is nonzero.</td>
</tr>
</tbody>
</table>

If HDCR.HPMN is less than PMCR.N, this bit affects the operation of event counters in the range [HDCR.HPMN .. (PMCR.N-1)].

If HDCR.HPMN is equal to PMCR.N, this bit has no effect.

This bit does not affect the operation of event counters in the range [0 .. (HDCR.HPMN-1)] and PMCCNTR.

The operation of this bit ignores the values of PMOVSR[(HDCR.HPMN-1):0].

The operation of this bit applies even when EL2 is disabled in the current Security state.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.
Reserved, RES0.

**MTPME, bit [28]**

When **FEAT_MTPMU** is implemented and **EL3** is not implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>.MT bits.

<table>
<thead>
<tr>
<th>MTPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>FEAT_MTPMU</strong> is disabled. The Effective value of PMEVTYPER&lt;n&gt;.MT is zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMEVTYPER&lt;n&gt;.MT bits not affected by this bit.</td>
</tr>
</tbody>
</table>

If **FEAT_MTPMU** is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is *IMPLEMENTATION DEFINED* whether the PE behaves as if this bit is 0b0.

On a Cold reset, in a system where the PE resets into EL2 or EL3, this field resets to 1.

Reserved, RES0.

**TDCC, bit [27]**

When **FEAT_FGT** is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

<table>
<thead>
<tr>
<th>TDCC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any register accesses to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Hyp Trap exception, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.</td>
</tr>
</tbody>
</table>

The DCC registers trapped by this control are:

- **DBGDTRRXext**, **DBGDTRTXext**, **DBGDSCRint**, **DBGDCCINT**, and, when the PE is in Non-debug state, **DBGDTRRXint** and **DBGDTRTXint**.

The traps are reported with EC syndrome value:

- 0x05 for trapped MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped LDC to **DBGDTRTXint** and STC from **DBGDTRRXint**.

When the PE is in Debug state, HDCR.TDCC does not trap any accesses to:

- **DBGDTRRXint** and **DBGDTRTXint**.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Reserved, RES0.

**HLP, bit [26]**

When **FEAT_PMUv3p5** is implemented:

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.
HDCR, Hyp Debug Control Register

<table>
<thead>
<tr>
<th>HLP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;n&gt;[31:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counter overflow on increment that causes unsigned overflow of PMEVCNTR&lt;n&gt;[63:0].</td>
</tr>
</tbody>
</table>

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is read/write or RAZ/WI.

If HDCR.HPMN is less than PMCR.N, this bit affects the operation of event counters in the range [HDCR.HPMN..(PMCR.N-1)]. Otherwise this bit has no effect on the operation of the event counters.

**Note**

The effect of HDCR.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the HDCR.HPMN field.

**Note**

PMEVCNTR<n>[63:32] cannot be accessed directly in AArch32 state.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [25:24]**

Reserved, RES0.

**HCCD, bit [23]**

When FEAT_PMUv3p5 is implemented:

Hypervisor Cycle Counter Disable. Prohibits PMCCNTR from counting at EL2.

<table>
<thead>
<tr>
<th>HCCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting by PMCCNTR is prohibited at EL2.</td>
</tr>
</tbody>
</table>

This bit does not affect the CPU_CYCLES event or any other event that counts cycles.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [22:20]**

Reserved, RES0.
**TTRF, bit [19]**

*When FEAT_TRF is implemented:*

Traps use of the Trace Filter Control registers at EL1 to EL2.

<table>
<thead>
<tr>
<th>TTRF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to TRFCR at EL1 are not affected by this control bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to TRFCR at EL1 generate a Hyp Trap exception.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [18]**

Reserved, RES0.

**HPMD, bit [17]**

*When FEAT_PMUv3p1 is implemented:*

Guest Performance Monitors Disable. This control prohibits event counting at EL2.

<table>
<thead>
<tr>
<th>HPMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting allowed in Hyp mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting prohibited in Hyp mode.</td>
</tr>
</tbody>
</table>

If FEAT_Debugv8p2 is not implemented, event counting is prohibited unless enabled by the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().

This control applies only to:

- The event counters in the range [0..(HDCR.HPMN-1)].
- If PMCR,DP is set to 1, PMCCNTR.

The other event counters are unaffected. When PMCR,DP is set to 0, PMCCNTR is unaffected.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [16:12]**

Reserved, RES0.

**TDRA, bit [11]**

Trap Debug ROM Address register access. Traps Non-secure EL0 and EL1 System register accesses to the Debug ROM registers to Hyp mode.

<table>
<thead>
<tr>
<th>TDRA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>
| 0b1  | Non-secure EL0 and EL1 System register accesses to the Debug

DBGDRAR or DBGDSAR are trapped to Hyp mode, unless it is trapped by DBGDSCRx.UDCCdis.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.
On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TDOSA, bit [10]**

**When FEAT DoubleLock is implemented:**

Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.</td>
</tr>
</tbody>
</table>

The registers for which accesses are trapped are as follows:

- DBGOSLcr, DBGOSlar, DBGOSDLr, and DBGPRcr.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

**Note**

These registers are not accessible at EL0.

If **HCR.TGE** or **HDCR.TDE** is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.</td>
</tr>
</tbody>
</table>

The registers for which accesses are trapped are as follows:

- DBGOSLcr, DBGOSlar, and DBGPRcr.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to **DBGOSDLr** are trapped.

**Note**

These registers are not accessible at EL0.

If **HCR.TGE** or **HDCR.TDE** is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TDA, bit [9]**

Trap debug access. Traps Non-secure EL0 and EL1 System register accesses to those debug System registers in the \( \text{coproc} = \text{0b1110} \) encoding space that are not trapped by either of the following:

- **HDCR.TDRA**.
- **HDCR.TDOSA**.
**TDA**, bit [7]

This control does not cause any instructions to be trapped.

<table>
<thead>
<tr>
<th>TDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL0 or EL1 System register accesses to the debug registers, other than the registers trapped by HDCR.TDRA and HDCR.TDOSA, are trapped to Hyp mode, unless it is trapped by DBGDSCRext.UDCCdis.</td>
</tr>
</tbody>
</table>

Traps of AArch32 accesses to DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TDE, bit [8]**

Trap Debug exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, EL_D.

<table>
<thead>
<tr>
<th>TDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The debug target Exception level is EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is enabled for the current Effective value of SCR.NS, the debug target Exception level is EL2, otherwise the debug target Exception level is EL1. The HDCR.TDRA, TDOSA, TDA fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.</td>
</tr>
</tbody>
</table>

For more information, see 'Routing debug exceptions'.

When HCR.TGE == 1, the PE behaves as if the value of this field is 1 for all purposes other than returning the value of a direct read of the register.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**HPME, bit [7]**

When FEAT_PMUv3 is implemented:

[HDCR.HPMN..(N-1)] event counters enable.

<table>
<thead>
<tr>
<th>HPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counters in the range [HDCR.HPMN..(PMCR.N-1)] are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counters in the range [HDCR.HPMN..(PMCR.N-1)] are enabled by PMCNTENSET.</td>
</tr>
</tbody>
</table>

If HDCR.HPMN is less than PMCR.N, the event counters in the range [HDCR.HPMN..(PMCR.N-1)], are enabled and disabled by this bit. Otherwise this bit has no effect on the operation of the event counters.

**Note**

The effect of HDCR.HPMN on the operation of this bit applies regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the HPMN field.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
**TPM, bit [6]**

*When FEAT_PMUv3 is implemented:*

Trap Performance Monitors accesses. Traps Non-secure EL0 and EL1 accesses to all Performance Monitors registers to Hyp mode.

<table>
<thead>
<tr>
<th>TPM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL0 and EL1 accesses to all Performance Monitors registers are trapped to Hyp mode.</td>
</tr>
</tbody>
</table>

**Note**

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TPMCR, bit [5]**

*When FEAT_PMUv3 is implemented:*

Trap PMCR accesses. Traps Non-secure EL0 and EL1 accesses to the PMCR to Hyp mode.

<table>
<thead>
<tr>
<th>TPMCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL0 and EL1 accesses to the PMCR are trapped to Hyp mode, unless it is trapped by PMUSERENR.EN.</td>
</tr>
</tbody>
</table>

**Note**

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**HPMN, bits [4:0]**

*When FEAT_PMUv3 is implemented:*

Defines the number of event counters that are accessible from Non-secure EL1 modes, and from Non-secure EL0 modes if unprivileged access is enabled.

If HPMN is less than PMCR.N, HPMN divides the event counters into two ranges, [0..(HPMN-1)] and [HPMN..(PMCR.N-1)].

For an event counter in the range [0..(HPMN-1)]:

- The counter is accessible from EL1 and EL2, and from EL0 if unprivileged access to the counters is enabled.
- If FEAT_PMUv3p5 is implemented, PMCR.LP determines whether the counter overflows at PMEVCNTR<n>[31:0] or PMEVCNTR<n>[63:0].
- PMCR.E enables the operation of counters in this range.

**Note**
If HPMN is equal to PMCR.N, this applies to all event counters.

If HPMN is less than PMCR.N, for an event counter in the range \([\text{HPMN}.(\text{PMCR}.N-1)]\):

- The counter is accessible only from EL2 and from Secure state.
- If FEAT.PMUv3p5 is implemented, HDCR.HLP determines whether the counter overflows at PMEVCNTR\(\text<n>\)[31:0] or PMEVCNTR\(\text<n>\)[63:0].
- HDCR.HPME enables the operation of counters in this range.

If this field is set to 0, or to a value larger than PMCR.N, then the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of HDCR.HPMN is UNKNOWN.
- Either:
  - An UNKNOWN number of counters are reserved for EL2 use. That is, the PE behaves as if HDCR.HPMN is set to an UNKNOWN non-zero value less than or equal to PMCR.N.
  - All counters are reserved for EL2 use, meaning no counters are accessible from Non-secure EL1 and Non-secure EL0.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in PMCR.N.

Otherwise:

Reserved, RES0.

### Accessing the HDCR

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc}1>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}\}, \{#<\text{opc}2}\}

HDFAR, Hyp Data Fault Address Register

The HDFAR characteristics are:

Purpose

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception that is taken to Hyp mode.

Configuration

AArch32 System register HDFAR bits [31:0] are architecturally mapped to AArch64 System register FAR_EL2[31:0].

AArch32 System register HDFAR bits [31:0] are architecturally mapped to AArch32 System register DFAR[31:0] (S) when EL2 is implemented, EL3 is implemented and the highest implemented Exception level is using AArch32 state.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HDFAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HDFAR is a 32-bit register.

Field descriptions

The HDFAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>VA of faulting address of synchronous Data Abort exception taken to Hyp mode</td>
</tr>
</tbody>
</table>

Bits [31:0]

VA of faulting address of synchronous Data Abort exception taken to Hyp mode.

On a Prefetch Abort exception, this register is UNKNOWN.

Any execution in a Non-secure EL1 or Non-secure EL0 mode makes this register UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the HDFAR

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>

HIFAR, Hyp Instruction Fault Address Register

The HIFAR characteristics are:

**Purpose**

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception that is taken to Hyp mode.

**Configuration**

AArch32 System register HIFAR bits [31:0] are architecturally mapped to AArch64 System register `FAR_EL2[63:32]`.

AArch32 System register HIFAR bits [31:0] are architecturally mapped to AArch32 System register `IFAR[31:0] (S)` when EL2 is implemented, EL3 is implemented and the highest implemented Exception level is using AArch32 state.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HIFAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HIFAR is a 32-bit register.

**Field descriptions**

The HIFAR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

    HIFAR = R[t];
end if;
HMAIR0, Hyp Memory Attribute Indirection Register 0

The HMAIR0 characteristics are:

**Purpose**

Along with HMAIR1, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIndx[2] indicates the HMAIR register to be used:

- When AttrIndx[2] is 0, HMAIR0 is used.
- When AttrIndx[2] is 1, HMAIR1 is used.

**Configuration**

AArch32 System register HMAIR0 bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HMAIR0 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HMAIR0 is a 32-bit register.

**Field descriptions**

The HMAIR0 bit assignments are:

**When TTBCR.EAE == 1:**

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Attr<n>, bits [8n+7:8n], for n = 3 to 0

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[7:4]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device memory. See encoding of Attr&lt;n&gt;[3:0] for the type of Device memory.</td>
</tr>
<tr>
<td>0b00RW, RW</td>
<td>Normal memory, Outer Write-Through Transient.</td>
</tr>
<tr>
<td>not0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01RW, RW</td>
<td>Normal memory, Outer Write-Back Transient.</td>
</tr>
<tr>
<td>not0b00</td>
<td>Normal memory, Outer Write-Through Non-transient.</td>
</tr>
<tr>
<td>0b10RW</td>
<td>Normal memory, Outer Write-Back Non-transient.</td>
</tr>
</tbody>
</table>

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

---

Page 2821
### **Attr<n>[3:0]**

<table>
<thead>
<tr>
<th>Meaning when Attr&lt;n&gt;[7:4] is 0b0000</th>
<th>Meaning when Attr&lt;n&gt;[7:4] is not 0b0000</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device-nGnRnE memory</td>
</tr>
<tr>
<td>0b00RW, RW not0b00</td>
<td>UNPREDICTABLE</td>
</tr>
<tr>

</tr>
<tr>
<td>0b1100</td>
<td>Device-GRE memory</td>
</tr>
<tr>
<td>0b11RW, RW not0b00</td>
<td>UNPREDICTABLE</td>
</tr>
</tbody>
</table>

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

<table>
<thead>
<tr>
<th>R or W</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Allocate</td>
</tr>
<tr>
<td>0b1</td>
<td>Allocate</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### **Accessing the HMAIRO0**

Accesses to this register use the following encodings:

\[

    UNDEFINED;
  else
    HMAIR0 = R[t];
HMAIR1, Hyp Memory Attribute Indirection Register 1

The HMAIR1 characteristics are:

**Purpose**

Along with HMAIR0, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIndx[2] indicates the HMAIR register to be used:

- When AttrIndx[2] is 0, HMAIR0 is used.
- When AttrIndx[2] is 1, HMAIR1 is used.

**Configuration**

AArch32 System register HMAIR1 bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL2[63:32].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HMAIR1 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HMAIR1 is a 32-bit register.

**Field descriptions**

The HMAIR1 bit assignments are:

**When TTBCR.EAE == 1:**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Attr7 | Attr6 | Attr5 | Attr4 |

Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 7 to 4

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

<table>
<thead>
<tr>
<th>Attr&lt;n&gt;[7:4]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device memory. See encoding of Attr&lt;n&gt;[3:0] for the type of Device memory.</td>
</tr>
<tr>
<td>0b00RW, RW</td>
<td>Normal memory, Outer Write-Through Transient.</td>
</tr>
<tr>
<td>not0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01RW, RW</td>
<td>Normal memory, Outer Write-Back Transient.</td>
</tr>
<tr>
<td>not0b00</td>
<td>Normal memory, Outer Write-Through Non-transient.</td>
</tr>
<tr>
<td>0b10RW</td>
<td>Normal memory, Outer Write-Back Non-transient.</td>
</tr>
</tbody>
</table>

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Page 2824
**Accessing the HMAIR1**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>

HPFAR, Hyp IPA Fault Address Register

The HPFAR characteristics are:

**Purpose**

Holds the faulting IPA for some aborts on a stage 2 translation taken to Hyp mode.

**Configuration**

AArch32 System register HPFAR bits [31:0] are architecturally mapped to AArch64 System register HPFAR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HPFAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HPFAR is a 32-bit register.

**Field descriptions**

The HPFAR bit assignments are:

| Bit | 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     | FIPA[39:12] |     | RES0 |

Execution in any Non-secure mode other than Hyp mode makes this register UNKNOWN.

**FIPA[39:12], bits [31:4]**

Bits [39:12] of the faulting intermediate physical address.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [3:0]**

Reserved, RES0.

**Accessing the HPFAR**

Accesses to this register use the following encodings:

\[
\text{MRC\{<c>\}{<q>}} \ <\text{coproc}, \ {#}<\text{opc1}, \ <\text{Rt}, \ <\text{CRn}, \ <CRm}, \ {#}<\text{opc2}\}
\]

HRMR, Hyp Reset Management Register

The HRMR characteristics are:

**Purpose**

If EL2 is the highest implemented Exception level and this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

**Configuration**

AArch32 System register HRMR bits [31:0] are architecturally mapped to AArch64 System register \texttt{RMR\_EL2[31:0]}.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HRMR are \texttt{UNDEFINED}.

Only implemented if EL2 is the highest implemented Exception level. In this case:

- If EL2 can use AArch32 and AArch64 then this register must be implemented.
- If EL2 cannot use AArch64 then it is \texttt{IMPLEMENTATION DEFINED} whether the register is implemented.

**Attributes**

HRMR is a 32-bit register.

**Field descriptions**

The HRMR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**Bits [31:2]**

Reserved, RES0.

**RR, bit [1]**

Reset Request. Setting this bit to 1 requests a Warm reset.

On a Warm reset, this field resets to 0.

**AA64, bit [0]**

When EL2 can use AArch64, determines which Execution state the PE boots into after a Warm reset:

<table>
<thead>
<tr>
<th>AA64</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>AArch64.</td>
</tr>
</tbody>
</table>

On coming out of the Warm reset, execution starts at the \texttt{IMPLEMENTATION DEFINED} reset vector address of the specified Execution state.

If EL2 cannot use AArch64 this bit is RAZ/WI.

When implemented as a RW field, this field resets to 0 on a Cold reset.
Accessing the HRMR

Accesses to this register use the following encodings:

\[ \text{MRC\{c\}\{q\}\{coproc\},\{opc\},\{Rt\},\{CRn\},\{CRm\}[,\{opc\}]} \]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b1100</td>
<td>0b0000</td>
<td>0b010</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
elsif PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
    AArch32.TakeHypTrapException(0x03);
elsif PSTATE.EL == EL2 && IsHighestEL(EL2) then
    return HRMR;
else
    UNDEFINED;

\[ \text{MCR\{c\}\{q\}\{coproc\},\{opc\},\{Rt\},\{CRn\},\{CRm\}[,\{opc\}]} \]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>

</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b1100</td>
<td>0b0000</td>
<td>0b010</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
elsif PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
    AArch32.TakeHypTrapException(0x03);
elsif PSTATE.EL == EL2 && IsHighestEL(EL2) then
    HRMR = R[t];
else
    UNDEFINED;
HSCTRL, Hyp System Control Register

The HSCTRL characteristics are:

**Purpose**

Provides top level control of the system operation in Hyp mode.

**Configuration**

AArch32 System register HSCTRL bits [31:0] are architecturally mapped to AArch64 System register SCTLR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HSCTRL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HSCTRL is a 32-bit register.

**Field descriptions**

The HSCTRL bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|
| DSSBS | TE | RES1 | RES0 | EE | RES0 | RES1 | RES0 | WXN | RES1 | RES0 | RES0 | RES1 | RES0 | RES0 | SED | ITD | RES0 | CP15BEN | LSMAOE | TLS |

**DSSBS, bit [31]**

When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry. The defined values are:

<table>
<thead>
<tr>
<th>DSSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.SSBS is set to 0 on an exception to Hyp mode.</td>
</tr>
<tr>
<td>0b1</td>
<td>PSTATE.SSBS is set to 1 on an exception to Hyp mode.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

**TE, bit [30]**

T32 Exception Enable. This bit controls whether exceptions to EL2 are taken to A32 or T32 state:

<table>
<thead>
<tr>
<th>TE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exceptions, including reset, taken to A32 state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Exceptions, including reset, taken to T32 state.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
Bits [29:28]

Reserved, RES1.

Bits [27:26]

Reserved, RES0.

**EE, bit [25]**

The value of the PSTATE.E bit on entry to Hyp mode, the endianness of stage 1 translation table walks in the EL2 translation regime, and the endianness of stage 2 translation table walks in the PL1&0 translation regime.

The possible values of this bit are:

<table>
<thead>
<tr>
<th>EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Little-endian. PSTATE.E is cleared to 0 on entry to Hyp mode. Stage 1 translation table walks in the EL2 translation regime, and stage 2 translation table walks in the PL1&amp;0 translation regime are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Big-endian. PSTATE.E is set to 1 on entry to Hyp mode. Stage 1 translation table walks in the EL2 translation regime, and stage 2 translation table walks in the PL1&amp;0 translation regime are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Bit [24]**

Reserved, RES0.

**Bits [23:22]**

Reserved, RES1.

**Bits [21:20]**

Reserved, RES0.

**WXN, bit [19]**

Write permission implies XN (Execute-never). For the EL2 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the EL2 translation regime is forced to XN for accesses from software executing at EL2.</td>
</tr>
</tbody>
</table>

This bit applies only when HSCTLR.M bit is set.

The WXN bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Bit [18]**

Reserved, RES1.
Bit [17]
Reserved, RES0.

Bit [16]
Reserved, RES1.

Bits [15:13]
Reserved, RES0.

I, bit [12]
Instruction access Cacheability control, for accesses at EL2:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All instruction access to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache.</td>
</tr>
<tr>
<td></td>
<td>If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>All instruction access to Normal memory from EL2 can be cached at all levels of instruction and unified cache.</td>
</tr>
<tr>
<td></td>
<td>If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.</td>
</tr>
</tbody>
</table>

This bit has no effect on the PL1&0 translation regime.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bit [11]
Reserved, RES1.

Bits [10:9]
Reserved, RES0.

SED, bit [8]
SETEND instruction disable. Disables SETEND instructions at EL2.

<table>
<thead>
<tr>
<th>SED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SETEND instruction execution is enabled at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>SETEND instructions are UNDEFINED at EL2.</td>
</tr>
</tbody>
</table>

If the implementation does not support mixed-endian operation at EL2, this bit is RES1.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

ITD, bit [7]
IT Disable. Disables some uses of IT instructions at EL2.
<table>
<thead>
<tr>
<th>ITD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All IT instruction functionality is enabled at EL2.</td>
</tr>
</tbody>
</table>
| 0b1 | Any attempt at EL2 to execute any of the following is UNDEFINED:  
  - All encodings of the IT instruction with hw1[3:0]!=1000.  
  - All encodings of the subsequent instruction with the following values for hw1:  
    - 11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.  
    - 1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'.  
    - 10100xxxxxxxxxxx: ADD Rd, PC, #imm  
    - 01001xxxxxxxxxxx: LDR Rd, [PC, #imm]  
    - 0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.  
    - 010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.  

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.  
It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:  
  - A 16-bit instruction, that can only be followed by another 16-bit instruction.  
  - The first half of a 32-bit instruction.  
This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.  
An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction. |

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information, see ‘Changes to an ITD control by an instruction in an IT block’.  

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the HSCTLR. If it is not implemented then this bit is RAZ/WI. |

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value. |

**Bit [6]**  
Reserved, RES0.  

**CP15BEN, bit [5]**  
System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL2:  

<table>
<thead>
<tr>
<th>CP15BEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.</td>
</tr>
</tbody>
</table>

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the HSCTLR. If it is not implemented then this bit is RAO/WI.  

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**LSMAOE, bit [4]**  
When FEAT_LSMAOC is implemented:  
Load Multiple and Store Multiple Atomicity and Ordering Enable.
For all memory accesses at EL2, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.

The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL2 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 1.

Reserved, RES1.

All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL2 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.

All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL2 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit has no effect on the PL1&0 translation regime.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Reserved, RES1.

All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, are Non-cacheable for all levels of data and unified cache.

All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, can be cached at all levels of data and unified cache.

This bit has no effect on the PL1&0 translation regime.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Alignment check enable. This is the enable bit for Alignment fault checking at EL2:
Alignment fault checking disabled when executing at EL2. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element or data elements being accessed.

Alignment fault checking enabled when executing at EL2. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element or data elements being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally unknown value.

### M, bit [0]

MMU enable for EL2 stage 1 address translation. Possible values of this bit are:

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2 stage 1 address translation disabled.</td>
</tr>
<tr>
<td></td>
<td>See the HSCTRL.R1 field for the behavior of instruction accesses to Normal memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 stage 1 address translation enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### Accessing the HSCTRL

Accesses to this register use the following encodings:

\[

HSR, Hyp Syndrome Register

The HSR characteristics are:

Purpose

Holds syndrome information for an exception taken to Hyp mode.

Configuration

AArch32 System register HSR bits [31:0] are architecturally mapped to AArch64 System register ESR_EL2[31:0]. This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HSR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HSR is a 32-bit register.

Field descriptions

The HSR bit assignments are:

</tbody>
</table>

Execution in any Non-secure PE mode other than Hyp mode makes this register UNKNOWN.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of HSR is UNKNOWN. The value written to HSR must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about. Possible values of this field are:
<table>
<thead>
<tr>
<th>EC</th>
<th>Meaning</th>
<th>ISS</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Unknown reason.</td>

<td>ISS encoding for Exception from an Illegal state or PC alignment fault</td>
</tr>
</tbody>
</table>
Data Abort from a lower Exception level.

Data Abort taken without a change in Exception level.

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction length bit. Indicates the size of the instruction that has been trapped to Hyp mode. When this bit is valid, possible values of this bit are:

<table>
<thead>
<tr>
<th>IL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>16-bit instruction trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>32-bit instruction trapped.</td>
</tr>
</tbody>
</table>

This field is RES1 and not valid for the following cases:

- When the EC field is 0b000000, indicating an exception with an unknown reason.
- Prefetch Aborts.
- Data Aborts for which the HSR.ISS.ISV field is 0.
- When the EC value is 0b001110, indicating an Illegal state exception.

Note

This is a change from the behavior in Armv7, where the IL field is UNK/SBZP for the corresponding cases.

The IL field is not valid and is UNKNOWN on an exception from a PC alignment fault.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

**ISS encoding for exceptions with an unknown reason**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 |

Bits [24:0]

Reserved, RES0.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or is not accessible in the current PE mode in the current Security state, including:
  - A read access using a System register encoding pattern that is not allocated for reads or that does not permit reads in the current PE mode and Security state.
A write access using a System register encoding pattern that is not allocated for writes or that does not permit writes in the current PE mode and Security state.
- Instruction encodings that are unallocated.
- Instruction encodings for instructions not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- The attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the SCTLR.{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by HCR.HCD, SCR.HCE, or SCR_EL3.HCE.
  - An SMC instruction when disabled by SCR.SCD or SCR_EL3.SMD.
  - An HLT instruction when disabled by EDSCR.HDE.
- An HVC instruction when disabled by HCR.HCD, SCR.HCE, or SCR_EL3.HCE. An SMC instruction when disabled by SCR.SCD or SCR_EL3.SMD. An HLT instruction when disabled by EDSCR.HDE.
- An exception generated because of the attempted execution of an MSR (Banked register) or MRS (Banked register) instruction that would access a Banked register that is not accessible from the Security state and PE mode at which the instruction was executed.

Note

An exception is generated only if the CONSTRAINED UNPREDICTABLE behavior of the instruction is that it is UNDEFINED, see 'MSR (banked register) and MRS (banked register)'.

- Attempted execution, in Debug state, of:
  - A DCPS1 instruction in Non-secure state from EL0 when EL2 is using AArch32 and the value of HCR.TGE is 1.
  - A DCPS2 instruction at EL1 or EL0 when EL2 is not implemented, or when EL3 is using AArch32 and the value of SCR.NS is 0, or when EL3 is using AArch64 and the value of SCR_EL3.NS is 0.
  - A DCPS3 instruction when EL3 is not implemented, or when the value of EDSCR.SDD is 1.
- In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.

'Undefinined Instruction exception, when the value of HCR.TGE is 1' describes the configuration settings for a trap that returns an HSR.EC value of 0b000000.

**ISS encoding for Exception from a WFI or WFE instruction**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|---|
| CV | COND | RES0 | TI |

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

The condition code for the trapped instruction.
When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:1]**

Reserved, RES0.

**TI, bit [0]**

Trapped instruction. Possible values of this bit are:

<table>
<thead>
<tr>
<th>TI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>WFI trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>WFE trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

‘Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions’ describes the configuration settings for this trap.

**ISS encoding for Exception from an MCR or MRC access**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CV | COND | Opc2 | Opc1 | CRn | RES0 | Rt | CRm | Direction |

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:
• If the instruction is conditional, COND is set to the condition code field value from the instruction.
• If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:
• With COND set to 0b1110, the value for unconditional.
• With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
• CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
• CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Opc2, bits [19:17]**

The Opc2 value from the issued instruction.
For a trapped VMRS access, holds the value 0b000.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Opc1, bits [16:14]**

The Opc1 value from the issued instruction.
For a trapped VMRS access, holds the value 0b111.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRn, bits [13:10]**

The CRn value from the issued instruction.
For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [9]**

Reserved, RES0.

**Rt, bits [8:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.
For a trapped VMRS access, holds the value 0b0000.
On a Warm reset, this field resets to an architecturally UNKNOWN value.
**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to System register space. MCR instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from System register space. MRC or VMRS instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

The following sections describe configuration settings for traps that are reported using EC value 0b000011:

- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to the ID registers'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to lockdown, DMA, and TCM operations'.
- 'Traps to Hyp mode of Non-secure EL1 execution of cache maintenance instructions'.
- 'Traps to Hyp mode of Non-secure EL1 accesses to the Auxiliary Control Register'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Performance Monitors registers'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Activity Monitors registers'.
- 'Traps to Hyp mode of Non-secure EL1 accesses to the CPACR'.
- 'Traps to Hyp mode of Non-secure EL1 accesses to virtual memory control registers'.
- 'General trapping to Hyp mode of Non-secure EL0 and EL1 accesses to System registers in the (coproc == 1111) encoding space'.

The following sections describe configuration settings for traps that are reported using EC value 0b000101:

- 'ID group 0, Primary device identification registers'.
- 'Traps to Hyp mode of Non-secure System register accesses to trace registers'.
- 'Trapping Non-secure System register accesses to Debug ROM registers'.
- 'Trapping Non-secure System register accesses to powerdown debug registers'.
- 'Trapping general Non-secure System register accesses to debug registers'.

The following sections describe configuration settings for traps that are reported using EC value 0b001000:

- 'ID group 0, Primary device identification registers'.
- 'ID group 3, Detailed feature identification registers'.

**ISS encoding for Exception from an MCRR or MRRC access**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |   0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CV | COND | Opc1 | RES0 | Rt2 | RES0 | Rt | CRm | Direction |

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is **IMPLEMENTATION DEFINED** whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**COND, bits [23:20]**

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.
A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Opc1, bits [19:16]**

The Opc1 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [15:14]**

Reserved, RES0.

**Rt2, bits [13:10]**

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [9]**

Reserved, RES0.

**Rt, bits [8:5]**

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to System register space. MCRR instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from System register space. MRRC instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following sections describe configuration settings for traps that are reported using EC value 0b000100:

- ‘Traps to Hyp mode of Non-secure EL1 accesses to virtual memory control registers’.
- ‘Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Performance Monitors registers’.
• ‘Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Activity Monitors registers’.
• ‘Traps to Hyp mode of Non-secure EL0 and EL1 accesses to the Generic Timer registers’.
• ‘General trapping to Hyp mode of Non-secure EL0 and EL1 accesses to System registers in the (coproc == 1111) encoding space’.

The following sections describe configuration settings for traps that are reported using EC value 0b001100:

• ‘Traps to Hyp mode of Non-secure System register accesses to trace registers’.
• ‘Trapping Non-secure System register accesses to Debug ROM registers’.

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**imm8, bits [19:12]**

The immediate value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [11:9]**

Reserved, RES0.
**Rn, bits [8:5]**

The Rn value from the issued instruction. Valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction.

When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Offset, bit [4]**

Indicates whether the offset is added or subtracted:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Subtract offset.</td>
</tr>
<tr>
<td>0b1</td>
<td>Add offset.</td>
</tr>
</tbody>
</table>

This bit corresponds to the U bit in the instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**AM, bits [3:1]**

Addressing mode. The permitted values of this field are:

<table>
<thead>
<tr>
<th>AM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>Immediate unindexed.</td>

</tr>
<tr>
<td></td>
<td>For a trapped STC instruction, this encoding is reserved.</td>
</tr>
</tbody>
</table>

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Direction</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Write to memory. STC instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Read from memory. LDC instruction.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

'Trapping general Non-secure System register accesses to debug registers' describes the configuration settings for the trap that is reported using EC value 0b000110.

**ISS encoding for Exception from an access to SIMD or floating-point functionality, resulting from HCPTR**

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| CV| COND| RES0| TA RES0| coproc|

Page 2847
Excludes exceptions that occur because Advanced SIMD and floating-point functionality is not implemented, or because the value of HCR.TGE or HCR_EL2.TGE is 1. These are reported with EC value 0b000000.

CV, bit [24]

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:6]

Reserved, RES0.

TA, bit [5]

Indicates trapped use of Advanced SIMD functionality. The possible values of this bit are:

<table>
<thead>
<tr>
<th>TA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Exception was not caused by trapped use of Advanced SIMD functionality.</td>
</tr>
<tr>
<td>0b1</td>
<td>Exception was caused by trapped use of Advanced SIMD functionality.</td>
</tr>
</tbody>
</table>

Any use of an Advanced SIMD instruction that is not also a floating-point instruction that is trapped to Hyp mode because of a trap configured in the HCPTR sets this bit to 1.

For a list of these instructions, see 'Controls of Advanced SIMD operation that do not apply to floating-point operation'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bit [4]

Reserved, RES0.

coproc, bits [3:0]

When the HSR.TA field returns the value 1, this field returns the value 0b1010. Otherwise, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000111:

- 'General trapping to Hyp mode of Non-secure accesses to the SIMD and floating-point registers'.
- 'Traps to Hyp mode of Non-secure accesses to Advanced SIMD functionality'.

ISS encoding for Exception from HVC or SVC instruction execution

| Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9  | Bit 8  | Bit 7  | Bit 6  | Bit 5  | Bit 4  | Bit 3  | Bit 2  | Bit 1  | Bit 0  |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| RES0   |        |        |        |        |        |        |        |        |        |        |        |        |        |        | imm16  |        |        |        |        |        |        |        |        |        |        |

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, this is the value of the imm16 field of the issued instruction.

For an SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.

- If the instruction is conditional, this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

'Supervisor Call exception, when the value of HCR.TGE is 1' describes the configuration settings for the trap reported with EC value 0b010001.

ISS encoding for Exception from SMC instruction execution

| Bit 24 | Bit 23 | Bit 22 | Bit 21 | Bit 20 | Bit 19 | Bit 18 | Bit 17 | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9  | Bit 8  | Bit 7  | Bit 6  | Bit 5  | Bit 4  | Bit 3  | Bit 2  | Bit 1  | Bit 0  |

| CV     | COND   | CCKNOWNPASS |        |        |        |        |        |        |        |        |        |        | RES0   |        |        |        |        |        |        |        |        |        |        |        |        |

CV, bit [24]

Condition code valid. Possible values of this bit are:

<table>
<thead>
<tr>
<th>CV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The COND field is not valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>The COND field is valid.</td>
</tr>
</tbody>
</table>

When an A32 instruction is trapped, CV is set to 1.
When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CCKNOWNPASS, bit [19]**

Indicates whether the instruction might have failed its condition code check.

<table>
<thead>
<tr>
<th>CCKNOWNPASS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The instruction was unconditional, or was conditional and passed its condition code check.</td>
</tr>
<tr>
<td>0b1</td>
<td>The instruction was conditional, and might have failed its condition code check.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [18:0]**

Reserved, RES0.

'Traps to Hyp mode of Non-secure EL1 execution of SMC instructions' describes the configuration settings for this trap, for instructions executed in Non-secure EL1.

**ISS encoding for Exception from a Prefetch Abort**

```
 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

| RES0 | FnV | EA | RES0 | S1PTW | RES0 | IFSC |
```

**Bits [24:11]**

Reserved, RES0.
**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>HIFAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>HIFAR is not valid, and holds an <strong>UNKNOWN</strong> value.</td>
</tr>
</tbody>
</table>

This field is valid only if the IFSC code is **0b010000**. It is **RES0** for all other aborts.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EA, bit [9]**

External abort type. This bit can provide an **IMPLEMENTATION DEFINED** classification of External aborts.

For any abort other than an External abort this bit returns a value of **0**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [8]**

Reserved, **RES0**.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<table>
<thead>
<tr>
<th>S1PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault not on a stage 2 translation for a stage 1 translation table walk.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault on the stage 2 translation of an access for a stage 1 translation table walk.</td>
</tr>
</tbody>
</table>

For any abort other than a stage 2 fault this bit is **RES0**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [6]**

Reserved, **RES0**.

**IFSC, bits [5:0]**

Instruction Fault Status Code. Possible values of this field are:
<table>
<thead>
<tr>
<th>IFSC</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Address size fault in translation table base register.</td>

<td>0b100010</td>
<td>Debug exception.</td>
<td></td>
</tr>
<tr>
<td>0b100000</td>
<td>TLB conflict abort.</td>
<td></td>
</tr>
</tbody>
</table>

All other values are reserved.

For more information about the lookup level associated with a fault, see ‘The level associated with MMU faults on a Long-descriptor translation table lookup’.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following sections describe cases where Prefetch Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value 0b100000:

- ‘Abort exceptions, when the value of HCR.TGE is 1’.
- ‘Routing debug exceptions to EL2 using AArch32’.

**ISS encoding for Exception from an Illegal state or PC alignment fault**

| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

<td>00000000</td>
<td></td>
</tr>
</tbody>
</table>

#### ISV, bit [24]

Instruction syndrome valid. Indicates whether the syndrome information in ISS[23:14] is valid.

<table>
<thead>
<tr>
<th>ISV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No valid instruction syndrome. ISS[23:14] are RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>ISS[23:14] hold a valid instruction syndrome.</td>
</tr>
</tbody>
</table>

This bit is 0 for all faults except Data Aborts generated by stage 2 address translations for which all the following apply to the instruction that generated the Data Abort exception:

- The instruction is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STRHT, STR, STRB, STLB, or STRBT instruction.
- The instruction is not performing register writeback.
- The instruction is not using the PC as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, as described in 'Data Aborts in Memory access mode', and otherwise indicates whether ISS[23:14] hold a valid syndrome.

**Note**

In the A32 instruction set, LDR*T and STR*T instructions always perform register writeback and therefore never return a valid instruction syndrome.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

ISV is set to 0 on a stage 2 abort on a stage 1 translation table walk.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### SAS, bits [23:22]

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

<table>
<thead>
<tr>
<th>SAS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Byte</td>
</tr>
<tr>
<td>0b01</td>
<td>Halfword</td>
</tr>
<tr>
<td>0b10</td>
<td>Word</td>
</tr>
<tr>
<td>0b11</td>
<td>Doubleword</td>
</tr>
</tbody>
</table>

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**SSE, bit [21]**

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

<table>
<thead>
<tr>
<th>SSE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sign-extension not required.</td>
</tr>
<tr>
<td>0b1</td>
<td>Data item must be sign-extended.</td>
</tr>
</tbody>
</table>

For all other operations this bit is 0.

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

This field is **RES0** when the value of ISV is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [20]**

Reserved, **RES0**.

**SRT, bits [19:16]**

Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction.

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

This field is **RES0** when the value of ISV is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [15]**

Reserved, **RES0**.

**AR, bit [14]**

Acquire/Release. When ISV is 1, the possible values of this bit are:

<table>
<thead>
<tr>
<th>AR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Instruction did not have acquire/release semantics.</td>
</tr>
<tr>
<td>0b1</td>
<td>Instruction did have acquire/release semantics.</td>
</tr>
</tbody>
</table>

This field is **UNKNOWN** when the value of ISV is **UNKNOWN**.

This field is **RES0** when the value of ISV is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [13:12]**

Reserved, **RES0**.

**AET, bits [11:10]**

When **FEAT_RAS** is implemented:

Asynchronous Error Type. When DFSC is 0b101001, describes the PE error state after taking the SError interrupt exception. The possible values of this field are:
### AET

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Uncontainable (UC).</td>
</tr>
<tr>
<td>0b01</td>
<td>Unrecoverable state (UEU).</td>
</tr>
<tr>
<td>0b10</td>
<td>Restartable state (UEO).</td>
</tr>
<tr>
<td>0b11</td>
<td>Recoverable state (UER).</td>
</tr>
</tbody>
</table>

On a synchronous Data Abort, this field is res0.

In the event of multiple errors taken as a single SError interrupt exception, the overall PE error state is reported.

**Note**

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

When FEAT_RAS is not implemented, or when DFSC is not 0b010001:

- Bit[11] is res0.
- Bit[10] forms the FnV field.

**Note**

Armv8.2 requires the implementation of FEAT_RAS.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**FnV**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>HDFAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>HDFAR is not valid, and holds an <strong>UNKNOWN</strong> value.</td>
</tr>
</tbody>
</table>

When FEAT_RAS is not implemented, this field is valid only if DFSC is 0b010000. It is res0 for all other aborts.

When FEAT_RAS is implemented:

- If DFSC is 0b010000, this field is valid.
- If DFSC is 0b010001, this bit forms part of the AET field, becoming AET[0].
- This field is res0 for all other aborts.

**Note**

Armv8.2 requires the implementation of FEAT_RAS.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EA, bit [9]**

External abort type. This bit can provide an **IMPLEMENTATION DEFINED** classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**CM, bit [8]**

Cache maintenance. For a synchronous fault, identifies fault that comes from a cache maintenance or address translation instruction. For synchronous faults, the possible values of this bit are:
<table>
<thead>
<tr>
<th>CM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault not generated by a cache maintenance or address translation instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault generated by a cache maintenance or address translation instruction.</td>
</tr>
</tbody>
</table>

For an asynchronous Data Abort exception, this bit is 0.

On a Warm reset, this field resets to an architecturally unknown value.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<table>
<thead>
<tr>
<th>S1PTW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Fault not on a stage 2 translation for a stage 1 translation table walk.</td>
</tr>
<tr>
<td>0b1</td>
<td>Fault on the stage 2 translation of an access for a stage 1 translation table walk.</td>
</tr>
</tbody>
</table>

For any abort other than a stage 2 fault this bit is RES0.

On a Warm reset, this field resets to an architecturally unknown value.

**WnR, bit [6]**

Write not Read. Indicates whether a synchronous abort was caused by a write instruction or a read instruction. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WnR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Abort caused by a read instruction.</td>
</tr>
<tr>
<td>0b1</td>
<td>Abort caused by a write instruction.</td>
</tr>
</tbody>
</table>

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

On an asynchronous Data Abort:

- When FEAT_RAS is not implemented, this bit is unknown.
- When FEAT_RAS is implemented, this bit is RES0.

**Note**

Armv8.2 requires the implementation of FEAT_RAS.

On a Warm reset, this field resets to an architecturally unknown value.

**DFSC, bits [5:0]**

Data Fault Status Code. Possible values of this field are:
### DFSC | Meaning | Applies when
--- | --- | ---
0b000000 | Address size fault in translation table base register. |  
0b000001 | Address size fault, level 1. |  
0b000010 | Address size fault, level 2. |  
0b000011 | Address size fault, level 3. |  
0b000100 | Translation fault, level 1. |  
0b000110 | Translation fault, level 2. |  
0b001000 | Translation fault, level 3. |  
0b001001 | Access flag fault, level 1. |  
0b001010 | Access flag fault, level 2. |  
0b001100 | Access flag fault, level 3. |  
0b001101 | Permission fault, level 1. |  
0b001110 | Permission fault, level 2. |  
0b001111 | Permission fault, level 3. |  
0b010000 | Synchronous External abort, not on translation table walk. |  
0b010001 | Asynchronous SError interrupt. |  
0b010010 | Synchronous External abort on translation table walk, level 1. |  
0b010100 | Synchronous External abort on translation table walk, level 2. |  
0b010110 | Synchronous External abort on translation table walk, level 3. |  
0b010111 | Asynchronous SError interrupt, from a parity or ECC error on memory access. |  
0b011000 | Synchronous parity or ECC error on memory access, not on translation table walk. | When FEAT_RAS is not implemented  
0b011001 | Synchronous parity or ECC error on memory access on translation table walk, level 1. | When FEAT_RAS is not implemented  
0b011010 | Synchronous parity or ECC error on memory access on translation table walk, level 2. | When FEAT_RAS is not implemented  
0b011111 | Synchronous parity or ECC error on memory access on translation table walk, level 3. | When FEAT_RAS is not implemented  
0b010001 | Alignment fault. |  
0b010010 | Debug exception. |  
0b110000 | TLB conflict abort. |  
0b110100 | IMPLEMENTATION DEFINED fault (Lockdown). |  
0b110101 | IMPLEMENTATION DEFINED fault (Unsupported Exclusive access). |  

All other values are reserved.

For more information about the lookup level associated with a fault, see ‘The level associated with MMU faults on a Long-descriptor translation table lookup’.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally *UNKNOWN* value.

The following describe cases where Data Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value 0b100000:

- 'Abort exceptions, when the value of HCR.TGE is 1'.
- 'Routing debug exceptions to EL2 using AArch32'.

The following describe cases that can cause a Data Abort exception that is taken to Hyp mode, and reported in the HSR with EC value of 0b100000 or 0b100100:
HSR, Hyp Syndrome Register

- Hyp mode control of Non-secure access permissions.
- Memory fault reporting in Hyp mode.

Accessing the HSR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b0101</td>
<td>0b0010</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then

    HSR = R[t];
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        HSR = R[t];
HSTR, Hyp System Trap Register

The HSTR characteristics are:

**Purpose**

Controls trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to System registers in the coproc == \(0b1111\) encoding space:

- By the CRn value used to access the register using MCR or MRC instruction.
- By the CRm value used to access the register using MCRR or MRRC instruction.

**Configuration**

AArch32 System register HSTR bits [31:0] are architecturally mapped to AArch64 System register HSTR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HSTR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HSTR is a 32-bit register.

**Field descriptions**

The HSTR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 | RES0 |

**Bits [31:16, 14, 4]**

Reserved, RES0.

**T<n>, bit [n], for n = 15, 13 to 5, 3 to 0**

The remaining fields control whether Non-secure EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == \(0b1111\) encoding space are trapped to Hyp mode:

<table>
<thead>
<tr>
<th>T&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0)</td>
<td>This control has no effect on Non-secure EL0 or EL1 accesses to System registers.</td>
</tr>
<tr>
<td>(0b1)</td>
<td>Any Non-secure EL1 MCR or MRC access with coproc == (0b1111) and CRn == &lt;n&gt; is trapped to Hyp mode. A Non-secure EL0 MCR or MRC access with these values is trapped to Hyp mode only if the access is not UNDEFINED when the value of this field is 0. Any Non-secure EL1 MCRR or MRRC access with coproc == (0b1111) and CRm == &lt;n&gt; is trapped to Hyp mode. A Non-secure EL0 MCRR or MRRC access with these values is trapped to Hyp mode only if the access is not UNDEFINED when the value of this field is 0.</td>
</tr>
</tbody>
</table>

For example, when HSTR.T7 is 1, for instructions executed at Non-secure EL1:

- An MCR or MRC instruction with coproc set to \(0b1111\) and <CRn> set to c7 is trapped to Hyp mode.
- An MCRR or MRRC instruction with coproc set to \(0b1111\) and <CRm> set to c7 is trapped to Hyp mode.
On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Accessing the HSTR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>

  endif
HTCR, Hyp Translation Control Register

The HTCR characteristics are:

**Purpose**

The control register for stage 1 of the EL2 translation regime.

**Note**

This stage of translation always uses the Long-descriptor translation table format.

**Configuration**

AArch32 System register HTCR bits [31:0] are architecturally mapped to AArch64 System register $TCR\_EL2[31:0]$.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HTCR are UNDEFINED.

If EL2 is not implemented, this register is $RES0$ from EL3.

**Attributes**

HTCR is a 32-bit register.

**Field descriptions**

The HTCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>

</tr>
</tbody>
</table>

**Bit [31]**

Reserved, RES1.

**IMPLEMENTATION DEFINED, bit [30]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [29]**

Reserved, RES0.

**HWU62, bit [28]**

When FEAT\_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.
<table>
<thead>
<tr>
<th>HWU62</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU61, bit [27]**

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU61</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU60, bit [26]**

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU60</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU59, bit [25]**
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU59</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD, bit [24]

When FEAT_AA32HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the PL2 translation regime.

<table>
<thead>
<tr>
<th>HPD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled.</td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

Bits [22:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using HTTBR.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using HTTBR.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using HTTBR.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [7:3]**

Reserved, RES0.

**T0SZ, bits [2:0]**

The size offset of the memory region addressed by HTTBR. The region size is $2^{(32-T0SZ)}$ bytes.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the HTCR**

Accesses to this register use the following encodings:

$$\text{MRC \{<c>\}{<q>} \text{ <coproc>}, \text{ \{#\}<opc1>, <Rt>, <CRn>, <CRm>{, \{#\}<opc2>}}$$

<table>

HTPIDR, Hyp Software Thread ID Register

The HTPIDR characteristics are:

**Purpose**

Provides a location where software running in Hyp mode can store thread identifying information that is not visible to Non-secure software executing at EL0 or EL1, for hypervisor management purposes.

The PE makes no use of this register.

**Configuration**

AArch32 System register HTPIDR bits [31:0] are architecturally mapped to AArch64 System register `TPIDR_EL2[31:0]`.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HTPIDR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

---

**Note**

The PE never updates this register.

---

**Attributes**

HTPIDR is a 32-bit register.

**Field descriptions**

The HTPIDR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

HTRFCR, Hyp Trace Filter Control Register

The HTRFCR characteristics are:

**Purpose**

Provides EL2 controls for Trace.

**Configuration**

AArch32 System register HTRFCR bits [31:0] are architecturally mapped to AArch64 System register TRFCR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_TRF is implemented. Otherwise, direct accesses to HTRFCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from Monitor mode when SCR.NS == 1.

**Attributes**

HTRFCR is a 32-bit register.

**Field descriptions**

The HTRFCR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0| TS      | RES0| CX    | RES0| E2TRE | E0HTRE |

**Bits [31:7]**

Reserved, RES0.

**TS, bits [6:5]**

Timestamp Control. Controls which timebase is used for trace timestamps.

<table>
<thead>
<tr>
<th>TS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The timestamp is controlled by TRFCR.TS.</td>
</tr>
<tr>
<td>0b01</td>
<td>Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF.</td>
</tr>
<tr>
<td>0b11</td>
<td>Physical timestamp. The traced timestamp is the physical counter value.</td>
</tr>
</tbody>
</table>

When SelfHostedTraceEnabled() == FALSE, this field is ignored.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Bit [4]**

Reserved, RES0.

**CX, bit [3]**

VMID Trace Enable.
<table>
<thead>
<tr>
<th>CX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>VMID tracing is not allowed.</td>
</tr>
<tr>
<td>0b1</td>
<td>VMID tracing is allowed.</td>
</tr>
</tbody>
</table>

When SelfHostedTraceEnabled() == FALSE, this field is ignored.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Bit [2]**

Reserved, RES0.

**E2TRE, bit [1]**

EL2 Trace Enable.

<table>
<thead>
<tr>
<th>E2TRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tracing is prohibited at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tracing is allowed at EL2.</td>
</tr>
</tbody>
</table>

When SelfHostedTraceEnabled() == FALSE, this field is ignored.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**E0HTRE, bit [0]**

EL0 Trace Enable.

<table>
<thead>
<tr>
<th>E0HTRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tracing is prohibited at EL0 when HCR.TGE == 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tracing is allowed at EL0 when HCR.TGE == 1.</td>
</tr>
</tbody>
</table>

This field is ignored if any of the following are true:

- The PE is in Secure state.
- SelfHostedTraceEnabled() == FALSE.
- HCR.TGE == 0.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Accessing the HTRFCR**

HTTBR, Hyp Translation Table Base Register

The HTTBR characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

**Configuration**

AArch32 System register HTTBR bits [47:1] are architecturally mapped to AArch64 System register TTBR0_EL2[47:1].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HTTBR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HTTBR is a 64-bit register.

**Field descriptions**

The HTTBR bit assignments are:

<table>

<td>5</td>
<td>4</td>
<td>3</td>
<td>2</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

**Bits [63:48]**

Reserved, RES0.

**BADDR, bits [47:1]**

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of HTCR.T0SZ as follows:

- If HTCR.T0SZ is 0 or 1, x = 5 · HTCR.T0SZ.
- If HTCR.T0SZ is greater than 1, x = 14 · HTCR.T0SZ.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**CnP, bit [0]**

*When FEAT_TTCNP is implemented:*

Common not Private. This bit indicates whether each entry that is pointed to by HTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of HTTBR.CnP is 1.

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The translation table entries pointed to by HTTBR are permitted to differ from corresponding entries for HTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of HTTBR.CnP on those other PEs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The translation table entries pointed to by HTTBR are the same as the translation table entries pointed to by HTTBR on every other PE in the Inner Shareable domain for which the value of HTTBR.CnP is 1.</td>
</tr>
</tbody>
</table>

**Note**

If the value of the HTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those HTTBRs do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see ‘CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values’.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Accessing the HTTBR**

Accesses to this register use the following encodings:

HVBAR, Hyp Vector Base Address Register

The HVBAR characteristics are:

**Purpose**

Holds the vector base address for any exception that is taken to Hyp mode.

**Configuration**

AArch32 System register HVBAR bits [31:0] are architecturally mapped to AArch64 System register VBAR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HVBAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

HVBAR is a 32-bit register.

**Field descriptions**

The HVBAR bit assignments are:

|   | Vector Base Address |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31| 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

The ICC_AP0R<n> characteristics are:

**Purpose**

Provides information about Group 0 active priorities.

**Configuration**

AArch32 System register ICC_AP0R<n> bits [31:0] are architecturally mapped to AArch64 System register ICC_AP0R<n>_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_AP0R<n> are **UNDEFINED**.

**Attributes**

ICC_AP0R<n> is a 32-bit register.

**Field descriptions**

The ICC_AP0R<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**IMPLEMENTATION DEFINED, bits [31:0]**

**IMPLEMENTATION DEFINED.**

On a Warm reset, this field resets to 0.

The contents of these registers are **IMPLEMENTATION DEFINED** with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

**Accessing the ICC_AP0R<n>**

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 0 active priorities) might result in **UNPREDICTABLE** behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP0R1 is only implemented in implementations that support 6 or more bits of preemption. ICC_AP0R2 and ICC_AP0R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are **UNDEFINED**.

**Note**

The number of bits of preemption is indicated by **ICH_VTR** PREbits.

Writing to the active priority registers in any order other than the following order will result in **UNPREDICTABLE** behavior:

- ICC_AP0R<n>.
- Secure ICC_AP1R<n>.
- Non-secure ICC_AP1R<n>.

Accesses to this register use the following encodings:

\[

e-------------------
ICC_AP1R<n>, Interrupt Controller Active Priorities
Group 1 Registers, n = 0 - 3

The ICC_AP1R<n> characteristics are:

**Purpose**

Provides information about Group 1 active priorities.

**Configuration**

AArch32 System register ICC_AP1R<n> bits [31:0] (S) are architecturally mapped to AArch64 System register ICC_AP1R<n>_EL1[31:0] (S).

AArch32 System register ICC_AP1R<n> bits [31:0] (NS) are architecturally mapped to AArch64 System register ICC_AP1R<n>_EL1[31:0] (NS).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_AP1R<n> are **UNDEFINED**.

**Attributes**

ICC_AP1R<n> is a 32-bit register.

**Field descriptions**

The ICC_AP1R<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | IMPLEMENTATION DEFINED |

**IMPLEMENTATION DEFINED, bits [31:0]**

**IMPLEMENTATION DEFINED.**

On a Warm reset, this field resets to 0.

The contents of these registers are **IMPLEMENTATION DEFINED** with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

**Accessing the ICC_AP1R<n>**

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 1 active priorities) might result in **UNPREDICTABLE** behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP1R1 is only implemented in implementations that support 6 or more bits of preemption. ICC_AP1R2 and ICC_AP1R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are **UNDEFINED**.

**Note**

The number of bits of preemption is indicated by ICH_VTR.PREbits.
Writing to the active priority registers in any order other than the following order will result in **UNPREDICTABLE** behavior:

- **ICC_AP0R<n>**
- Secure ICC_AP1R<n>
- Non-secure ICC_AP1R<n>

Accesses to this register use the following encodings:

The ICC_ASGI1R characteristics are:

**Purpose**
Generates Group 1 SGIs for the Security state that is not the current Security state.

**Configuration**
AArch32 System register ICC_ASGI1R performs the same function as AArch64 System register ICC_ASGI1R_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_ASGI1R are UNDEFINED.

Under certain conditions a write to ICC_ASGI1R can generate Group 0 interrupts, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**
ICC_ASGI1R is a 64-bit register.

**Field descriptions**
The ICC_ASGI1R bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>62</td>
<td>Aff3</td>
</tr>
<tr>
<td>55-48</td>
<td>The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.</td>
</tr>
<tr>
<td>47-44</td>
<td>RangeSelector</td>
</tr>
</tbody>
</table>

**Bits [63:56]**
Reserved, RES0.

**Aff3, bits [55:48]**
The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**RS, bits [47:44]**
RangeSelector
Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of :
- The write is ignored.
- The RS field is treated as 0.
Bits [43:41]
Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

<table>
<thead>
<tr>
<th>IRM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.&lt;target list&gt;.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupts routed to all PEs in the system, excluding &quot;self&quot;.</td>
</tr>
</tbody>
</table>

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note

This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16. If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

Accessing the ICC_ASGI1R

This register allows software executing in a Secure state to generate Non-secure Group 1 SGIs. It will also allow software executing in a Non-secure state to generate Secure Group 1 SGIs, if permitted by the settings of GICR_NSACR in the Redistributor corresponding to the target PE.

When GICD_CTLR.DS==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the GICR_NSACR register associated with the target PE. For more information, see 'Use of control registers for SGI
forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

---

**Note**

Accesses from Secure Monitor mode are treated as Secure regardless of the value of SCR.NS.

---

Accesses to this register use the following encodings:

ICC_BPR0, Interrupt Controller Binary Point Register 0

The ICC_BPR0 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

Configuration

AArch32 System register ICC_BPR0 bits [31:0] are architecturally mapped to AArch64 System register ICC_BPR0_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_BPR0 are UNDEFINED.

Attributes

ICC_BPR0 is a 32-bit register.

Field descriptions

The ICC_BPR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | BinaryPoint |

Bits [31:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

<table>
<thead>
<tr>
<th>Binary point value</th>
<th>Group priority field</th>
<th>Subpriority field</th>
<th>Field with binary point</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>[7:1]</td>
<td>[0]</td>
<td>ggggggg.s</td>
</tr>
<tr>
<td>1</td>
<td>[7:2]</td>
<td>[1:0]</td>
<td>gggggg.ss</td>
</tr>
<tr>
<td>2</td>
<td>[7:3]</td>
<td>[2:0]</td>
<td>ggggg.sss</td>
</tr>
<tr>
<td>3</td>
<td>[7:4]</td>
<td>[3:0]</td>
<td>gggg.sssss</td>
</tr>
<tr>
<td>4</td>
<td>[7:5]</td>
<td>[4:0]</td>
<td>ggg.sssssss</td>
</tr>
<tr>
<td>5</td>
<td>[7:6]</td>
<td>[5:0]</td>
<td>g.sssssssss</td>
</tr>
<tr>
<td>6</td>
<td>[7]</td>
<td>[6:0]</td>
<td>sssssssssss</td>
</tr>
<tr>
<td>7</td>
<td>No preemption</td>
<td>[7:0]</td>
<td>.ssssssss</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the ICC_BPR0

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is IMPLEMENTATION DEFINED, and reported by ICC_CTLR PRIbits and ICC_MCTLR PRIbits.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is set to the minimum supported value.
Accesses to this register use the following encodings:

**The ICC_BPR1 characteristics are:**

### Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

### Configuration

AArch32 System register ICC_BPR1 bits [31:0] (S) are architecturally mapped to AArch64 System register ICC_BPR1_EL1[31:0] (S).

AArch32 System register ICC_BPR1 bits [31:0] (NS) are architecturally mapped to AArch64 System register ICC_BPR1_EL1[31:0] (NS).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_BPR1 are UNDEFINED.

In GIC implementations supporting two Security states, this register is Banked.

### Attributes

ICC_BPR1 is a 32-bit register.

### Field descriptions

The ICC_BPR1 bit assignments are:

<table>

</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**BinaryPoint, bits [2:0]**

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Writing 0 to this field will set this field to its reset value.

If EL3 is implemented and ICC_MCTLR_CBPR_EL1S is 1:

- Accesses to this register at EL3 not in Monitor mode access the state of ICC_BPR0.
- When SCR_EL3.EEL2 is 1 and HCR_EL2.IMO is 1, Secure accesses to this register at EL1 access the state of ICC_BPR1.
- Otherwise, Secure accesses to this register at EL1 access the state of ICC_BPR0.

If EL3 is implemented and ICC_MCTLR_CBPR_EL1NS is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR.IMO and SCR.IRQ:
HCR.IMO      SCR_IRQ      Behavior
0b0          0b0        Non-secure EL1 and EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.
0b0          0b1        Non-secure EL1 and EL2 accesses trap to EL3.
0b1          0b0        Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL2 writes ignored.
0b1          0b1        Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 accesses trap to EL3.

If EL3 is not implemented and ICC_CTLR.CBPR is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR.IMO:

<table>
<thead>
<tr>
<th>HCR.IMO</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1 and EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL2 writes are ignored.</td>
</tr>
</tbody>
</table>

This field resets to an IMPLEMENTATION DEFINED non-zero value.

### Accessing the ICC_BPR1

When the PE resets into an Exception level that is using AArch32, the reset value is equal to:

- For the Secure copy of the register, the minimum value of ICC_BPR0 plus one.
- For the Non-secure copy of the register, the minimum value of ICC_BPR0.

Where the minimum value of ICC_BPR0 is IMPLEMENTATION DEFINED.

If EL3 is not implemented:

- If the PE is Secure this reset value is (minimum value of ICC_BPR0 plus one).
- If the PE is Non-secure this reset value is (minimum value of ICC_BPR0).

An attempt to program the binary point field to a value less than the reset value sets the field to the reset value.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} \text{ <coproc>, \#<opc1>, <Rt>, <CRn>, <CRm>, \#, \#<opc2>}
\]

The ICC_CTLR characteristics are:

**Purpose**

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

**Configuration**

AArch32 System register ICC_CTLR bits [31:0] (S) are architecturally mapped to AArch64 System register ICC_CTLR_EL1[31:0] (S).

AArch32 System register ICC_CTLR bits [31:0] (NS) are architecturally mapped to AArch64 System register ICC_CTLR_EL1[31:0] (NS).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_CTLR are UNDEFINED.

**Attributes**

ICC_CTLR is a 32-bit register.

**Field descriptions**

The ICC_CTLR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>ExtRange</td>
</tr>
<tr>
<td>29</td>
<td>RSS</td>
</tr>
<tr>
<td>28</td>
<td>RES0</td>
</tr>
<tr>
<td>27</td>
<td>A3V</td>
</tr>
<tr>
<td>26</td>
<td>SEIS</td>
</tr>
<tr>
<td>25</td>
<td>IDbits</td>
</tr>
<tr>
<td>24</td>
<td>PR1bits</td>
</tr>
<tr>
<td>23</td>
<td>RES0</td>
</tr>
<tr>
<td>22</td>
<td>PMHE</td>
</tr>
<tr>
<td>21</td>
<td>RES0</td>
</tr>
<tr>
<td>20</td>
<td>EOImode</td>
</tr>
<tr>
<td>19</td>
<td>CBPR</td>
</tr>
</tbody>
</table>

**Bits [31:20]**

Reserved, RES0.

**ExtRange, bit [19]**

Extended INTID range (read-only).

<table>
<thead>
<tr>
<th>ExtRange</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>CPU interface does not support INTIDs in the range 1024..8191. Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.</td>
</tr>
<tr>
<td>0b1</td>
<td>CPU interface supports INTIDs in the range 1024..8191. All INTIDs in the range 1024..8191 are treated as requiring deactivation.</td>
</tr>
</tbody>
</table>

**Note**

Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.

If EL3 is implemented, ICC_CTLR_EL1.ExtRange is an alias of ICC_CTLR_EL3.ExtRange.

**RSS, bit [18]**

Range Selector Support. Possible values are:
<table>
<thead>
<tr>
<th>Bits [17:16]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**A3V, bit [15]**

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and using AArch32, this bit is an alias of ICC_MCTLR.A3V.

If EL3 is implemented and using AArch64, this bit is an alias of ICC_CTLR_EL3.A3V.

**SEIS, bit [14]**

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports local generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic does not support local generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports local generation of SEIs.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and using AArch32, this bit is an alias of ICC_MCTLR.SEIS.

If EL3 is implemented and using AArch64, this bit is an alias of ICC_CTLR_EL3.SEIS.

**IDbits, bits [13:11]**

Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported:

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b01</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If EL3 is implemented and using AArch32, this field is an alias of ICC_MCTLR.IDbits.

If EL3 is implemented and using AArch64, this field is an alias of ICC_CTLR_EL3.IDbits.

**PRIbits, bits [10:8]**

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

---

**Note**

This bit is read-only.
This field always returns the number of priority bits implemented, regardless of the Security state of the access or the value of GICD_CTLR.DS.

The division between group priority and subpriority is defined in the binary point registers ICC_BPR0 and ICC_BPR1.

If EL3 is implemented and using AArch32, physical accesses return the value from ICC_MCTLR.PRIbits.

If EL3 is implemented and using AArch64, physical accesses return the value from ICC_CTLR_EL3.PRIbits.

If EL3 is not implemented, physical accesses return the value from this field.

**Bit [7]**

Reserved, RES0.

**PMHE, bit [6]**

Priority Mask Hint Enable. Controls whether the priority mask register is used as a hint for interrupt distribution:

<table>
<thead>
<tr>
<th>PMHE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disables use of ICC_PMR as a hint for interrupt distribution.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enables use of ICC_PMR as a hint for interrupt distribution.</td>
</tr>
</tbody>
</table>

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of ICC_MCTLR.PMHE.
- If EL3 is using AArch64, this bit is an alias of ICC_CTLR_EL3.PMHE.
- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

**Bits [5:2]**

Reserved, RES0.

**EOImode, bit [1]**

EOI mode for the current Security state. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

<table>
<thead>
<tr>
<th>EOImode</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of ICC_MCTLR.EOImode_EL1{S, NS} where S or NS corresponds to the current Security state.
- If EL3 is using AArch64, this bit is an alias of ICC_CTLR_EL3.EOImode_EL1{S, NS} where S or NS corresponds to the current Security state.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.
**CBPR, bit [0]**

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 interrupts:

<table>
<thead>
<tr>
<th>CBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_BPR0 determines the preemption group for Group 0 interrupts only. ICC_BPR1 determines the preemption group for Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_BPR0 determines the preemption group for both Group 0 and Group 1 interrupts.</td>
</tr>
</tbody>
</table>

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of ICC_MCTLR.CBPR_EL1{S,NS} where S or NS corresponds to the current Security state.
- If EL3 is using AArch64, this bit is an alias of ICC_CTLR_EL3.CBPR_EL1{S,NS} where S or NS corresponds to the current Security state.
- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

**Accessing the ICC_CTLR**

Accesses to this register use the following encodings:

ICC_DIR, Interrupt Controller Deactivate Interrupt Register

The ICC_DIR characteristics are:

### Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified interrupt.

### Configuration

AArch32 System register ICC_DIR performs the same function as AArch64 System register ICC_DIR_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_DIR are UNDEFINED.

### Attributes

ICC_DIR is a 32-bit register.

### Field descriptions

The ICC_DIR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | INTID |

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR IDbits and ICC_MCTLR IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

### Accessing the ICC_DIR

There are two cases when writing to ICC_DIR_EL1 that were UNPREDICTABLE for a corresponding GICv2 write to GICC_DIR:

- When EOImode == 0. GICv3 implementations must ignore such writes. In systems supporting system error generation, an implementation might generate an SEI.
- When EOImode == 1 but no EOI has been issued. The interrupt will be de-activated by the Distributor, however the active priority in the CPU interface for the interrupt will remain set (because no EOI was issued).

Accesses to this register use the following encodings:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>

ICC_EOIR0, Interrupt Controller End Of Interrupt Register 0

The ICC_EOIR0 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 0 interrupt.

Configuration

AArch32 System register ICC_EOIR0 performs the same function as AArch64 System register ICC_EOIR0_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_EOIR0 are UNDEFINED.

Attributes

ICC_EOIR0 is a 32-bit register.

Field descriptions

The ICC_EOIR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | INTID |

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICC_IAR0 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_IDbits and ICC_MCTLR IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR to deactivate the interrupt.

The appropriate EOImode bit varies as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR EOImode.
- If EL3 is implemented and the software is executing in Monitor mode, the appropriate bit is ICC_MCTLR.EOImode_EL3.
- If EL3 is implemented and the software is not executing in Monitor mode, the bit depends on the current Security state:
  - If the software is executing in Secure state, the bit is ICC_CTLR.EOImode in the Secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOImode_EL1S.
  - If the software is executing in Non-secure state, the bit is ICC_CTLR.EOImode in the Non-secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOImode_EL1NS.
Accessing the ICC_EOIR0

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICC_IAR0, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings:

\[
\text{MCR}\{<c>\}{<q>}, \{#<opc1>, <Rt>, <CRn>, <CRm>\}, \{#<opc2>\}
\]

    end
The ICC_EOIR1 characteristics are:

**Purpose**

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 1 interrupt.

**Configuration**

AArch32 System register ICC_EOIR1 performs the same function as AArch64 System register ICC_EOIR1_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_EOIR1 are **Undefined**.

**Attributes**

ICC_EOIR1 is a 32-bit register.

**Field descriptions**

The ICC_EOIR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Pos</th>
<th>Bit Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>23-0</td>
<td>INTID</td>
<td>INTID from ICC_IAR1 access.</td>
</tr>
</tbody>
</table>

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID from the corresponding ICC_IAR1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_IDbits and ICC_MCTLR_IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR to deactivate the interrupt.

The appropriate EOImode bit varies as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR EOImode.
- If EL3 is implemented and the software is executing in Monitor mode, the appropriate bit is ICC_MCTLR_EOImode_EL3.
- If EL3 is implemented and the software is not executing in Monitor mode, the bit depends on the current Security state:
  - If the software is executing in Secure state, the bit is ICC_CTLR EOImode in the Secure instance of ICC_CTLR. This is an alias of ICC_MCTLR_EOImode_EL1S.
  - If the software is executing in Non-secure state, the bit is ICC_CTLR EOImode in the Non-secure instance of ICC_CTLR. This is an alias of ICC_MCTLR_EOImode_EL1NS.
Accessing the ICC_EOIR1

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICC_IAR1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings:

ICC_HSRE, Interrupt Controller Hyp System Register Enable register

The ICC_HSRE characteristics are:

**Purpose**

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL2.

**Configuration**

AArch32 System register ICC_HSRE bits [31:0] are architecturally mapped to AArch64 System register ICC_SRE_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_HSRE are **UNDEFINED**.

**Attributes**

ICC_HSRE is a 32-bit register.

**Field descriptions**

The ICC_HSRE bit assignments are:

<td>Non-secure EL1 accesses to ICC_SRE trap to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses to ICC_SRE do not trap to EL2.</td>
</tr>
</tbody>
</table>

If ICC_HSRE,SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_HSRE.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DIB, bit [2]**

Disable IRQ bypass.

<table>
<thead>
<tr>
<th>DIB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IRQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>IRQ bypass disabled.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and GICD_CTLR,DS is 0, this field is a read-only alias of ICC_MSRE,DIB.
If EL3 is implemented and \texttt{GICD_CTLR.DS} is 1, this field is a read-write alias of \texttt{ICC_MSRE.DIB}.

In systems that do not support IRQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

**DFB, bit [1]**

Disable FIQ bypass.

<table>
<thead>
<tr>
<th>DFB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FIQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>FIQ bypass disabled.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and \texttt{GICD_CTLR.DS} is 0, this field is a read-only alias of \texttt{ICC_MSRE.DFB}.

If EL3 is implemented and \texttt{GICD_CTLR.DS} is 1, this field is a read-write alias of \texttt{ICC_MSRE.DFB}.

In systems that do not support FIQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

**SRE, bit [0]**

System Register Enable.

<table>
<thead>
<tr>
<th>SRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The memory-mapped interface must be used. Accesses at EL2 or below to any \texttt{ICH_<em>} System register, or any EL1 or EL2 ICC_</em> register other than \texttt{ICC_SRE} or \texttt{ICC_HSRE}, are \texttt{UNDEFINED}.</td>
</tr>
<tr>
<td>0b1</td>
<td>The System register interface to the \texttt{ICH_<em>} registers and the EL1 and EL2 ICC_</em> registers is enabled for EL2.</td>
</tr>
</tbody>
</table>

If software changes this bit from 1 to 0, the results are \texttt{UNPREDICTABLE}.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and using AArch64:

- When \texttt{ICC_SRE_EL3.SRE==0} this bit is RAZ/WI.

If EL3 is implemented using AArch32:

- When \texttt{ICC_MSRE.SRE==0} this bit is RAZ/WI.

On a Warm reset, this field resets to 0.

**Accessing the ICC_HSRE**

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while \texttt{ICC_HSRE.SRE==0}, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as \texttt{UNKNOWN}.

Accesses to this register use the following encodings:

\[
\text{MRC\{<-c>{<q>\}}\{<coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>{, \{#<opc2>}}\}}
\]

<table>
<thead>
<tr>
<th>coproc</th>

MCR{<c} is not defined
The ICC_IAR0 characteristics are:

**Purpose**

The PE reads this register to obtain the INTID of the signaled Group 0 interrupt. This read acts as an acknowledge for the interrupt.

**Configuration**

AArch32 System register ICC_IAR0 performs the same function as AArch64 System register ICC_IAR0_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_IAR0 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see ‘Observability of the effects of accesses to the GIC registers’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICC_IAR0 is a 32-bit register.

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the signaled interrupt.

This is the INTID of the highest priority pending interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. These special INTIDs can be one of: 1020, 1021, or 1023. For more information, see ‘Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_IDbits and ICC_MCTLR_IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Virtual accesses to this register update ICH_VMCR.VENG0.

On a Warm reset, this field resets to 0.

**Accessing the ICC_IGRPEN0**

The lowest Exception level at which this register can be accessed is governed by the Exception level to which FIQ is routed. This routing depends on SCR.FIQ, SCR.NS and HCR.FMO.

If an interrupt is pending within the CPU interface when Enable becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
UNDEFINED;
elsif PSTATE.EL == EL1 then
  if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1'" && !ELUsingAArch32(EL3) && SCR_EL3.FIQ == '1' then
    UNDEFINED;
  elsif Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1'" && ELUsingAArch32(EL3) && PSTATE.M != M32_Monitor && SCR.FIQ == '1' then

ICC_IGRPEN1, Interrupt Controller Interrupt Group 1 Enable register

The ICC_IGRPEN1 characteristics are:

**Purpose**

Controls whether Group 1 interrupts are enabled for the current Security state.

**Configuration**

AArch32 System register ICC_IGRPEN1 bits [31:0] (S) are architecturally mapped to AArch64 System register ICC_IGRPEN1_EL1[31:0] (S).

AArch32 System register ICC_IGRPEN1 bits [31:0] (NS) are architecturally mapped to AArch64 System register ICC_IGRPEN1_EL1[31:0] (NS).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_IGRPEN1 are UNDEFINED.

**Attributes**

ICC_IGRPEN1 is a 32-bit register.

**Field descriptions**

The ICC_IGRPEN1 bit assignments are:

<table>

</tbody>
</table>

**Bits [31:1]**

Reserved, RES0.

**Enable, bit [0]**

Enables Group 1 interrupts for the current Security state.

<table>
<thead>
<tr>
<th>Enable</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 1 interrupts are disabled for the current Security state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 1 interrupts are enabled for the current Security state.</td>
</tr>
</tbody>
</table>

Virtual accesses to this register update ICH_VMCR.VENG1.

If EL3 is present:

- This bit is a read/write alias of ICC_MGRPEN1_EnableGrp1{S, NS} as appropriate if EL3 is using AArch32, or ICC_IGRPEN1_EL3_EnableGrp1{S, NS} as appropriate if EL3 is using AArch64.
- When this register is accessed at EL3, the copy of this register appropriate to the current setting of SCR.NS is accessed.

On a Warm reset, this field resets to 0.
Accessing the ICC_IGRPEN1

The lowest Exception level at which this register can be accessed is governed by the Exception level to which IRQ is routed. This routing depends on SCR.IQR, SCR.NS and HCR.IMO.

If an interrupt is pending within the CPU interface when Enable becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} \ <\text{coproc}, \ {#}<opc1>, \ <Rt>, \ <CRn>, \ <CRm>{, \ {#}<opc2>}\}
\]

<table>

ICC_MCTLR, Interrupt Controller Monitor Control Register

The ICC_MCTLR characteristics are:

**Purpose**

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

**Configuration**

AArch32 System register ICC_MCTLR bits [31:0] can be mapped to AArch64 System register ICC_CTLR_EL3[31:0], but this is not architecturally mandated.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_MCTLR are UNDEFINED.

**Attributes**

ICC_MCTLR is a 32-bit register.

**Field descriptions**

The ICC_MCTLR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ExtRange | RSSnDS | RES0A3V | SEIS | IDbits | PRIbits | RES0PMHE | RM | EOImode_EL1NS | EOImode_EL1S | CBRPR_EL1NS | CBRPR_EL1S |  |

**Bits [31:20]**

Reserved, RES0.

**ExtRange, bit [19]**

Extended INTID range (read-only).

<table>
<thead>
<tr>
<th>ExtRange</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>CPU interface does not support INTIDs in the range 1024..8191. Behavior is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.</td>
</tr>
<tr>
<td>0b1</td>
<td>CPU interface supports INTIDs in the range 1024..8191. All INTIDs in the range 1024..8191 are treated as requiring deactivation.</td>
</tr>
</tbody>
</table>

**Note**

Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.

**RSS, bit [18]**

Range Selector Support. Possible values are:
<table>
<thead>
<tr>
<th>RSS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 15 are supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 255 are supported.</td>
</tr>
</tbody>
</table>

This bit is read-only.

**nDS, bit [17]**

Disable Security not supported. Read-only and writes are ignored.

<table>
<thead>
<tr>
<th>nDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic supports disabling of security.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic does not support disabling of security, and requires that security is not disabled.</td>
</tr>
</tbody>
</table>

**Bit [16]**

Reserved, RES0.

**A3V, bit [15]**

Affinity 3 Valid. Read-only and writes are ignored.

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic does not support non-zero values of the Aff3 field in SGI generation System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports non-zero values of the Aff3 field in SGI generation System registers.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTLR.A3V is an alias of ICC_MCTLR.A3V

**SEIS, bit [14]**

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports generation of SEIs.

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic does not support generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic supports generation of SEIs.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTLR.SEIS is an alias of ICC_MCTLR.SEIS

**IDbits, bits [13:11]**

Identifier bits. Read-only and writes are ignored. Indicates the number of physical interrupt identifier bits supported.

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b001</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If EL3 is present, ICC_CTLR.IDbits is an alias of ICC_MCTLR.IDbits

**PRIbits, bits [10:8]**

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).
Note
This field always returns the number of priority bits implemented, regardless of the value of SCR.NS or the value of GICD_CTRLR.DS.

The division between group priority and subpriority is defined in the binary point registers ICC_BPR0 and ICC_BPR1. This field determines the minimum value of ICC_BPR0.

Bit [7]
Reserved, RES0.

PMHE, bit [6]
Priority Mask Hint Enable.

<table>
<thead>
<tr>
<th>PMHE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disables use of the priority mask register as a hint for interrupt distribution.</td>
</tr>
<tr>
<td>0b1</td>
<td>Enables use of the priority mask register as a hint for interrupt distribution.</td>
</tr>
</tbody>
</table>

Software must write ICC_PM to 0xFF before clearing this field to 0.

An implementation might choose to make this field RAO/WI.

If EL3 is present, ICC_CTRLR_PMHE is an alias of ICC_MCTLR_PMHE.

On a Warm reset, this field resets to 0.

RM, bit [5]
SBZ.

The equivalent bit in AArch64 is the Routing Modifier bit. This feature is not supported when EL3 is using AArch32.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL1NS, bit [4]
EOI mode for interrupts handled at Non-secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

<table>
<thead>
<tr>
<th>EOImode_EL1NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

If EL3 is present, ICC_CTRLR(NS)_EOImode is an alias of ICC_MCTLR.EOImode_EL1NS.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL1S, bit [3]
EOI mode for interrupts handled at Secure EL1. Controls whether a write to an End of Interrupt register also deactivates the interrupt.
EOImode_EL1S | Meaning
---|---
0b0 | ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.
0b1 | ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.

If EL3 is present, ICC_CTLR(S).EOImode is an alias of ICC_MCTLR.EOImode_EL1S.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL3, bit [2]

EOI mode for interrupts handled at EL3. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL3 | Meaning
---|---
0b0 | ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.
0b1 | ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR_EL1NS, bit [1]

Common Binary Point Register, EL1 Non-secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Non-secure interrupts at EL1 and EL2.

CBPR_EL1NS | Meaning
---|---
0b0 | ICC_BPR0 determines the preemption group for Group 0 interrupts only.
0b1 | ICC_BPR0 determines the preemption group for Group 0 interrupts and Non-secure Group 1 interrupts. Non-secure accesses to GICC_BPR and ICC_BPR1 access the state of ICC_BPR0.

If EL3 is present, ICC_CTLR(NS).CBPR is an alias of ICC_MCTLR.CBPR_EL1NS.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR_EL1S, bit [0]

Common Binary Point Register, EL1 Secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Secure interrupts in Secure non-Monitor modes.

CBPR_EL1S | Meaning
---|---
0b0 | ICC_BPR0 determines the preemption group for Group 0 interrupts only.
0b1 | ICC_BPR0 determines the preemption group for Group 0 interrupts and Secure Group 1 interrupts. Secure EL1 accesses, or EL3 accesses when not in Monitor mode, to ICC_BPR1 access the state of ICC_BPR0.

If EL3 is present, ICC_CTLR(S).CBPR is an alias of ICC_MCTLR.CBPR_EL1S.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**Accessing the ICC_MCTLR**

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>}{<q>}\text{<coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>{, \{#<opc2>\}\}\
\text{coproc} & \text{opc1} & \text{CRn} & \text{CRm} & \text{opc2} \\

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
The ICC_MGRPEN1 characteristics are:

**Purpose**

Controls whether Group 1 interrupts are enabled or not.

**Configuration**

AArch32 System register ICC_MGRPEN1 bits [31:0] can be mapped to AArch64 System register ICC_IGRPEN1_EL3[31:0], but this is not architecturally mandated.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_MGRPEN1 are **UNDEFINED**.

**Attributes**

ICC_MGRPEN1 is a 32-bit register.

**Field descriptions**

The ICC_MGRPEN1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-2</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>1</td>
<td>EnableGrp1S</td>
</tr>
<tr>
<td>0</td>
<td>EnableGrp1NS</td>
</tr>
</tbody>
</table>

**EnableGrp1S, bit [1]**

Enables Group 1 interrupts for the Secure state.

<table>
<thead>
<tr>
<th>EnableGrp1S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>

The Secure ICC_IGRPEN1.Enable bit is a read/write alias of the ICC_MGRPEN1.EnableGrp1S bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

On a Warm reset, this field resets to 0.

**EnableGrp1NS, bit [0]**

Enables Group 1 interrupts for the Non-secure state.

<table>
<thead>
<tr>
<th>EnableGrp1NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>

The Non-secure ICC_IGRPEN1.Enable bit is a read/write alias of the ICC_MGRPEN1.EnableGrp1NS bit.
If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

On a Warm reset, this field resets to 0.

**Accessing the ICC_MGRPEN1**

If an interrupt is pending within the CPU interface when an Enable bit becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b110</td>
<td>0b1100</td>
<td>0b1100</td>
<td>0b111</td>
</tr>
</tbody>
</table>

```assembly
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

```assembly

    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
    AArch32.TakeHypTrapException(0x03);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  UNDEFINED;
elsif PSTATE.EL == EL3 then
  if ICC_MSRE.SRE == '0' then
    UNDEFINED;
  else
    ICC_MGRPEN1 = R[t];
```
ICC_MSRE, Interrupt Controller Monitor System Register Enable register

The ICC_MSRE characteristics are:

**Purpose**

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL3.

**Configuration**

AArch32 System register ICC_MSRE bits [31:0] can be mapped to AArch64 System register `ICC_SRE_EL3[31:0]`, but this is not architecturally mandated.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_MSRE are **UNDEFINED**.

**Attributes**

ICC_MSRE is a 32-bit register.

**Field descriptions**

The ICC_MSRE bit assignments are:

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
|   RES0 | Enable | DIB | DFB | SRE |
```

**Bits [31:4]**

Reserved, RES0.

**Enable, bit [3]**

Enable. Enables lower Exception level access to ICC_SRE and ICC_HSRE.

<table>
<thead>
<tr>
<th>Enable</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure EL1 accesses to Secure ICC_SRE trap to EL3. EL2 accesses to Non-secure ICC_SRE and ICC_HSRE trap to EL3. Non-secure EL1 accesses to ICC_SRE trap to EL3, unless these accesses are trapped to EL2 as a result of ICC_HSRE.Enable == 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure EL1 accesses to Secure ICC_SRE do not trap to EL3. EL2 accesses to Non-secure ICC_SRE and ICC_HSRE do not trap to EL3. Non-secure EL1 accesses to ICC_SRE do not trap to EL3.</td>
</tr>
</tbody>
</table>

If ICC_MSRE.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_MSRE.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
**DIB, bit [2]**

Disable IRQ bypass.

<table>
<thead>
<tr>
<th>DIB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IRQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>IRQ bypass disabled.</td>
</tr>
</tbody>
</table>

In systems that do not support IRQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

**DFB, bit [1]**

Disable FIQ bypass.

<table>
<thead>
<tr>
<th>DFB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FIQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>FIQ bypass disabled.</td>
</tr>
</tbody>
</table>

In systems that do not support FIQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

**SRE, bit [0]**

System Register Enable.

<table>
<thead>
<tr>
<th>SRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The memory-mapped interface must be used. Accesses at EL3 or below to any ICH_* System register, or any EL1, EL2, or EL3 ICC_* register other than ICC_SRE, ICC_HSRE, or ICC_MSRE, are UNDEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>The System register interface to the ICH_* registers and the EL1, EL2, and EL3 ICC_* registers is enabled for EL3.</td>
</tr>
</tbody>
</table>

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

**Accessing the ICC_MSRE**

This register is always System register accessible.

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while ICC_MSRE.SRE==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b110</td>
<td>0b1100</td>
<td>0b1100</td>
<td>0b101</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return ICC_MSRE;

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>

        UNDEFINED;
    else
        ICC_MSRE = R[t];
The ICC_PMR characteristics are:

**Purpose**

Provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

**Configuration**

AArch32 System register ICC_PMR bits [31:0] are architecturally mapped to AArch64 System register ICC_PMR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_PMR are **UNDEFINED**.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICC_PMR is a 32-bit register.

**Field descriptions**

The ICC_PMR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

The possible priority field values are as follows:

<table>
<thead>
<tr>
<th>Implemented priority bits</th>
<th>Possible priority field values</th>
<th>Number of priority levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>[7:0]</td>
<td>0x00-0xFF (0-255), all values</td>
<td>256</td>
</tr>
<tr>
<td>[7:1]</td>
<td>0x00-0xFE (0-254), even values only</td>
<td>128</td>
</tr>
<tr>
<td>[7:2]</td>
<td>0x00-0xFC (0-252), in steps of 4</td>
<td>64</td>
</tr>
<tr>
<td>[7:3]</td>
<td>0x00-0xF8 (0-248), in steps of 8</td>
<td>32</td>
</tr>
<tr>
<td>[7:4]</td>
<td>0x00-0xF0 (0-240), in steps of 16</td>
<td>16</td>
</tr>
</tbody>
</table>
Unimplemented priority bits are RAZ/WI.

On a Warm reset, this field resets to 0.

**Accessing the ICC_PMR**

Accesses to this register use the following encodings:

\[
\text{MRC}\{\langle c\rangle\}\{\langle q\rangle\} \langle\text{coproc}\rangle, \{\#\}\langle\text{opc1}\rangle, \langle\text{Rt}\rangle, \langle\text{CRn}\rangle, \langle\text{CRm}\rangle, \{\#\}\langle\text{opc2}\rangle\}

**Bits [31:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The current running priority on the CPU interface. This is the group priority of the current active interrupt.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

**Note**

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

**Accessing the ICC_RPR**

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings:
MRC{<c>{<q>}} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

**ICC_SGI0R, Interrupt Controller Software Generated Interrupt Group 0 Register**

The ICC_SGI0R characteristics are:

**Purpose**

Generates Secure Group 0 SGIs.

**Configuration**

AArch32 System register ICC_SGI0R performs the same function as AArch64 System register ICC_SGI0R_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_SGI0R are **UNDEFINED**.

**Attributes**

ICC_SGI0R is a 64-bit register.

**Field descriptions**

The ICC_SGI0R bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:56</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>55:48</td>
<td>Affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.</td>
</tr>
<tr>
<td>47:44</td>
<td>RangeSelector</td>
</tr>
<tr>
<td>36:32</td>
<td>TargetList</td>
</tr>
</tbody>
</table>

**Bits [63:56]**

Reserved, RES0.

**Aff3, bits [55:48]**

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**RS, bits [47:44]**

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value \((RS \times 16) + n\).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a **CONSTRAINED UNPREDICTABLE** choice of:

- The write is ignored.
- The RS field is treated as 0.
Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

<table>
<thead>
<tr>
<th>IRM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.&lt;target list&gt;.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupts routed to all PEs in the system, excluding &quot;self&quot;.</td>
</tr>
</tbody>
</table>

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note

This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16. If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

Accessing the ICC_SGI0R

This register allows software executing in a Secure state to generate Group 0 SGIs. It will also allow software executing in a Non-secure state to generate Group 0 SGIs, if permitted by the settings of GICR_NSACR in the Redistributor corresponding to the target PE.

When GICD_CTLR_DS==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the GICR_NSACR register associated with the target PE. For more information, see ‘Use of control registers for SGI
forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Note**

Accesses from Secure Monitor mode are treated as Secure regardless of the value of SCR.NS.

Accesses to this register use the following encodings:

\[
\text{MCRR}\{<c>\}{<q>}, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{Rt2}>, <\text{CRm}>
\]

| RES0 | Aff3 | RES0 | INTID | Aff1 | RS | RES0 | IRM | Aff2 | TargetList |

#### Bits [63:56]
Reserved, RES0.

#### Aff3, bits [55:48]
The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

#### RS, bits [47:44]
RangeSelector
Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of:

- The write is ignored.
- The RS field is treated as 0.
Bits [43:41]
Reserved, RES0.

IRM, bit [40]
Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

<table>
<thead>
<tr>
<th>IRM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.&lt;target list&gt;.</td>
</tr>
<tr>
<td>0b1</td>
<td>Interrupts routed to all PEs in the system, excluding &quot;self&quot;.</td>
</tr>
</tbody>
</table>

Aff2, bits [39:32]
The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.
If the IRM bit is 1, this field is RES0.

Bits [31:28]
Reserved, RES0.

INTID, bits [27:24]
The INTID of the SGI.

Aff1, bits [23:16]
The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.
If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]
Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.
If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note
This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16. If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.
If the IRM bit is 1, this field is RES0.

    ICC_SGIIR = R[t2]:R[t];
endif
The ICC_SRE characteristics are:

**Purpose**

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL0 and EL1.

**Configuration**

AArch32 System register ICC_SRE bits [31:0] (S) are architecturally mapped to AArch64 System register ICC_SRE_EL1[31:0] (S).

AArch32 System register ICC_SRE bits [31:0] (NS) are architecturally mapped to AArch64 System register ICC_SRE_EL1[31:0] (NS).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC_SRE are UNDEFINED.

**Attributes**

ICC_SRE is a 32-bit register.

**Field descriptions**

The ICC_SRE bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>DIB</td>
</tr>
<tr>
<td>29</td>
<td>DFBSRE</td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**DIB, bit [2]**

Disable IRQ bypass.

<table>
<thead>
<tr>
<th>DIB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IRQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>IRQ bypass disabled.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and GICD_CTRLR.DS == 0, this field is a read-only alias of ICC_MSRE.DIB.

If EL3 is implemented and GICD_CTRLR.DS == 1, and EL2 is not implemented, this field is a read-write alias of ICC_MSRE.DIB.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of ICC_HSRE.DIB.

If GICD_CTRLR.DS == 1 and EL2 is implemented, this field is a read-only alias of ICC_HSRE.DIB.

In systems that do not support IRQ bypass, this field is RAO/WI.

On a Warm reset, this field resets to 0.
**DFB, bit [1]**

Disable FIQ bypass.

<table>
<thead>
<tr>
<th>DFB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FIQ bypass enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>FIQ bypass disabled.</td>
</tr>
</tbody>
</table>

If EL3 is implemented and \texttt{GICD_CTLR.DS == 0}, this field is a read-only alias of \texttt{ICC_MSRE.DFB}.

If EL3 is implemented and \texttt{GICD_CTLR.DS == 1}, and EL2 is not implemented, this field is a read-write alias of \texttt{ICC_MSRE.DFB}.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of \texttt{ICC_HSRE.DFB}.

If \texttt{GICD_CTLR.DS == 1} and EL2 is implemented, this field is a read-only alias of \texttt{ICC_HSRE.DFB}.

In systems that do not support FIQ bypass, this field is RAO/WI.

On a Warm reset, this field resets to 0.

**SRE, bit [0]**

System Register Enable.

<table>
<thead>
<tr>
<th>SRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The memory-mapped interface must be used. Accesses at EL1 to any ICC_* System register other than ICC_SRE are UNDEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>The System register interface for the current Security state is enabled.</td>
</tr>
</tbody>
</table>

If software changes this bit from 1 to 0 in the Secure instance of this register, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and using AArch64:

- When \texttt{ICC_SRE_EL3.SRE==0} the Secure copy of this bit is RAZ/WI.
- When \texttt{ICC_SRE_EL3.SRE==0} the Non-secure copy of this bit is RAZ/WI.

If EL3 is implemented and using AArch32:

- When \texttt{ICC_MSRE.SRE==0} the Secure copy of this bit is RAZ/WI.
- When \texttt{ICC_MSRE.SRE==0} the Non-secure copy of this bit is RAZ/WI.

If EL2 is implemented and using AArch64:

- When \texttt{ICC_SRE_EL2.SRE==0} the Non-secure copy of this bit is RAZ/WI.

If EL2 is implemented and using AArch32:

- When \texttt{ICC_HSRE.SRE==0} the Non-secure copy of this bit is RAZ/WI.

On a Warm reset, this field resets to 0.

**Accessing the ICC_SRE**

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while ICC_SRE.SRE==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

Accesses to this register use the following encodings:
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>

<td>P0</td>
</tr>
</tbody>
</table>

P<x>, bit [x], for x = 31 to 0

Provides the access to the virtual active priorities for Group 0 interrupts. Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There is no Group 0 interrupt active at the priority corresponding to that bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>There is a Group 0 interrupt active at the priority corresponding to that bit.</td>
</tr>
</tbody>
</table>

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP0R0 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP0R0 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH_AP0R1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP0R0 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH_AP0R1 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP0R2 in the bits corresponding to 10:Priority[5:1].
• The active state of preemption levels 192 - 254 are held in ICH_AP0R3 in the bits corresponding to 11:Priority[5:1].

Note

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n> and ICH_AP1R<n> might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

On a Warm reset, this field resets to 0.

**Accessing the ICH_AP0R<n>**

ICH_AP0R1 is only implemented in implementations that support 6 or more bits of preemption. ICH_AP0R2 and ICH_AP0R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR.PREbits

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

• ICH_AP0R<n>
• ICH_AP1R<n>

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>

ICH_AP1R<n>, Interrupt Controller Hyp Active Priorities Group 1 Registers, n = 0 - 3

The ICH_AP1R<n> characteristics are:

**Purpose**

Provides information about Group 1 active priorities for EL2.

**Configuration**

AArch32 System register ICH_AP1R<n> bits [31:0] are architecturally mapped to AArch64 System register ICH_AP1R<n>_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH_AP1R<n> are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

ICH_AP1R<n> is a 32-bit register.

**Field descriptions**

The ICH_AP1R<n> bit assignments are:

P<x>, bit [x], for x = 31 to 0

Group 1 interrupt active priorities. Possible values of each bit are:

<table>
<thead>
<tr>
<th>P&lt;x&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>There is no Group 1 interrupt active at the priority corresponding to that bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>There is a Group 1 interrupt active at the priority corresponding to that bit.</td>
</tr>
</tbody>
</table>

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP1R0 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP1R0 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH_AP1R1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP1R0 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH_AP1R1 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP1R2 in the bits corresponding to 10:Priority[5:1].
• The active state of preemption levels 192 - 254 are held in ICH_AP1R3 in the bits corresponding to 11:Priority[5:1].

**Note**

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n> and ICH_AP1R<n> might result in **UNPREDICTABLE** behavior of the interrupt prioritization system for virtual interrupts.

On a Warm reset, this field resets to 0.

**Accessing the ICH_AP1R<n>**

ICH_AP1R1 is only implemented in implementations that support 6 or more bits of preemption. ICH_AP1R2 and ICH_AP1R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are **UNDEFINED**.

**Note**

The number of bits of preemption is indicated by ICH_VTR.PREbits

Writing to the active priority registers in any order other than the following order will result in **UNPREDICTABLE** behavior:

- ICH_AP0R<n>
- ICH_AP1R<n>

Accesses to this register use the following encodings:

    elsif PSTATE.EL == EL3 then
        if ICC_MSRE.SRE == '0' then
            UNDEFINED;
        else
            ICH_AP1R[UInt(opc2<1:0>)] = R[t];
        end
end
**ICH_EISR, Interrupt Controller End of Interrupt Status Register**

The ICH_EISR characteristics are:

**Purpose**

Indicates which List registers have outstanding EOI maintenance interrupts.

**Configuration**

AArch32 System register ICH_EISR bits [31:0] are architecturally mapped to AArch64 System register `ICH_EISR_EL2[31:0]`.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH_EISR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

ICH_EISR is a 32-bit register.

**Field descriptions**

The ICH_EISR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | Status15 | Status14 | Status13 | Status12 | Status11 | Status10 | Status9 | Status8 | Status7 |

**Bits [31:16]**

Reserved, RES0.

**Status<n>, bit [n], for n = 15 to 0**

EOI maintenance interrupt status bit for List register <n>:

<table>
<thead>
<tr>
<th>Status&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>List register &lt;n&gt;, ICH_LR&lt;n&gt;, does not have an EOI maintenance interrupt.</td>
</tr>
<tr>
<td>0b1</td>
<td>List register &lt;n&gt;, ICH_LR&lt;n&gt;, has an EOI maintenance interrupt that has not been handled.</td>
</tr>
</tbody>
</table>

For any ICH_LR<n>, the corresponding status bit is set to 1 if all of the following are true:

- `ICH_LRC<n>.State` is 0b00.
- `ICH_LRC<n>.HW` is 0.
- `ICH_LRC<n>.EOI` (bit [9]) is 1, indicating that when the interrupt corresponding to that List register is deactivated, a maintenance interrupt is asserted.

On a Warm reset, this field resets to 0.

**Accessing the ICH_EISR**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
    AArch32.TakeHypTrapException(0x03);
  else
    UNDEFINED;
endif
elsif PSTATE.EL == EL2 then
  if ICC_HSRE.SRE == '0' then
    UNDEFINED;
  else
    return ICH_EISR;
endif
elsif PSTATE.EL == EL3 then
  if ICC_MSRE.SRE == '0' then
    UNDEFINED;
  else
    return ICH_EISR;
endif
ICH_ELRSR, Interrupt Controller Empty List Register Status Register

The ICH_ELRSR characteristics are:

**Purpose**

Indicates which List registers contain valid interrupts.

**Configuration**

AArch32 System register ICH_ELRSR bits [31:0] are architecturally mapped to AArch64 System register ICH_ELRSR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH_ELRSR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

ICH_ELRSR is a 32-bit register.

**Field descriptions**

The ICH_ELRSR bit assignments are:

| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0| Status15 | Status14 | Status13 | Status12 | Status11 | Status10 | Status9 | Status8 | Status7 |

**Bits [31:16]**

Reserved, RES0.

**Status<n>, bit [n], for n = 15 to 0**

Status bit for List register <n>, ICH_LR<n>:

<table>
<thead>
<tr>
<th>Status&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>List register ICH_LR&lt;n&gt;, if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.</td>
</tr>
<tr>
<td>0b1</td>
<td>List register ICH_LR&lt;n&gt; does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.</td>
</tr>
</tbody>
</table>

For any List register <n>, the corresponding status bit is set to 1 if ICH_LRC<n>.State is 0b0 and either ICH_LRC<n>.HW is 1 or ICH_LRC<n>.EOI (bit [9]) is 0.

**Accessing the ICH_ELRSR**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
    end if;
elsif PSTATE.EL == EL2 then
    if ICC_HSRE.SRE == '0' then
        UNDEFINED;
    else
        return ICH_ELRSR;
    end if;
elsif PSTATE.EL == EL3 then
    if ICC_MSRE.SRE == '0' then
        UNDEFINED;
    else
        return ICH_ELRSR;
    end if;
ICH_HCR, Interrupt Controller Hyp Control Register

The ICH_HCR characteristics are:

**Purpose**

Controls the environment for VMs.

**Configuration**

AArch32 System register ICH_HCR bits [31:0] are architecturally mapped to AArch64 System register ICH_HCR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH_HCR are **UNDEFINED**.

If EL2 is not implemented, this register is **RES0** from EL3.

**Attributes**

ICH_HCR is a 32-bit register.

**Field descriptions**

The ICH_HCR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**EOICount, bits [31:27]**

This field is incremented whenever a successful write to a virtual EOIR or DIR register would have resulted in a virtual interrupt deactivation. That is either:

- A virtual write to EOIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is zero and no List Register was found.
- A virtual write to DIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is one and no List Register was found.

This allows software to manage more active interrupts than there are implemented List Registers.

It is **CONSTRAINED UNPREDICTABLE** whether a virtual write to EOIR that does not clear a bit in the Active Priorities registers (ICH_AP0R<n>/ICH_AP1R<n>) increments EOICount. Permitted behaviors are:

- Increment EOICount.
- Leave EOICount unchanged.

On a Warm reset, this field resets to 0.

**Bits [26:15]**

Reserved, RES0.

**TDIR, bit [14]**

Trap Non-secure EL1 writes to ICC_DIR and ICV_DIR.
ICH_HCR, Interrupt Controller Hyp Control Register

<table>
<thead>
<tr>
<th>TDIR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1 writes of ICC_DIR and ICV_DIR are not trapped to EL2, unless trapped by other mechanisms.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 writes of ICV_DIR are trapped to EL2. It is IMPLEMENTATION DEFINED whether Non-secure writes of ICC_DIR are trapped. Not trapping ICC_DIR writes is DEPRECATED.</td>
</tr>
</tbody>
</table>

Support for this bit is OPTIONAL, with support indicated by ICH_VTR.

If the implementation does not support this trap, this bit is RES0.

Arm deprecates not including this trap bit.

On a Warm reset, this field resets to 0.

**TSEI, bit [13]**

Trap all locally generated SEIs. This bit allows the hypervisor to intercept locally generated SEIs that would otherwise be taken at Non-secure EL1.

<table>
<thead>
<tr>
<th>TSEI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Locally generated SEIs do not cause a trap to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Locally generated SEIs trap to EL2.</td>
</tr>
</tbody>
</table>

If ICH_VTR.SEIS is 0, this bit is RES0.

On a Warm reset, this field resets to 0.

**TALL1, bit [12]**

Trap all Non-secure EL1 accesses to ICC_* and ICV_* System registers for Group 1 interrupts to EL2.

<table>
<thead>
<tr>
<th>TALL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts proceed as normal.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts trap to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**TALL0, bit [11]**

Trap all Non-secure EL1 accesses to ICC_* and ICV_* System registers for Group 0 interrupts to EL2.

<table>
<thead>
<tr>
<th>TALL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts proceed as normal.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts trap to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**TC, bit [10]**

Trap all Non-secure EL1 accesses to System registers that are common to Group 0 and Group 1 to EL2.

<table>
<thead>
<tr>
<th>TC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure EL1 accesses to common registers proceed as normal.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure EL1 accesses to common registers trap to EL2.</td>
</tr>
</tbody>
</table>

This affects accesses to ICC_SGI0R, ICC_SGI1R, ICC_ASGI1R, ICC_CTLR, ICC_DIR, ICC_PMR, ICC_RPR, ICV_CTLR, ICV_DIR, ICV_PMR, and ICV_RPR.

On a Warm reset, this field resets to 0.
Bit [9]

Reserved, RES0.

vSGIEOICount, bit [8]

When FEAT_Gicv4p1 is implemented:

Controls whether deactivation of virtual SGIs can increment ICH_HCR_ELOIcount

<table>
<thead>
<tr>
<th>vSGIEOICount</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Deactivation of virtual SGIs can increment</td>
</tr>
<tr>
<td></td>
<td>ICH_HCR.EOICount.</td>
</tr>
<tr>
<td>0b1</td>
<td>Deactivation of virtual SGIs does not increment</td>
</tr>
<tr>
<td></td>
<td>ICH_HCR.EOICount.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

VGrp1DIE, bit [7]

VM Group 1 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is disabled:

<table>
<thead>
<tr>
<th>VGrp1DIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when</td>
</tr>
<tr>
<td></td>
<td>ICH_VMCR.VENG1 is 0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

VGrp1EIE, bit [6]

VM Group 1 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is enabled:

<table>
<thead>
<tr>
<th>VGrp1EIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when</td>
</tr>
<tr>
<td></td>
<td>ICH_VMCR.VENG1 is 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

VGrp0DIE, bit [5]

VM Group 0 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is disabled:

<table>
<thead>
<tr>
<th>VGrp0DIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when</td>
</tr>
<tr>
<td></td>
<td>ICH_VMCR.VENG0 is 0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

VGrp0EIE, bit [4]

VM Group 0 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is enabled:
ICH_HCR, Interrupt Controller Hyp Control Register

<table>
<thead>
<tr>
<th>VGrp0EIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled when ICH_VMCR.VENG0 is 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**NPIE, bit [3]**

No Pending Interrupt Enable. Enables the signaling of a maintenance interrupt when there are no List registers with the State field set to 0b01 (pending):

<table>
<thead>
<tr>
<th>NPIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**LRENPIE, bit [2]**

List Register Entry Not Present Interrupt Enable. Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register entry for an EOI request:

<table>
<thead>
<tr>
<th>LRENPIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt is asserted while the EOICount field is not 0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**UIE, bit [1]**

Underflow Interrupt Enable. Enables the signaling of a maintenance interrupt when the List registers are empty, or hold only one valid entry:

<table>
<thead>
<tr>
<th>UIE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt is asserted if none, or only one, of the List register entries is marked as a valid interrupt.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**En, bit [0]**

Enable. Global enable bit for the virtual CPU interface:

<table>
<thead>
<tr>
<th>En</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual CPU interface operation disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual CPU interface operation enabled.</td>
</tr>
</tbody>
</table>

When this field is set to 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of ICV_IAR0, ICV_IAR1, GICV_IAR or GICV_AIAR returns a spurious interrupt ID.

On a Warm reset, this field resets to 0.

**Accessing the ICH_HCR**

Accesses to this register use the following encodings:
ICH_HCR, Interrupt Controller Hyp Control Register

$\text{MCR}\{\text{<c>}}\{\text{<q>}}\text{ <coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>\} \{#<opc2>\}}$

<table>

    ICH_HCR = R[t];
elsif PSTATE.EL == EL3 then
  if ICC MSRE.SRE == '0' then
    UNDEFINED;
  else
    ICH_HCR = R[t];
ICH_LRC<n>, Interrupt Controller List Registers, n = 0 - 15

The ICH_LRC<n> characteristics are:

**Purpose**

Provides interrupt context information for the virtual CPU interface.

**Configuration**

AArch32 System register ICH_LRC<n> bits [31:0] are architecturally mapped to AArch64 System register ICH_LR<n>_EL2[63:32].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH_LRC<n> are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

If list register n is not implemented, then accesses to this register are UNDEFINED.

**Attributes**

ICH_LRC<n> is a 32-bit register.

**Field descriptions**

The ICH_LRC<n> bit assignments are:

<table>
<thead>
<tr>
<th>State</th>
<th>HW</th>
<th>Group</th>
<th>Priority</th>
<th>pINTID</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 30</td>
<td>29</td>
<td>28</td>
<td>27 26 25</td>
<td>24 23 22</td>
</tr>
</tbody>
</table>

**State, bits [31:30]**

The state of the interrupt:

<table>
<thead>
<tr>
<th>State</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Invalid (Inactive).</td>
</tr>
<tr>
<td>0b01</td>
<td>Pending.</td>
</tr>
<tr>
<td>0b10</td>
<td>Active.</td>
</tr>
<tr>
<td>0b11</td>
<td>Pending and active.</td>
</tr>
</tbody>
</table>

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the invalid state are ignored, except for the purpose of generating virtual maintenance interrupts.

For hardware interrupts, the pending and active state is held in the physical Distributor rather than the virtual CPU interface. A hypervisor must only use the pending and active state for software originated interrupts, which are typically associated with virtual devices, or SGIs.

On a Warm reset, this field resets to 0.

**HW, bit [29]**

Indicates whether this virtual interrupt maps directly to a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt with the INTID that the pINTID field indicates.
**Meaning**

<table>
<thead>
<tr>
<th>HW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The interrupt is triggered entirely by software. No notification is</td>
</tr>
<tr>
<td></td>
<td>sent to the Distributor when the virtual interrupt is deactivated.</td>
</tr>
<tr>
<td>0b1</td>
<td>The interrupt maps directly to a hardware interrupt. A deactivate</td>
</tr>
<tr>
<td></td>
<td>interrupt request is sent to the Distributor when the virtual</td>
</tr>
<tr>
<td></td>
<td>interrupt is deactivated, using the pINTID field from this register</td>
</tr>
<tr>
<td></td>
<td>to indicate the physical INTID. If <strong>ICH_VMCR</strong> VEOIM is 0, this request</td>
</tr>
<tr>
<td></td>
<td>corresponds to a write to <strong>ICC_EOIR0</strong> or <strong>ICC_EOIR1</strong>. Otherwise,</td>
</tr>
<tr>
<td></td>
<td>it corresponds to a write to <strong>ICC_DIR</strong>.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**Group, bit [28]**

Indicates the group for this virtual interrupt.

<table>
<thead>
<tr>
<th>Group</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This is a Group 0 virtual interrupt. <strong>ICH_VMCR</strong> VFIQEn determines</td>

<tr>
<td></td>
<td>whether it is signaled as a virtual IRQ or as a virtual FIQ, and</td>
</tr>
<tr>
<td></td>
<td><strong>ICH_VMCR</strong> VENG0 enables signaling of this interrupt to the virtual</td>
</tr>
<tr>
<td></td>
<td>machine.</td>
</tr>
<tr>
<td>0b1</td>
<td>This is a Group 1 virtual interrupt, signaled as a virtual IRQ.</td>
</tr>
<tr>
<td></td>
<td><strong>ICH_VMCR</strong> VENG1 enables the signaling of this interrupt to the</td>
</tr>
<tr>
<td></td>
<td>virtual machine. If <strong>ICH_VMCR</strong> VCBPR is 0, then <strong>ICC_BPR1</strong></td>
</tr>
<tr>
<td></td>
<td>determines if a pending Group 1 interrupt has sufficient priority to</td>
</tr>
<tr>
<td></td>
<td>preempt current execution. Otherwise, <strong>ICH_LR&lt;n&gt;</strong> determines</td>
</tr>
<tr>
<td></td>
<td>preemption.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**Bits [27:24]**

Reserved, RES0.

**Priority, bits [23:16]**

The priority of this interrupt.

It is IMPLEMENTATION DEFINED how many bits of priority are implemented, though at least five bits must be implemented. Unimplemented bits are RES0 and start from bit[16] up to bit[18]. The number of implemented bits can be discovered from **ICH_VTR** PRIbits.

On a Warm reset, this field resets to 0.

**Bits [15:13]**

Reserved, RES0.

**pINTID, bits [12:0]**

Physical INTID, for hardware interrupts.

When **ICH_LRC<n>**.HW is 0 (there is no corresponding physical interrupt), this field has the following meaning:

- Bits[12:10] : RES0.
- Bit[9] : EOI. If this bit is 1, then when the interrupt identified by vINTID is deactivated, an EOI maintenance interrupt is asserted.
- Bits[8:0] : Reserved, RES0.

When **ICH_LRC<n>**.HW is 1 (there is a corresponding physical interrupt):

- This field indicates the physical INTID. This field is only required to implement enough bits to hold a valid value for the implemented INTID size. Any unused higher order bits are RES0.
When ICC_CTLR_EL1.ExtRange is 0, then bits[44:42] of this field are RES0.

- If the value of pINTID is not a valid INTID, behavior is UNPREDICTABLE. If the value of pINTID indicates a PPI, this field applies to the PPI associated with this same physical PE ID as the virtual CPU interface requesting the deactivation.

A hardware physical identifier is only required in List Registers for interrupts that require deactivation. This means only 13 bits of Physical INTID are required, regardless of the number specified by ICC_CTLR.IDbits.

On a Warm reset, this field resets to 0.

**Accessing the ICH_LRC<n>**

ICH_LRC<n> and ICH_LRC<n> can be updated independently.

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>}\ <\text{coproc}\>,\

ICH_LR<n>, Interrupt Controller List Registers, n = 0 - 15

The ICH_LR<n> characteristics are:

**Purpose**

Provides interrupt context information for the virtual CPU interface.

**Configuration**

AArch32 System register ICH_LR<n> bits [31:0] are architecturally mapped to AArch64 System register ICH_LR<n>_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH_LR<n> are **UNDEFINED**.

If EL2 is not implemented, this register is **RES0** from EL3.

If list register n is not implemented, then accesses to this register are **UNDEFINED**.

**Attributes**

ICH_LR<n> is a 32-bit register.

**Field descriptions**

The ICH_LR<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | vINTID |

**vINTID**, bits [31:0]

Virtual INTID of the interrupt.

If the value of vINTID is 1020-1023 and ICH_LRC<n>.State!=0b00 (Inactive), behavior is **UNPREDICTABLE**.

Behavior is **UNPREDICTABLE** if two or more List Registers specify the same vINTID when:

- ICH_LRC<n>.State == 01.
- ICH_LRC<n>.State == 10.
- ICH_LRC<n>.State == 11.

It is **IMPLEMENTATION DEFINED** how many bits are implemented, though at least 16 bits must be implemented.

Unimplemented bits are **RES0**. The number of implemented bits can be discovered from ICH_VTR.IDbits.

**Note**

When a VM is using memory-mapped access to the GIC, software must ensure that the correct source PE ID is provided in bits[12:10].

On a Warm reset, this field resets to 0.

**Accessing the ICH_LR<n>**

ICH_LR<n> and ICH_LRC<n> can be updated independently.
Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}\{<q>\}\{<coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>\}, \{#<opc2>\}\
\]

<table>

ICH_MISR, Interrupt Controller Maintenance Interrupt State Register

The ICH_MISR characteristics are:

**Purpose**

Indicates which maintenance interrupts are asserted.

**Configuration**

AArch32 System register ICH_MISR bits [31:0] are architecturally mapped to AArch64 System register ICH_MISR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH_MISR are **UNDEFINED**.

If EL2 is not implemented, this register is **RES0** from EL3.

**Attributes**

ICH_MISR is a 32-bit register.

**Field descriptions**

The ICH_MISR bit assignments are:

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0
|RES0| VGrp1D|VGrp1E|VGrp0D|VGrp0E|NP|LREN|RP|U|EO|
```

**Bits [31:8]**

Reserved, **RES0**.

**VGrp1D, bit [7]**

vPE Group 1 Disabled.

<table>
<thead>
<tr>
<th>VGrp1D</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>vPE Group 1 Disabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>vPE Group 1 Disabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when ICH_HCR.VGrp1DIE is 1 and ICH_VMCR.VENG0 is 0.

On a Warm reset, this field resets to 0.

**VGrp1E, bit [6]**

vPE Group 1 Enabled.

<table>
<thead>
<tr>
<th>VGrp1E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>vPE Group 1 Enabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>vPE Group 1 Enabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when ICH_HCR.VGrp1EIE is 1 and ICH_VMCR.VENG1 is 1.

On a Warm reset, this field resets to 0.
**VGrp0D, bit [5]**

vPE Group 0 Disabled.

<table>
<thead>
<tr>
<th>VGrp0D</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>vPE Group 0 Disabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>vPE Group 0 Disabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when \texttt{ICH\_HCR}\_VGrp0DIE is 1 and \texttt{ICH\_VMCR}\_VENG0 is 0.

On a Warm reset, this field resets to 0.

**VGrp0E, bit [4]**

vPE Group 0 Enabled.

<table>
<thead>
<tr>
<th>VGrp0E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>vPE Group 0 Enabled maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>vPE Group 0 Enabled maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when \texttt{ICH\_HCR}\_VGrp0EIE is 1 and \texttt{ICH\_VMCR}\_VENG0 is 1.

On a Warm reset, this field resets to 0.

**NP, bit [3]**

No Pending.

<table>
<thead>
<tr>
<th>NP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Pending maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>No Pending maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when \texttt{ICH\_HCR}\_NPIE is 1 and no List register is in pending state.

On a Warm reset, this field resets to 0.

**LRENP, bit [2]**

List Register Entry Not Present.

<table>
<thead>
<tr>
<th>LRENP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>List Register Entry Not Present maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>List Register Entry Not Present maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when \texttt{ICH\_HCR}\_LRENPIE is 1 and \texttt{ICH\_HCR}\_EOIcount is non-zero.

On a Warm reset, this field resets to 0.

**U, bit [1]**

Underflow.

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Underflow maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Underflow maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when \texttt{ICH\_HCR}\_UIE is 1 and zero or one of the List register entries are marked as a valid interrupt, that is, if the corresponding \texttt{ICH\_LRC<n>}\_State bits do not equal 0x0.

On a Warm reset, this field resets to 0.
EOI, bit [0]

End OfInterrupt.

<table>
<thead>
<tr>
<th>EOI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>End Of Interrupt maintenance interrupt not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>End Of Interrupt maintenance interrupt asserted.</td>
</tr>
</tbody>
</table>

This maintenance interrupt is asserted when at least one bit in ICH_EISR is 1.

On a Warm reset, this field resets to 0.

Accessing the ICH_MISR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>

ICH_VMCR, Interrupt Controller Virtual Machine Control Register

The ICH_VMCR characteristics are:

Purpose

Enables the hypervisor to save and restore the virtual machine view of the GIC state.

Configuration

AArch32 System register ICH_VMCR bits [31:0] are architecturally mapped to AArch64 System register ICH_VMCR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH_VMCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_VMCR is a 32-bit register.

Field descriptions

The ICH_VMCR bit assignments are:

VPMR, bits [31:24]

Virtual Priority Mask. The priority mask level for the virtual CPU interface. If the priority of a pending virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

This field is an alias of ICV_PMR.Priority.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

VBPR0, bits [23:21]

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if ICH_VMCR.VCBPR == 1.

This field is an alias of ICV_BPR0.BinaryPoint.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

VBPR1, bits [20:18]

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption if ICH_VMCR.VCBPR == 0.

This field is an alias of ICV_BPR1.BinaryPoint.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bits [17:10]

Reserved, RES0.

VEOIM, bit [9]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

<table>
<thead>
<tr>
<th>VEOIM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICV_EOIR0 and ICV_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR are UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICV_EOIR0 and ICV_EOIR1 provide priority drop functionality only. ICV_DIR provides interrupt deactivation functionality.</td>
</tr>
</tbody>
</table>

This bit is an alias of ICV_CTLR.EOImode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:5]

Reserved, RES0.

VCBPR, bit [4]

Virtual Common Binary Point Register. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VCBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>ICV_BPR0 determines the preemption group for virtual Group 0 interrupts only. ICV_BPR1 determines the preemption group for virtual Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>ICV_BPR0 determines the preemption group for both virtual Group 0 and virtual Group 1 interrupts. Reads of ICV_BPR1 return ICV_BPR0 plus one, saturated to 0b111. Writes to ICV_BPR1 are ignored.</td>
</tr>
</tbody>
</table>

This field is an alias of ICV_CTLR.CBPR.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

VFIQEn, bit [3]

Virtual FIQ enable. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VFIQEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Group 0 virtual interrupts are presented as virtual IRQs.</td>
</tr>
<tr>
<td>0b1</td>
<td>Group 0 virtual interrupts are presented as virtual FIQs.</td>
</tr>
</tbody>
</table>

This bit is an alias of GICV_CTLR.FIQEn.

In implementations where the Non-secure copy of ICC_SRE.SRE is always 1, this bit is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

VAckCtl, bit [2]

Virtual AckCtl. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VAckCtl</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an INTID of 1022.</td>
</tr>
<tr>
<td>0b1</td>
<td>If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the INTID of the corresponding interrupt.</td>
</tr>
</tbody>
</table>
This bit is an alias of \texttt{GICV_CTLR.AckCtl}.

This field is supported for backwards compatibility with GICv2. Arm deprecates the use of this field.

In implementations where the Non-secure copy of \texttt{ICC_SRE.SRE} is always 1, this bit is \texttt{RES0}.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{VENG1, bit [1]}

Virtual Group 1 interrupt enable. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VENG1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>

This bit is an alias of \texttt{ICV_IGRPEN1.Enable}.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{VENG0, bit [0]}

Virtual Group 0 interrupt enable. Possible values of this bit are:

<table>
<thead>
<tr>
<th>VENG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual Group 0 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual Group 0 interrupts are enabled.</td>
</tr>
</tbody>
</table>

This bit is an alias of \texttt{ICV_IGRPEN0.Enable}.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

\textbf{Accessing the ICH_VMCR}

When EL2 is using System register access, EL1 using either System register or memory-mapped access must be supported.

Accesses to this register use the following encodings:

\[
\text{MRC}<c>{<q>} <coproc>, {#}<opc1>, <CRn>, <CRm>{, {#}<opc2>}\]

\[
\begin{array}{|l|l|l|l|l|}
\hline
\text{coproc} & \text{opc1} & \text{CRn} & \text{CRm} & \text{opc2} \\
\hline
0b1111 & 0b100 & 0b1100 & 0b1011 & 0b111 \\
\hline
\end{array}
\]

if PSTATE.EL == EL0 then

  else
    ICH_VMCR = R[t];
The ICH_VTR characteristics are:

**Purpose**

Reports supported GIC virtualization features.

**Configuration**

AArch32 System register ICH_VTR bits [31:0] are architecturally mapped to AArch64 System register ICH_VTR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH_VTR are **UNDEFINED**.

If EL2 is not implemented, all bits in this register are **RES0** from EL3, except for nV4, which is **RES1** from EL3.

**Attributes**

ICH_VTR is a 32-bit register.

**Field descriptions**

The ICH_VTR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| PRIbits | PREbits | IDbits | SEISA3VnV4TDS | RES0 | ListRegs |

**PRIbits, bits [31:29]**

Priority bits. The number of virtual priority bits implemented, minus one.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

This field is an alias of **ICV_CTLR.PRIbits**.

**PREbits, bits [28:26]**

The number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

The value of this field must be less than or equal to the value of ICH_VTR.PRIbits.

**IDbits, bits [25:23]**

The number of virtual interrupt identifier bits supported:

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b0001</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is an alias of **ICV_CTLR.IDbits**.
SEIS, bit [22]

SEI Support. Indicates whether the virtual CPU interface supports generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic does not support generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports generation of SEIs.</td>
</tr>
</tbody>
</table>

This bit is an alias of ICV_CTLR.SEIS.

A3V, bit [21]

Affinity 3 Valid. Possible values are:

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
</tbody>
</table>

This bit is an alias of ICV_CTLR.A3V.

nV4, bit [20]

Direct injection of virtual interrupts not supported. Possible values are:

<table>
<thead>
<tr>
<th>nV4</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The CPU interface logic supports direct injection of virtual interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td>The CPU interface logic does not support direct injection of virtual interrupts.</td>
</tr>
</tbody>
</table>

If FEAT_GICv4 is not implemented, this bit is RES1.

TDS, bit [19]

Separate trapping of Non-secure EL1 writes to ICV_DIR supported.

<table>
<thead>
<tr>
<th>TDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Implementation does not support ICH_HCR.TDIR.</td>
</tr>
<tr>
<td>0b1</td>
<td>Implementation supports ICH_HCR.TDIR.</td>
</tr>
</tbody>
</table>

Bits [18:5]

Reserved, RES0.

ListRegs, bits [4:0]

The number of implemented List registers, minus one. For example, a value of 0b01111 indicates that the maximum of 16 List registers are implemented.

**Accessing the ICH_VTR**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>

ICIALLU, Instruction Cache Invalidate All to PoU

The ICIALLU characteristics are:

**Purpose**

Invalidate all instruction caches to PoU. If branch predictors are architecturally visible, also flush branch predictors.

**Configuration**

AArch32 System instruction ICIALLU performs the same function as AArch64 System instruction IC IALLU.

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICIALLU are UNDEFINED.

**Attributes**

ICIALLU is a 32-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

**Executing the ICIALLU instruction**

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

When HCR.FB is 1, at Non-secure EL1 this instruction executes as a ICIALLUIS.

Accesses to this instruction use the following encodings:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>

ICIALLUIS, Instruction Cache Invalidate All to PoU, Inner Shareable

The ICIALLUIS characteristics are:

**Purpose**

Invalidate all instruction caches Inner Shareable to PoU. If branch predictors are architecturally visible, also flush branch predictors.

**Configuration**

AArch32 System instruction ICIALLUIS performs the same function as AArch64 System instruction ICIALLUIS.

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICIALLUIS are UNDEFINED.

**Attributes**

ICIALLUIS is a 32-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

**Executing the ICIALLUIS instruction**

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

Accesses to this instruction use the following encodings:

```

ICIMVAU, Instruction Cache line Invalidate by VA to PoU

The ICIMVAU characteristics are:

Purpose

Invalidate instruction cache line by virtual address to PoU.

Configuration

AArch32 System instruction ICIMVAU performs the same function as AArch64 System instruction IC IVAU.

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICIMVAU are UNDEFINED.

Attributes

ICIMVAU is a 32-bit System instruction.

Field descriptions

The ICIMVAU input value bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ICV_AP0R<n>, Interrupt Controller Virtual Active Priorities Group 0 Registers, n = 0 - 3

The ICV_AP0R<n> characteristics are:

**Purpose**

Provides information about virtual Group 0 active priorities.

**Configuration**

AArch32 System register ICV_AP0R<n> bits [31:0] are architecturally mapped to AArch64 System register ICV_AP0R<n>_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_AP0R<n> are UNDEFINED.

**Attributes**

ICV_AP0R<n> is a 32-bit register.

**Field descriptions**

The ICV_AP0R<n> bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | IMPLEMENTATION DEFINED |

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to 0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

**Accessing the ICV_AP0R<n>**

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV_AP0R1 is only implemented in implementations that support 6 or more bits of priority. ICV_AP0R2 and ICV_AP0R3 are only implemented in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:

- ICV_AP0R<n>.
- ICV_AP1R<n>.

Accesses to this register use the following encodings:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to 0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

Accessing the ICV_AP1R<n>

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 1 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV_AP1R1 is only implemented in implementations that support 6 or more bits of priority. ICV_AP1R2 and ICV_AP1R3 are only implemented in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:

- ICV_AP0R<n>.  
- ICV_AP1R<n>.

Accesses to this register use the following encodings:
ICV_AP1R<n>, Interrupt Controller Virtual Active Priorities Group 1 Registers, n = 0 - 3

The ICV_BPR0 characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 0 interrupt preemption.

**Configuration**

AArch32 System register ICV_BPR0 bits [31:0] are architecturally mapped to AArch64 System register ICV_BPR0_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_BPR0 are UNDEFINED.

**Attributes**

ICV_BPR0 is a 32-bit register.

**Field descriptions**

The ICV_BPR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:3]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [2:0]</td>
<td>BinaryPoint</td>
</tr>
</tbody>
</table>

**BinaryPoint, bits [2:0]**

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

<table>
<thead>
<tr>
<th>Binary point value</th>
<th>Group priority field</th>
<th>Subpriority field</th>
<th>Field with binary point</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>[7:1]</td>
<td>[0]</td>
<td>ggggggg.s</td>
</tr>
<tr>
<td>1</td>
<td>[7:2]</td>
<td>[1:0]</td>
<td>gggggg.ss</td>
</tr>
<tr>
<td>2</td>
<td>[7:3]</td>
<td>[2:0]</td>
<td>gggggg.sss</td>
</tr>
<tr>
<td>3</td>
<td>[7:4]</td>
<td>[3:0]</td>
<td>ggggg.sssss</td>
</tr>
<tr>
<td>4</td>
<td>[7:5]</td>
<td>[4:0]</td>
<td>ggg.ssssss</td>
</tr>
<tr>
<td>5</td>
<td>[7:6]</td>
<td>[5:0]</td>
<td>g.sssssss</td>
</tr>
<tr>
<td>6</td>
<td>[7]</td>
<td>[6:0]</td>
<td>.ssssssss</td>
</tr>
<tr>
<td>7</td>
<td>No preemption</td>
<td>[7:0]</td>
<td>.ssssssss</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ICV_BPR0**

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is IMPLEMENTATION DEFINED, and reported by ICV_CTLR.PRIbits.
An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is set to the minimum supported value.

Accesses to this register use the following encodings:

\[
\text{MRC}\{\langle c \rangle\}{\langle q \rangle}\ <\text{coproc},\ \{\#\}<\text{opc1},\ <Rt>,\ <\text{CRn},\ <\text{CRm}\},\ \{\#\}<\text{opc2}\}
\]

ICV_BPR1, Interrupt Controller Virtual Binary Point Register 1

The ICV_BPR1 characteristics are:

**Purpose**

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 1 interrupt preemption.

**Configuration**

AArch32 System register ICV_BPR1 bits [31:0] are architecturally mapped to AArch64 System register ICV_BPR1_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_BPR1 are UNDEFINED.

**Attributes**

ICV_BPR1 is a 32-bit register.

**Field descriptions**

The ICV_BPR1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [31:3]

Reserved, RES0.

**BinaryPoint, bits [2:0]**

If the GIC is configured to use separate binary point fields for virtual Group 0 and virtual Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

<table>
<thead>
<tr>
<th>Binary point value</th>
<th>Group priority field</th>
<th>Subpriority field</th>
<th>Field with binary point</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>.</td>
<td>.</td>
<td>.</td>
</tr>
<tr>
<td>1</td>
<td>[7:1]</td>
<td>[0]</td>
<td>ggggggg.s</td>
</tr>
<tr>
<td>2</td>
<td>[7:2]</td>
<td>[1:0]</td>
<td>ggggg.gg</td>
</tr>
<tr>
<td>3</td>
<td>[7:3]</td>
<td>[2:0]</td>
<td>ggggg.sss</td>
</tr>
<tr>
<td>4</td>
<td>[7:4]</td>
<td>[3:0]</td>
<td>gggg.sssss</td>
</tr>
<tr>
<td>5</td>
<td>[7:5]</td>
<td>[4:0]</td>
<td>ggg.sssss</td>
</tr>
<tr>
<td>6</td>
<td>[7:6]</td>
<td>[5:0]</td>
<td>gg.sssssss</td>
</tr>
<tr>
<td>7</td>
<td>[7]</td>
<td>[6:0]</td>
<td>g.sssssssss</td>
</tr>
</tbody>
</table>

Writing 0 to this field will set this field to its reset value.

If ICV_CTLR.CBPR is set to 1, Non-secure EL1 reads return ICV_BPR0 + 1 saturated to 0b111. Non-secure EL1 writes are ignored.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the ICV_BPR1

The minimum value of this register is equal to the minimum value of ICV_BPR0 plus one.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings:

\[
\text{MRC\{<c>|<q>\} \ <coproc>, \ {#}<opc1>, \ <Rt>, \ <CRn>, \ <CRm>{, \ {#}<opc2>}}
\]

<table>
<thead>
<tr>
<th>proc</th>

ICV_CTLR, Interrupt Controller Virtual Control Register

The ICV_CTLR characteristics are:

**Purpose**

Controls aspects of the behavior of the GIC virtual CPU interface and provides information about the features implemented.

**Configuration**

AArch32 System register ICV_CTLR bits [31:0] are architecturally mapped to AArch64 System register ICV_CTLR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_CTLR are **UNDEFINED**.

**Attributes**

ICV_CTLR is a 32-bit register.

**Field descriptions**

The ICV_CTLR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | ExtRange | RSS | RES0 | A3V | SEIS | IDbits | PRibits | RES0 | EOImode | CBPR |

**Bits [31:20]**

Reserved, RES0.

**ExtRange, bit [19]**

Extended INTID range (read-only).

<table>
<thead>
<tr>
<th>ExtRange</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>CPU interface does not support INTIDs in the range 1024..8191. Behaviour is <strong>UNPREDICTABLE</strong> if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.</td>
</tr>
<tr>
<td>0b1</td>
<td>CPU interface supports INTIDs in the range 1024..8191. All INTIDs in the range 1024..8191 are treated as requiring deactivation.</td>
</tr>
</tbody>
</table>

**Note**

Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.

ICV_CTLR.ExtRange is an alias of ICC_CTLR.ExtRange.

**RSS, bit [18]**

Range Selector Support. Possible values are:
Meaning

<table>
<thead>
<tr>
<th>RSS</th>
<th>Targeted SGIs with affinity level 0 values of 0 - 15 are supported.</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>Targeted SGIs with affinity level 0 values of 0 - 255 are supported.</td>
</tr>
</tbody>
</table>

This bit is read-only.

**Bits [17:16]**

Reserved, RES0.

**A3V, bit [15]**

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

<table>
<thead>
<tr>
<th>A3V</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.</td>
</tr>
</tbody>
</table>

**SEIS, bit [14]**

SEI Support. Read-only and writes are ignored. Indicates whether the virtual CPU interface supports local generation of SEIs:

<table>
<thead>
<tr>
<th>SEIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The virtual CPU interface logic does not support local generation of SEIs.</td>
</tr>
<tr>
<td>0b1</td>
<td>The virtual CPU interface logic supports local generation of SEIs.</td>
</tr>
</tbody>
</table>

**IDbits, bits [13:11]**

Identifier bits. Read-only and writes are ignored. The number of virtual interrupt identifier bits supported:

<table>
<thead>
<tr>
<th>IDbits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>16 bits.</td>
</tr>
<tr>
<td>0b01</td>
<td>24 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**PRIbits, bits [10:8]**

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation must implement at least 32 levels of physical priority (5 priority bits).

**Note**

This field always returns the number of priority bits implemented.

The division between group priority and subpriority is defined in the binary point registers ICV_BPR0 and ICV_BPR1.

**Bits [7:2]**

Reserved, RES0.

**EOImode, bit [1]**

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:
EOImode | Meaning
--- | ---
0b0  | *ICV_EOIR0* and *ICV_EOIR1* provide both priority drop and interrupt deactivation functionality. Accesses to *ICV_DIR* are UNPREDICTABLE.
0b1  | *ICV_EOIR0* and *ICV_EOIR1* provide priority drop functionality only. *ICV_DIR* provides interrupt deactivation functionality.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CBPR, bit [0]**

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both virtual Group 0 and virtual Group 1 interrupts:

<table>
<thead>
<tr>
<th>CBPR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><em>ICV_BPR0</em> determines the preemption group for virtual Group 0 interrupts only. <em>ICV_BPR1</em> determines the preemption group for virtual Group 1 interrupts.</td>
</tr>
<tr>
<td>0b1</td>
<td><em>ICV_BPR0</em> determines the preemption group for both virtual Group 0 and virtual Group 1 interrupts. Reads of <em>ICV_BPR1</em> return <em>ICV_BPR0</em> plus one, saturated to 0b111. Writes to <em>ICV_BPR1</em> are ignored.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ICV_CTLR**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} \ <\text{coproc}>\text{, }{#}\text{<opc1>}, <\text{Rt}>\text{, }<\text{CRn}>\text{, }<\text{CRm}>\{, {#}\text{<opc2>}}
\]

<table>

ICV_DIR, Interrupt Controller Deactivate Virtual Interrupt Register

The ICV_DIR characteristics are:

**Purpose**

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified virtual interrupt.

**Configuration**

AArch32 System register ICV_DIR bits [31:0] performs the same function as AArch64 System register ICV_DIR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_DIR are UNDEFINED.

**Attributes**

ICV_DIR is a 32-bit register.

**Field descriptions**

The ICV_DIR bit assignments are:

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the virtual interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

**Accessing the ICV_DIR**

When EOImode == 0, writes are ignored. In systems supporting system error generation, an implementation might generate an SEI.

Accesses to this register use the following encodings:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID from the corresponding ICV_IAR0 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the ICV_CTLR.EOImode bit is 0, a write to this register drops the priority for the virtual interrupt, and also deactivates the virtual interrupt.

If the ICV_CTLR.EOImode bit is 1, a write to this register only drops the priority for the virtual interrupt. Software must write to ICV_DIR to deactivate the virtual interrupt.

**Accessing the ICV_EOIR0**

A write to this register must correspond to the most recent valid read by this vPE from a Virtual Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICV_IAR0, otherwise the system behavior is **UNPREDICTABLE**. A valid read is a read that returns a valid INTID that is not a special INTID.

Accesses to this register use the following encodings:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

**Bits [31:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the highest priority pending virtual interrupt.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. This special INTID can take the value 1023 only. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

ICV_HPPIR1, Interrupt Controller Virtual Highest Priority Pending Interrupt Register 1

The ICV_HPPIR1 characteristics are:

**Purpose**

Indicates the highest priority pending virtual Group 1 interrupt on the virtual CPU interface.

**Configuration**

AArch32 System register ICV_HPPIR1 performs the same function as AArch64 System register ICV_HPPIR1_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_HPPIR1 are UNDEFINED.

**Attributes**

ICV_HPPIR1 is a 32-bit register.

**Field descriptions**

The ICV_HPPIR1 bit assignments are:

ICV_IAR0, Interrupt Controller Virtual Interrupt Acknowledge Register 0

The ICV_IAR0 characteristics are:

**Purpose**

The PE reads this register to obtain the INTID of the signaled virtual Group 0 interrupt. This read acts as an acknowledge for the interrupt.

**Configuration**

AArch32 System register ICV_IAR0 performs the same function as AArch64 System register ICV_IAR0_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_IAR0 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see ‘Observability of the effects of accesses to the GIC registers’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICV_IAR0 is a 32-bit register.

**Field descriptions**

ICV_IGRPEN1, Interrupt Controller Virtual Interrupt Group 1 Enable register

The ICV_IGRPEN1 characteristics are:

**Purpose**

Controls whether virtual Group 1 interrupts are enabled for the current Security state.

**Configuration**

AArch32 System register ICV_IGRPEN1 bits [31:0] are architecturally mapped to AArch64 System register ICV_IGRPEN1_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_IGRPEN1 are **UNDEFINED**.

**Attributes**

ICV_IGRPEN1 is a 32-bit register.

**Field descriptions**

The ICV_IGRPEN1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>29</td>
<td>Enable</td>
</tr>
</tbody>
</table>

**Bits [31:1]**

Reserved, RES0.

**Enable, bit [0]**

Enables virtual Group 1 interrupts.

<table>
<thead>
<tr>
<th>Enable</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Virtual Group 1 interrupts are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Virtual Group 1 interrupts are enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**Accessing the ICV_IGRPEN1**

ICV_PMR, Interrupt Controller Virtual Interrupt Priority Mask Register

The ICV_PMR characteristics are:

**Purpose**

Provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

**Configuration**

AArch32 System register ICV_PMR bits [31:0] are architecturally mapped to AArch64 System register ICV_PMR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_PMR are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICV_PMR is a 32-bit register.

**Field descriptions**

The ICV_PMR bit assignments are:

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
</tr>
<tr>
<td>Priority</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The priority mask level for the virtual CPU interface. If the priority of a virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

The possible priority field values are as follows:

<table>
<thead>
<tr>
<th>Implemented priority bits</th>
<th>Possible priority field values</th>
<th>Number of priority levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>[7:0]</td>
<td>0x00-0xFF (0-255), all values</td>
<td>256</td>
</tr>
<tr>
<td>[7:1]</td>
<td>0x00-0xFE (0-254), even values only</td>
<td>128</td>
</tr>
<tr>
<td>[7:2]</td>
<td>0x00-0xFC (0-252), in steps of 4</td>
<td>64</td>
</tr>
<tr>
<td>[7:3]</td>
<td>0x00-0xF8 (0-248), in steps of 8</td>
<td>32</td>
</tr>
<tr>
<td>[7:4]</td>
<td>0x00-0xF0 (0-240), in steps of 16</td>
<td>16</td>
</tr>
</tbody>
</table>
Unimplemented priority bits are RAZ/WI.

On a Warm reset, this field resets to 0.

ICV_RPR, Interrupt Controller Virtual Running Priority Register

The ICV_RPR characteristics are:

**Purpose**

Indicates the Running priority of the virtual CPU interface.

**Configuration**

AArch32 System register ICV_RPR performs the same function as AArch64 System register ICV_RPR_EL1.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV_RPR are UNDEFINED.

**Attributes**

ICV_RPR is a 32-bit register.

**Field descriptions**

The ICV_RPR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    | RES0 | Priority |

**Bits [31:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The current running priority on the virtual CPU interface. This is the group priority of the current active virtual interrupt.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

**Note**

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

**Accessing the ICV_RPR**

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings:

The ID_DFR0 characteristics are:

**Purpose**

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, **MIDR**.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_DFR0 bits [31:0] are architecturally mapped to AArch64 System register **ID_DFR0_EL1[31:0]**.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_DFR0 are **UNDEFINED**.

**Attributes**

ID_DFR0 is a 32-bit register.

**Field descriptions**

The ID_DFR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| TraceFilt | PerfMon | MProfDbg | MMapTrc | CopTrc | MMapDbg | CopSDbg | CopDbg |

**TraceFilt, bits [31:28]**

Armv8.4 Self-hosted Trace Extension version. Defined values are:

<table>
<thead>
<tr>
<th>TraceFilt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Armv8.4 Self-hosted Trace Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Armv8.4 Self-hosted Trace Extension implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_TRF implements the functionality added by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

**PerfMon, bits [27:24]**

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'.

Defined values are:
### PerfMon

| 0b0000 | Performance Monitors Extension not implemented. |
| 0b0001 | Performance Monitors Extension, PMUv1 implemented. |
| 0b0010 | Performance Monitors Extension, PMUv2 implemented. |
| 0b0011 | Performance Monitors Extension, PMUv3 implemented. |
| 0b0100 | PMUv3 for Armv8.1. As 0b0011, and also includes support for: |
|        | • Extended 16-bit PM_EVTYPER<n>.evtCount field. |
|        | • If EL2 is implemented, the HDCR.HPMD control bit. |
| 0b0101 | PMUv3 for Armv8.4. As 0b0100, and also includes support for the PMMIR register. |
| 0b0110 | PMUv3 for Armv8.5. As 0b0101, and also includes support for: |
|        | • 64-bit event counters. |
|        | • If EL2 is implemented, the HDCR.HCCD control bit. |
|        | • If EL3 is implemented, the SDCR.SCCD control bit. |
| 0b0111 | PMUv3 for Armv8.7. As 0b0110, and also includes support for: |
|        | • The PMCR.FZO and, if EL2 is implemented, HDCR.HPMFZO control bits. |
|        | • If EL3 is implemented and using AArch64, the MDCR_EL3.{MPMX,MCCD} control bits. |
| 0b1111 | IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations. |

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0011.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

In any Armv8 implementation, the values 0b0000 and 0b0010 are not permitted.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0011 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

**Note**

In Armv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an Armv8 implementation.

### MProfDbg, bits [23:20]

M Profile Debug. Support for memory-mapped debug model for M profile processors. Defined values are:

<table>
<thead>
<tr>
<th>MProfDbg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for M profile Debug architecture, with memory-mapped access.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.
MMapTrc, bits [19:16]

Memory Mapped Trace. Support for memory-mapped trace model. Defined values are:

<table>
<thead>
<tr>
<th>MMapTrc</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for Arm trace architecture, with memory-mapped access.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

CopTrc, bits [15:12]

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space. Defined values are:

<table>
<thead>
<tr>
<th>CopTrc</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for Arm trace architecture, with System registers access.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

MMapDbg, bits [11:8]

Memory Mapped Debug. Support for v7 memory-mapped debug model, for A and R profile processors.

In Armv8-A, this field is RES0.

The optional memory map defined by Armv8 is not compatible with Armv7.

CopSDbg, bits [7:4]

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

CopDbg, bits [3:0]

Support for System registers-based debug model, using registers in the coproc == 0b1110 encoding space, for A and R profile processors. Defined values are:
<table>
<thead>
<tr>
<th>CopDbg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for Armv6, v6 Debug architecture, with System registers access.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Support for Armv6, v6.1 Debug architecture, with System registers access.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Support for Armv7, v7 Debug architecture, with System registers access.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Support for Armv7, v7.1 Debug architecture, with System registers access.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Support for Armv8 debug architecture, with System registers access.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Support for Armv8 debug architecture, with System registers access, and Virtualization Host Extensions.</td>
</tr>
<tr>
<td>0b1000</td>
<td>Support for Armv8.2 debug architecture.</td>
</tr>
<tr>
<td>0b1001</td>
<td>Support for Armv8.4 debug architecture.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.

In Armv8.0, the only permitted value is 0b0110.

In Armv8.1, the only permitted value is 0b0111.

In Armv8.2, the only permitted value is 0b1000.

From Armv8.4, the only permitted value is 0b1001.

## Accessing the ID_DFR0

**Bits [31:4]**

Reserved, RES0.

**MTPMU, bits [3:0]**

Multi-threaded PMU extension. Defined values are:

<table>
<thead>
<tr>
<th>MTPMU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER&lt;n&gt;.MT are read/write or RES0.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPER&lt;n&gt;.MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPER&lt;n&gt;.MT are 0.</td>
</tr>
<tr>
<td>0b1111</td>
<td>FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTYPER&lt;n&gt;.MT are RES0.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value 0b0000 is not permitted.
In an implementation that does not include FEAT_PMUv3, the value 0b0001 is not permitted.

**Accessing the ID_DFR1**

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} \text{ <coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>\{, \{#<opc2>\}}}
\]

<table>
<thead>
<tr>

ID_ISAR0, Instruction Set Attribute Register 0

The ID_ISAR0 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_ISAR0 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR0_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_ISAR0 are UNDEFINED.

**Attributes**

ID_ISAR0 is a 32-bit register.

**Field descriptions**

The ID_ISAR0 bit assignments are:

<table>

**Bits [31:28]**

Reserved, RES0.

**Divide, bits [27:24]**

Indicates the implemented Divide instructions. Defined values are:

<table>
<thead>
<tr>
<th>Divide</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds SDIV and UDIV in the T32 instruction set.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds SDIV and UDIV in the A32 instruction set.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**Debug, bits [23:20]**

Indicates the implemented Debug instructions. Defined values are:

<table>
<thead>
<tr>
<th>Debug</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>

</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds generic MCRR2 and MRRC2.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**CmpBranch, bits [15:12]**

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>CmpBranch</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds CBNZ and CBZ.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**BitField, bits [11:8]**

Indicates the implemented BitField instructions. Defined values are:

<table>
<thead>
<tr>
<th>BitField</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds BFC, BFI, SBFX, and UBFX.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**BitCount, bits [7:4]**

Indicates the implemented Bit Counting instructions. Defined values are:

<table>
<thead>
<tr>
<th>BitCount</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds CLZ.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Swap, bits [3:0]**

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>Swap</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds SWP and SWPB.</td>
</tr>
</tbody>
</table>
All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**Accessing the ID_ISAR0**

Accesses to this register use the following encodings:

ID_ISAR1, Instruction Set Attribute Register 1

The ID_ISAR1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_ISAR1 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR1_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_ISAR1 are UNDEFINED.

**Attributes**

ID_ISAR1 is a 32-bit register.

**Field descriptions**

The ID_ISAR1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Jazelle | Interwork | Immediate | IfThen | Extend | Except_AR | Except | Endian |

**Jazelle, bits [31:28]**

Indicates the implemented Jazelle extension instructions. Defined values are:

<table>
<thead>
<tr>
<th>Jazelle</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No support for Jazelle.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the BXJ instruction, and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Interwork, bits [27:24]**

Indicates the implemented Interworking instructions. Defined values are:

<table>
<thead>
<tr>
<th>Interwork</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the BX instruction, and the T bit in the PSR.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A, the only permitted value is 0b0011.

**Immediate, bits [23:20]**

Indicates the implemented data-processing instructions with long immediates. Defined values are:

<table>
<thead>
<tr>
<th>Immediate</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
</tbody>
</table>
| 0b0001    | Adds:  
|           | • The MOVT instruction  
|           | • The MOV instruction encodings with zero-extended 16-bit immediates.  
|           | • The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**IfThen, bits [19:16]**

Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>IfThen</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the IT instructions, and the IT bits in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Extend, bits [15:12]**

Indicates the implemented Extend instructions. Defined values are:

<table>
<thead>
<tr>
<th>Extend</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SXTB, SXTH, UXTB, and UXTH instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**Except_AR, bits [11:8]**

Indicates the implemented A and R profile exception-handling instructions. Defined values are:

<table>
<thead>
<tr>
<th>Except_AR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SRS and RFE instructions, and the A and R profile forms of the CPS instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Except, bits [7:4]**

Indicates the implemented exception-handling instructions in the A32 instruction set. Defined values are:
## Exception, bits [7:4]

Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.

<table>
<thead>
<tr>
<th>Except</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

## Endian, bits [3:0]

Indicates the implemented Endian instructions. Defined values are:

<table>
<thead>
<tr>
<th>Endian</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SETEND instruction, and the E bit in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

## Accessing the ID_ISAR1

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>

  elsif EL2Enabled() && ELUsingAAArch32(EL2) && HCR.TID3 == '1' then
    AArch32.TakeHypTrapException(0x03);
  else
    return ID_ISAR1;
elsif PSTATE.EL == EL2 then
  return ID_ISAR1;
elsif PSTATE.EL == EL3 then
  return ID_ISAR1;
**ID_ISAR2, Instruction Set Attribute Register 2**

The ID_ISAR2 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see ‘Principles of the ID scheme for fields in ID registers’.

**Configuration**

AArch32 System register ID_ISAR2 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR2_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_ISAR2 are UNDEFINED.

**Attributes**

ID_ISAR2 is a 32-bit register.

**Field descriptions**

The ID_ISAR2 bit assignments are:

<table>
<thead>
<tr>
<th>Reversal</th>
<th>PSR_AR</th>
<th>MultU</th>
<th>MultS</th>
<th>Mult</th>
<th>MultiAccessInt</th>
<th>MemHint</th>
<th>LoadStore</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28</td>
<td>27</td>
<td>26</td>
<td>25</td>
<td>24</td>
</tr>
</tbody>
</table>

**Reversal, bits [31:28]**

Indicates the implemented Reversal instructions. Defined values are:

<table>
<thead>
<tr>
<th>Reversal</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the REV, REV16, and REVSH instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the RBIT instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**PSR_AR, bits [27:24]**

Indicates the implemented A and R profile instructions to manipulate the PSR. Defined values are:

<table>
<thead>
<tr>
<th>PSR_AR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:
In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute. In the T32 instruction set, the SUBS PC,LR,#N instruction.

MultU, bits [23:20]
Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

<table>
<thead>
<tr>
<th>MultU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the UMULL and UMLAL instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the UMAAL instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

MultS, bits [19:16]
Indicates the implemented advanced signed Multiply instructions. Defined values are:

<table>
<thead>
<tr>
<th>MultS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SMULL and SMLAL instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMMAL, SMMALAR, SMMMLS, SMMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Mult, bits [15:12]
Indicates the implemented additional Multiply instructions. Defined values are:

<table>
<thead>
<tr>
<th>Mult</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No additional instructions implemented. This means only MUL is implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the MLA instruction.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the MLS instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

MultiAccessInt, bits [11:8]
Indicates the support for interruptible multi-access instructions. Defined values are:

<table>
<thead>
<tr>
<th>MultiAccessInt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No support. This means the LDM and STM instructions are not interruptible.</td>
</tr>
<tr>
<td>0b0001</td>
<td>LDM and STM instructions are restartable.</td>
</tr>
<tr>
<td>0b0010</td>
<td>LDM and STM instructions are continuable.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.
MemHint, bits [7:4]
Indicates the implemented Memory Hint instructions. Defined values are:

<table>
<thead>
<tr>
<th>MemHint</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the PLD instruction.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.)</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0001 (or 0b0010), and adds the PLI instruction.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds the PLDW instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

LoadStore, bits [3:0]
Indicates the implemented additional load/store instructions. Defined values are:

<table>
<thead>
<tr>
<th>LoadStore</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No additional load/store instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the LDRD and STRD instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Accessing the ID_ISAR2
Accesses to this register use the following encodings:

```c
MRC{<c>}{<q>} <coproc>, {#<opc1>, <Rt>, <CRn>, <CRm>{, {#<opc2>}}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>

The ID_ISAR3 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_ISAR3 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR3_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_ISAR3 are UNDEFINED.

**Attributes**

ID_ISAR3 is a 32-bit register.

**Field descriptions**

The ID_ISAR3 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| T32EE | TrueNOP | T32Copy | TabBranch | SynchPrim | SVC | SIMD | Saturate |

**T32EE, bits [31:28]**

Indicates the implemented T32EE instructions. Defined values are:

<table>
<thead>
<tr>
<th>T32EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**TrueNOP, bits [27:24]**

Indicates the implemented true NOP instructions. Defined values are:

<table>
<thead>
<tr>
<th>TrueNOP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. This means there are no NOP instructions that do not have any register dependencies.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.
T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

<table>
<thead>
<tr>
<th>T32Copy</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>TabBranch</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the TBB and TBH instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SynchPrim, bits [15:12]

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

<table>
<thead>
<tr>
<th>SynchPrim</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If SynchPrim_frac == 0b000, no Synchronization Primitives implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>If SynchPrim_frac == 0b000, adds the LDREX and STREX instructions.</td>
</tr>
<tr>
<td></td>
<td>If SynchPrim_frac == 0b011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>If SynchPrim_frac == 0b000, as for [0b001, 0b011] and also adds the LDREXD and STREXD instructions.</td>
</tr>
</tbody>
</table>

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0010.

SVC, bits [11:8]

Indicates the implemented SVC instructions. Defined values are:

<table>
<thead>
<tr>
<th>SVC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SVC instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SIMD, bits [7:4]

Indicates the implemented SIMD instructions. Defined values are:
### SIMD

<table>
<thead>
<tr>
<th>SIMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SSAT and USAT instructions, and the Q bit in the PSRs.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0001, and adds the PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UAXS, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports floating-point and Advanced SIMD instructions, MVFR0, MVFR1, and MVFR2 give information about the implemented Advanced SIMD instructions.

### Saturate, bits [3:0]

Indicates the implemented Saturate instructions. Defined values are:

<table>
<thead>
<tr>
<th>Saturate</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. This means no non-Advanced SIMD saturate instructions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### Accessing the ID_ISAR3

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#<\text{opc2}>\}
\]

ID_ISAR4, Instruction Set Attribute Register 4

The ID_ISAR4 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_ISAR4 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR4_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_ISAR4 are UNDEFINED.

**Attributes**

ID_ISAR4 is a 32-bit register.

**Field descriptions**

The ID_ISAR4 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| SWP_frac | PSR_M | SynchPrim_frac | Barrier | SMC | Writeback | WithShifts | Unpriv |

**SWP_frac, bits [31:28]**

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

<table>
<thead>
<tr>
<th>SWP_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SWP or SWPB instructions not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other Requesters can come between the load memory access and the store memory access of the SWP or SWPB.</td>
</tr>
</tbody>
</table>

All other values are reserved. This field is valid only if ID_ISAR0.Swap is 0b0000.

In Armv8-A, the only permitted value is 0b0000.

**PSR_M, bits [27:24]**

Indicates the implemented M profile instructions to modify the PSRs. Defined values are:

<table>
<thead>
<tr>
<th>PSR_M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the M profile forms of the CPS, MRS, and MSR instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A, the only permitted value is 0b0000.

**SynchPrim_frac, bits [23:20]**

Used in conjunction with ID_ISAR3.SynchPrim to indicate the implemented Synchronization Primitive instructions. Possible values are:

<table>
<thead>
<tr>
<th>SynchPrim_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.</td>
</tr>
<tr>
<td>0b0011</td>
<td>If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.</td>
</tr>
</tbody>
</table>

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0000.

**Barrier, bits [19:16]**

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

<table>
<thead>
<tr>
<th>Barrier</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the DMB, DSB, and ISB barrier instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**SMC, bits [15:12]**

Indicates the implemented SMC instructions. Defined values are:

<table>
<thead>
<tr>
<th>SMC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. SMC instructions</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SMC instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Writeback, bits [11:8]**

Indicates the support for Writeback addressing modes. Defined values are:

<table>
<thead>
<tr>
<th>Writeback</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds support for all of the writeback addressing modes.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**WithShifts, bits [7:4]**

Indicates the support for instructions with shifts. Defined values are:
### WithShifts

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Nonzero shifts supported only in MOV and shift instructions.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds support for shifts of loads and stores over the range LSL 0-3.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds support for register-controlled shift options.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

### Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions. Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. No T variant instructions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the LDRBT, LDRT, STRBT, and STRT instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

### Accessing the ID_ISAR4

Accesses to this register use the following encodings:

\[
\text{MRC}\{<c>\}{<q>\text{ <coproc>, \#<opc1>, <Rt>, <CRn>, <CRm>, \#<opc2>}}
\]

<table>

ID_ISAR5, Instruction Set Attribute Register 5

The ID_ISAR5 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, and ID_ISAR4.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_ISAR5 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR5_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_ISAR5 are UNDEFINED.

**Attributes**

ID_ISAR5 is a 32-bit register.

**Field descriptions**

The ID_ISAR5 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| VCMA | RDM | RES0 | CRC32 | SHA2 | SHA1 | AES | SEVL |

**VCMA, bits [31:28]**

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

<table>
<thead>
<tr>
<th>VCMA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The VCMLA and VCADD instructions are not implemented in AArch32.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The VCMLA and VCADD instructions are implemented in AArch32.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_FCMA implements the functionality identified by 0b0001.

From Armv8.3, the only permitted value is 0b0001.

**RDM, bits [27:24]**

Indicates support for the VQRDMLAH and VQRDMLSH instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>RDM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No VQRDMLAH and VQRDMLSH instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VQRDMLAH and VQRDMLSH instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_RDM implements the functionality identified by the value 0b0001.
From Armv8.1, the only permitted value is 0b0001.

**Bits [23:20]**

Reserved, RES0.

**CRC32, bits [19:16]**

Indicates support for the CRC32 instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>CRC32</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No CRC32 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

**SHA2, bits [15:12]**

Indicates support for the SHA2 instructions in AArch32 state.

<table>
<thead>
<tr>
<th>SHA2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SHA2 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**SHA1, bits [11:8]**

Indicates support for the SHA1 instructions are implemented in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>SHA1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SHA1 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**AES, bits [7:4]**

Indicates support for the AES instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>AES</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No AES instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AESE, AESD, AESMC, and AESIMC implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

**SEVL, bits [3:0]**

Indicates support for the SEVL instruction in AArch32 state. Defined values are:
<table>
<thead>
<tr>
<th>SEVL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SEVL is implemented as a NOP.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SEVL is implemented as Send Event Local.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Accessing the ID_ISAR5**

Accesses to this register use the following encodings:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0010</td>
<td>0b101</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then

    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_ISAR5;
    end
elsif PSTATE.EL == EL2 then
    return ID ISAR5;
elsif PSTATE.EL == EL3 then
    return ID_ISAR5;
ID_ISAR6, Instruction Set Attribute Register 6

The ID_ISAR6 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_ISAR6 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR6_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_ISAR6 are **UNDEFINED**.

**Note**

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

**Attributes**

ID_ISAR6 is a 32-bit register.

**Field descriptions**

The ID_ISAR6 bit assignments are:

|   31   |  30  |  29  |  28  |  27  |  26  |  25  |  24  |  23  |  22  |  21  |  20  |  19  |  18  |  17  |  16  |  15  |  14  |  13  |  12  |  11  |  10  |  9   |  8   |  7   |  6   |  5   |  4   |  3   |  2   |  1   |  0   |
|-------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| RES0  | I8MM | BF16 | SPECRES | SB  | FHM  | DP   | JSCVT |

**Bits [31:28]**

Reserved, RES0.

**I8MM, bits [27:24]**

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>I8MM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Int8 matrix multiplication instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VSMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_AA32I8MM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.
BF16, bits [23:20]

Indicates support for Advanced SIMD and floating-point BF16 instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>BF16</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>BF16 instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VCVT, VCVTB, VCVTT, VDOT, VFMAB, VFMAT, and VMMLA instructions with BF16 operand or result types are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_AA32BF16 implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

SPECRES, bits [19:16]

Indicates support for Speculation invalidation instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>SPECRES</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>CFPRCTX, DVPRCTX, and CPPRCTX instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>CFPRCTX, DVPRCTX, and CPPRCTX instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8.5, the only permitted value is 0b0001.

SB, bits [15:12]

Indicates support for SB instruction in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>SB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SB instruction is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SB instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8.5, the only permitted value is 0b0001.

FHM, bits [11:8]

Indicates support for Advanced SIMD and floating-point VFMAL and VFMSL instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>FHM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>VFMAL and VMFSL instructions not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VFMAL and VMFSL instructions implemented.</td>
</tr>
</tbody>
</table>

FEAT_FHM implements the functionality identified by the value 0b0001.

DP, bits [7:4]

Indicates support for dot product instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>DP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No dot product instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VUDOT and VSDOT instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_DotProd implements the functionality identified by the value 0b0001.
**JSCVT, bits [3:0]**

Indicates support for the Javascript conversion instruction in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>JSCVT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The VJCVT instruction is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The VJCVT instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8.0, the only permitted value is 0b0000.

FEAT_JSCVT implements the functionality identified by 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

**Accessing the ID_ISAR6**

Accesses to this register use the following encodings:

\[ \text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}\}[, \{#\}<\text{opc2}\}] \]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0010</td>
<td>0b111</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!IsZero(ID_ISAR6) || boolean IMPLEMENTATION_DEFINED "ID_ISAR6 trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && (!IsZero(ID_ISAR6) || boolean IMPLEMENTATION_DEFINED "ID_ISAR6 trapped by HCR.TID3") && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_ISAR6;
    endif
elsif PSTATE.EL == EL2 then
    return ID_ISAR6;
elsif PSTATE.EL == EL3 then
    return ID_ISAR6;
else
    return ID_ISAR6;
end
ID_MMFR0, Memory Model Feature Register 0

The ID_MMFR0 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR1, ID_MMFR2, ID_MMFR3, and ID_MMFR4.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch32 System register ID_MMFR0 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR0_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_MMFR0 are UNDEFINED.

**Attributes**

ID_MMFR0 is a 32-bit register.

**Field descriptions**

The ID_MMFR0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| InnerShr | FCSE | AuxReg | TCM | ShareLvl | OuterShr | PMSA | VMSA |

**InnerShr, bits [31:28]**

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

<table>
<thead>
<tr>
<th>InnerShr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Implemented as Non-cacheable.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented with hardware coherency support.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Shareability ignored.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000, 0b0001, and 0b1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0.ShareLvl having the value 0b0001.

When ID_MMFR0.ShareLvl is zero, this field is UNKNOWN.

**FCSE, bits [27:24]**

Indicates whether the implementation includes the FCSE. Defined values are:

<table>
<thead>
<tr>
<th>FCSE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for FCSE.</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A, the only permitted value is \texttt{0b0000}.

**AuxReg, bits [23:20]**

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

<table>
<thead>
<tr>
<th>AuxReg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>None supported.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>Support for Auxiliary Control Register only.</td>
</tr>
<tr>
<td>\texttt{0b0010}</td>
<td>Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is \texttt{0b0010}.

**Note**

Accesses to unimplemented Auxiliary registers are \texttt{UNDEFINED}.

**TCM, bits [19:16]**

Indicates support for TCMs and associated DMAs. Defined values are:

<table>
<thead>
<tr>
<th>TCM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>Not supported.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>Support is implementation defined. Armv7 requires this setting.</td>
</tr>
<tr>
<td>\texttt{0b0010}</td>
<td>Support for TCM only. Armv6 implementation.</td>
</tr>
<tr>
<td>\texttt{0b0011}</td>
<td>Support for TCM and DMA, Armv6 implementation.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is \texttt{0b0000}.

**ShareLvl, bits [15:12]**

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

<table>
<thead>
<tr>
<th>ShareLvl</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>One level of shareability implemented.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
