ICV_EOIR0_EL1, Interrupt Controller Virtual End Of Interrupt Register 0

The ICV_EOIR0_EL1 characteristics are:

**Purpose**

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified virtual Group 0 interrupt.

**Configuration**

AArch64 System register ICV_EOIR0_EL1 performs the same function as AArch32 System register ICV_EOIR0.

**Attributes**

ICV_EOIR0_EL1 is a 64-bit register.

**Field descriptions**

The ICV_EOIR0_EL1 bit assignments are:

| Bit 63 | Bit 62 | Bit 61 | Bit 60 | Bit 59 | Bit 58 | Bit 57 | Bit 56 | Bit 55 | Bit 54 | Bit 53 | Bit 52 | Bit 51 | Bit 50 | Bit 49 | Bit 48 | Bit 47 | Bit 46 | Bit 45 | Bit 44 | Bit 43 | Bit 42 | Bit 41 | Bit 40 | Bit 39 | Bit 38 | Bit 37 | Bit 36 | Bit 35 | Bit 34 | Bit 33 | Bit 32 |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
|        |        |        |        | RES0   |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        | RES0   |

**Bits [63:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID from the corresponding ICV_IAR0_EL1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the ICV_CTLR.EOImode bit is 0, a write to this register drops the priority for the virtual interrupt, and also deactivates the virtual interrupt.

If the ICV_CTLR.EOImode bit is 1, a write to this register only drops the priority for the virtual interrupt. Software must write to ICV_DIR_EL1 to deactivate the virtual interrupt.

**Accessing the ICV_EOIR0_EL1**

A write to this register must correspond to the most recent valid read by this vPE from a Virtual Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICV_IAR0_EL1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

Accesses to this register use the following encodings:

MSR ICC_EOIR0_EL1, <Xt>

ICV_IAR0_EL1, Interrupt Controller Virtual Interrupt Acknowledge Register 0

The ICV_IAR0_EL1 characteristics are:

**Purpose**

The PE reads this register to obtain the INTID of the signaled virtual Group 0 interrupt. This read acts as an acknowledge for the interrupt.

**Configuration**

AArch64 System register ICV_IAR0_EL1 performs the same function as AArch32 System register ICV_IAR0.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.\{I,F\} == \{0,0\}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICV_IAR0_EL1 is a 64-bit register.

**Field descriptions**

The ICV_IAR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>62-24</td>

ICV_IAR1_EL1, Interrupt Controller Virtual Interrupt Acknowledge Register 1

The ICV_IAR1_EL1 characteristics are:

**Purpose**

The PE reads this register to obtain the INTID of the signaled virtual Group 1 interrupt. This read acts as an acknowledge for the interrupt.

**Configuration**

AArch64 System register ICV_IAR1_EL1 performs the same function as AArch32 System register ICV_IAR1.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see ‘Observability of the effects of accesses to the GIC registers’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICV_IAR1_EL1 is a 64-bit register.

**Field descriptions**

The ICV_IAR1_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|
| RES0 | RES0 | INTID |

**Bits [63:24]**

Reserved, RES0.

**INTID, bits [23:0]**

The INTID of the signaled virtual interrupt.

This is the INTID of the highest priority pending virtual interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. This special INTID can take the value 1023 only. For more information, see ‘Special INTIDs’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

**Accessing the ICV_IAR1_EL1**

Accesses to this register use the following encodings:

ICV_PMR_EL1, Interrupt Controller Virtual Interrupt Priority Mask Register

The ICV_PMR_EL1 characteristics are:

**Purpose**

Provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

**Configuration**

AArch64 System register ICV_PMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_PMR[31:0].

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Attributes**

ICV_PMR_EL1 is a 64-bit register.

**Bits [63:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The priority mask level for the virtual CPU interface. If the priority of a virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

The possible priority field values are as follows:

<table>
<thead>
<tr>
<th>Implemented priority bits</th>
<th>Possible priority field values</th>
<th>Number of priority levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>[7:0]</td>
<td>0x00-0xFF (0-255), all values</td>
<td>256</td>
</tr>
<tr>
<td>[7:1]</td>
<td>0x00-0xFE (0-254), even values only</td>
<td>128</td>
</tr>
<tr>
<td>[7:2]</td>
<td>0x00-0xFC (0-252), in steps of 4</td>
<td>64</td>
</tr>
<tr>
<td>[7:3]</td>
<td>0x00-0xF8 (0-248), in steps of 8</td>
<td>32</td>
</tr>
<tr>
<td>[7:4]</td>
<td>0x00-0xF0 (0-240), in steps of 16</td>
<td>16</td>
</tr>
</tbody>
</table>
Unimplemented priority bits are RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ICV_PMR_EL1**

The ICV_RPR_EL1 characteristics are:

**Purpose**

Indicates the Running priority of the virtual CPU interface.

**Configuration**

AArch64 System register ICV_RPR_EL1 performs the same function as AArch32 System register ICV_RPR.

**Attributes**

ICV_RPR_EL1 is a 64-bit register.

**Field descriptions**

The ICV_RPR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

**Bits [63:8]**

Reserved, RES0.

**Priority, bits [7:0]**

The current running priority on the virtual CPU interface. This is the group priority of the current active virtual interrupt.

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

**Note**

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

**Accessing the ICV_RPR_EL1**

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings:
MRS <Xt>, ICC_RPR_EL1

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:60]**

Reserved, RES0.

**CSRE, bits [59:56]**

Call Stack Recorder Extension. Defined values are:

<table>
<thead>
<tr>
<th>CSRE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Call Stack Recorder Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Call Stack Recorder Extension implemented, FEAT_CSRE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**BRBE, bits [55:52]**

Branch Record Buffer Extension. Defined values are:

<table>
<thead>
<tr>
<th>BRBE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Branch Record Buffer Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Branch Record Buffer Extension implemented, FEAT_BRBE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**MTPMU, bits [51:48]**

Multi-threaded PMU extension. Defined values are:
<table>
<thead>
<tr>
<th>MTPMU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is implementation defined whether PMEVTYPER&lt;n&gt;_EL0.MT and PMEVTYPER&lt;n&gt;.MT are read/write or RES0.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPER&lt;n&gt;_EL0.MT and PMEVTYPER&lt;n&gt;.MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPER&lt;n&gt;_EL0.MT and PMEVTYPER&lt;n&gt;.MT are 0.</td>
</tr>
<tr>
<td>0b1111</td>
<td>FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTYPER&lt;n&gt;_EL0.MT and PMEVTYPER&lt;n&gt;.MT are RES0.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT_PMUv3, the value 0b0001 is not permitted.

**TraceBuffer, bits [47:44]**

Trace Buffer Extension. Defined values are:

<table>
<thead>
<tr>
<th>TraceBuffer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Trace Buffer Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Trace Buffer Extension implemented, FEAT_TRBE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**TraceFilt, bits [43:40]**

Armv8.4 Self-hosted Trace Extension version. Defined values are:

<table>
<thead>
<tr>
<th>TraceFilt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Armv8.4 Self-hosted Trace Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Armv8.4 Self-hosted Trace Extension implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_TRF implements the functionality identified by the value 0b0001.

From Armv8.4, if an Embedded Trace Macrocell Architecture PE Trace Unit is implemented, the value 0b0000 is not permitted.

**DoubleLock, bits [39:36]**

OS Double Lock implemented. Defined values are:

<table>
<thead>
<tr>
<th>DoubleLock</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>OS Double Lock implemented. OSDLR_EL1 is RW.</td>
</tr>
<tr>
<td>0b1111</td>
<td>OS Double Lock not implemented. OSDLR_EL1 is RAZ/WI.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_DoubleLock implements the functionality identified by the value 0b0000.

In Armv8.0, the only permitted value is 0b0000.

If FEAT_Debugv8p2 is implemented and FEAT_DoPD is not implemented, the permitted values are 0b0000 and 0b1111.

If FEAT_DoPD is implemented, the only permitted value is 0b1111.
**PMSVer, bits [35:32]**

Statistical Profiling Extension version. Defined values are:

<table>
<thead>
<tr>
<th>PMSVer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Statistical Profiling Extension not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Statistical Profiling Extension implemented.</td>
</tr>
</tbody>
</table>
| 0b0010 | As 0b0001, and adds:  
  • Support for the Event packet Alignment flag.  
  • If FEAT_SVE is implemented, support for the Scalable Vector extensions to Statistical Profiling. |
| 0b0011 | As 0b0010, and adds:  
  • The last branch target Address packet.  
  • Discard mode.  
  • Extended event filtering, including the PMSNEVFR_EL1 System register.  
  • If FEAT_PMUv3 is implemented, controls to freeze the PMU event counters after an SPE buffer management event occurs.  
  • If FEAT_PMUv3 is implemented, the SAMPLE_FEED_BR, SAMPLE_FEED_EVENT, SAMPLE_FEED_LAT, SAMPLE_FEED_LD, SAMPLE_FEED_OP, and SAMPLE_FEED_ST PMU events. |

All other values are reserved.

FEAT_SPE implements the functionality identified by the value 0b0001.

FEAT_SPEv1p1 implements the functionality identified by the value 0b0010.

FEAT_SPEv1p2 implements the functionality identified by the value 0b0011.

In Armv8.5, if FEAT_SPE is implemented, the value 0b0001 is not permitted.

From Armv8.7, if FEAT_SPE is implemented, the value 0b0010 is not permitted.

**CTX_CMPs, bits [31:28]**

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

**Bits [27:24]**

Reserved, RES0.

**WRPs, bits [23:20]**

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

**Bits [19:16]**

Reserved, RES0.

**BRPs, bits [15:12]**

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

**PMUVer, bits [11:8]**

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:
<table>
<thead>
<tr>
<th>PMUVer</th>
<th>Meaning</th>
</tr>

<tr>
<td>0b0111</td>
<td>PMUv3 for Armv8.7. As 0b0110, and also includes support for:</td>
</tr>
<tr>
<td></td>
<td>• The PMCR_EL0 FZO and, if EL2 is implemented,</td>
</tr>
<tr>
<td></td>
<td>• MDCR_EL2. HPMFZO control bits.</td>
</tr>
<tr>
<td></td>
<td>• If EL3 is implemented, the MDCR_EL3. {MPMX,MCCD} control bits.</td>
</tr>
<tr>
<td>0b1111</td>
<td>IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0001.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

In Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0001 is not permitted.

In Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

In Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

**TraceVer, bits [7:4]**

Trace support. Indicates whether System register interface to a PE trace unit is implemented. Defined values are:

<table>
<thead>
<tr>
<th>TraceVer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PE trace unit System registers not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>PE trace unit System registers implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

When PE trace unit System registers are implemented, see TRCIDR1 for tracing capabilities of the trace unit.

**DebugVer, bits [3:0]**

Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:

<table>
<thead>
<tr>
<th>DebugVer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0110</td>
<td>Armv8 debug architecture.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv8 debug architecture with Virtualization Host Extensions.</td>
</tr>
<tr>
<td>0b1000</td>
<td>Armv8.2 debug architecture.</td>
</tr>
<tr>
<td>0b1001</td>
<td>Armv8.4 debug architecture.</td>
</tr>
</tbody>
</table>
All other values are reserved.

FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.

In Armv8.1, the value 0b0110 is not permitted.

In Armv8.2, the value 0b0111 is not permitted.

From Armv8.4, the value 0b1000 is not permitted.

**Accessing the ID_AA64DFR0_EL1**

Accesses to this register use the following encodings:

\[
\text{MRS } <Xt>, \text{ ID_AA64DFR0_EL1}
\]

\[
\begin{array}{|c|c|c|c|c|}
\hline

</tbody>
</table>

**RNDR, bits [63:60]**

Indicates support for Random Number instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>RNDR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No Random Number instructions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>RNDR and RNDRRS registers are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_RNG implements the functionality identified by the value 0b0001.

From Armv8.5, the permitted values are 0b0000 and 0b0001.

**TLB, bits [59:56]**

Indicates support for Outer shareable and TLB range maintenance instructions. Defined values are:

<table>
<thead>
<tr>
<th>TLB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Outer shareable and TLB range maintenance instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Outer shareable TLB maintenance instructions are implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Outer shareable and TLB range maintenance instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_TLBIOS implements the functionality identified by the values 0b0001 and 0b0010.
FEAT_TLBIRANGE implements the functionality identified by the value \texttt{0b0010}.

From Armv8.4, the only permitted value is \texttt{0b0010}.

**TS, bits [55:52]**

Indicates support for flag manipulation instructions. Defined values are:

<table>
<thead>
<tr>
<th>TS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>No flag manipulation instructions are implemented.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>CFINV, RMIF, SETF16, and SETF8 instructions are implemented.</td>
</tr>
<tr>
<td>\texttt{0b0010}</td>
<td>CFINV, RMIF, SETF16, SETF8, AXFLAG, and XAFLAG instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_FlagM implements the functionality identified by the value \texttt{0b0001}.

FEAT_FlagM2 implements the functionality identified by the value \texttt{0b0010}.

In Armv8.2, the permitted values are \texttt{0b0000} and \texttt{0b0001}.

In Armv8.4, the only permitted value is \texttt{0b0001}.

From Armv8.5, the only permitted value is \texttt{0b0010}.

**FHM, bits [51:48]**

Indicates support for FMLAL and FMLSL instructions. Defined values are:

<table>
<thead>
<tr>
<th>FHM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>FMLAL and FMLSL instructions are not implemented.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>FMLAL and FMLSL instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_FHM implements the functionality identified by the value \texttt{0b0001}.

From Armv8.2, the permitted values are \texttt{0b0000} and \texttt{0b0001}.

**DP, bits [47:44]**

Indicates support for Dot Product instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>DP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>No Dot Product instructions implemented.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>UDOT and SDOT instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_DotProd implements the functionality identified by the value \texttt{0b0001}.

From Armv8.2, the permitted values are \texttt{0b0000} and \texttt{0b0001}.

**SM4, bits [43:40]**

Indicates support for SM4 instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SM4</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>No SM4 instructions implemented.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>SM4E and SM4EKEY instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If FEAT_SM4 is not implemented, the value \texttt{0b0001} is reserved.
From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM3.

**SM3, bits [39:36]**

Indicates support for SM3 instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SM3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SM3 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, and SM3PARTW2 instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If FEAT_SM3 is not implemented, the value 0b0001 is reserved.

FEAT_SM3 implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM4.

**SHA3, bits [35:32]**

Indicates support for SHA3 instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SHA3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SHA3 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EOR3, RAX1, XAR, and BCAX instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If FEAT_SHA3 is not implemented, the value 0b0001 is reserved.

FEAT_SHA3 implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, this field must have the value 0b0000.

If the value of this field is 0b0001, ID_AA64ISAR0_EL1.SHA2 must have the value 0b0010.

**RDM, bits [31:28]**

Indicates support for SQRDMLAH and SQRDMLSH instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>RDM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No RDMA instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SQRDMLAH and SQRDMLSH instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_RDM implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

**TME, bits [27:24]**

Indicates support for TME instructions. Defined values are:

<table>
<thead>
<tr>
<th>TME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>TME instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>TCANCEL, TCOMMIT, TSTART, and TTEST instructions are implemented.</td>
</tr>
</tbody>
</table>

If HCR_EL2.TME == 0, reads of this field at EL1 return 0.
If SCR_EL3.TME == 0, reads of this field at EL1 or EL2 return 0.

All other values are reserved.

**Atomic, bits [23:20]**

Indicates support for Atomic instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>Atomic</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No Atomic instructions implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>LDADD, LDCLR, LDEOR, LDSET, LDSMAX, LDSMIN, LDUMAX, LDUMIN, CAS, CASP, and SWP instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_LSE implements the functionality identified by the value 0b0010.

From Armv8.1, the only permitted value is 0b0010.

**CRC32, bits [19:16]**

Indicates support for CRC32 instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>CRC32</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No CRC32 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, and CRC32CX instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

**SHA2, bits [15:12]**

Indicates support for SHA2 instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SHA2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SHA2 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implements instructions: SHA256H, SHA256H2, SHA256SU0, and SHA256SU1.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Implements instructions:</td>
</tr>
<tr>
<td></td>
<td>• SHA256H, SHA256H2, SHA256SU0, and SHA256SU1.</td>
</tr>
<tr>
<td></td>
<td>• SHA512H, SHA512H2, SHA512SU0, and SHA512SU1.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_SHA256 implements the functionality identified by the value 0b0001.

FEAT_SHA512 implements the functionality identified by the value 0b0010.

In Armv8, the permitted values are 0b0000 and 0b0001.

From Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, this field must have the value 0b0000.

If the value of this field is 0b0010, ID_AA64ISAR0_EL1.SHA3 must have the value 0b0001.

**SHA1, bits [11:8]**

Indicates support for SHA1 instructions in AArch64 state. Defined values are:
### SHA1

<table>
<thead>
<tr>
<th>SHA1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SHA1 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_SHA1 implements the functionality identified by the value 0b0001.

From Armv8, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR0_EL1.SHA2 is 0b0000, this field must have the value 0b0000.

### AES, bits [7:4]

Indicates support for AES instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>AES</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No AES instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AESE, AESD, AESMC, and AESIMC instructions implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, plus PMULL/PMULL2 instructions operating on 64-bit data quantities.</td>
</tr>
</tbody>
</table>

FEAT_AES implements the functionality identified by the value 0b0001.

FEAT_PMULL implements the functionality identified by the value 0b0010.

All other values are reserved.

From Armv8, the permitted values are 0b0000 and 0b0010.

### Bits [3:0]

Reserved, RES0.

### Accessing the ID_AA64ISAR0_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_AA64ISAR0_EL1
```

<table>
<thead>

  endif
endif
The ID_AA64ISAR1_EL1 characteristics are:

**Purpose**

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

If ID_AA64ISAR1_EL1.{API, APA} == {0000, 0000}, then:

- The TCR_EL1.{TBID,TBID0}, TCR_EL2.TBID and TCR_EL3.TBID bits are RES0.
- APIAKeyHi_EL1, APIAKeyLo_EL1, APIBKeyHi_EL1, APIBKeyLo_EL1, APDAKeyHi_EL1, APDAKeyLo_EL1, APDBKeyHi_EL1, APDBKeyLo_EL1 are not allocated.
- SCTLR_ELx.EnIA, SCTLR_ELx.EnIB, SCTLR_ELx.EnDA, SCTLR_ELx.EnDB are all RES0.

If ID_AA64ISAR1_EL1.{GPI, GPA, API, APA} == {0000, 0000, 0000, 0000}, then:

- HCR_EL2.API and HCR_EL2.AP are RES0.
- SCR_EL3.API and SCR_EL3.AP are RES0.

**Attributes**

ID_AA64ISAR1_EL1 is a 64-bit register.

**Field descriptions**

**LS64, bits [63:60]**

Indicates support for LD64B and ST64B* instructions, and the ACCDATA_EL1 register. Defined values of this field are:

<table>
<thead>
<tr>
<th>LS64</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The LD64B and ST64B* instructions, the ACCDATA_EL1 register, and associated traps are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The LD64B and ST64B instructions are supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>The LD64B, ST64B, and ST64BV instructions, and their associated traps are supported.</td>
</tr>
<tr>
<td>0b0011</td>
<td>The LD64 and ST64B* instructions, the ACCDATA_EL1 register, and their associated traps are supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_LS64 implements the functionality identified by 0b0001.

FEAT_LS64_V implements the functionality identified by 0b0010.

FEAT_LS64_ACCDATA implements the functionality identified by 0b0011.
From Armv8.7, the permitted values are 0b0001, 0b0010, and 0b0011.

**XS, bits [59:56]**

Indicates support for the XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.\{FGTnXS, FnXS\} fields in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>XS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.{FGTnXS, FnXS} fields are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.{FGTnXS, FnXS} fields are supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_XS implements the functionality identified by 0b0001.

From Armv8.7, the only permitted value is 0b0001.

**I8MM, bits [55:52]**

Indicates support for Advanced SIMD and Floating-point Int8 matrix multiplication instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>I8MM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Int8 matrix multiplication instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ZFR0_EL1.I8MM.

From Armv8.6, the only permitted value is 0b0001.

**DGH, bits [51:48]**

Indicates support for the Data Gathering Hint instruction. Defined values are:

<table>
<thead>
<tr>
<th>DGH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Data Gathering Hint is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Data Gathering Hint is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_DGH implements the functionality identified by 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

If the DGH instruction has no effect in preventing the merging of memory accesses, the value of this field is 0b0000.

**BF16, bits [47:44]**

Indicates support for Advanced SIMD and Floating-point BFloat16 instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>BF16</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>BFloat16 instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>BFCTV, BFCTVN, BFCTVN2, BFDOT, BFMALB, BFMALALT, and BFMMLA instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.
FEAT_BF16 implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ZFR0_EL1.BF16.

From Armv8.6, the only permitted value is 0b0001.

**SPECRES, bits [43:40]**

Indicates support for prediction invalidation instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SPECRES</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>CFP RCTX, DVP RCTX, and CPP RCTX instructions are not</td>
</tr>
<tr>
<td></td>
<td>implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>CFP RCTX, DVP RCTX, and CPP RCTX instructions are</td>
</tr>
<tr>
<td></td>
<td>implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_SPECRES implements the functionality identified by 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

**SB, bits [39:36]**

Indicates support for SB instruction in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SB instruction is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SB instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_SB implements the functionality identified by 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

**FRINTTS, bits [35:32]**

Indicates support for the FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented. Defined values are:

<table>
<thead>
<tr>
<th>FRINTTS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X</td>
</tr>
<tr>
<td></td>
<td>instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X</td>
</tr>
<tr>
<td></td>
<td>instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_FRINTTS implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

**GPI, bits [31:28]**

Indicates support for an IMPLEMENTATION DEFINED algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:
### GPI, bits [27:24]

Indicates whether QARMA or Architected algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>GPA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Generic Authentication using an Architected algorithm is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Generic Authentication using the QARMA algorithm is implemented. This includes the PACGA instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPA is non-zero, this field must have the value 0b0000.

### FEAT_LRCPC

Implements the functionality identified by the value 0b0001.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

In Armv8.3, the permitted values are 0b0001 and 0b0010.

From Armv8.4, the only permitted value is 0b0010.

### RCP, bits [23:20]

Indicates support for weaker release consistency, RCpc, based model. Defined values are:

<table>
<thead>
<tr>
<th>LRCPC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The LDAPR*, LDAPUR*, and STLUR* instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The LDAPR* instructions are implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>The LDAPR*, LDAPUR*, and STLUR* instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_LRCPC implements the functionality identified by the value 0b0001.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

In Armv8.3, the permitted values are 0b0001 and 0b0010.

From Armv8.4, the only permitted value is 0b0010.

### FCMA, bits [19:16]

Indicates support for complex number addition and multiplication, where numbers are stored in vectors. Defined values are:

<table>
<thead>
<tr>
<th>FCMA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The FCMLA and FCADD instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The FCMLA and FCADD instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_FCMA implements the functionality identified by the value 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.
From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

**JSCVT, bits [15:12]**

Indicates support for JavaScript conversion from double precision floating point values to integers in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>JSCVT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The FJCVTZS instruction is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The FJCVTZS instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_JSCVT implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

**API, bits [11:8]**

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

<table>
<thead>
<tr>
<th>API</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Address Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE, and the HaveEnhancedPAC2() function returning FALSE.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_PAuth implements the functionality added by the values 0b0000, 0b0001, and 0b0010.

FEAT_PAuth2 implements the functionality added by the value 0b0011.

FEAT_FPAC implements the functionality added by the values 0b0100 and 0b0101.

From Armv8.6, the permitted values are 0b0111, 0b0100, and 0b0101.

If the value of ID_AA64ISAR1_EL1.APA is non-zero, this field must have the value 0b0000.
**APA, bits [7:4]**

Indicates whether QARMA or Architected algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

<table>
<thead>
<tr>
<th>APA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Address Authentication using an Architected algorithm is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE and the HaveEnhancedPAC2() function returning FALSE.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning FALSE, the HaveFPACCoupled() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCoupled() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCoupled() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_PAuth implements the functionality added by the values 0b0000, 0b0001, and 0b0010.

FEAT_PAuth2 implements the functionality added by the value 0b0011.

FEAT_FPAC implements the functionality added by the values 0b0100 and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of the ID_AA64ISAR1_EL1.API is non-zero, this field must have the value 0b0000.

**DPB, bits [3:0]**

Data Persistence writeback. Indicates support for the DC CVAP and DC CVADP instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>DPB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>DC CVAP not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>DC CVAP supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>DC CVAP and DC CVADP supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_DPB implements the functionality identified by the value 0b0001.

FEAT_DPB2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0001 and 0b0010.

From Armv8.5, the only permitted value is 0b0010.

**Accessing the ID_AA64ISAR1_EL1**

Accesses to this register use the following encodings:
MRS <Xt>, ID_AA64ISAR1_EL1

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>

  elsif PSTATE.EL == EL3 then
    return ID_AA64ISAR1_EL1;
The ID_AA64ISAR2_EL1 characteristics are:

**Purpose**

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see Principles of the ID scheme for fields in ID registers.

**Configuration**

This register is present only from Armv8.7. Otherwise, direct accesses to ID_AA64ISAR2_EL1 are UNDEFINED.

**Attributes**

ID_AA64ISAR2_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64ISAR2_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

**Bits [63:8]**

Reserved, RES0.

**RPRES, bits [7:4]**

When **FPCR.AH** is 1, indicates support for 12 bits of mantissa in reciprocal and reciprocal square root instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>RPRES</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Reciprocal and reciprocal square root estimates give 8 bits of mantissa.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Reciprocal and reciprocal square root estimates give 12 bits of mantissa.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**FEAT_RPRES** implements the functionality identified by the value 0b0001.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the only permitted value is 0b0001.

**WFxT, bits [3:0]**

Indicates support for the WFET and WFIT instructions in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>WFxT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>WFET and WFIT are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>WFET and WFIT are supported.</td>
</tr>
</tbody>
</table>
All other values are reserved.

FEAT_WFxT implements the functionality identified by the value \(0b0001\).

From Armv8.7, the only permitted value is \(0b0001\).

**Accessing the ID_AA64ISAR2_EL1**

The ID_AA64MMFR0_EL1 characteristics are:

### Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

### Configuration

There are no configuration notes.

### Attributes

ID_AA64MMFR0_EL1 is a 64-bit register.

### Field descriptions

The ID_AA64MMFR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-60</td>
<td>ECV</td>
</tr>
<tr>

<tr>
<td>23-20</td>
<td>ASIDBits</td>
</tr>
<tr>
<td>19-16</td>
<td>PARange</td>
</tr>
</tbody>
</table>

#### ECV, bits [63:60]

Indicates presence of Enhanced Counter Virtualization. Defined values are:

<table>
<thead>
<tr>
<th>ECV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Enhanced Counter Virtualization is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Enhanced Counter Virtualization is implemented. Supports CNTHCTL_EL2, (EL1TVT, EL1TVCT, EL1NVPCT, EL1NVVCT, EVTIS), CNTKCTL_EL1, EVCNT, CNTPCTSS_EL0 counter views, and CNTVCTSS_EL0 counter views. Extends the PMSR_EL1.PCT, PMSR_EL2.PCT, TRFCR_EL1.TS, and TRFCR_EL2.TS fields.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As 0b0001, and also includes support for CNTHCTL_EL2.ECV and CNTPOFF_EL2.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_ECV implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.6, the only permitted values are 0b0001 and 0b0010.

#### FGT, bits [59:56]

Indicates presence of the Fine-Grained Trap controls:

- If EL2 is implemented, the HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGTR_EL2, HFGITR_EL2 and HFGWTR_EL2 registers, and their associated traps.
- If EL2 is implemented, MDCR_EL2.TDCC.
- If EL3 is implemented, MDCR_EL3.TDCC.
• If both EL2 and EL3 are implemented, SCR_EL3.FGTEn.

Defined values are:

<table>
<thead>
<tr>
<th>FGT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The fine-grained trap controls are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The fine-grained trap controls are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_FGT implements the functionality identified by the value 0b0001.

From Armv8.6, the only permitted value is 0b0001.

**Bits [55:48]**

Reserved, RES0.

**ExS, bits [47:44]**

Indicates support for disabling context synchronizing exception entry and exit. Defined values are:

<table>
<thead>
<tr>
<th>ExS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>All exception entries and exits are context synchronization events.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Non-context synchronizing exception entry and exit are supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_ExS implements the functionality identified by the value 0b0001.

**TGran4_2, bits [43:40]**

Indicates support for 4KB memory granule size at stage 2. Defined values are:

<table>
<thead>
<tr>
<th>TGran4_2</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Support for 4KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran4 field.</td>
<td></td>
</tr>
<tr>
<td>0b0001</td>
<td>4KB granule not supported at stage 2.</td>
<td></td>
</tr>
<tr>
<td>0b0010</td>
<td>4KB granule supported at stage 2.</td>

</tr>
<tr>
<td>0b0011</td>
<td>4KB granule at stage 2 supports 52-bit input and output addresses.</td>
<td>When FEAT_LPA2 is implemented</td>
</tr>
</tbody>
</table>

All other values are reserved.

The 0b0000 value is deprecated.

**TGran64_2, bits [39:36]**

Indicates support for 64KB memory granule size at stage 2. Defined values are:

<table>
<thead>
<tr>
<th>TGran64_2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Support for 64KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran64 field.</td>
</tr>
<tr>
<td>0b0001</td>
<td>64KB granule not supported at stage 2.</td>
</tr>
<tr>
<td>0b0010</td>
<td>64KB granule supported at stage 2.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The 0b0000 value is deprecated.
### TGran16_2, bits [35:32]
Indicates support for 16KB memory granule size at stage 2. Defined values are:

<table>
<thead>
<tr>
<th>TGran16_2</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Support for 16KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran16 field.</td>
<td></td>
</tr>
<tr>
<td>0b0001</td>
<td>16KB granule not supported at stage 2.</td>
<td></td>
</tr>
<tr>
<td>0b0010</td>
<td>16KB granule supported at stage 2.</td>
<td></td>
</tr>
<tr>
<td>0b0011</td>
<td>16KB granule at stage 2 supports 52-bit input and output addresses.</td>
<td>When FEAT_LPA2 is implemented</td>
</tr>
</tbody>
</table>

All other values are reserved.

The 0b0000 value is deprecated.

### TGran4, bits [31:28]
Indicates support for 4KB memory translation granule size. Defined values are:

<table>
<thead>
<tr>
<th>TGran4</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>4KB granule supported.</td>
<td></td>
</tr>
<tr>
<td>0b0001</td>
<td>4KB granule supports 52-bit input and output addresses.</td>
<td>When FEAT_LPA2 is implemented</td>
</tr>
<tr>
<td>0b1111</td>
<td>4KB granule not supported.</td>
<td></td>
</tr>
</tbody>
</table>

All other values are reserved.

### TGran64, bits [27:24]
Indicates support for 64KB memory translation granule size. Defined values are:

<table>
<thead>
<tr>
<th>TGran64</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>64KB granule supported.</td>
</tr>
<tr>
<td>0b1111</td>
<td>64KB granule not supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

### TGran16, bits [23:20]
Indicates support for 16KB memory translation granule size. Defined values are:

<table>
<thead>
<tr>
<th>TGran16</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>16KB granule not supported.</td>
<td></td>
</tr>
<tr>
<td>0b0001</td>
<td>16KB granule supported.</td>
<td></td>
</tr>
<tr>
<td>0b0010</td>
<td>16KB granule supports 52-bit input and output addresses.</td>
<td>When FEAT_LPA2 is implemented</td>
</tr>
</tbody>
</table>

All other values are reserved.

### BigEndEL0, bits [19:16]
Indicates support for mixed-endian at EL0 only. Defined values are:

<table>
<thead>
<tr>
<th>BigEndEL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No mixed-endian support at EL0. The SCTLR_EL1.E0E bit has a fixed value.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Mixed-endian support at EL0. The SCTLR_EL1.E0E bit can be configured.</td>
</tr>
</tbody>
</table>

All other values are reserved.
This field is invalid and is RES0 if ID_AA64MMFR0_EL1.BigEnd is not 0b0000.

**SNSMem, bits [15:12]**

Indicates support for a distinction between Secure and Non-secure Memory. Defined values are:

<table>
<thead>
<tr>
<th>SNSMem</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Does not support a distinction between Secure and Non-secure Memory.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Does support a distinction between Secure and Non-secure Memory.</td>
</tr>
</tbody>
</table>

**Note**

If EL3 is implemented, the value 0b0000 is not permitted.

All other values are reserved.

**BigEnd, bits [11:8]**

Indicates support for mixed-endian configuration. Defined values are:

<table>
<thead>
<tr>
<th>BigEnd</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No mixed-endian support. The 'SCTLR_ELx'.EE bits have a fixed value. See the BigEndEL0 field, bits[19:16], for whether EL0 supports mixed-endian.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Mixed-endian support. The 'SCTLR_ELx'.EE and SCTLR_EL1.E0E bits can be configured.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**ASIDBits, bits [7:4]**

Number of ASID bits. Defined values are:

<table>
<thead>
<tr>
<th>ASIDBits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>8 bits.</td>
</tr>
<tr>
<td>0b0010</td>
<td>16 bits.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**PARange, bits [3:0]**

Physical Address range supported. Defined values are:

<table>
<thead>
<tr>
<th>PARange</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>32 bits, 4GB.</td>
</tr>
<tr>
<td>0b0001</td>
<td>36 bits, 64GB.</td>
</tr>
<tr>
<td>0b0010</td>
<td>40 bits, 1TB.</td>
</tr>
<tr>
<td>0b0011</td>
<td>42 bits, 4TB.</td>
</tr>
<tr>
<td>0b0100</td>
<td>44 bits, 16TB.</td>
</tr>
<tr>
<td>0b0101</td>
<td>48 bits, 256TB.</td>
</tr>
<tr>
<td>0b0110</td>
<td>52 bits, 4PB.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The value 0b0110 is permitted only if the implementation includes FEAT_LPA, otherwise it is reserved.

**Accessing the ID_AA64MMFR0_EL1**

Accesses to this register use the following encodings:
MRS <Xt>, ID_AA64MMFR0_EL1

<table>
<thead>
<tr>

The ID_AA64MMFR1_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

There are no configuration notes.

**Attributes**

ID_AA64MMFR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64MMFR1_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Res0</td>
<td>Reserved</td>
</tr>
<tr>
<td>47-44</td>
<td>AFP</td>
<td>Indicates support for FPCR. {AH, FIZ, NEP}. Defined values are:</td>
</tr>
<tr>
<td>43-40</td>
<td>HCX</td>
<td>Indicates support for HCRX_EL2 and its associated EL3 trap. Defined values are:</td>
</tr>
<tr>
<td>19-16</td>
<td>LO</td>
<td></td>
</tr>
<tr>
<td>15-12</td>
<td>HPDS</td>
<td></td>
</tr>
<tr>
<td>11-8</td>
<td>VH</td>
<td></td>
</tr>
<tr>
<td>7-4</td>
<td>VMIDBits</td>
<td></td>
</tr>
<tr>
<td>3-0</td>
<td>PAN</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:48]**

Reserved, Res0.

**AFP, bits [47:44]**

Indicates support for FPCR. {AH, FIZ, NEP}. Defined values are:

<table>
<thead>
<tr>
<th>AFP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The FPCR. {AH, FIZ, NEP} fields are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The FPCR. {AH, FIZ, NEP} fields are supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_AFP implements the functionality identified by the value 0b0001.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the only permitted value is 0b0001.

**HCX, bits [43:40]**

Indicates support for HCRX_EL2 and its associated EL3 trap. Defined values are:

<table>
<thead>
<tr>
<th>HCX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>HCRX_EL2 and its associated EL3 trap are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>HCRX_EL2 and its associated EL3 trap are supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.
FEAT_HCX implements the functionality identified by the value 0b0001.

From Armv8.7, if EL2 is implemented, the only permitted value is 0b0001.

**ETS, bits [39:36]**

Indicates support for Enhanced Translation Synchronization. Defined values are:

<table>
<thead>
<tr>
<th>ETS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Enhanced Translation Synchronization is not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Enhanced Translation Synchronization is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_ETS implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.7, the only permitted value is 0b0001.

**TWED, bits [35:32]**

Indicates support for the configurable delayed trapping of WFE. Defined values are:

<table>
<thead>
<tr>
<th>TWED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Configurable delayed trapping of WFE is not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Configurable delayed trapping of WFE is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_TWED implements the functionality identified by the value 0b0001.

From Armv8.6, the permitted values are 0b0000 and 0b0001.

**XNX, bits [31:28]**

Indicates support for execute-never control distinction by Exception level at stage 2. Defined values are:

<table>
<thead>
<tr>
<th>XNX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Distinction between EL0 and EL1 execute-never control at stage 2 not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Distinction between EL0 and EL1 execute-never control at stage 2 supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_XNX implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

**SpecSEI, bits [27:24]**

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

<table>
<thead>
<tr>
<th>SpecSEI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The PE never generates an SError interrupt due to an External abort on a speculative read.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The PE might generate an SError interrupt due to an External abort on a speculative read.</td>
</tr>
</tbody>
</table>

All other values are reserved.
PAN, bits [23:20]

Privileged Access Never. Indicates support for the PAN bit in PSTATE, SPSR_EL1, SPSR_EL2, SPSR_EL3, and DSPSR_EL0. Defined values are:

<table>
<thead>
<tr>
<th>PAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PAN not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>PAN supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>PAN supported and AT S1E1RP and AT S1E1WP instructions supported.</td>
</tr>
<tr>
<td>0b0011</td>
<td>PAN supported, AT S1E1RP and AT S1E1WP instructions supported, and SCTLR_EL1.EPAN and SCTLR_EL2.EPAN bits supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_PAN implements the functionality identified by the value 0b0001.

FEAT_PAN2 implements the functionality added by the value 0b0010.

FEAT_PAN3 implements the functionality added by the value 0b0011.

In Armv8.1, the permitted values are 0b0001 and 0b0011.

From Armv8.2, the permitted values are 0b0010 and 0b0011.

From Armv8.7, the only permitted value is 0b0011.

LO, bits [19:16]

LORegions. Indicates support for LORegions. Defined values are:

<table>
<thead>
<tr>
<th>LO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>LORegions not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>LORegions supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_LOR implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

HPDS, bits [15:12]

Hierarchical Permission Disables. Indicates support for disabling hierarchical controls in translation tables. Defined values are:

<table>
<thead>
<tr>
<th>HPDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Disabling of hierarchical controls not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Disabling of hierarchical controls supported with the TCR_EL1.(HPD1, HPD0), TCR_EL2.HPD or TCR_EL2.(HPD1, HPD0), and TCR_EL3.HPD bits.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_HPDS implements the functionality identified by the value 0b0001.

FEAT_HPDS2 implements the functionality identified by the value 0b0010.

From Armv8.1, the value 0b0000 is not permitted.

VH, bits [11:8]

Virtualization Host Extensions. Defined values are:
<table>
<thead>
<tr>
<th>VH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Virtualization Host Extensions not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Virtualization Host Extensions supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_VHE implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

**VMIDBits, bits [7:4]**

Number of VMID bits. Defined values are:

<table>
<thead>
<tr>
<th>VMIDBits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>8 bits</td>
</tr>
<tr>
<td>0b0010</td>
<td>16 bits</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_VMID16 implements the functionality identified by the value 0b0010.

From Armv8.1, the permitted values are 0b0000 and 0b0010.

**HAFDBS, bits [3:0]**

Hardware updates to Access flag and Dirty state in translation tables. Defined values are:

<table>
<thead>
<tr>
<th>HAFDBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Hardware update of the Access flag and dirty state are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Hardware update of the Access flag is supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Hardware update of both the Access flag and dirty state is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_HAFDBS implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.1, the permitted values are 0b0000, 0b0001, and 0b0010.

**Accessing the ID_AA64MMFR1_EL1**

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_AA64MMFR1_EL1
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b00</td>
<td>0b0000</td>
<td>0b0111</td>
<td>0b001</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);

        return ID_AA64MMFR1_EL1;
    end
elsif PSTATE.EL == EL2 then
    return ID_AA64MMFR1_EL1;
elsif PSTATE.EL == EL3 then
    return ID_AA64MMFR1_EL1;
The ID_AA64MMFR2_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

**Attributes**

ID_AA64MMFR2_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64MMFR2_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| E0PD | EVT | BBM | TTL | RES0 | FWB | IDS | AT | E0PD | EVT | BBM | TTL | RES0 | FWB | IDS | AT | E0PD | EVT | BBM | TTL | RES0 | FWB | IDS | AT | E0PD | EVT | BBM | TTL | RES0 | FWB | IDS | AT 
| ST | NV | CCIDX | VARange | IESB | LSM | UAO | CnP |

**E0PD, bits [63:60]**

Indicates support for the E0PD mechanism. Defined values are:

<table>
<thead>
<tr>
<th>E0PD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>E0PDx mechanism is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>E0PDx mechanism is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_E0PD implements the functionality identified by the value 0b0001.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

**EVT, bits [59:56]**

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR_EL2, {TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps. Defined values are:
EVT

<table>
<thead>
<tr>
<th>EVT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>HCR_EL2.{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>HCR_EL2.{TOCU, TICAB, TID4} traps are supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>HCR_EL2.{TTLBOS, TTLBIS} traps are not supported.</td>
</tr>
</tbody>
</table>

FEAT_EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0010 when EL2 is implemented.

BBM, bits [55:52]

Allows identification of the requirements of the hardware to have break-before-make sequences when changing block size for a translation.

<table>
<thead>
<tr>
<th>BBM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Level 0 support for changing block size is supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Level 1 support for changing block size is supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Level 2 support for changing block size is supported.</td>
</tr>
</tbody>
</table>

FEAT_BBM implements the functionality identified by the values 0b0000, 0b0001, and 0b0010.

From Armv8.4, the permitted values are 0b0000, 0b0001, and 0b0010.

TTL, bits [51:48]

Indicates support for TTL field in address operations. Defined values are:

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>TLB maintenance instructions by address have bits[47:44] as RES0.</td>
</tr>
<tr>
<td>0b0001</td>
<td>TLB maintenance instructions by address have bits[47:44] holding the TTL field.</td>
</tr>
</tbody>
</table>

FEAT_TTL implements the functionality identified by the value 0b0001.

This field affects TLBI IPAS2E1, TLBI IPAS2E1IS, TLBI IPAS2E1OS, TLBI IPAS2LE1, TLBI IPAS2LE1IS, TLBI IPAS2LE1OS, TLBI VAEE1, TLBI VAEE1IS, TLBI VAEE1OS, TLBI VAEE1IS, TLBI VAEE1OS, TLBI VAEE2, TLBI VAEE2IS, TLBI VAEE2OS, TLBI VAEE3, TLBI VAEE3IS, TLBI VAEE3OS, TLBI VAEE1, TLBI VAEE1IS, TLBI VAEE1OS, TLBI VAEE2, TLBI VAEE2IS, TLBI VAEE2OS, TLBI VAEE3, TLBI VAEE3IS, TLBI VAEE3OS.

From Armv8.4, the only permitted value is 0b0001.

Bits [47:44]

Reserved, RES0.

FWB, bits [43:40]

Indicates support for HCR_EL2.FWB. Defined values are:
### FWB

<table>
<thead>
<tr>
<th>FWB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>HCR_EL2.FWB bit is not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>HCR_EL2.FWB is supported.</td>
</tr>
</tbody>
</table>

All other values reserved.

FEAT_S2FWB implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

### IDS, bits [39:36]

Indicates the value of ESR_ELx.EC that reports an exception generated by a read access to the feature ID space. Defined values are:

<table>
<thead>
<tr>
<th>IDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>An exception which is generated by a read access to the feature ID space, other than a trap caused by HCR_EL2.TIDx, SCTLR_EL1.UCT, or SCTLR_EL2.UCT, is reported by ESR_ELx.EC == 0x8.</td>
</tr>
<tr>
<td>0b0001</td>
<td>All exceptions generated by an AArch64 read access to the feature ID space are reported by ESR_ELx.EC == 0x18.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The Feature ID space is defined as the System register space in AArch64 with op0==3, op1=={0, 1, 3}, CRn==0, CRm=={0-7}, op2=={0-7}.

FEAT_IDST implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

### AT, bits [35:32]

Identifies support for unaligned single-copy atomicity and atomic functions. Defined values are:

<table>
<thead>
<tr>
<th>AT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Unaligned single-copy atomicity and atomic functions are not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Unaligned single-copy atomicity and atomic functions with a 16-byte address range aligned to 16-bytes are supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_LSE2 implements the functionality identified by the value 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

From Armv8.4, the only permitted value is 0b0001.

### ST, bits [31:28]

Identifies support for small translation tables. Defined values are:

<table>
<thead>
<tr>
<th>ST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 39.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 48 for 4KB and 16KB granules, and 47 for 64KB granules.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_TTST implements the functionality identified by the value 0b0001.

If FEAT_SEL2 is implemented, the only permitted value is 0b0001.

In an implementation which does not support FEAT_SEL2, the permitted values are 0b0000 and 0b0001.
**NV, bits [27:24]**

Nested Virtualization. If EL2 is implemented, indicates support for the use of nested virtualization. Defined values are:

<table>
<thead>
<tr>
<th>NV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Nested virtualization is not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The HCR_EL2.NV, HCR_EL2.NV1, HCR_EL2.AT bits are implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>The VNCR_EL2 register and the HCR_EL2.{AT, NV, NV1, NV2} bits are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If EL2 is not implemented, the only permitted value is 0b0000.

FEAT_NV implements the functionality identified by the value 0b0001.

FEAT_NV2 implements the functionality identified by the value 0b0010.

In Armv8.3, if EL2 is implemented, the permitted values are 0b0000 and 0b0001.

From Armv8.4, if EL2 is implemented, the permitted values are 0b0000, 0b0001, and 0b0010.

**CCIDX, bits [23:20]**

Support for the use of revised CCSIDR_EL1 register format. Defined values are:

<table>
<thead>
<tr>
<th>CCIDX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>32-bit format implemented for all levels of the CCSIDR_EL1.</td>
</tr>
<tr>
<td>0b0001</td>
<td>64-bit format implemented for all levels of the CCSIDR_EL1.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_CCIDX implements the functionality identified by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

**VARange, bits [19:16]**

Indicates support for a larger virtual address. Defined values are:

<table>
<thead>
<tr>
<th>VARange</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>VMSAv8-64 supports 48-bit VAs.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VMSAv8-64 supports 52-bit VAs when using the 64KB translation granule. The other translation granules support 48-bit VAs.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_LVA implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

**IESB, bits [15:12]**

Indicates support for the IESB bit in the SCTLR_ELx registers. Defined values are:

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>IESB bit in the SCTLR_ELx registers is not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>IESB bit in the SCTLR_ELx registers is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_IESB implements the functionality identified by the value 0b0001.
LSM, bits [11:8]

Indicates support for LSMAOE and nTLSMD bits in SCTLR_EL1 and SCTLR_EL2. Defined values are:

<table>
<thead>
<tr>
<th>LSM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>LSMAOE and nTLSMD bits not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>LSMAOE and nTLSMD bits supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_LSMAOC implements the functionality identified by the value 0b0001.

UAO, bits [7:4]

User Access Override. Defined values are:

<table>
<thead>
<tr>
<th>UAO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>UAO not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>UAO supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_UAO implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

CnP, bits [3:0]

Indicates support for Common not Private translations. Defined values are:

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Common not Private translations not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Common not Private translations supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

Accessing the ID_AA64MMFR2_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID_AA64MMFR2_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0111</td>
<td>0b010</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        end if
    else
        UNDEFINED;
    end if
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && (!IsZero(ID_AA64MMFR2_EL1) || boolean IMPLEMENTATION_DEFINED "ID_AA64MMFR2 trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_AA64MMFR2_EL1;
    end if
elsif PSTATE.EL == EL2 then
    return ID_AA64MMFR2_EL1;
elsif PSTATE.EL == EL3 then
    return ID_AA64MMFR2_EL1;
end if
The ID_AA64PFR0_EL1 characteristics are:

**Purpose**

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

The external register EDPFR gives information from this register.

**Attributes**

ID_AA64PFR0_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64PFR0_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CSV3 | CSV2 | RES0 | DIT | AMU | MPAM | SEL2 | SVE |
| RAS | GIC | AdvSIMD | FP | EL3 | EL2 | EL1 | EL0 |

**CSV3, bits [63:60]**

Speculative use of faulting data. Defined values are:

<table>
<thead>
<tr>
<th>CSV3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>This Device does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence</td>
</tr>
<tr>
<td>0b0001</td>
<td>Data loaded under speculation with a permission or domain fault cannot be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

**CSV2, bits [59:56]**

Speculative use of out of context branch targets. Defined values are:
### CSV2

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000 This Device does not disclose whether branch targets trained in</td>
</tr>
<tr>
<td>one hardware described context can affect speculative execution in a</td>
</tr>
<tr>
<td>different hardware described context.</td>
</tr>
<tr>
<td>0b0001 Branch targets trained in one hardware described context can</td>
</tr>
<tr>
<td>only affect speculative execution in a different hardware described</td>
</tr>
<tr>
<td>context in a hard-to-determine way. Contexts do not include the</td>
</tr>
<tr>
<td>SCXTNUM_ELx register contexts, and these registers are not supported.</td>
</tr>
<tr>
<td>0b0010 Branch targets trained in one hardware described context can</td>
</tr>
<tr>
<td>only affect speculative execution in a different hardware described</td>
</tr>
<tr>
<td>context in a hard-to-determine way. Contexts include the SCXTNUM_ELx</td>
</tr>
<tr>
<td>register contexts, and these registers are supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8.0, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are 0b0001 and 0b0010.

### Bits [55:52]

Reserved, RES0.

### DIT, bits [51:48]

Data Independent Timing. Defined values are:

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000 AArch64 does not guarantee constant execution time of any</td>
</tr>
<tr>
<td>instructions.</td>
</tr>
<tr>
<td>0b0001 AArch64 provides the PSTATE.DIT mechanism to guarantee constant</td>
</tr>
<tr>
<td>execution time of certain instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

### AMU, bits [47:44]

Indicates support for Activity Monitors Extension. Defined values are:

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000 Activity Monitors Extension is not implemented.</td>
</tr>
<tr>
<td>0b0001 FEAT_AMUv1 is implemented.</td>
</tr>
<tr>
<td>0b0010 FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for</td>
</tr>
<tr>
<td>virtualization of the activity monitor event counters.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

### MPAM, bits [43:40]

Indicates support for MPAM Extension. Defined values are:
### MPAM

<table>
<thead>
<tr>
<th>MPAM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If ID_AA64PFR1_EL1.MPAM_frac == 0b0000, MPAM Extension is not implemented.</td>
</tr>
<tr>
<td></td>
<td>If ID_AA64PFR1_EL1.MPAM_frac == 0b0001, MPAM Extension version 0.1 is implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>If ID_AA64PFR1_EL1.MPAM_frac == 0b0000, MPAM Extension version 1.0 is implemented.</td>
</tr>
<tr>
<td></td>
<td>If ID_AA64PFR1_EL1.MPAM_frac == 0b0001, MPAM Extension version 1.1 is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

### SEL2, bits [39:36]

Secure EL2. Defined values are:

<table>
<thead>
<tr>
<th>SEL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Secure EL2 is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Secure EL2 is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_SEL2 implements the functionality identified by the value 0b0001.

### SVE, bits [35:32]

Scalable Vector Extension. Defined values are:

<table>
<thead>
<tr>
<th>SVE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SVE architectural state and programmers' model are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SVE architectural state and programmers' model are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

If implemented, refer to ID_AA64ZFR0_EL1 for information about which SVE instructions are available.

### RAS, bits [31:28]

RAS Extension version. Defined values are:

<table>
<thead>
<tr>
<th>RAS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No RAS Extension.</td>
</tr>
<tr>
<td>0b0001</td>
<td>RAS Extension present.</td>
</tr>
<tr>
<td>0b0010</td>
<td>FEAT_RASv1p1 present. As 0b0001, and adds support for:</td>
</tr>
<tr>
<td></td>
<td>• If EL3 is implemented, FEAT_DoubleFault.</td>
</tr>
<tr>
<td></td>
<td>• Additional ERXMISC&lt;m&gt;_EL1 System registers.</td>
</tr>
<tr>
<td></td>
<td>• Additional System registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and the</td>
</tr>
<tr>
<td></td>
<td>SCR_EL3, FIEN and HCR_EL2.FIEN trap controls, to support the optional</td>
</tr>
<tr>
<td></td>
<td>RAS Common Fault Injection Model Extension.</td>
</tr>
<tr>
<td></td>
<td>Error records accessed through System registers conform to RAS System</td>
</tr>
<tr>
<td></td>
<td>Architecture v1.1, which includes simplifications to ERR&lt;n&gt;STATUS and</td>
</tr>
<tr>
<td></td>
<td>support for the optional RAS Timestamp and RAS Common Fault Injection</td>
</tr>
<tr>
<td></td>
<td>Model Extensions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 and FEAT_DoubleFault implement the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.
From Armv8.4, if FEAT_DoubleFault is implemented, the only permitted value is 0b0010.

From Armv8.4, when FEAT_DoubleFault is not implemented, and ERRIDR_EL1 is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

**Note**

When the value of this field is 0b0001, ID_AA64PFR1_EL1.RAS_frac indicates whether FEAT_RASv1p1 is implemented.

---

**GIC, bits [27:24]**

System register GIC CPU interface. Defined values are:

<table>
<thead>
<tr>
<th>GIC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>GIC CPU interface system registers not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.</td>
</tr>
<tr>
<td>0b0011</td>
<td>System register interface to version 4.1 of the GIC CPU interface is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**AdvSIMD, bits [23:20]**

Advanced SIMD. Defined values are:

<table>
<thead>
<tr>
<th>AdvSIMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Advanced SIMD is implemented, including support for the following SISD and SIMD operations:</td>
</tr>
<tr>
<td></td>
<td>• Integer byte, halfword, word and doubleword element operations.</td>
</tr>
<tr>
<td></td>
<td>• Single-precision and double-precision floating-point arithmetic.</td>
</tr>
<tr>
<td></td>
<td>• Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.</td>
</tr>
<tr>
<td>0b0001</td>
<td>As for 0b0000, and also includes support for half-precision floating-point arithmetic.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Advanced SIMD is not implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with Advanced SIMD support that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without Advanced SIMD support.

**FP, bits [19:16]**

Floating-point. Defined values are:

<table>
<thead>
<tr>
<th>FP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Floating-point is implemented, and includes support for:</td>
</tr>
<tr>
<td></td>
<td>• Single-precision and double-precision floating-point types.</td>
</tr>
<tr>
<td></td>
<td>• Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.</td>
</tr>
<tr>
<td>0b0001</td>
<td>As for 0b0000, and also includes support for half-precision floating-point arithmetic.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Floating-point is not implemented.</td>
</tr>
</tbody>
</table>
All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with floating-point support that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without floating-point support.

### EL3, bits [15:12]

EL3 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL3 is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL3 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL3 can be executed in either AArch64 or AArch32 state.</td>
</tr>
</tbody>
</table>

All other values are reserved.

### EL2, bits [11:8]

EL2 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL2 is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL2 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL2 can be executed in either AArch64 or AArch32 state.</td>
</tr>
</tbody>
</table>

All other values are reserved.

### EL1, bits [7:4]

EL1 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>EL1 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL1 can be executed in either AArch64 or AArch32 state.</td>
</tr>
</tbody>
</table>

All other values are reserved.

### EL0, bits [3:0]

EL0 Exception level handling. Defined values are:

<table>
<thead>
<tr>
<th>EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>EL0 can be executed in AArch64 state only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>EL0 can be executed in either AArch64 or AArch32 state.</td>
</tr>
</tbody>
</table>

All other values are reserved.

### Accessing the ID_AA64PFR0_EL1

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>MRS &lt;Xt&gt;, ID_AA64PFR0_EL1</th>
</tr>
</thead>
<tbody>
<tr>
<td>op0</td>
</tr>
<tr>
<td>-----</td>
</tr>
<tr>
<td>0b11</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);

elsif PSTATE.EL == EL2 then
    return ID_AA64PFR0_EL1;
elsif PSTATE.EL == EL3 then
    return ID_AA64PFR0_EL1;
The ID_AA64PFR1_EL1 characteristics are:

**Purpose**

Reserved for future expansion of information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

There are no configuration notes.

**Attributes**

ID_AA64PFR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64PFR1_EL1 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |

**Bits [63:20]**

Reserved, RES0.

**MPAM_frac, bits [19:16]**

MPAM Extension fractional field. Defined values are:

<table>
<thead>
<tr>
<th>MPAM_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If \texttt{ID-AA64PFR0_EL1.MPAM} == 0b0000, MPAM Extension not implemented. If \texttt{ID-AA64PFR0_EL1.MPAM} == 0b0001, MPAM Extension v1.0 is implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>If \texttt{ID-AA64PFR0_EL1.MPAM} == 0b0000, implements MPAM v0.1, which is like v1.1 but reduces support for Secure PARTIDs. If \texttt{ID-AA64PFR0_EL1.MPAM} == 0b0001, implements MPAM v1.1 and adds support for MPAM2_EL2.TIDR to provide trapping of MPAMIDR_EL1 when MPAMHCR_EL2 is not present.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**RAS_frac, bits [15:12]**

RAS Extension fractional field. Defined values are:
### RAS_frac

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If \texttt{ID_AA64PFR0_EL1.RAS} == 0b0001, RAS Extension implemented.</td>
</tr>
</tbody>
</table>
| 0b0001 | If \texttt{ID\_AA64PFR0\_EL1.RAS} == 0b0001, as 0b0000 and adds support for:  
  - Additional \texttt{ERXMISC<	extless;m\textgreater;} EL1 System registers.  
  - Additional System registers \texttt{ERXPFGCDN\_EL1}, \texttt{ERXPFGCTL\_EL1}, and \texttt{ERXPFGF\_EL1}, and the \texttt{SCR\_EL3.FIEN} and \texttt{HCR\_EL2.FIEN} trap controls, to support the optional RAS Common Fault Injection Model Extension.  
  - Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to \texttt{ERR<n>STATUS}, and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions. |

All other values are reserved.

FEAT\_RASv1p1 implements the functionality identified by the value 0b0001.

This field is valid only if \texttt{ID\_AA64PFR0\_EL1.RAS} == 0b0001.

### MTE, bits [11:8]

Support for the Memory Tagging Extension. Defined values are:

<table>
<thead>
<tr>
<th>MTE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Memory Tagging Extension is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Instruction-only Memory Tagging Extension is implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Full Memory Tagging Extension is implemented.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Memory Tagging Extension is implemented with support for asymmetric Tag Check Fault handling.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT\_MTE implements the functionality identified by the value 0b0001.

FEAT\_MTE2 implements the functionality identified by the value 0b0010

FEAT\_MTE3 implements the functionality identified by the value 0b0011.

In Armv8.5, the permitted values are 0b0000, 0b0001 and 0b0010.

From Armv8.7, the value 0b0001 is not permitted.

### SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>AArch64 provides no mechanism to control the use of Speculative Store Bypassing.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.</td>
</tr>
<tr>
<td>0b0010</td>
<td>AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypassing Safe, and the MSR and MRS instructions to directly read and write the PSTATE.SSBS field.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT\_SSBS implements the functionality identified by the value 0b0001.

FEAT\_SSBS2 implements the functionality identified by the value 0b0010.
BT, bits [3:0]

Branch Target Identification mechanism support in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>BT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The Branch Target Identification mechanism is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The Branch Target Identification mechanism is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_BTI implements the functionality identified by the value 0b0001.

From Armv8.5, the only permitted value is 0b0001.

Accessing the ID_AA64PFR1_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID_AA64PFR1_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0100</td>

The ID_AA64ZFR0_EL1 characteristics are:

**Purpose**

Provides additional information about the implemented features of the AArch64 Scalable Vector Extension, when the ID_AA64PFR0_EL1.SVE field is not zero.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

**Note**

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

**Attributes**

ID_AA64ZFR0_EL1 is a 64-bit register.

**Field descriptions**

The ID_AA64ZFR0_EL1 bit assignments are:

<table>

**Bits [63:60]**

Reserved, RES0.

**F64MM, bits [59:56]**

Indicates support for SVE FP64 double-precision floating-point matrix multiplication instructions. Defined values are:

<table>
<thead>
<tr>
<th>F64MM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>FP64 matrix multiplication and related instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FP64 variant of the FMMLA instruction, and LD1RO* instructions are implemented. The 128-bit element variations of TRN1, TRN2, UZP1, UZP2, ZIP1, and ZIP2 are also implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_F64MM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.
**F32MM, bits [55:52]**

Indicates support for the SVE FP32 single-precision floating-point matrix multiplication instruction. Defined values are:

<table>
<thead>
<tr>
<th>F32MM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>FP32 matrix multiplication instruction is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FP32 variant of the FMMLA instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_F32MM implements the functionality identified by 0b0001.

From Arm v8.2, the permitted values are 0b0000 and 0b0001.

**Bits [51:48]**

Reserved, RES0.

**I8MM, bits [47:44]**

Indicates support for SVE Int8 matrix multiplication instructions. Defined values are:

<table>
<thead>
<tr>
<th>I8MM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Int8 matrix multiplication instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ISAR1_EL1.I8MM.

From Armv8.6, the only permitted value is 0b0001.

**SM4, bits [43:40]**

Indicates support for SVE SM4 instructions. Defined values are:

<table>
<thead>
<tr>
<th>SM4</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SVE SM4 instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SVE SM4E and SM4EKEY instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_SVE_SM4 implements the functionality identified by 0b0001.

**Bits [39:36]**

Reserved, RES0.

**SHA3, bits [35:32]**

Indicates support for the SVE SHA3 instructions. Defined values are:

<table>
<thead>
<tr>
<th>SHA3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SVE SHA3 instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SVE RAX1 instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_SVE_SHA3 implements the functionality identified by 0b0001.
Bits [31:24]

Reserved, RES0.

BF16, bits [23:20]

Indicates support for SVE BFloat16 instructions. Defined values are:

<table>
<thead>
<tr>
<th>BF16</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>BFloat16 instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>BFCVT, BFCVTT, BFDO, BFMLA, BFMLALT, and BFMLLA instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_BF16 implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ISAR1_EL1.BF16.

From Armv8.6, the only permitted value is 0b0001.

BitPerm, bits [19:16]

Indicates support for SVE bit permute instructions. Defined values are:

<table>
<thead>
<tr>
<th>BitPerm</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SVE bit permute instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SVE BDEP, BEXT, and BGRP instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_SVE_BitPerm implements the functionality identified by 0b0001.

Bits [15:8]

Reserved, RES0.

AES, bits [7:4]

Indicates support for SVE AES instructions. Defined values are:

<table>
<thead>
<tr>
<th>AES</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SVE AES instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SVE AESE, AESD, AESMC, and AESMC instructions are implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As 0b0001, plus SVE PMULLB and PMULLT instructions with 64-bit source.</td>
</tr>
</tbody>
</table>

FEAT_SVE_AES implements the functionality identified by the value 0b0001.

FEAT_SVE_PMULL128 implements the functionality identified by the value 0b0010.

All other values are reserved.

The permitted values are 0b0000 and 0b0010.

SVEver, bits [3:0]

Indicates support for SVE version 2. Defined values are:

<table>
<thead>
<tr>
<th>SVEver</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SVE instructions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SVE and the non-optional SVE2 instructions are implemented.</td>
</tr>
</tbody>
</table>

Page 1098
FEAT_SVE2 implements the functionality identified by the value 0b0001.

All other values are reserved. This field is valid only if the ID_AA64PFR0_EL1.SVE field is not zero.

ID_AFR0_EL1, AArch32 Auxiliary Feature Register 0

The ID_AFR0_EL1 characteristics are:

**Purpose**

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32 state.

Must be interpreted with the Main ID Register, MIDR_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_AFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_AFR0[31:0].

**Attributes**

ID_AFR0_EL1 is a 64-bit register.

**Field descriptions**

The ID_AFR0_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

<table>

</table>

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0011.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0011 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

Note

In Armv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an Armv8 implementation.

MProfDbg, bits [23:20]

M Profile Debug. Support for memory-mapped debug model for M profile processors. Defined values are:

<table>
<thead>
<tr>
<th>MProfDbg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for M profile Debug architecture, with memory-mapped access.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.
**MMapTrc, bits [19:16]**

Memory Mapped Trace. Support for memory-mapped trace model. Defined values are:

<table>
<thead>
<tr>
<th>MMapTrc</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for Arm trace architecture, with memory-mapped access.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

**CopTrc, bits [15:12]**

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space. Defined values are:

<table>
<thead>
<tr>
<th>CopTrc</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for Arm trace architecture, with System registers access.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

**MMapDbg, bits [11:8]**

Memory Mapped Debug. Support for v7 memory-mapped debug model, for A and R profile processors.

In Armv8-A, this field is RES0.

The optional memory map defined by Armv8 is not compatible with Armv7.

**CopSDbg, bits [7:4]**

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

**CopDbg, bits [3:0]**

Support for System registers-based debug model, using registers in the coproc == 0b1110 encoding space, for A and R profile processors. Defined values are:
### CopDbg

ID_DFR1_EL1, Debug Feature Register 1

The ID_DFR1_EL1 characteristics are:

**Purpose**

Provides top level information about the debug system in AArch32.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_DFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_DFR1[31:0].

**Note**

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

**Attributes**

ID_DFR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_DFR1_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

<table>
<thead>
<tr>
<th>Bit</th>

<td>FEAT_MTPMU and FEAT_PMUV3 implemented. PMEVTYPER&lt;n&gt;.MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPER&lt;n&gt;.MT are 0.</td>
</tr>
<tr>
<td>0b1111</td>
<td>FEAT_MTPMU not implemented. If FEAT_PMUV3 is implemented, PMEVTYPER&lt;n&gt;.MT are RES0.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value 0b0001.
From Armv8.6, in an implementation that includes FEAT_PMUv3, the value \texttt{0b0000} is not permitted.

In an implementation that does not include FEAT_PMUv3, the value \texttt{0b0001} is not permitted.

**Otherwise:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

ID_ISAR0_EL1, AArch32 Instruction Set Attribute Register 0

The ID_ISAR0_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_ISAR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR0[31:0].

**Attributes**

ID_ISAR0_EL1 is a 64-bit register.

**Field descriptions**

The ID_ISAR0_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

**Reversal, bits [31:28]**

Indicates the implemented Reversal instructions. Defined values are:

<table>
<thead>
<tr>
<th>Reversal</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the REV, REV16, and REVSH instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the RBIT instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**PSR_AR, bits [27:24]**

Indicates the implemented A and R profile instructions to manipulate the PSR. Defined values are:
All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.

**MultU, bits [23:20]**

Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

<table>
<thead>
<tr>
<th>MultU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the UMULL and UMLAL instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the UMAAL instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**MultS, bits [19:16]**

Indicates the implemented advanced signed Multiply instructions. Defined values are:

<table>
<thead>
<tr>
<th>MultS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>

ID_ISAR3_EL1, AArch32 Instruction Set Attribute Register 3

The ID_ISAR3_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_ISAR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR3[31:0].

**Attributes**

ID_ISAR3_EL1 is a 64-bit register.

**Field descriptions**

The ID_ISAR3_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| T32EE | TrueNOP | T32Copy | TabBranch | SynchPrim | SVC | SIMD | Saturate |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

Reserved, RES0.

**T32EE, bits [31:28]**

Indicates the implemented T32EE instructions. Defined values are:

<table>
<thead>
<tr>
<th>T32EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**TrueNOP, bits [27:24]**

Indicates the implemented true NOP instructions. Defined values are:
TrueNOP

<table>
<thead>
<tr>
<th></th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. This means there are no NOP instructions that do not have any register dependencies.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**T32Copy, bits [23:20]**

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

<table>
<thead>
<tr>
<th>T32Copy</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**TabBranch, bits [19:16]**

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

<table>
<thead>
<tr>
<th>TabBranch</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the TBB and TBH instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**SynchPrim, bits [15:12]**

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

<table>
<thead>
<tr>
<th>SynchPrim</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If SynchPrim_frac == 0b0000, no Synchronization Primitives implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>If SynchPrim_frac == 0b0000, adds the LDREX and STREX instructions.</td>
</tr>
<tr>
<td></td>
<td>If SynchPrim_frac == 0b0011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>If SynchPrim_frac == 0b0000, as for [0b0001, 0b0011] and also adds the LDREXD and STREXD instructions.</td>
</tr>
</tbody>
</table>

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0010.

**SVC, bits [11:8]**

Indicates the implemented SVC instructions. Defined values are:

<table>
<thead>
<tr>
<th>SVC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SVC instruction.</td>
</tr>
</tbody>
</table>
All other values are reserved.
In Armv8-A, the only permitted value is 0b0001.

**SIMD, bits [7:4]**

Indicates the implemented SIMD instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SSAT and USAT instructions, and the Q bit in the PSRs.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QAX, SHADD16, SHADD8, SHAX, SHSUB16, SHSUB8, SHAX, SSAT16, SSUB8, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UAX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQAX, UQAX, USAD16, USAD8, USAD8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A, the only permitted value is 0b0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports floating-point and Advanced SIMD instructions, **MVFR0**, **MVFR1**, and **MVFR2** give information about the implemented Advanced SIMD instructions.

**Saturate, bits [3:0]**

Indicates the implemented Saturate instructions. Defined values are:

<table>
<thead>
<tr>
<th>Saturate</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. This means no non-Advanced SIMD saturate instructions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.</td>
</tr>
</tbody>
</table>

All other values are reserved.
In Armv8-A, the only permitted value is 0b0001.

**Otherwise:**

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>
</tr>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Reserved, **UNKNOWN**.

**Bits [63:32]**

Reserved, RES0.

**SWP_frac, bits [31:28]**

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

<table>
<thead>
<tr>
<th><strong>SWP_frac</strong></th>
<th><strong>Meaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SWP or SWPB instructions not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other Requesters can come between the load memory access and the store memory access of the SWP or SWPB.</td>
</tr>
</tbody>
</table>

All other values are reserved. This field is valid only if ID_ISAR0.Swap is 0b0000.

In Armv8-A, the only permitted value is 0b0000.
PSR_M, bits [27:24]

Indicates the implemented M profile instructions to modify the PSRs. Defined values are:

<table>
<thead>
<tr>
<th>PSR_M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the M profile forms of the CPS, MRS, and MSR instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

SynchPrim_frac, bits [23:20]

Used in conjunction with ID_ISAR3, SynchPrim to indicate the implemented Synchronization Primitive instructions. Possible values are:

<table>
<thead>
<tr>
<th>SynchPrim_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.</td>
</tr>
<tr>
<td>0b0011</td>

</tr>
</tbody>
</table>

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0000.

Barrier, bits [19:16]

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

<table>
<thead>
<tr>
<th>Barrier</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the DMB, DSB, and ISB barrier instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SMC, bits [15:12]

Indicates the implemented SMC instructions. Defined values are:

<table>
<thead>
<tr>
<th>SMC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the SMC instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32, then this field has the value 0b0000.

Writeback, bits [11:8]

Indicates the support for Writeback addressing modes. Defined values are:
### Writeback

<table>
<thead>
<tr>
<th>Writeback</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds support for all of the writeback addressing modes.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### WithShifts, bits [7:4]

Indicates the support for instructions with shifts. Defined values are:

<table>
<thead>
<tr>
<th>WithShifts</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Nonzero shifts supported only in MOV and shift instructions.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds support for shifts of loads and stores over the range LSL 0-3.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds support for register-controlled shift options.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

### Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions. Defined values are:

<table>
<thead>
<tr>
<th>Unpriv</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None implemented. No T variant instructions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Adds the LDRBT, LDRT, STRBT, and STRT instructions.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

### Otherwise:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>
<td>UNKNOWN</td>
</tr>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td>UNKNOWN</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Reserved, UNKNOWN.

### Accessing the ID_ISAR4_EL1

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>MRS &lt;Xt&gt;, ID_ISAR4_EL1</th>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b0000</td>
<td>0b0010</td>
<td>0b100</td>
<td></td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_ISAR4_EL1;
    elsif PSTATE.EL == EL2 then
        return ID_ISAR4_EL1;
    elsif PSTATE.EL == EL3 then
        return ID_ISAR4_EL1;
ID_ISAR5_EL1, AArch32 Instruction Set Attribute Register 5

The ID_ISAR5_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR4_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_ISAR5_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR5[31:0].

**Attributes**

ID_ISAR5_EL1 is a 64-bit register.

**Field descriptions**

The ID_ISAR5_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | VCMA | RDM | RES0 | CRC32 | SHA2 | SHA1 | AES | SEVL |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

Reserved, RES0.

**VCMA, bits [31:28]**

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

<table>
<thead>
<tr>
<th>VCMA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The VCMLA and VCADD instructions are not implemented in AArch32.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The VCMLA and VCADD instructions are implemented in AArch32.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_FCMA implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, the only permitted value is 0b0001.
RDM, bits [27:24]

Indicates whether the VQRDMLAH and VQRDMLSLH instructions are implemented in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>RDM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No VQRDMLAH and VQRDMLSLH instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VQRDMLAH and VQRDMLSLH instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_RDM implements the functionality identified by the value 0b0001.

In Armv8.0, the only permitted value is 0b0000.

From Armv8.1, the only permitted value is 0b0001.

Bits [23:20]

Reserved, RES0.

CRC32, bits [19:16]

Indicates whether the CRC32 instructions are implemented in AArch32 state.

<table>
<thead>
<tr>
<th>CRC32</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No CRC32 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

SHA2, bits [15:12]

Indicates whether the SHA2 instructions are implemented in AArch32 state.

<table>
<thead>
<tr>
<th>SHA2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SHA2 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SHA1, bits [11:8]

Indicates whether the SHA1 instructions are implemented in AArch32 state.

<table>
<thead>
<tr>
<th>SHA1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No SHA1 instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

AES, bits [7:4]

Indicates whether the AES instructions are implemented in AArch32 state.
**AES, bits [7:0]**

Indicates whether the AES instruction is implemented in AArch32 state.

<table>
<thead>
<tr>
<th>AES</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No AES instructions implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AESE, AESD, AESMC, and AESIMC implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

**SEVL, bits [3:0]**

Indicates whether the SEVL instruction is implemented in AArch32 state.

<table>
<thead>
<tr>
<th>SEVL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SEVL is implemented as a NOP.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SEVL is implemented as Send Event Local.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Otherwise:**

### Bits [63:0]

Reserved, UNKNOWN.

**Accessing the ID_ISAR5_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, ID_ISAR5_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b00</td>
<td>0b0000</td>
<td>0b0010</td>
<td>0b101</td>
</tr>
</tbody>
</table>

```java
if PSTATE.EL == EL0 then
  if IsFeatureImplemented(FEAT_IDST) then
    if EL2Enabled() & HCR_EL2.TGE == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else
      AArch64.SystemAccessTrap(EL1, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() & HCR_EL2.TID3 == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    return ID_ISAR5_EL1;
elsif PSTATE.EL == EL2 then
  return ID_ISAR5_EL1;
else
  ID_ISAR5_EL1;
```
The ID_ISAR6_EL1 characteristics are:

**Purpose**

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1 and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_ISAR6_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR6[31:0].

**Note**

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

**Attributes**

ID_ISAR6_EL1 is a 64-bit register.

**Field descriptions**

The ID_ISAR6_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | I8MM | BF16 | SPECRES | SB | FHM | DP | JSCVT |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:28]**

Reserved, RES0.

**I8MM, bits [27:24]**

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch32 state. Defined values of this field are:

<table>
<thead>
<tr>
<th>I8MM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Int8 matrix multiplication instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VSMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.
FEAT_AA32I8MM implements the functionality identified by 0b0001.

**BF16, bits [23:20]**

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>BF16</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>BFloat16 instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VCVT, VCVTB, VCVTT, VDOT, VFMA, VFMA, VFMT, and VMMLA</td>
</tr>
<tr>
<td></td>
<td>instructions with BF16 operand or result types are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_AA32BF16 implements the functionality identified by 0b0001.

**SPECRES, bits [19:16]**

Indicates support for Speculation invalidation instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>SPECRES</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Prediction invalidation instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>CFPRCTX, DVPRCTX, and CPPRCTX instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_SPECRES implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

**SB, bits [15:12]**

Indicates support for the SB instruction in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>SB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>SB instruction is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>SB instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_SB implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

**FHM, bits [11:8]**

Indicates support for Advanced SIMD and floating-point VFMAL and VFMSL instructions in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>FHM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>VFMAL and VMFSL instructions are not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>VFMAL and VMFSL instructions are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_FHM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

**DP, bits [7:4]**

Indicates support for Advanced SIMD and floating-point VFMAL and VFMSL instructions in AArch32 state. Defined values are:
DP | Meaning
---|---
0b0000 | Dot product instructions are not implemented.
0b0001 | UDOT and VSDOT instructions are implemented.

All other values are reserved.

FEAT_DotProd implements the functionality identified by 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

From Armv8.4, the only permitted value is 0b0001.

**JSCVT, bits [3:0]**

Indicates support for the VJCVT instruction in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>JSCVT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The VJCVT instruction is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The VJCVT instruction is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_JSCVT implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

**Otherwise:**

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>63  62  61  60  59  58  57  56  55  54  53  52  51  50  49  48  47  46  45  44  43  42  41  40  39  38  37  36  35  34  33  32</td>
<td>UNKNOWN</td>

elsif PSTATE.EL == EL3 then
    return ID_ISAR6_EL1;
The ID_MMFR0_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR1_EL1, ID_MMFR2_EL1, ID_MMFR3_EL1, and ID_MMFR4_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_MMFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR0[31:0].

**Attributes**

ID_MMFR0_EL1 is a 64-bit register.

**Field descriptions**

The ID_MMFR0_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

<table>
<thead>
<tr>
<th>InnerShr</th>
<th>FCSE</th>
<th>AuxReg</th>
<th>TCM</th>
<th>ShareLvl</th>
<th>OuterShr</th>
<th>PMSA</th>
<th>VMSA</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**InnerShr, bits [31:28]**

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

<table>
<thead>
<tr>
<th>InnerShr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Implemented as Non-cacheable.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented with hardware coherency support.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Shareability ignored.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0_EL1.ShareLvl having the value 0b0001.

When ID_MMFR0_EL1.ShareLvl is zero, this field is **UNKNOWN**.
FCSE, bits [27:24]

Indicates whether the implementation includes the FCSE. Defined values are:

<table>
<thead>
<tr>
<th>FCSE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for FCSE.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

AuxReg, bits [23:20]

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

<table>
<thead>
<tr>
<th>AuxReg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for Auxiliary Control Register only.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for Auxiliary Fault Status Registers (AIFSR and ADFS) and Auxiliary Control Register.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0010.

Note

Accesses to unimplemented Auxiliary registers are UNDEFINED.

TCM, bits [19:16]

Indicates support for TCMs and associated DMAs. Defined values are:

<table>
<thead>
<tr>
<th>TCM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support is IMPLEMENTATION DEFINED. Armv7 requires this setting.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for TCM only, Armv6 implementation.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Support for TCM and DMA, Armv6 implementation.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

ShareLvl, bits [15:12]

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

<table>
<thead>
<tr>
<th>ShareLvl</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>One level of shareability implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Two levels of shareability implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the only permitted value is 0b0001.

OuterShr, bits [11:8]

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:
### OuterShr

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Implemented as Non-cacheable.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented with hardware coherency support.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Shareability ignored.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

### PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:

<table>
<thead>
<tr>
<th>PMSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for IMPLEMENTATION DEFINED PMSA.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for PMSAv6, with a Cache Type Register implemented.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Support for PMSAv7, with support for memory subsections. Armv7-R profile.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

### VMSA, bits [3:0]

Indicates support for a VMSA. Defined values are:

<table>
<thead>
<tr>
<th>VMSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for IMPLEMENTATION DEFINED VMSA.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for VMSAv6, with Cache and TLB Type Registers implemented.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Support for VMSAv7, with support for remapping and the Access flag. Armv7-A profile.</td>
</tr>
<tr>
<td>0b0100</td>
<td>As for 0b0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.</td>
</tr>
<tr>
<td>0b0101</td>
<td>As for 0b0100, and adds support for the Long-descriptor translation table format.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0101.

### Otherwise:

    return ID_MMFR0_EL1;
ID_MMFR1_EL1, AArch32 Memory Model Feature Register 1

The ID_MMFR1_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID_MMFR0_EL1], [ID_MMFR2_EL1], [ID_MMFR3_EL1], and [ID_MMFR4_EL1].

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_MMFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_MMFR1[31:0]].

**Attributes**

ID_MMFR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_MMFR1_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>31-28</td>
<td>Branch Predictor. Indicates branch predictor management requirements. Defined values are:</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**BPred, bits [31:28]**

Branch Predictor. Indicates branch predictor management requirements. Defined values are:
## BPred

<table>
<thead>
<tr>
<th>BPred</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No branch predictor, or no MMU present. Implies a fixed MPU configuration.</td>
</tr>
</tbody>
</table>
| 0b0001 | Branch predictor requires flushing on:  
· Enabling or disabling a stage of address translation.  
· Writing new data to instruction locations.  
· Writing new mappings to the translation tables.  
· Changes to the TTBR0, TTBR1, or TTBCR registers.  
· Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported. |
| 0b0010 | Branch predictor requires flushing on:  
· Enabling or disabling a stage of address translation.  
· Writing new data to instruction locations.  
· Writing new mappings to the translation tables.  
· Any change to the TTBR0, TTBR1, or TTBCR registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported. |
| 0b0011 | Branch predictor requires flushing only on writing new data to instruction locations. |
| 0b0100 | For execution correctness, branch predictor requires no flushing at any time. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0010, 0b0011, and 0b0100. For values other than 0b0000 and 0b0100 the Arm Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

### L1TstCln, bits [27:24]

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

<table>
<thead>
<tr>
<th>L1TstCln</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
</tbody>
</table>
| 0b0001 | Supported Level 1 data cache test and clean operations are:  
· Test and clean data cache. |
| 0b0010 | As for 0b0001, and adds:  
· Test, clean, and invalidate data cache. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

### L1Uni, bits [23:20]

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1Uni</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
</tbody>
</table>
| 0b0001 | Supported entire Level 1 cache operations are:  
· Invalidate cache, including branch predictor if appropriate.  
· Invalidate branch predictor, if appropriate. |
| 0b0010 | As for 0b0001, and adds:  
· Clean cache, using a recursive model that uses the cache dirty status bit.  
· Clean and invalidate cache, using a recursive model that uses the cache dirty status bit. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.
L1Hvd, bits [19:16]

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1Hvd</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>

<tr>
<td></td>
<td>• Clean data cache, using a recursive model that uses the</td>
</tr>
<tr>
<td></td>
<td>cache dirty status bit.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache, using a recursive model</td>
</tr>
<tr>
<td></td>
<td>that uses the cache dirty status bit.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1UniSW, bits [15:12]

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1UniSW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 unified cache line maintenance operations by set/way are:</td>
</tr>
<tr>
<td></td>
<td>• Clean cache line by set/way.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate cache line by set/way.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate cache line by set/way.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1HvdSW, bits [11:8]

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1HvdSW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported Level 1 Harvard cache line maintenance operations by set/way are:</td>
</tr>
<tr>
<td></td>
<td>• Clean data cache line by set/way.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache line by set/way.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate data cache line by set/way.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate instruction cache line by set/way.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.
**L1UniVA, bits [7:4]**

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1UniVA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
</tbody>
</table>
| 0b0001  | Supported Level 1 unified cache line maintenance operations by VA are:  
          • Clean cache line by VA.  
          • Invalidate cache line by VA.  
          • Clean and invalidate cache line by VA. |
| 0b0010  | As for 0b0001, and adds:  
          • Invalidate branch predictor by VA, if branch predictor is implemented. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**L1HvdVA, bits [3:0]**

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

<table>
<thead>
<tr>
<th>L1HvdVA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
</tbody>
</table>
| 0b0001  | Supported Level 1 Harvard cache line maintenance operations by VA are:

<td>RESERVED</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**HWAccFlg, bits [31:28]**

Hardware Access Flag. In earlier versions of the Arm Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

<table>
<thead>
<tr>
<th>HWAccFlg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for VMSAv7 Access flag, updated in hardware.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

**WFIStall, bits [27:24]**

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:
### WFIStall

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Support for WFI stalling.</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8, the permitted values are 0b0000 and 0b0001.

### MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc==0b1111) encoding space:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported memory barrier System instructions are:</td>
</tr>
<tr>
<td></td>
<td>• Data Synchronization Barrier (DSB).</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Instruction Synchronization Barrier (ISB).</td>
</tr>
<tr>
<td></td>
<td>• Data Memory Barrier (DMB).</td>
</tr>
</tbody>
</table>

All other values are reserved.

From Armv8, the only permitted value is 0b0010.

Arm deprecates the use of these operations. ID_ISAR4.Barrier_instrs indicates the level of support for the preferred barrier instructions.

### UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported unified TLB maintenance operations are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate all entries in the TLB.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate TLB entry by VA.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate TLB entries by ASID match.</td>
</tr>
<tr>
<td>0b0011</td>
<td>As for 0b0010, and adds:</td>

</tr>
<tr>
<td></td>
<td>• TLBIIIPAS2IS, TLBIIIPAS2LIS, TLBIIIPAS2, TLBIIIPAS2L.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0110.

### HvdTLB, bits [15:12]

If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is IMPLEMENTATION DEFINED. Arm deprecates the use of this field by software.

### L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:
### L1HvdRng

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
</tbody>
</table>
| 0b0001 | Supported Level 1 Harvard cache maintenance range operations are:  
• Invalidate data cache range by VA.  
• Invalidate instruction cache range by VA.  
• Clean data cache range by VA.  
• Clean and invalidate data cache range by VA. |

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

### L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
</tbody>
</table>
| 0b0001 | Supported Level 1 Harvard cache background fetch operations are:  
• Fetch instruction cache range by VA.  
• Fetch data cache range by VA. |

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

### L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
</tbody>
</table>
| 0b0001 | Supported Level 1 Harvard cache foreground fetch operations are:  
• Fetch instruction cache range by VA.  
• Fetch data cache range by VA. |

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

### Otherwise:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>
<td>UNKNOWN</td>
</tr>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td>UNKNOWN</td>
</tr>
</tbody>
</table>

### Bits [63:0]

Reserved, UNKNOWN.

### Accessing the ID_MMFR2_EL1

Accesses to this register use the following encodings:
MRS <Xt>, ID_MMFR2_EL1

<table>

ID_MMFR3_EL1, AArch32 Memory Model Feature Register 3

The ID_MMFR3_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR2_EL1, and ID_MMFR4_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_MMFR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR3[31:0].

**Attributes**

ID_MMFR3_EL1 is a 64-bit register.

**Field descriptions**

The ID_MMFR3_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

<table>
<thead>
<tr>
<th>Bits</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**Supersec, bits [31:28]**

Supersections. On a VMSA implementation, indicates whether Supersections are supported. Defined values are:

<table>
<thead>
<tr>
<th>Supersec</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Supersections supported.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Supersections not supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b1111.

**CMemSz, bits [27:24]**

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:
CMemSz | Meaning
---|---
0b0000 | 4GB, corresponding to a 32-bit physical address range.
0b0001 | 64GB, corresponding to a 36-bit physical address range.
0b0010 | 1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000, 0b0001, and 0b0010.

**CohWalk, bits [23:20]**

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification. Defined values are:

<table>
<thead>
<tr>
<th>CohWalk</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**PAN, bits [19:16]**

Privileged Access Never. Indicates support for the PAN bit in CPSR, SPSR, and DPSR in AArch32 state. Defined values are:

<table>
<thead>
<tr>
<th>PAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>PAN not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>PAN supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>PAN supported and ATS1CPRP and ATS1CPWP instructions supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_PAN implements the functionality identified by the value 0b0001.

FEAT_PAN2 implements the functionality added by the value 0b0010.

In Armv8.1, the value 0b0000 is not permitted.

From Armv8.2, the only permitted value is 0b0010.

**MaintBcst, bits [15:12]**

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

<table>
<thead>
<tr>
<th>MaintBcst</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Cache, TLB, and branch predictor operations only affect local structures.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.
BPMaint, bits [11:8]

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

<table>
<thead>
<tr>
<th>BPMaint</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported branch predictor maintenance operations are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate all branch predictors.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate branch predictors by VA.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

CMaintSW, bits [7:4]

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

<table>
<thead>
<tr>
<th>CMaintSW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported hierarchical cache maintenance instructions by set/way are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate data cache by set/way.</td>
</tr>
<tr>
<td></td>
<td>• Clean data cache by set/way.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache by set/way.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

CMaintVA, bits [3:0]

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

<table>
<thead>
<tr>
<th>CMaintVA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>None supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported hierarchical cache maintenance operations by VA are:</td>
</tr>
<tr>
<td></td>
<td>• Invalidate data cache by VA.</td>
</tr>
<tr>
<td></td>
<td>• Clean data cache by VA.</td>
</tr>
<tr>
<td></td>
<td>• Clean and invalidate data cache by VA.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate instruction cache by VA.</td>
</tr>
<tr>
<td></td>
<td>• Invalidate all instruction cache entries.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

Otherwise:

```
63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
  UNKNOWN
```

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
  UNKNOWN
```
Bits [63:0]
Reserved, UNKNOWN.

Accessing the ID_MMFR3_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID_MMFR3_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

elsif PSTATE.EL == EL2 then
  return ID_MMFR3_EL1;
elsif PSTATE.EL == EL3 then
  return ID_MMFR3_EL1;
The ID_MMFR4_EL1 characteristics are:

**Purpose**

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR2_EL1, and ID_MMFR3_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_MMFR4_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR4[31:0].

**Attributes**

ID_MMFR4_EL1 is a 64-bit register.

**Field descriptions**

The ID_MMFR4_EL1 bit assignments are:

*When AArch32 is supported at any Exception level:*

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>EVT</td>
</tr>
<tr>
<td>62</td>
<td>CCIDX</td>
</tr>
<tr>
<td>61</td>
<td>LSM</td>
</tr>
<tr>
<td>60</td>
<td>HPDS</td>
</tr>
<tr>
<td>59</td>
<td>CnP</td>
</tr>
<tr>
<td>58</td>
<td>XNX</td>
</tr>
<tr>
<td>57</td>
<td>AC2</td>
</tr>
<tr>
<td>56</td>
<td>SpecSEI</td>
</tr>
<tr>
<td>55</td>
<td>RES0</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**EVT, bits [31:28]**

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR2.{TTLBIS, TOCU, TICAB, TID4} traps. Defined values are:

<table>
<thead>
<tr>
<th>EVT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>HCR2. {TTLBIS, TOCU, TICAB, TID4} traps are not supported.</td>
</tr>
</tbody>
</table>
| 0b0001 | HCR2. {TOCU, TICAB, TID4} traps are supported.  
HCR2.TTLBIS trap is not supported. |
| 0b0010 | HCR2. {TTLBIS, TOCU, TICAB, TID4} traps are supported. |

All other values are reserved.

FEAT EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented supporting AArch32, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.
From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0010 when EL2 is implemented.

**CCIDX, bits [27:24]**

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated. Defined values are:

<table>
<thead>
<tr>
<th>CCIDX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_CCIDX implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

**LSM, bits [23:20]**

Indicates support for LSMAOE and nTLSMD bits in HSCTRL and SCTLR. Defined values are:

<table>
<thead>
<tr>
<th>LSM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>LSMAOE and nTLSMD bits not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>LSMAOE and nTLSMD bits supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_LSMAOC implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

**HPDS, bits [19:16]**

Hierarchical permission disables bits in translation tables. Defined values are:

<table>
<thead>
<tr>
<th>HPDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Disabling of hierarchical controls not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supports disabling of hierarchical controls using the TTBCR2.HPD0, TTBCR2.HPD1, and HTCRI.HPD bits.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_AA32HPD implements the functionality identified by the value 0b0001.

FEAT_HPDS2 implements the functionality added by the value 0b0010.

---

**Note**

The value 0b0000 implies that the encoding for TTBCR2 is UNDEFINED.

---

**CnP, bits [15:12]**

Common not Private translations. Defined values are:

<table>
<thead>
<tr>
<th>CnP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Common not Private translations not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Common not Private translations supported.</td>
</tr>
</tbody>
</table>
All other values are reserved.

FEAT_TTCNP implements the functionality identified by the value \texttt{0b0001}.

From Armv8.2 the only permitted value is \texttt{0b0001}.

**XNX, bits [11:8]**

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

<table>
<thead>
<tr>
<th>XNX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>Distinction between EL0 and EL1 execute-never control at stage 2 not supported.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>Distinction between EL0 and EL1 execute-never control at stage 2 supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_XNX implements the functionality identified by the value \texttt{0b0001}.

When FEAT_XNX is implemented:

- If all of the following conditions are true, it is \textsc{implementation defined} whether the value of \texttt{ID_MMFR4_EL1.XNX} is \texttt{0b0000} or \texttt{0b0001}:
  - \texttt{ID-AA64MMFR1_EL1.XNX} ==1,
  - EL2 cannot use AArch32,
  - EL1 can use AArch32.
- If EL2 can use AArch32 then the only permitted value is \texttt{0b0001}.

**AC2, bits [7:4]**

Indicates the extension of the \texttt{ACTLR} and \texttt{HACTLR} registers using \texttt{ACTLR2} and \texttt{HACTLR2}. Defined values are:

<table>
<thead>
<tr>
<th>AC2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>\texttt{ACTLR2} and \texttt{HACTLR2} are not implemented.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>\texttt{ACTLR2} and \texttt{HACTLR2} are implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8.0 and Armv8.1 the permitted values are \texttt{0b0000} and \texttt{0b0001}.

From Armv8.2, the only permitted value is \texttt{0b0001}.

**SpecSEI, bits [3:0]**

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

<table>
<thead>
<tr>
<th>SpecSEI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0000}</td>
<td>The PE never generates an SError interrupt due to an External abort on a speculative read.</td>
</tr>
<tr>
<td>\texttt{0b0001}</td>
<td>The PE might generate an SError interrupt due to an External abort on a speculative read.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Otherwise:**

<table>
<thead>
<tr>
<th>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</th>
<th>UNKNOWN</th>
</tr>
</thead>
<tbody>

ID_PFR0_EL1, AArch32 Processor Feature Register 0

The ID_PFR0_EL1 characteristics are:

Purpose

Gives top-level information about the instruction sets supported by the PE in AArch32 state.

Must be interpreted with ID_PFR1_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_PFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR0[31:0].

Attributes

ID_PFR0_EL1 is a 64-bit register.

Field descriptions

The ID_PFR0_EL1 bit assignments are:

When AArch32 is supported at any Exception level:

<table>

</tr>
<tr>
<td>0b0010</td>
<td>FEAT_RASv1p1 present. As 0b0001, and adds support for additional ERXMISC(m) System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR(n)&gt;STATUS and support for the optional RAS Timestamp Extension.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.
In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, if FEAT_DoubleFault is implemented, the only permitted value is 0b0010.

From Armv8.4, when FEAT_DoubleFault is not implemented, and ERRDR_EL1.NUM is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

---

Note

When the value of this field is 0b0001, ID_PFR2_EL1.RAS_frac indicates whether FEAT_RASv1p1 is implemented.

---

**DIT, bits [27:24]**

Data Independent Timing. Defined values are:

<table>
<thead>
<tr>
<th>DIT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>AArch32 does not guarantee constant execution time of any instructions.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AArch32 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

**AMU, bits [23:20]**

Indicates support for Activity Monitors Extension. Defined values are:

<table>
<thead>
<tr>
<th>AMU</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Activity Monitors Extension is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>

</tr>
<tr>
<td>0b0010</td>
<td>FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

**CSV2, bits [19:16]**

Speculative use of out of context branch targets. Defined values are:

<table>
<thead>
<tr>
<th>CSV2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>This Device does not disclose whether branch targets trained in one hardware described context can affect speculative execution in a different hardware described context.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Branch targets trained in one hardware described context can only affect speculative execution in a different hardware described context in a hard-to-determine way.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_CSV2 implements the functionality identified by 0b0001.
From Armv8.5, the only permitted value is 0b0001.

**State3, bits [15:12]**

T32EE instruction set support. Defined values are:

<table>
<thead>
<tr>
<th>State3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>T32EE instruction set implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**State2, bits [11:8]**

Jazelle extension support. Defined values are:

<table>
<thead>
<tr>
<th>State2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>

elsif PSTATE.EL == EL3 then
  return ID_PFR0_EL1;
The ID_PFR1_EL1 characteristics are:

**Purpose**

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register ID_PFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR1[31:0].

**Attributes**

ID_PFR1_EL1 is a 64-bit register.

**Field descriptions**

The ID_PFR1_EL1 bit assignments are:

When AArch32 is supported at any Exception level:

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
<th>Reserved, RES0</th>
</tr>
</thead>
</table>

**GIC, bits [31:28]**

System register GIC CPU interface. Defined values are:

<table>
<thead>
<tr>
<th>GIC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>GIC CPU interface system registers not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.</td>
</tr>
<tr>
<td>0b0011</td>
<td>System register interface to version 4.1 of the GIC CPU interface is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**Virt_frac, bits [27:24]**

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for features from the ARMv7 Virtualization Extensions. Defined values are:
Virt_frac

<table>
<thead>
<tr>
<th>Virt_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No features from the ARMv7 Virtualization Extensions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The following features of the ARMv7 Virtualization Extensions are implemented:</td>
</tr>
<tr>
<td></td>
<td>• The SCR.SIF bit, if EL3 is implemented.</td>
</tr>
<tr>
<td></td>
<td>• The modifications to the SCR.AW and SCR.FW bits described in the Virtualization Extensions, if EL3 is implemented.</td>
</tr>
<tr>
<td></td>
<td>• The MSR (banked register) and MRS (banked register) instructions.</td>
</tr>
<tr>
<td></td>
<td>• The ERET instruction.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is implemented.
- 0b0001 when EL2 is not implemented.

This field is only valid when the value of ID_PFR1_EL1.Virtualization is 0, otherwise it holds the value 0b0000.

Note

The ID_ISAR registers do not identify whether the instructions added by the ARMv7 Virtualization Extensions are implemented.

Sec_frac, bits [23:20]

Security fractional field. When the Security field is 0b0000, determines the support for features from the ARMv7 Security Extensions. Defined values are:

<table>
<thead>
<tr>
<th>Sec_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>No features from the ARMv7 Security Extensions are implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The following features from the ARMv7 Security Extensions are implemented:</td>
</tr>
<tr>
<td></td>
<td>• The VBAR register.</td>
</tr>
<tr>
<td></td>
<td>• The TTBCR_PD0 and TTBCR_PD1 bits.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, plus the ability to access Secure or Non-secure physical memory is supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is implemented.
- 0b0001 or 0b0010 when EL3 is not implemented.

This field is only valid when the value of ID_PFR1_EL1.Security is 0, otherwise it holds the value 0b0000.

GenTimer, bits [19:16]

Generic Timer support. Defined values are:

<table>
<thead>
<tr>
<th>GenTimer</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Generic Timer is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Generic Timer is implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Generic Timer is implemented, and also includes support for CNTHCTL_EVTIS and CNTKCTL_EVTIS fields, and CNTPCTSS and CNTVCTSS counter views.</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_ECV implements the functionality identified by the value 0b0010.

In Armv8.0, Armv8.1, Armv8.2, Armv8.3, Armv8.4, and Armv8.5, the only permitted value is 0b0001.
From Armv8.6, the only permitted value is 0b0010.

**Virtualization, bits [15:12]**

Virtualization support. Defined values are:

<table>
<thead>
<tr>
<th>Virtualization</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL2, Hyp mode, and the HVC instruction not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0b0001 implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

**Note**

The ID_ISARs do not identify whether the HVC instruction is implemented.

**MProgMod, bits [11:8]**

M profile programmers' model support. Defined values are:

<table>
<thead>
<tr>
<th>MProgMod</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Support for two-stack programmers' model.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

**Security, bits [7:4]**

Security support. Defined values are:

<table>
<thead>
<tr>
<th>Security</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL3, Monitor mode, and the SMC instruction not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0b0001 implemented.</td>
</tr>
<tr>
<td>0b0010</td>
<td>As for 0b0001, and adds the ability to set the NSACR.RFR bit. Not permitted in Armv8 as the NSACR.RFR bit is RES0.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is not implemented.
- 0b0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.
ProgMod, bits [3:0]

Support for the standard programmers' model for Armv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

<table>
<thead>
<tr>
<th>ProgMod</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32 then this field has the value 0b0000.

Otherwise:

| 63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32 |
|----------|-------------------------------------------------|
| 0b0000    | UNKNOWN                                         |
| 0b0001    | UNKNOWN                                         |

Bits [63:0]

Reserved, UNKNOWN.

Accessing the ID_PFR1_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID_PFR1_EL1

if PSTATE.EL == EL0 then
  if IsFeatureImplemented(FEAT_IDST) then
    if EL2Enabled() && HCR_EL2.TGE == '1' then

**Bits [63:12]**

Reserved, RES0.

**RAS_frac, bits [11:8]**

RAS Extension fractional field. Defined values are:

<table>
<thead>
<tr>
<th>RAS_frac</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>If ID_PFR0_EL1.RAS == 0b0001, RAS Extension implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>If ID_PFR0_EL1.RAS == 0b0001, as 0b0000 and adds support for additional ERXMISC&lt;m&gt; System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR&lt;n&gt;STATUS and support for the optional RAS Timestamp Extension.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is valid only if ID_PFR0_EL1.RAS == 0b0001.
SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state. Defined values are:

<table>
<thead>
<tr>
<th>SSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>AArch32 provides no mechanism to control the use of Speculative Store Bypassing.</td>
</tr>
<tr>
<td>0b0001</td>
<td>AArch32 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.</td>
</tr>
</tbody>
</table>

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

All other values are reserved.

CSV3, bits [3:0]

Speculative use of faulting data. Defined values are:

<table>
<thead>
<tr>
<th>CSV3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>This Device does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence</td>
</tr>
<tr>
<td>0b0001</td>
<td>Data loaded under speculation with a permission or domain fault cannot be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence</td>
</tr>
</tbody>
</table>

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

Otherwise:

<table>
<thead>
<tr>

### IFSR32_EL2, Instruction Fault Status Register (EL2)

The IFSR32_EL2 characteristics are:

#### Purpose

Allows access to the AArch32 IFSR register from AArch64 state only. Its value has no effect on execution in AArch64 state.

#### Configuration

AArch64 System register IFSR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register IFSR[31:0].

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to IFSR32_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

#### Attributes

IFSR32_EL2 is a 64-bit register.

#### Field descriptions

The IFSR32_EL2 bit assignments are:

##### When TTBCR.EAE == 0:

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IFAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>IFAR is not valid, and holds an UNKNOWN value.</td>
</tr>
</tbody>
</table>

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [15:13]**

Reserved, RES0.
ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

<table>
<thead>
<tr>
<th>FS</th>

</tr>
<tr>
<td>0b11110</td>
<td>Synchronous parity or ECC error on translation table walk, level 2.</td>
<td>When FEAT_RAS is not implemented</td>
</tr>
</tbody>
</table>

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup'.

The FS field is split as follows:

- FS[4] is IFSR32_EL2[10].
- FS[3:0] is IFSR32_EL2[3:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Using the Short-descriptor translation table formats.</td>
</tr>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table formats.</td>
</tr>
</tbody>
</table>
Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [8:4]**

Reserved, **RES0**.

**When TTBCR.EAE == 1:**

<table>
<thead>
<tr>
<th>Bits</th>
<th>Reserved, <strong>RES0</strong></th>
</tr>
</thead>
</table>

**FnV, bit [16]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<table>
<thead>
<tr>
<th>FnV</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IFAR is valid.</td>
</tr>
<tr>
<td>0b1</td>
<td>IFAR is not valid, and holds an <strong>UNKNOWN</strong> value.</td>
</tr>
</tbody>
</table>

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is **RES0** for all other Prefetch Abort exceptions.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [63:17]**

Reserved, **RES0**.

**ExT, bit [12]**

External abort type. This bit can be used to provide an **IMPLEMENTATION DEFINED** classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is **RES0**.

For aborts other than External aborts this bit always returns 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [15:13]**

Reserved, **RES0**.

**LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

<table>
<thead>
<tr>
<th>LPAE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Using the Short-descriptor translation table formats.</td>
</tr>
<tr>
<td>0b1</td>
<td>Using the Long-descriptor translation table formats.</td>
</tr>
</tbody>
</table>

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [8:6]**

Reserved, RES0.

**STATUS, bits [5:0]**

Fault status bits. Possible values of this field are:

<table>
<thead>
<tr>

</tbody>
</table>

All other values are reserved.

When FEAT_RAS is implemented, 0b011000, 0b011101, 0b011110, and 0b011111 are reserved.

For more information about the lookup level associated with a fault, see ‘The level associated with MMU faults on a Long-descriptor translation table lookup’.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the IFSR32_EL2**

Accesses to this register use the following encodings:

**MRS <Xt>, IFSR32_EL2**
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    IFSR32_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    IFSR32_EL2 = X[t];

MSR IFSR32_EL2, <Xt>
ISR_EL1, Interrupt Status Register

The ISR_EL1 characteristics are:

**Purpose**

Shows the pending status of the IRQ, FIQ, or SError interrupt.

When executing at EL2, EL3 or Secure EL1 when SCR_EL3.EEL2 == 0b0, this shows the pending status of the physical IRQ, FIQ, or SError interrupts.

When executing at either Non-secure EL1 or at Secure EL1 when SCR_EL3.EEL2 == 0b1:

- If the HCR_EL2.{IMO,FMO,AMO} bit has a value of 1, the corresponding ISR_EL1.{I,F,A} bit shows the pending status of the virtual IRQ, FIQ, or SError.
- If the HCR_EL2.{IMO,FMO,AMO} bit has a value of 0, the corresponding ISR_EL1.{I,F,A} bit shows the pending status of the physical IRQ, FIQ, or SError.

**Configuration**

AArch64 System register ISR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ISR[31:0].

**Attributes**

ISR_EL1 is a 64-bit register.

**Field descriptions**

The ISR_EL1 bit assignments are:

<table>

The LOREA_EL1 characteristics are:

**Purpose**

Holds the physical address of the end of the LORegion described in the current LORegion descriptor selected by LORC_EL1_DS.

**Configuration**

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LOREA_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1_DS points to a LORegion that is not supported by the PE.

**Attributes**

LOREA_EL1 is a 64-bit register.

**Field descriptions**

The LOREA_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | EA[51:48] | EA[47:16] |
| EA[47:16] | RES0 |

Any of the fields in this register are permitted to be cached in a TLB.

**Bits [63:52]**

Reserved, RES0.

**EA[51:48], bits [51:48]**

When FEAT_LPA is implemented:

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EA[47:16], bits [47:16]**

Bits [47:16] of the end physical address of an LORegion described in the current LORegion descriptor selected by LORC_EL1_DS. Bits[15:0] of this address are defined to be 0xFFFF. For implementations with fewer than 48 bits, the upper bits of this field are RES0.
When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, EA[51:48] form the upper part of the address value. Otherwise, for implementations with fewer than 52 physical address bits, EA[51:48] are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [15:0]**

Reserved, RES0.

LORID_EL1, LORegionID (EL1)

The LORID_EL1 characteristics are:

**Purpose**

Indicates the number of LORegions and LORegion descriptors supported by the PE.

**Configuration**

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORID_EL1 are **UNDEFINED**.

If no LORegion descriptors are implemented, then the registers LORC_EL1, LORN_EL1, LOREA_EL1, and LORSA_EL1 are **RES0**.

**Attributes**

LORID_EL1 is a 64-bit register.

**Field descriptions**

The LORID_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

    end if
    return LORID_EL1;
elsif PSTATE.EL == EL3 then
    return LORID_EL1;
LORN_EL1, LORegion Number (EL1)

The LORN_EL1 characteristics are:

**Purpose**

Holds the number of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

**Configuration**

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORN_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

**Attributes**

LORN_EL1 is a 64-bit register.

**Field descriptions**

The LORN_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

Any of the fields in this register are permitted to be cached in a TLB.

**Bits [63:8]**

Reserved, RES0.

**Num, bits [7:0]**

Number of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

The maximum number of LORegions supported by the PE is 256. If the maximum number is less than 256, then bits[8:N] are RES0, where N is (Log2(Number of LORegions supported by the PE)).

If this field points to a LORegion that is not supported by the PE, then the current LORegion descriptor does not match any LORegion.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the LORN_EL1**

</table>

**SA, bits [35:0]**

The start physical address of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

Bits[15:0] of this address are defined to be 0x0000.

When 52-bit addresses and a 64KB translation granule are in use, LORSA_EL1.SA[35:32] forms the upper part of the address value.

For implementations with fewer than 52 physical address bits, LORSA_EL1.SA[35:32] is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
SA encoding when FEAT_LPA is not implemented

| 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | SA |

**Bits [35:32]**

Reserved, RES0.

**SA, bits [31:0]**

The start physical address of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

Bits[15:0] of this address are defined to be 0x0000.

For implementations with fewer than 48 bits, the upper bits of this field are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [15:1]**

Reserved, RES0.

**Valid, bit [0]**

Indicates whether the current LORegion Descriptor is enabled.

<table>
<thead>
<tr>
<th>Valid</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled</td>
</tr>
<tr>
<td>0b1</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**Accessing the LORSA_EL1**

Accesses to this register use the following encodings:

MAIR_EL1, Memory Attribute Indirection Register (EL1)

The MAIR_EL1 characteristics are:

**Purpose**

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL1.

**Configuration**

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PRRR[31:0] when TTBCR.EAE == 0.

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MAIR0[31:0] when TTBCR.EAE == 1.

AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register NMRR[31:0] when TTBCR.EAE == 0.

AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register MAIR1[31:0] when TTBCR.EAE == 1.

**Attributes**

MAIR_EL1 is a 64-bit register.

**Field descriptions**

The MAIR_EL1 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Attr7 | Attr6 | Attr5 | Attr4 |
| Attr3 | Attr2 | Attr1 | Attr0 |

MAIR_EL1 is permitted to be cached in a TLB.

**Attr<n>, bits [8n+7:8n], for n = 7 to 0**

Attr is encoded as follows:
<table>
<thead>
<tr>
<th>Attr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000dd00</td>
<td>Device memory. See encoding of 'dd' for the type of Device memory.</td>
</tr>
<tr>
<td>0b0000dd01</td>
<td>If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b0000dd1x</td>
<td>UNPREDICTABLE.</td>
</tr>
<tr>

**MAIR_EL2, Memory Attribute Indirection Register (EL2)**

The MAIR_EL2 characteristics are:

**Purpose**

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL2.

**Configuration**

AArch64 System register MAIR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HMAIR0[31:0].

AArch64 System register MAIR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HMAIR1[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MAIR_EL2 is a 64-bit register.

**Field descriptions**

The MAIR_EL2 bit assignments are:

<table>

MAIR_EL3, Memory Attribute Indirection Register (EL3)

The MAIR_EL3 characteristics are:

**Purpose**

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL3.

**Configuration**

This register is present only when EL3 is implemented. Otherwise, direct accesses to MAIR_EL3 are UNDEFINED.

**Attributes**

MAIR_EL3 is a 64-bit register.

**Field descriptions**

The MAIR_EL3 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Attr7 | Attr6 | Attr5 | Attr4 |
| Attr3 | Attr2 | Attr1 | Attr0 |

MAIR_EL3 is permitted to be cached in a TLB.

**Attr<n>, bits [8n+7:8n], for n = 7 to 0**

Attr is encoded as follows:
<table>
<thead>
<tr>
<th>Attr</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000dd00</td>
<td>Device memory. See encoding of 'dd' for the type of Device memory.</td>
</tr>
<tr>
<td>0b0000dd01</td>
<td>If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise,UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b0000dd1x</td>
<td>UNPREDICTABLE.</td>
</tr>
<tr>
<td>0booooiiii, (oooo != 0000 and iiii != 0000)</td>
<td>Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.</td>
</tr>
<tr>
<td>0b01000000</td>
<td>If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b10100000</td>
<td>If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.</td>
</tr>
<tr>
<td>0b11110000</td>
<td>If FEAT_MTE is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise,UNPREDICTABLE.</td>
</tr>
<tr>
<td>0bxxxx0000, (xxxx != 0000, xxxx != 0100, xxxx != 1010, xxxx != 1111)</td>
<td>UNPREDICTABLE.</td>
</tr>
</tbody>
</table>

'dd' is encoded as follows:

<table>
<thead>
<tr>
<th>dd</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Device-nGnRnE memory</td>
</tr>
<tr>
<td>0b01</td>
<td>Device-nGnRE memory</td>
</tr>
<tr>
<td>0b10</td>
<td>Device-NGRE memory</td>
</tr>
<tr>
<td>0b11</td>
<td>Device-GRE memory</td>
</tr>
</tbody>
</table>

'oooo' is encoded as follows:

<table>
<thead>
<tr>
<th>'oooo'</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>See encoding of Attr</td>
</tr>
<tr>
<td>0b00RW, RW not0b00</td>
<td>Normal memory, Outer Write-Through Transient</td>
</tr>
<tr>
<td>0b0100</td>
<td>Normal memory, Outer Non-cacheable</td>
</tr>
<tr>
<td>0b01RW, RW not0b00</td>
<td>Normal memory, Outer Write-Back Transient</td>
</tr>
<tr>
<td>0b10RW</td>
<td>Normal memory, Outer Write-Through Non-transient</td>
</tr>
<tr>
<td>0b11RW</td>
<td>Normal memory, Outer Write-Back Non-transient</td>
</tr>
</tbody>
</table>

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

<table>
<thead>
<tr>
<th>'iiii'</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>See encoding of Attr</td>
</tr>
<tr>
<td>0b00RW, RW not0b00</td>
<td>Normal memory, Inner Write-Through Transient</td>
</tr>
<tr>
<td>0b0100</td>
<td>Normal memory, Inner Non-cacheable</td>
</tr>
<tr>
<td>0b01RW, RW not0b00</td>
<td>Normal memory, Inner Write-Back Transient</td>
</tr>
<tr>
<td>0b10RW</td>
<td>Normal memory, Inner Write-Through Non-transient</td>
</tr>
<tr>
<td>0b11RW</td>
<td>Normal memory, Inner Write-Back Non-transient</td>
</tr>
</tbody>
</table>

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:
<table>
<thead>
<tr>
<th>R or W</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Allocate</td>
</tr>
<tr>
<td>0b1</td>
<td>Allocate</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally \textit{UNKNOWN} value.

    MAIR\_EL3 = X[t];
\end{verbatim}
MDCCINT_EL1, Monitor DCC Interrupt Enable Register

The MDCCINT_EL1 characteristics are:

**Purpose**

Enables interrupt requests to be signaled based on the DCC status flags.

**Configuration**

AArch64 System register MDCCINT_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDCCINT[31:0].

**Attributes**

MDCCINT_EL1 is a 64-bit register.

**Field descriptions**

The MDCCINT_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>62</td>
<td>RX, bit [30]</td>
</tr>
<tr>
<td>61</td>
<td>DCC interrupt request enable control for DTRRX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.</td>
</tr>
<tr>
<td>60</td>
<td>0b0 No interrupt request generated by DTRRX.</td>
</tr>
<tr>
<td>60</td>
<td>0b1 Interrupt request will be generated on RXfull == 1.</td>
</tr>
<tr>
<td>59</td>
<td>TX, bit [29]</td>
</tr>
<tr>
<td>58</td>
<td>DCC interrupt request enable control for DTRTX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.</td>
</tr>
<tr>
<td>57</td>
<td>0b0 No interrupt request generated by DTRTX.</td>
</tr>
<tr>
<td>56</td>
<td>0b1 Interrupt request will be generated on TXfull == 0.</td>
</tr>
</tbody>
</table>

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the value of this bit.

On a Warm reset, this field resets to 0.
Bits [28:0]
Reserved, RES0.

MDCR_EL2, Monitor Debug Configuration Register (EL2)

The MDCR_EL2 characteristics are:

**Purpose**

Provides EL2 configuration options for self-hosted debug and the Performance Monitors Extension.

**Configuration**

AArch64 System register MDCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HDCR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MDCR_EL2 is a 64-bit register.

**Field descriptions**

The MDCR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>

Bits [63:37]

Reserved, RES0.

**HPMFZS, bit [36]**

When FEAT_SPEv1p2 is implemented:

Hyp Performance Monitors Freeze-on-SPE event. Stop counters when PMBLIMITR_EL1.(PMFZ, E) == {1, 1} and PMBSR_EL1.S == 0b1.

<table>
<thead>
<tr>
<th>HPMFZS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not freeze on Statistical Profiling Buffer Management event.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counters do not count following a Statistical Profiling Buffer Management event.</td>
</tr>
</tbody>
</table>

If MDCR_EL2.HPMN is less than PMCR_EL0.N, this bit affects the operation of event counters in the range [MDCR_EL2.HPMN .. (PMCR_EL0.N-1)].

If MDCR_EL2.HPMN is equal to PMCR_EL0.N, this bit has no effect.

This bit does not affect the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)] and PMCCNTR_EL0.

The operation of this bit applies even when EL2 is disabled in the current Security state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**Bits [35:30]**

Reserved, RES0.

**HPMFZO, bit [29]**

When FEAT_PMUv3p7 is implemented:

Hyp Performance Monitors Freeze-on-overflow. Stop event counters on overflow.

<table>
<thead>
<tr>
<th>HPMFZO</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not freeze on overflow. Event counters do not count when PMOVSLR_EL0[(PMCR_EL0.N-1):MDCR_EL2.HPMN] is nonzero.</td>
</tr>
</tbody>
</table>

If MDCR_EL2.HPMN is less than PMCR_EL0.N, this bit affects the operation of event counters in the range [MDCR_EL2.HPMN .. (PMCR_EL0.N-1)].

If MDCR_EL2.HPMN is equal to PMCR_EL0.N, this bit has no effect.

This bit does not affect the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)] and PMCNTR_EL0.

The operation of this bit ignores the values of PMOVSLR_EL0[(MDCR_EL2.HPMN-1):0].

The operation of this bit applies even when EL2 is disabled in the current Security state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**MTPME, bit [28]**

When FEAT_MTPMU is implemented and EL3 is not implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>_EL0.MT bits.

<table>
<thead>
<tr>
<th>MTPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FEAT_MTPMU is disabled. The Effective value of PMEVTYPER&lt;n&gt;_EL0.MT is zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMEVTYPER&lt;n&gt;_EL0.MT bits not affected by this bit.</td>
</tr>
</tbody>
</table>

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0b0.

On a Cold reset, this field resets to 1.

Otherwise:

Reserved, RES0.

**TDCC, bit [27]**

When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.
### TDCC

<table>
<thead>
<tr>
<th><strong>Meaning</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any register accesses to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Trap exception to EL2, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.</td>
</tr>
</tbody>
</table>

The DCC registers trapped by this control are:

- **AArch64:** `OSDTRRX_EL1`, `OSDTRTX_EL1`, `MDCCSR_EL0`, `MDCCINT_EL1`, and, when the PE is in Non-debug state, `DBGDTR_EL0`, `DBGDTRRX_EL0`, and `DBGDTRTX_EL0`.
- **AArch32:** `DBGDTRRXext`, `DBGDTRTXext`, `DBGDSCRint`, `DBGDCCINT`, and, when the PE is in Non-debug state, `DBGDTRRXint` and `DBGDTRTXint`.

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 `MRC` and `MCR` accesses with `coproc` == 0b1110.
- 0x06 for trapped AArch32 `LDC` to `DBGDTRTXint` and `STC` from `DBGDTRRXint`.
- 0x18 for trapped AArch64 `MRS` and `MSR` accesses.

When the PE is in Debug state, `MDCR_EL2.TDCC` does not trap any accesses to:

- **AArch64:** `DBGDTR_EL0`, `DBGDTRRX_EL0`, and `DBGDTRTX_EL0`.
- **AArch32:** `DBGDTRRXint` and `DBGDTRTXint`.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### HLP, bit [26]

**When FEAT_PMUv3p5 is implemented:**

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

<table>
<thead>
<tr>
<th><strong>Meaning</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counter overflow on increment that causes unsigned overflow of <code>PMEVCNTR&lt;n&gt;_EL0[31:0]</code>.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counter overflow on increment that causes unsigned overflow of <code>PMEVCNTR&lt;n&gt;_EL0[63:0]</code>.</td>
</tr>
</tbody>
</table>

If `MDCR_EL2.HPMN` is less than `PMCR_EL0.N` or `PMCR.N`, this bit affects the operation of event counters in the range `[MDCR_EL2.HPMN..(PMCR_EL0.N-1)]` or `[MDCR_EL2.HPMN..(PMCR.N-1)]`. Otherwise this bit has no effect on the operation of the event counters.

**Note**

The effect of `MDCR_EL2.HPMN` on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the `MDCR_EL2.HPMN` field.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Otherwise:

Reserved, RES0.
E2TB, bits [25:24]

When FEAT_TRBE is implemented:

EL2 Trace Buffer.

If EL2 is implemented and enabled in the Trace Buffer owning Security state, controls the owning translation regime.

If EL2 is implemented and enabled in the current Security state, controls access to Trace Buffer control registers from EL1.

<table>
<thead>
<tr>
<th>E2TB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>If EL2 is implemented and enabled in the Trace Buffer owning Security state, the Trace Buffer owning Exception level is EL2. Otherwise, the Trace Buffer owning Exception level is EL1 and, if TraceBufferEnabled() == TRUE, tracing is prohibited at EL2. If EL2 is implemented and enabled in the current Security state, accesses to Trace Buffer control registers at EL1 generate a Trap exception to EL2.</td>
</tr>
<tr>
<td>0b10</td>
<td>Trace Buffer owning Exception level is EL1. If TraceBufferEnabled() == TRUE, tracing is prohibited at EL2. If EL2 is implemented and enabled in the current Security state, accesses to Trace Buffer control registers at EL1 generate a Trap exception to EL2.</td>
</tr>
<tr>
<td>0b11</td>
<td>Trace Buffer owning Exception level is EL1. If TraceBufferEnabled() == TRUE, tracing is prohibited at EL2.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The Trace Buffer control registers trapped by this control are: TRBBASER_EL1, TRBLIMITR_EL1, TRBMAR_EL1, TRBPTR_EL1, TRBSR_EL1, and TRBTRG_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HCCD, bit [23]

When FEAT_PMUv3p5 is implemented:

Hypervisor Cycle Counter Disable. Prohibits PMCCNTR_EL0 from counting at EL2.

<table>
<thead>
<tr>
<th>HCCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR_EL0 is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting by PMCCNTR_EL0 is prohibited at EL2.</td>
</tr>
</tbody>
</table>

This bit does not affect the CPU_CYCLES event or any other event that counts cycles.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [22:20]

Reserved, RES0.

TTRF, bit [19]

When FEAT_TRF is implemented:

Traps use of the Trace Filter Control registers at EL1 to EL2, as follows:
• Access to TRFCR_EL1 is trapped to EL2, reported using EC syndrome value 0x18.

• Access to TRFCR is trapped to EL2, reported using EC syndrome value 0x03.

<table>
<thead>
<tr>
<th>TTRF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to TRFCR_EL1 and TRFCR at EL1 are not affected by this control.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to TRFCR_EL1 and TRFCR at EL1 generate a trap exception to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

Otherwise:
Reserved, RES0.

Bit [18]
Reserved, RES0.

HPMD, bit [17]

When FEAT_PMUv3p1 is implemented:

Guest Performance Monitors Disable. This control prohibits event counting at EL2.

<table>
<thead>
<tr>
<th>HPMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting allowed at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting prohibited at EL2.</td>
</tr>
<tr>
<td></td>
<td>If FEAT_Debugv8p2 is not implemented, event counting is prohibited unless enabled by the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().</td>
</tr>
</tbody>
</table>

This control applies only to:

• The event counters in the range [0..(MDCR_EL2.HPMN-1)].
• If PMCR_EL0.DP is set to 1, PMCCNTR_EL0.

The other event counters are unaffected, and when PMCR_EL0.DP is set to 0, PMCCNTR_EL0 is unaffected.

On a Warm reset, this field resets to 0.

Otherwise:
Reserved, RES0.

Bits [16:15]
Reserved, RES0.

TPMS, bit [14]

When FEAT_SPE is implemented:

Trap Performance Monitor Sampling. If EL2 is implemented and enabled in the current Security state, controls access to Statistical Profiling control registers from EL1.

<table>
<thead>
<tr>
<th>TPMS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not trap Statistical Profiling controls to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is implemented and enabled in the current Security state, accesses to Statistical Profiling control registers at EL1 generate a Trap exception to EL2.</td>
</tr>
</tbody>
</table>

The Statistical Profiling control registers trapped by this control are:
• *PMSCR_EL1*, *PMSEVFR_EL1*, *PMSFCR_EL1*, *PMSICR_EL1*, *PMSIDR_EL1*, *PMSIRR_EL1*, and *PMSLATFR_EL1*.

If FEAT_SPEv1p2 is implemented, *PMSNEVFR_EL1*.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**E2PB, bits [13:12]**

**When FEAT_SPE is implemented:**

EL2 Profiling Buffer. If EL2 is implemented and enabled in the Profiling Buffer owning Security state, this field controls the owning translation regime. If EL2 is implemented and enabled in the current Security state, this field controls access to Profiling Buffer control registers from EL1.

<table>
<thead>
<tr>
<th>E2PB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>If EL2 is implemented and enabled in the Profiling Buffer owning Security state, the Profiling Buffer uses the EL2 or EL2&amp;0 stage 1 translation regime. Otherwise the Profiling Buffer uses the EL1&amp;0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.</td>
</tr>
<tr>
<td>0b10</td>
<td>Profiling Buffer uses the EL1&amp;0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.</td>
</tr>
<tr>
<td>0b11</td>
<td>Profiling Buffer uses the EL1&amp;0 stage 1 translation regime. Accesses to Profiling Buffer control registers at EL1 are not trapped to EL2.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The Profiling Buffer control registers trapped by this control are: *PMLIMITR_EL1*, *PMBPTR_EL1*, and *PMBSR_EL1*.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TDRA, bit [11]**

Trap Debug ROM Address register access. Traps System register accesses to the Debug ROM registers to EL2 when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64 state, accesses to *MDRAR_EL1* are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 or EL1 is using AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05 and MRRC or MCRR accesses are trapped to EL2, reported using EC syndrome value 0x0C:
  - DBGDRAR, DBGDSAR.

<table>
<thead>
<tr>
<th>TDRA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 and EL1 System register accesses to the Debug ROM registers are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by <strong>DBGDSCRext</strong>, <strong>UDCCdis</strong> or <strong>MDSCR_EL1.TDCC</strong>.</td>
</tr>
</tbody>
</table>

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- *MDCR_EL2.TDE == 1*.
- *HCR_EL2.TGE == 1*.
EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally "UNKNOWN" value.

**TDOSA, bit [10]**

*When FEAT_DoubleLock is implemented:*

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - OSLAR_EL1, OSLSR_EL1, OSDLR_EL1, and DBGPRCR_EL1.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:
  - DBGOSLSR, DBGOSLAR, DBGOSDLR, and DBGPRCR.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

*Note*

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1.
- HCR_EL2.TGE == 1.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally "UNKNOWN" value.

*Otherwise:*

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - OSLAR_EL1, OSLSR_EL1, and DBGPRCR_EL1.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:
  - DBGOSLSR, DBGOSLAR, and DBGPRCR.
Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to OSDLR_EL1 are trapped.

It is IMPLEMENTATION DEFINED whether accesses to DBGOSDLR are trapped.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

Note

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1.
- HCR_EL2.TGE == 1.

Traps of AArch32 accesses to DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

Traps of AArch64 accesses to DBGDTRX_INT, DBGDTRRX_INT, DBGDTRX_INT, and DBGDTRTX_INT are ignored in Debug state.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1
- HCR_EL2.TGE == 1
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**TDE, bit [8]**

Trap Debug Exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, EL_D.

<table>
<thead>
<tr>
<th>TDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The debug target Exception level is EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>If EL2 is enabled for the current Effective value of SCR_EL3.NS, the debug target Exception level is EL2, otherwise the debug target Exception level is EL1. The MDCR_EL2.(TDRA, TDOSA, TDA) fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.</td>
</tr>
</tbody>
</table>

For more information, see 'Routing debug exceptions'.

This field is treated as being 1 for all purposes other than a direct read when HCR_EL2.TGE == 1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**HPME, bit [7]**

When FEAT_PMUv3 is implemented:

[MDCR_EL2.HPMN..(N-1)] event counters enable.

<table>
<thead>
<tr>
<th>HPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] are enabled by PMCNETENSEL_EL0.</td>
</tr>
</tbody>
</table>

If MDCR_EL2.HPMN is less than PMCR_EL0.N or PMCR.N, the event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] or [HDCR.HPMN..(PMCR.N-1)], are enabled and disabled by this bit. Otherwise this bit has no effect on the operation of the event counters.

**Note**

The effect of MDCR_EL2.HPMN on the operation of this bit applies regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the HPMN field.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TPM, bit [6]**

When FEAT_PMUv3 is implemented:

Trap Performance Monitors accesses. Traps EL0 and EL1 accesses to all Performance Monitor registers to EL2 when EL2 is enabled in the current Security state, from both Execution states, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - PMCR_EL0, PMCNETENSEL_EL0, PMCNETENCLR_EL0, PMOVSCLR_EL0, PMSWINC_EL0, PMSELR_EL0, PMCEID0_EL0, PMCEID1_EL0, PMCCNTR_EL0, PMXEVTYPE_EL0, PMXEVCNTR_EL0, PMUSERENR_EL0, PMINTENSET_EL1, PMINTENCLR_EL1, PMOVSET_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMCCFILTR_EL0.
If FEAT_PMUv3p4 is implemented, PMMIR_EL1.

- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, MRRC or MCRR accesses are trapped to EL2 and reported using EC syndrome value 0x04:
  - PMCR, PMCNTENSET, PMCNTENCLR, PMOVSIR, PMSWINC, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTPYER, PMXEVCNTR, PMUSERENR, PMINTENSET, PMINTENCLR, PMOVSSET, PMEVCNTR<n>, PMEVTYPYER<n>, PMCCFILTR.

- If FEAT_PMUv3p4 is implemented, PMMIR.

- If FEAT_PMUv3p1 is implemented, PMCEID2, and PMCEID3.

<table>
<thead>
<tr>
<th>TPM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 and EL1 accesses to all Performance Monitor registers are trapped to EL2 when EL2 is enabled in the current Security state.</td>
</tr>
</tbody>
</table>

**Note**

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TPMCR, bit [5]**

When FEAT_PMUv3 is implemented:

Trap PMCR_EL0 or PMCR accesses. Traps EL0 and EL1 accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to PMCR_EL0 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, accesses to PMCR are trapped to EL2, reported using EC syndrome value 0x03.

<table>
<thead>
<tr>
<th>TPMCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 and EL1 accesses to the PMCR_EL0 or PMCR are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by PMUSERENR_EN or PMUSERENR_EL0_EN.</td>
</tr>
</tbody>
</table>

**Note**

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
HPMN, bits [4:0]

When FEAT_PMUv3 is implemented:

Defines the number of event counters that are accessible from EL3, EL2, EL1, and from EL0 if permitted.

If HPMN is less than PMCR_EL0.N, HPMN divides the Performance Monitors into two ranges: [0..(HPMN-1)] and [HPMN..(PMCR_EL0.N-1)].

For an event counter in the range [0..(HPMN-1)]:

- The counter is accessible from EL3, EL2, and EL1, and from EL0 if permitted by PMUSERENR_EL0 or PMUSERENR.
- If FEAT_PMUv3p5 is implemented, PMCR_EL0.LP or PMCR.LP determines whether the counter overflow flag is set on unsigned overflow of PMEVCNTR<n>_EL0[31:0] or PMEVCNTR<n>_EL0[63:0].
- The counter is enabled by PMCR_EL0.E or PMCR.E and bit <n> of PMCNTENSET_EL0.

Note

If HPMN is equal to PMCR_EL0.N, this applies to all event counters.

If HPMN is less than PMCR_EL0.N, for an event counter in the range [HPMN..(PMCR_EL0.N-1)]:

- The counter is accessible from EL2 and EL3.
- If FEAT_SEL2 is disabled or is not implemented, the counter is also accessible from Secure EL1, and from Secure EL0 if permitted by PMUSERENR_EL0.
- If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP or HDCR.HLP determines whether the counter overflow flag is set on unsigned overflow of PMEVCNTR<n>_EL0[31:0] or PMEVCNTR<n>_EL0[63:0].
- The counter is enabled by MDCR_EL2.HPME or HDCR.HPME and bit <n> of PMCNTENSET_EL0.

If this field is set to 0, or to a value larger than PMCR_EL0.N, then the following constrained unpredictable behaviors apply:

- The value returned by a direct read of MDCR_EL2.HPMN is UNKNOWN.
- Either:
  - An unknown number of counters are reserved for EL2 and EL3 use. That is, the PE behaves as if MDCR_EL2.HPMN is set to an unknown non-zero value less than or equal to PMCR_EL0.N.
  - All counters are reserved for EL2 and EL3 use, meaning no counters are accessible from EL1 and EL0.

On a Warm reset, this field resets to the value in PMCR_EL0.N.

Otherwise:

Reserved, RES0.

Accessing the MDCR_EL2

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b100</td>
<td>0b0001</td>
<td>0b0001</td>
<td>0b0001</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then

  MDCR_EL2 = X[t];
MDCR_EL3, Monitor Debug Configuration Register (EL3)

The MDCR_EL3 characteristics are:

**Purpose**

Provides EL3 configuration options for self-hosted debug and the Performance Monitors Extension.

**Configuration**

AArch64 System register MDCR_EL3 bits [31:0] can be mapped to AArch32 System register SDCR[31:0], but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to MDCR_EL3 are UNDEFINED.

**Attributes**

MDCR_EL3 is a 64-bit register.

**Field descriptions**

The MDCR_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:37]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:59</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>58:37</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>56</td>
<td>EnPMSN</td>
</tr>
<tr>
<td>31</td>
<td>0b0: Accesses to PMSNEFR_EL1 at EL2 and EL1 generate a Trap exception to EL3.</td>
</tr>
<tr>
<td>30</td>
<td>0b1: Do not trap PMSNEFR_EL1 to EL3.</td>
</tr>
</tbody>
</table>

Bits [63:37]

Reserved, RES0.

**EnPMSN, bit [36]**

When FEAT_SPEv1p2 is implemented:

Trap accesses to PMSNEFR_EL1. Controls access to Statistical Profiling PMSNEFR_EL1 System register from EL2 and EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
MPMX, bit [35]

When FEAT_PMUv3p7 is implemented:

Monitor Performance Monitors Extended control. In conjunction with MDCR_EL3.SPME, controls when event counters are disabled at EL3 and in other Secure Exception levels.

<table>
<thead>
<tr>
<th>MPMX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting by some or all event counters is prohibited at EL3.</td>
</tr>
</tbody>
</table>

If EL2 is implemented, MDCR_EL3.SPME == 0b1, and MDCR_EL2.HPMN is less than PMCR_EL0.N then all the following are true:

- This bit affects the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)].
- This bit does not affect the operation of event counters in the range [MDCR_EL2.HPMN .. (PMCR_EL0.N-1)].
- This applies even when EL2 is disabled in Secure state.

If EL2 is not implemented, MDCR_EL3.SPME == 0b0, or MDCR_EL2.HPMN is equal to PMCR_EL0.N then this bit affects the operation of all event counters.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

MCCD, bit [34]

When FEAT_PMUv3p7 is implemented:

Monitor Cycle Counter Disable. Prohibits the Cycle Counter, PMCCNTR_EL0, from counting at EL3.

<table>
<thead>
<tr>
<th>MCCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR_EL0 is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting by PMCCNTR_EL0 is prohibited at EL3.</td>
</tr>
</tbody>
</table>

This bit does not affect the CPU_CYCLES event or any other event that counts cycles.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SBRBE, bits [33:32]

When FEAT_BRBE is implemented:

Secure Branch Record Buffer Enable. Controls branch recording by the BRBE, and access to BRBE registers and instructions at EL2 and EL1.
<table>
<thead>
<tr>
<th>SBRBE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Direct accesses to BRBE registers and instructions, except when in EL3, generate a Trap exception to EL3. All Exception levels are prohibited regions.</td>
</tr>
<tr>
<td>0b01</td>
<td>Direct accesses to BRBE registers and instructions in Secure state, except when in EL3, generate a Trap exception to EL3. Secure state is a prohibited region. This control does not cause any direct accesses to BRBE registers when not in Secure state to be trapped, and does not cause any Exception levels when not in Secure state to be a prohibited region.</td>
</tr>
<tr>
<td>0b10</td>
<td>Direct accesses to BRBE registers and instructions, except when in EL3, generate a Trap exception to EL3. This control does not cause any Exception levels to be a prohibited region.</td>
</tr>
<tr>
<td>0b11</td>
<td>This control does not cause any direct accesses to BRBE registers or instruction to be trapped, and does not cause any Exception levels to be a prohibited region.</td>
</tr>
</tbody>
</table>

The Branch Record Buffer registers trapped by this control are: BRBCR_EL1, BRBCR_EL2, BRBCR_EL12, BRBFCSR_EL1, BRBIDR0_EL1, BRBINF<n>_EL1, BRBINFINJ_EL1, BRBSRC<n>_EL1, BRBTS_EL1.

The Branch Record Buffer instructions trapped by this control are:

- BRB IALL.
- BRB INJ.

If EL3 is not implemented then the Effective value of this field is 0b11.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [31:29]**

Reserved, RES0.

**MTPME, bit [28]**

When FEAT_MTPMU is implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPE<n>_EL0.MT bits.

<table>
<thead>
<tr>
<th>MTPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>FEAT_MTPMU is disabled. The Effective value of PMEVTYPE&lt;n&gt;_EL0.MT is zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMEVTYPE&lt;n&gt;_EL0.MT bits not affected by this bit.</td>
</tr>
</tbody>
</table>

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0b0.

On a Cold reset, this field resets to 1.

**Otherwise:**

Reserved, RES0.

**TDCC, bit [27]**

When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL2, EL1, and EL0 to EL3.
### TDCC

<table>
<thead>
<tr>
<th>TDCC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any register accesses to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to the DCC registers at EL2, EL1, and EL0 generate a Trap exception to EL3, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.</td>
</tr>
</tbody>
</table>

The DCC registers trapped by this control are:

AArch64: `OSDTRRX_EL1`, `OSDTRTX_EL1`, `MDCCSR_EL0`, `MDCCINT_EL1`, and, when the PE is in Non-debug state, `DBGDTR_EL0`, `DBGDTRRX_EL0`, and `DBGDTRTX_EL0`.

AArch32: `DBGDTRRXext`, `DBGDTRTXext`, `DBGDSCRint`, `DBGDCCINT`, and, when the PE is in Non-debug state, `DBGDTRRXint` and `DBGDTRTXint`.

The traps are reported with EC syndrome value:
- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to `DBGDTRTXint` and STC from `DBGDTRRXint`.
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL3.TDCC does not trap any accesses to:

AArch64: `DBGDTR_EL0`, `DBGDTRRX_EL0`, and `DBGDTRTX_EL0`.

AArch32: `DBGDTRRXint` and `DBGDTRTXint`.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [26]**

Reserved, RES0.

### NSTB, bits [25:24]

When FEAT_TRBE is implemented:

Non-secure Trace Buffer. Controls the owning translation regime and accesses to Trace Buffer control registers from EL2 and EL1.

<table>
<thead>
<tr>
<th>NSTB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Trace Buffer owning security state is Secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.</td>
</tr>
<tr>
<td>0b01</td>
<td>Trace Buffer owning security state is Secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure state. Accesses to Trace Buffer control registers at EL2 and EL1 in Non-secure state generate Trap exceptions to EL3.</td>
</tr>
<tr>
<td>0b10</td>
<td>Trace Buffer owning security state is Non-secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.</td>
</tr>
<tr>
<td>0b11</td>
<td>Trace Buffer owning security state is Non-secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 in Secure state generate Trap exceptions to EL3.</td>
</tr>
</tbody>
</table>

The Trace Buffer control registers trapped by this control are: `TRBASER_EL1`, `TRBLIMITR_EL1`, `TRBMAR_EL1`, `TRBPTR_EL1`, `TRBSR_EL1`, and `TRBTRG_EL1`.

If EL3 is not implemented and the Effective value of `SCR_EL3.NS` is 0b1, then the Effective value of this field is 0b11.
If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this field is 0b01.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

SCCD, bit [23]

When FEAT_PMUv3p5 is implemented:

Secure Cycle Counter Disable. Prohibits PMCCNTR_EL0 from counting in Secure state.

<table>
<thead>
<tr>
<th>SCCD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR_EL0 is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counting by PMCCNTR_EL0 is prohibited in Secure state.</td>
</tr>
</tbody>
</table>

This bit does not affect the CPU_CYCLES event or any other event that counts cycles.
On a Warm reset, this field resets to 0.

Otherwise:
Reserved, RES0.

ETAD, bit [22]

When external debugger access to the PE Trace Unit registers is implemented and FEAT_TRBE is implemented:

External Trace Access Disable. Controls Non-secure access to PE Trace Unit registers by an external debugger.

<table>
<thead>
<tr>
<th>ETAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure accesses from an external debugger to PE Trace Unit are allowed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure accesses from an external debugger to some PE Trace Unit registers are prohibited. See individual registers for the effect of this bit.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.
On a Warm reset, this field resets to 0.

Otherwise:
Reserved, RES0.

EPMAD, bit [21]

When FEAT_Debugv8p4 is implemented and FEAT_PMUv3 is implemented:

External Performance Monitors Non-secure Access Disable. Controls Non-secure access to Performance Monitor registers by an external debugger.

<table>
<thead>
<tr>
<th>EPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Non-secure access to Performance Monitor registers from external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Non-secure access to Performance Monitor registers from external debugger is not permitted.</td>
</tr>
</tbody>
</table>

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.
Otherwise, if EL3 is not implemented and the Effective value of SCR_EL3.NS is \(0b0\), then the Effective value of this bit is \(0b1\).

On a Warm reset, this field resets to 0.

When FEAT_PMUv3 is implemented:

External Performance Monitors Access Disable. Controls access to Performance Monitor registers by an external debugger.

<table>
<thead>
<tr>
<th>EPMAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0)</td>
<td>Access to Performance Monitor registers from external debugger is permitted.</td>
</tr>
<tr>
<td>(0b1)</td>
<td>Access to Performance Monitor registers from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
</tbody>
</table>

If the Performance Monitors Extension does not support external debug interface accesses this bit is \(0b0\).

Otherwise, if EL3 is not implemented and the Effective value of SCR_EL3.NS is \(0b0\), then the Effective value of this bit is \(0b1\).

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, \(0b0\).

EDAD, bit [20]

When FEAT_Debugv8p4 is implemented:

External Debug Non-secure Access Disable. Controls Non-secure access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0)</td>
<td>Non-secure access to debug registers from external debugger is permitted.</td>
</tr>
<tr>
<td>(0b1)</td>
<td>Non-secure access to breakpoint and watchpoint registers, and OSLAR_EL1 from external debugger is not permitted.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR_EL3.NS is \(0b0\), then the Effective value of this field is \(0b1\).

On a Warm reset, this field resets to 0.

When FEAT_Debugv8p2 is implemented:

External Debug Access Disable. Controls access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0b0)</td>
<td>Access to debug registers, and to OSLAR_EL1 from external debugger is permitted.</td>
</tr>
<tr>
<td>(0b1)</td>
<td>Access to breakpoint and watchpoint registers, and to OSLAR_EL1 from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR_EL3.NS is \(0b0\), then the Effective value of this field is \(0b1\).

On a Warm reset, this field resets to 0.
Otherwise:

External Debug Access disable. Controls access to breakpoint, watchpoint, and optionally OSLAR_EL1 registers by an external debugger:

<table>
<thead>
<tr>
<th>EDAD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to debug registers from external debugger is permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to breakpoint and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the OSLAR_EL1 register from an external debugger is permitted or not permitted.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR_EL3:NS is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, this field resets to 0.

**TTRF, bit [19]**

When FEAT_TRF is implemented:

Trap Trace Filter controls. Traps use of the Trace Filter control registers at EL2 and EL1 to EL3.

The Trace Filter registers trapped by this control are:

- TRFCR_EL2, TRFCR_EL12, TRFCR_EL1, reported using EC syndrome value 0x18.
- HTRFCR and TRFCR, reported using EC syndrome value 0x03.

<table>
<thead>
<tr>
<th>TTRF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to Trace Filter registers at EL2 and EL1 are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to Trace Filter registers at EL2 and EL1 generate a Trap exception to EL3, unless the access generates a higher priority exception.</td>
</tr>
</tbody>
</table>

Otherwise:

Reserved, RES0.

**STE, bit [18]**

When FEAT_TRF is implemented:

Secure Trace enable. Enables tracing in Secure state.

<table>
<thead>
<tr>
<th>STE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace in Secure state is not affected by this bit.</td>
</tr>
</tbody>
</table>

This bit also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace'.

If EL3 is not implemented and the Effective value of SCR_EL3:NS is 0b0, the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**SPME, bit [17]**
When FEAT_PMUv3 is implemented and FEAT_PMUv3p7 is implemented:

Secure Performance Monitors Enable.

Controls event counting in Secure state and EL3.

When MDCR_EL3.MPMX == 0b1, this bit affects the operation of event counters at EL3 only. See MDCR_EL3.MPMX for more information.

<table>
<thead>
<tr>
<th>SPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When MDCR_EL3.MPMX == 0b0: Event counting prohibited in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>When MDCR_EL3.MPMX == 0b0: Event counting in Secure state not affected by this bit.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

When FEAT_PMUv3 is implemented and FEAT_Debugv8p2 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

<table>
<thead>
<tr>
<th>SPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting prohibited in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting in Secure state not affected by this bit.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

When FEAT_PMUv3 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

<table>
<thead>
<tr>
<th>SPME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event counting prohibited in Secure state, unless ExternalSecureNoninvasiveDebugEnabled() is TRUE.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counting in Secure state not affected by this bit.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SDD, bit [16]

AArch64 Secure Self-hosted invasive debug disable. Disables Software debug exceptions in Secure state, other than Breakpoint Instruction exceptions.

<table>
<thead>
<tr>
<th>SDD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Debug exceptions in Secure state are not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>Debug exceptions, other than Breakpoint Instruction exceptions, are disabled from all Exception levels in Secure state.</td>
</tr>
</tbody>
</table>

The SDD bit is ignored unless both of the following are true:

- The PE is in Secure state.
- The Effective value of SCR_EL3.RW is 0b1.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SPD32, bits [15:14]**

**When EL1 is capable of using AArch32:**

AArch32 Secure self-hosted privileged debug. Enables or disables debug exceptions from Secure EL1 using AArch32, other than Breakpoint Instruction exceptions.

<table>
<thead>
<tr>
<th>SPD32</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Legacy mode. Debug exceptions from Secure EL1 are enabled by the IMPLEMENTATION DEFINED authentication interface.</td>
</tr>
<tr>
<td>0b10</td>
<td>Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.</td>
</tr>
<tr>
<td>0b11</td>
<td>Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.</td>
</tr>
</tbody>
</table>

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored if the PE is either:

- In Non-secure state.
- In Secure state and Secure EL1 is using AArch64.

If Secure EL1 is using AArch32 then:

- If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of `SDER32_EL3.SUIDEN` is 0b1.

If EL3 is not implemented and the Effective value of `SCR_EL3.NS` is 0b0, then the Effective value of this field is 0b11.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**NSPB, bits [13:12]**

**When FEAT_SPE is implemented:**

Non-secure Profiling Buffer. Controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers.
NSPB            | Meaning
---             |--------------------------------------------------
0b00            | Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in both Security states generate Trap exceptions to EL3.
0b01            | Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure state generate Trap exceptions to EL3.
0b10            | Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and enabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in both Security states generate Trap exceptions to EL3.
0b11            | Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Secure state generate Trap exceptions to EL3.

The Statistical Profiling and Profiling Buffer control registers trapped by this control are:

- PMBLIMITR_EL1, PMBPRTR_EL1, PMBSR_EL1, PMSCR_EL1, PMSCR_EL2, PMSEVFR_EL1, PMSECR_EL1, PMSIDR_EL1, PMSIRR_EL1, and PMSLATFR_EL1.
- If FEAT_SPEv1p2 is implemented, PMSNEVFR_EL1.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b1, the Effective value of this field is 0b11.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, the Effective value of this field is 0b01.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES0.

TDOSA, bit [10]

When FEAT_DoubleLock is implemented:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

Accesses to the registers are trapped as follows:

- Accesses from AArch64 state, OSLAR_EL1, OSLSR_EL1, OSDLR_EL1, DBGPRCR_EL1 and any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit, are trapped to EL3 and reported using EC syndrome value 0x18.
- Accesses using MCR or MRC to DBGOSLAR, DBGOSLSR, DBGOSDLR, and DBGPRCR, are trapped to EL3 and reported using EC syndrome value 0x85.
- Accesses to any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA.</td>
</tr>
</tbody>
</table>

Note
The powerdown debug registers are not accessible at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

The following registers are affected by this trap:

- AArch64: OSLAR_EL1, OSLSR_EL1, and DBGPRCR_EL1.
- AArch32: DBGOSLAR, DBGOSLSR, and DBGPRCR.
- AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- It is IMPLEMENTATION DEFINED whether accesses to OSDLR_EL1 and DBGOSDLR are trapped.

<table>
<thead>
<tr>
<th>TDOSA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA.</td>
</tr>
</tbody>
</table>

Note

The powerdown debug registers are not accessible at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap Debug Access. Traps EL2, EL1, and EL0 System register accesses to those debug System registers that cannot be trapped using the MDCR_EL3.TDOSA field.

Accesses to the debug registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported using EC syndrome value 0x18:
  - DBGVR<n>_EL1, DBGBCR<n>_EL1, DBGVR<n>_EL1, DBGWCR<n>_EL1,DBGCLAIMSET_EL1,DBGCLAIMCLR_EL1,DBGAUTHSTATUS_EL1,DBGVCVR32_EL2.
  - AArch64: MDCR_EL2, MDRAR_EL1, MDCCS_SET_EL0, MDCCINT_EL1, MDSCR_EL1, OSDTRRX_EL1, OSDTRTX_EL1, OSECCR_EL1.
- In AArch32 state, SDER is trapped to EL3 and reported using EC syndrome value 0x03.
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x05, accesses using MRR or MRC are reported using EC syndrome value 0x06:
  - HDCR, DBGRDRAR, DBGDSAD, DBGDIRD, DBGGCINT, DBGWFAR, DBGVC, DBGVR<n>, DBGCB<n>, DBGCBV<n>,DBGWCR<n>,DBGVR<n>,DBGVCR.
  - DBGCLAIMSET, DBGCLAIMCLR, DBGAUTHSTATUS, DBGDEVID, DBGDEVID1, DBGDEVID2, DBGSECCR.
- In AArch32 state, STC accesses to DBGDTRRXINT and LDC accesses to DBGDTRTXINT are reported using EC syndrome value 0x06.
- When not in Debug state, the following registers are also trapped to EL3:
  - AArch64 accesses to DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0, reported using EC syndrome value 0x18.
  - AArch32 accesses using MCR or MRC to DBGDTRRXINT and DBGDTRTXINT, reported using EC syndrome value 0x05.

<table>

<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0, EL1, and EL2 accesses to the debug registers, other than the registers that can be trapped by MDCR_EL3.TDOSA, are trapped to EL3, from both Security states and both Execution states, unless it is trapped by DBGDSCRx.TDCC, MDSCR_EL1.TDCC, HDCR.TDA or MDCR_EL2.TDA.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Bits [8:7]

Reserved, RES0.

TPM, bit [6]

When FEAT_PMUv3 is implemented:

Trap Performance Monitor register accesses. Accesses to all Performance Monitor registers from EL0, EL1 and EL2 to EL3, from both Security states and both Execution states are trapped as follows:

- In AArch64 state, accesses to the following registers are trapped to EL3 and are reported using EC syndrome value 0x18:
  - PMCR_EL0, PMCNTENSET_EL0, PMCNTENCLR_EL0, PMOVSCLR_EL0, PMSWINC_EL0, PMSEL EL0, PMCEID0_EL0, PMCEID1_EL0, PMCCNTR_EL0, PMXEVTYPER_EL0, PMXEVCTR_EL0, PMUSERENR_EL0, PMINTENSET_EL1, PMINTENCLR_EL1, PMOVSSET_EL0, PMOVSCLR_EL0, PMUSERENR_EL0, PMINTENSET_EL1, PMINTENCLR_EL1, PMOVSSET_EL0, PMOVSCLR_EL0.
- If FEAT_PMUv3p4 is implemented, PMMIR_EL1.
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x03, accesses using MCRR or MRRC are reported using EC syndrome value 0x04:
  - PMCR, PMCNTENSET, PMCNTENCLR, PMOVS, PMSWINC, PMSEL, PMCEID0, PMCEID1, PMCCNTR, PMXEVTYPER, PMXEVCTR, PMUSERENR, PMINTENSET, PMINTENCLR, PMOVSSET, PMOVSCLR, PMUSERENR, PMINTENSET, PMINTENCLR, PMOVSSET, PMOVSCLR, PMXEVCTR.<n>, PMXEVTYPER.<n>, PMCCFILT.
- If FEAT_PMUV3p1 is implemented, PMCEID2, and PMCEID3.
- If FEAT_PMUv3p4 is implemented, PMMIR.

The MDRAR_EL1 characteristics are:

**Purpose**

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Armv8 deprecates any use of this register.

**Configuration**

AArch64 System register MDRAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register DBGDRAR[63:0].

**Attributes**

MDRAR_EL1 is a 64-bit register.

**Field descriptions**

The MDRAR_EL1 bit assignments are:

</tbody>
</table>

**ROMADDR, bits [39:0]**

The ROM table physical address.

Bits [11:0] of the ROM table physical address are defined to be zero.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

If MDRAR_EL1.Valid == 0b00, then this field is UNKNOWN.

The upper part of the address value.

If the physical address size in bits (PAsize) is less than 52, then the register bits corresponding to ROMADDR [39:PAsize] are RES0.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ROMADDR encoding when FEAT_LPA is not implemented or AArch32 is supported at any Exception level**

| 39 38 37 36 35 34 33 32 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | RES0 ROMADDR |

**Bits [39:36]**

Reserved, RES0.

**ROMADDR, bits [35:0]**

The ROM table physical address.

Bits [11:0] of the ROM table physical address are defined to be zero.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Arm strongly recommends that bits ROMADDR[(Psize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

If MDRAR_EL1.Valid == 0b00, then this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [11:2]**

Reserved, RES0.

**Valid, bits [1:0]**

This field indicates whether the ROM Table address is valid.

<table>
<thead>
<tr>
<th>Valid</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>ROM Table address is not valid. Software must ignore ROMADDR.</td>

**Bits [63:32]**

Reserved, RES0.

**TFO, bit [31]**

When FEAT_TRF is implemented:

- Trace Filter override. Used for save/restore of EDSCR.TFO.
- When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.
- When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TFO. Reads and writes of this bit are indirect accesses to EDSCR.TFO.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is RW.
- When OSLSR_EL1.OSLK == 0, access to this field is RO.

**Otherwise:**

Reserved, RES0.

**RXfull, bit [30]**

Used for save/restore of EDSCR.RXfull.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.
When `OSLSR_EL1.OSLK == 1`, this bit holds the value of `EDSCR.RXfull`. Reads and writes of this bit are indirect accesses to `EDSCR.RXfull`.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When `OSLSR_EL1.OSLK == 1`, access to this field is **RW**.
- When `OSLSR_EL1.OSLK == 0`, access to this field is **RO**.

**TXfull, bit [29]**

Used for save/restore of `EDSCR.TXfull`.

When `OSLSR_EL1.OSLK == 0`, software must treat this bit as UNK/SBZP.

When `OSLSR_EL1.OSLK == 1`, this bit holds the value of `EDSCR.TXfull`. Reads and writes of this bit are indirect accesses to `EDSCR.TXfull`.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When `OSLSR_EL1.OSLK == 1`, access to this field is **RW**.
- When `OSLSR_EL1.OSLK == 0`, access to this field is **RO**.

**Bit [28]**

Reserved, RES0.

**RXO, bit [27]**

Used for save/restore of `EDSCR.RXO`.

When `OSLSR_EL1.OSLK == 0`, software must treat this bit as UNK/SBZP.

When `OSLSR_EL1.OSLK == 1`, this bit holds the value of `EDSCR.RXO`. Reads and writes of this bit are indirect accesses to `EDSCR.RXO`.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When `OSLSR_EL1.OSLK == 1`, access to this field is **RW**.
- When `OSLSR_EL1.OSLK == 0`, access to this field is **RO**.

**TXU, bit [26]**

Used for save/restore of `EDSCR.TXU`.

When `OSLSR_EL1.OSLK == 0`, software must treat this bit as UNK/SBZP.

When `OSLSR_EL1.OSLK == 1`, this bit holds the value of `EDSCR.TXU`. Reads and writes of this bit are indirect accesses to `EDSCR.TXU`.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When `OSLSR_EL1.OSLK == 1`, access to this field is **RW**.
- When `OSLSR_EL1.OSLK == 0`, access to this field is **RO**.

**Bits [25:24]**

Reserved, RES0.
INTdis, bits [23:22]

Used for save/restore of EDSCR.INTdis.

When OSLR_EL1.OSLK == 0, and software must treat this bit as UNK/SBZP.

When OSLR_EL1.OSLK == 1, this field holds the value of EDSCR.INTdis. Reads and writes of this field are indirect accesses to EDSCR.INTdis.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLR_EL1.OSLK == 1, access to this field is RW.
- When OSLR_EL1.OSLK == 0, access to this field is RO.

TDA, bit [21]

Used for save/restore of EDSCR.TDA.

When OSLR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLR_EL1.OSLK == 1, this bit holds the value of EDSCR.TDA. Reads and writes of this bit are indirect accesses to EDSCR.TDA.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLR_EL1.OSLK == 1, access to this field is RW.
- When OSLR_EL1.OSLK == 0, access to this field is RO.

Bit [20]

Reserved, RES0.

SC2, bit [19]

When FEAT_PCSRv8 is implemented, FEAT_VHE is implemented and FEAT_PCSRv8p2 is not implemented:

Used for save/restore of EDSCR.SC2.

When OSLR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLR_EL1.OSLK == 1, this bit holds the value of EDSCR.SC2. Reads and writes of this bit are indirect accesses to EDSCR.SC2.

Accessing this field has the following behavior:

- When OSLR_EL1.OSLK == 1, access to this field is RW.
- When OSLR_EL1.OSLK == 0, access to this field is RO.

Otherwise:

Reserved, RES0.

Bits [18:16]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.
MDSCR_EL1, Monitor Debug System Control Register

**MDE, bit [15]**
Monitor debug events. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

<table>
<thead>
<tr>
<th>MDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Breakpoint, Watchpoint, and Vector Catch exceptions disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Breakpoint, Watchpoint, and Vector Catch exceptions enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**HDE, bit [14]**

Used for save/restore of EDSCR.HDE.

When **OSLSR_EL1.OSLK** == 0, software must treat this bit as UNK/SBZP.

When **OSLSR_EL1.OSLK** == 1, this bit holds the value of EDSCR.HDE. Reads and writes of this bit are indirect accesses to EDSCR.HDE.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When **OSLSR_EL1.OSLK** == 1, access to this field is RW.
- When **OSLSR_EL1.OSLK** == 0, access to this field is RO.

**KDE, bit [13]**
Local (kernel) debug enable. If EL_D is using AArch64, enable debug exceptions within EL_D. Permitted values are:

<table>
<thead>
<tr>
<th>KDE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Debug exceptions, other than Breakpoint Instruction exceptions, disabled within EL_D.</td>
</tr>
<tr>
<td>0b1</td>
<td>All debug exceptions enabled within EL_D.</td>
</tr>
</tbody>
</table>

RES0 if EL_D is using AArch32.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TDCC, bit [12]**
Traps EL0 accesses to the Debug Communication Channel (DCC) registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and **HCR_EL2**.TGE is 1, from both Execution states, as follows:

- In AArch64 state, MRS or MSR accesses to the following DCC registers are trapped, reported using EC syndrome value 0x18:
  - MDCCSR_EL0.
  - If not in Debug state, DBGDTR_EL0, DBGDTRTX_EL0, and DBGDTRRX_EL0.

- In AArch32 state, MRC or MCR accesses to the following registers are trapped, reported using EC syndrome value 0x05:
  - DBGDSCRint, DBGDIR, DBGDSAR, DBGDRAR.
  - If not in Debug state, DBGDTRRXint, and DBGDTRTXint.

- In AArch32 state, LDC access to DBGDTRRXint and STC access to DBGDTRTXint are trapped, reported using EC syndrome value 0x06.
- In AArch32 state, MRRC accesses to DBGDSAR and DBGDRAR are trapped, reported using EC syndrome value 0x0C.

<table>
<thead>
<tr>
<th>TDCC</th>

<tr>
<td>0b1</td>
<td>EL0 using AArch64: EL0 accesses to the AArch64 DCC registers are trapped. EL0 using AArch32: EL0 accesses to the AArch32 DCC registers are trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
**Bits [11:7]**

Reserved, RES0.

**ERR, bit [6]**

Used for save/restore of EDSCR.ERR.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.ERR. Reads and writes of this bit are indirect accesses to EDSCR.ERR.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is RW.
- When OSLSR_EL1.OSLK == 0, access to this field is RO.

**Bits [5:1]**

Reserved, RES0.

**SS, bit [0]**

Software step control bit. If EL1 is using AArch64, enable Software step. Permitted values are:

<table>
<thead>
<tr>
<th>SS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Software step disabled</td>
</tr>
<tr>
<td>0b1</td>
<td>Software step enabled</td>
</tr>
</tbody>
</table>

RES0 if EL1 is using AArch32.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the MDSCR_EL1**

Individual fields within this register might have restricted accessibility when OSLSR_EL1.OSLK == 0 (the OS lock is unlocked). See the field descriptions for more detail.

Accesses to this register use the following encodings:

*MRS <Xt>, MDSCR_EL1*

<table>

The MIDR_EL1 characteristics are:

**Purpose**

Provides identification information for the PE, including an implementer code for the device and a device ID number.

**Configuration**

AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MIDR_EL1[31:0].

AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to External register MIDR_EL1[31:0].

**Attributes**

MIDR_EL1 is a 64-bit register.

**Field descriptions**

The MIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:32]</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>[31:24]</td>

</tr>
<tr>
<td>[17:15]</td>
<td>Architecture</td>
</tr>
<tr>
<td>[14:10]</td>
<td>PartNum</td>
</tr>
<tr>
<td>[9:5]</td>
<td>Revision</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**Implementer, bits [31:24]**

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

<table>
<thead>
<tr>
<th>Hex representation</th>
<th>Implementer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>Reserved for software use</td>
</tr>
<tr>
<td>0x0C</td>
<td>Ampere Computing</td>
</tr>
<tr>
<td>0x41</td>

</tr>
<tr>
<td>0x51</td>
<td>Qualcomm Inc.</td>
</tr>
<tr>
<td>0x56</td>
<td>Marvell International Ltd.</td>
</tr>
<tr>
<td>0x69</td>
<td>Intel Corporation</td>
</tr>
</tbody>
</table>

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.
**Variant, bits [23:20]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

**Architecture, bits [19:16]**

Architecture version. For A-profile, the defined values are:

<table>
<thead>
<tr>
<th>Architecture</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Armv4.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Armv4T.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Armv5 (obsolete).</td>
</tr>
<tr>
<td>0b0100</td>
<td>Armv5T.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Armv5TE.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Armv5TEJ.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Armv6.</td>
</tr>
<tr>
<td>0b1111</td>
<td>Architectural features are individually identified in the ID * registers, see 'ID registers'.</td>
</tr>
</tbody>
</table>

All other values are reserved.

**PartNum, bits [15:4]**

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

**Revision, bits [3:0]**

An IMPLEMENTATION DEFINED revision number for the device.

**Accessing the MIDR_EL1**

Accesses to this register use the following encodings:

MRS \(<Xt>\), MIDR_EL1

<table>

```

MIDR_EL1, Main ID Register
The MPAM0_EL1 characteristics are:

**Purpose**

Holds information to generate MPAM labels for memory requests when executing at EL0. When EL2 is present and enabled, the MPAM virtualization option is present, MPAMHCR_EL2.GSTAPP_PLK == 1 and HCR_EL2.TGE == 0, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM information to label memory requests.

If EL2 is present and enabled, and HCR_EL2.E2H == 0 or HCR_EL2.TGE == 0, the MPAM virtualization option is present and MPAMHCR_EL2.EL0.VPMEN == 1, then MPAM PARTIDs in MPAM0_EL1 are virtual and mapped into physical PARTIDs for the current Security state.

**Configuration**

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM0_EL1 are UNDEFINED.

**Attributes**

MPAM0_EL1 is a 64-bit register.

**Field descriptions**

The MPAM0_EL1 bit assignments are:

| 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

  endif;
else
  MPAM0_EL1 = X[t];
endif;
elsif PSTATE.EL == EL3 then
  MPAM0_EL1 = X[t];
The MPAM1_EL1 characteristics are:

**Purpose**

Holds information to generate MPAM labels for memory requests when executing at EL1.

When EL2 is present and enabled, the MPAM virtualization option is present, MPAMHCR_EL2.GSTAPP.PLK == 1 and HCR_EL2.TGE == 0, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM labels for memory requests when executing at EL0.

MPAM1_EL1 is an alias for MPAM2_EL2 when executing at EL2 with HCR_EL2.E2H == 1.

MPAM1_EL12 is an alias for MPAM1_EL1 when executing at EL2 or EL3 with HCR_EL2.E2H == 1.

If EL2 is present and enabled, the MPAM virtualization option is present and MPAMHCR_EL2.EL1_VPMEN == 1, MPAM PARTIDs in MPAM1_EL1 are virtual and mapped into physical PARTIDs for the current Security state. This mapping of MPAM1_EL1 virtual PARTIDs to physical PARTIDs when EL1_VPMEN is 1 also applies when MPAM1_EL1 is used at EL0 due to MPAMHCR_EL2.GSTAPP.PLK.

**Configuration**

AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register MPAM3_EL3[63] when EL3 is implemented.

AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register MPAM2_EL2[63] when EL3 is not implemented and EL2 is implemented.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM1_EL1 are UNDEFINED.

**Attributes**

MPAM1_EL1 is a 64-bit register.

**Field descriptions**

The MPAM1_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| MPAMEN | RES0 | FORCED_NS | RES0 | PMG_D | PMG_I |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**MPAMEN, bit [63]**

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

<table>
<thead>
<tr>
<th>MPAMEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The default PARTID and default PMG are output in MPAM information.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.</td>
</tr>
</tbody>
</table>

If neither EL3 nor EL2 is implemented, this field is read/write.

If EL3 is implemented, this field is read-only and reads the current value of the read/write bit MPAM3_EL3.MPAMEN.
If EL3 is not implemented and EL2 is implemented, this field is read-only and reads the current value of the read/write bit MPAM2_EL2.MPAMEN.

On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- When EL3 is not implemented and EL2 is not implemented, access to this field is RW.
- Otherwise, access to this field is RO.

**Bits [62:61]**

Reserved, RES0.

**FORCED_NS, bit [60]**

When FEAT_MPAMv0p1 is implemented:

In the Secure state, FORCED_NS indicates the state of MPAM3_EL3.FORCE_NS.

<table>
<thead>
<tr>
<th>FORCED_NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>In the Non-secure state, always reads as 0. In the Secure state, indicates that MPAM3_EL3.FORCE_NS == 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>In the Secure state, indicates that MPAM3_EL3.FORCE_NS == 1.</td>
</tr>
</tbody>
</table>

Always reads as 0 in the Non-secure state.

Writes are ignored.

Access to this field is RO.

**Otherwise:**

Reserved, RES0.

**Bits [59:48]**

Reserved, RES0.

**PMG_D, bits [47:40]**

Performance monitoring group property for PARTID_D.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PMG_I, bits [39:32]**

Performance monitoring group property for PARTID_I.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PARTID_D, bits [31:16]**

Partition ID for data accesses, including load and store accesses, made from EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PARTID_I, bits [15:0]**

Partition ID for instruction accesses made from EL1.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing the MPAM1_EL1

When **HCR_EL2.E2H** is 1, without explicit synchronization, accesses from EL3 using the mnemonic **MPAM1_EL1** or **MPAM1_EL12** are not guaranteed to be ordered with respect to accesses using the other mnemonic.

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

The MPAM2_EL2 characteristics are:

**Purpose**

Holds information to generate MPAM labels for memory requests when executing at EL2.

**Configuration**

AArch64 System register MPAM2_EL2 bit [63] is architecturally mapped to AArch64 System register MPAM3_EL3[63] when EL3 is implemented.

AArch64 System register MPAM2_EL2 bit [63] is architecturally mapped to AArch64 System register MPAM1_EL1[63].

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM2_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MPAM2_EL2 is a 64-bit register.

**Field descriptions**

The MPAM2_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>MPAMEN</th>
<th>RES0</th>
<th>TIDR</th>
<th>RES0</th>
<th>TRAPMPAM0EL1</th>
<th>TRAPMPAM1EL1</th>
<th>PMG_D</th>
<th>PMG_I</th>
<th>PARTID_D</th>
<th>PARTID_I</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62616059</td>
<td>58</td>
<td>575655453525150</td>
<td>49</td>
<td>48</td>
<td>4746454434241403938373635343332</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>31</td>
<td>30292827</td>
<td>26</td>
<td>2524232221201918</td>
<td>17</td>
<td>16</td>
<td>151413121110</td>
<td>9</td>
<td>8</td>
<td>7</td>
</tr>
</tbody>
</table>

**MPAMEN, bit [63]**

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

<table>
<thead>
<tr>
<th>MPAMEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The default PARTID and default PMG are output in MPAM information from all Exception levels.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, this field is read/write.

If EL3 is implemented, this field is read-only and reads the current value of the read/write MPAM3_EL3.MPAMEN bit.

On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- When EL3 is not implemented, access to this field is **RW**.
- Otherwise, access to this field is **RO**.

**Bits [62:59]**

Reserved, RES0.
TIDR, bit [58]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMIDR_EL1.HAS_TIDR == 1:

TIDR traps accesses to MPAMIDR_EL1 from EL1 to EL2.

<table>
<thead>
<tr>
<th>TIDR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trap accesses to MPAMIDR_EL1 from EL1 to EL2.</td>
</tr>
</tbody>
</table>

MPAMHCR_EL2.TRAP_MPAMIDR_EL1 == 1 also traps MPAMIDR_EL1 accesses from EL1 to EL2. If either TIDR or TRAP_MPAMIDR_EL1 are 1, accesses are trapped.

Otherwise:

Reserved, RES0.

Bits [57:50]

Reserved, RES0.

TRAPMPAM0EL1, bit [49]

TRAPMPAM0EL1: Trap accesses from EL1 to the MPAM0_EL1 register trap to EL2.

<table>
<thead>
<tr>
<th>TRAPMPAM0EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to MPAM0_EL1 from EL1 are not trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to MPAM0_EL1 from EL1 are trapped to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, when EL3 is not implemented, this field resets to 1.

On a Warm reset, when EL3 is implemented, this field resets to an architecturally UNKNOWN value.

TRAPMPAM1EL1, bit [48]

TRAPMPAM1EL1: Trap accesses from EL1 to the MPAM1_EL1 register trap to EL2.

<table>
<thead>
<tr>
<th>TRAPMPAM1EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to MPAM1_EL1 from EL1 are not trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to MPAM1_EL1 from EL1 are trapped to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, when EL3 is not implemented, this field resets to 1.

On a Warm reset, when EL3 is implemented, this field resets to an architecturally UNKNOWN value.

PMG_D, bits [47:40]

Performance monitoring group for data accesses.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group for instruction accesses.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL2.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PARTID_I, bits [15:0]**

Partition ID for instruction accesses made from EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the MPAM2_EL2**

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

**MRS <Xt>, MPAM2_EL2**

MPAM3_EL3, MPAM3 Register (EL3)

The MPAM3_EL3 characteristics are:

**Purpose**

Holds information to generate MPAM labels for memory requests when executing at EL3.

**Configuration**

AArch64 System register MPAM3_EL3 bit [63] is architecturally mapped to AArch64 System register MPAM2_EL2[63] when EL2 is implemented.

AArch64 System register MPAM3_EL3 bit [63] is architecturally mapped to AArch64 System register MPAM1_EL1[63].

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM3_EL3 are UNDEFINED.

**Attributes**

MPAM3_EL3 is a 64-bit register.

**Field descriptions**

The MPAM3_EL3 bit assignments are:

**MPAMEN, bit [63]**

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

Values of this field are:

<table>
<thead>
<tr>
<th>MPAMEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The default PARTID and default PMG are output in MPAM information when executing at any ELn.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.</td>
</tr>
</tbody>
</table>

This field is always read/write in MPAM3_EL3.

On a Warm reset, this field resets to 0.

**TRAPLOWER, bit [62]**

Trap direct accesses to any MPAM system registers that are not UNDEFINED from all ELn lower than EL3.

<table>
<thead>
<tr>
<th>TRAPLOWER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not force trapping of direct accesses of MPAM system registers to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>Force all direct accesses of MPAM system registers to trap to EL3.</td>
</tr>
</tbody>
</table>
On a Cold reset, this field resets to 1.

**SDEFLT, bit [61]**

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMIDR_EL1.HAS_SDEFLT == 1:

SDEFLT overrides the PARTID with the default PARTID when executing in the Secure state.

<table>
<thead>
<tr>
<th>SDEFLT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The PARTID is determined normally in the Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>The PARTID is always PARTID 0 when executing in the Secure state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**FORCE_NS, bit [60]**

When FEAT_MPAMv0p1 is implemented and MPAMIDR_EL1.HAS_FORCE_NS == 1:

FORCE_NS forces MPAM_NS to always be 1 in the Secure state.

<table>
<thead>
<tr>
<th>FORCE_NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAM NS is 0 when executing in the Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM NS is 1 when executing in the Secure state.</td>
</tr>
</tbody>
</table>

An implementation is permitted to have this field as RAO if the implementation does not support generating MPAM_NS as 0.

On a Warm reset, this field resets to an **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bits [59:48]**

Reserved, RES0.

**PMG_D, bits [47:40]**

Performance monitoring group for data accesses.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PMG_I, bits [39:32]**

Performance monitoring group for instruction accesses.

**PARTID_D, bits [31:16]**

Partition ID for data accesses, including load and store accesses, made from EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PARTID_I, bits [15:0]**

Partition ID for instruction accesses made from EL3.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the MPAM3_EL3**

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

\[
\text{MRS } <Xt>, \text{ MPAM3_EL3}
\]

<table>
<thead>
<tr>

    MPAM3_EL3 = X[t];
The MPAMHCR_EL2 characteristics are:

**Purpose**

Controls the PARTID virtualization features of MPAM. It controls the mapping of virtual PARTIDs into physical PARTIDs in MPAM0_EL1 when EL0_VPMEN == 1 and in MPAM1_EL1 when EL1_VPMEN == 1.

**Configuration**

This register is present only when FEAT_MPAM is implemented and MPAMIDR_EL1.HAS_HCR == 1. Otherwise, direct accesses to MPAMHCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MPAMHCR_EL2 is a 64-bit register.

**Field descriptions**

The MPAMHCR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>62</td>
<td>TRAP_MPAMIDR_EL1, bit [31]</td>

</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**TRAP_MPAMIDR_EL1, bit [31]**

Trap accesses from EL1 to MPAMIDR_EL1 to EL2.

<table>
<thead>
<tr>
<th>TRAP_MPAMIDR_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Direct accesses to MPAMIDR_EL1 from EL1 are trapped to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, when EL3 is not implemented, this field resets to 1.

On a Warm reset, when EL3 is implemented, this field resets to an architecturally UNKNOWN value.

**Bits [30:9]**

Reserved, RES0.

**GSTAPP_PLK, bit [8]**

Make the PARTIDs at EL0 the same as the PARTIDs at EL1. When executing at EL0, EL2 is enabled, HCR_EL2.TGE == 0 and GSTAPP_PLK = 1, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM labels for memory requests.
Meaning

<table>
<thead>
<tr>
<th>GSTAPP_PLK</th>
<th>MPAM0_EL1 is used to generate MPAM labels when executing at EL0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM1_EL1 is used to generate MPAM labels when executing at EL0 with EL2 enabled and HCR_EL2.TGE == 0. Otherwise MPAM0_EL1 is used.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally unknown value.

**Bits [7:2]**

Reserved, RES0.

**EL1_VPMEN, bit [1]**

Enable the virtual PARTID mapping of the PARTID fields in MPAM1_EL1 when executing at EL1. This bit also enables virtual PARTID mapping when MPAM1_EL1 is used to generate MPAM labels for memory requests at EL0 due to GSTAPP_PLK == 1.

Meaning

<table>
<thead>
<tr>
<th>EL1_VPMEN</th>
<th>MPAM1_EL1.PARTID_I and MPAM1_EL1.PARTID_D are physical PARTIDs that are used to label memory system requests.</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td></td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM1_EL1.PARTID_I and MPAM1_EL1.PARTID_D are virtual PARTIDs that are used to index the PhyPARTID fields of MPAMVPM0_EL2 to MPAMVPM7_EL2 registers to map the virtual PARTID into a physical PARTID to label memory system requests.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally unknown value.

**EL0_VPMEN, bit [0]**

Enable the virtual PARTID mapping of the PARTID fields of MPAM0_EL1 unless HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1.

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1, EL0_VPMEN is ignored and MPAM0_EL1 PARTID fields are not mapped.

When MPAMHCR_EL2.GSTAPP_PLK == 1 and HCR_EL2.TGE == 0, MPAM1_EL1 is used as the source of PARTIDs and the virtual PARTID mapping of MPAM1_EL1 PARTIDs is controlled by MPAMHCR_EL2.EL1_VPMEN.

Meaning

<table>
<thead>
<tr>
<th>EL0_VPMEN</th>
<th>MPAM0_EL1.PARTID_I and MPAM0_EL1.PARTID_D are physical PARTIDs that are used to label memory system requests.</th>
</tr>
</thead>

MPAMIDR_EL1, MPAM ID Register (EL1)

The MPAMIDR_EL1 characteristics are:

**Purpose**

Indicates the presence and maximum PARTID and PMG values supported in the implementation. It also indicates whether the implementation supports MPAM virtualization.

**Configuration**

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMIDR_EL1 are UNDEFINED.

**Attributes**

MPAMIDR_EL1 is a 64-bit register.

**Field descriptions**

The MPAMIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-62</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>61</td>
<td>HAS_SDEFLT</td>
</tr>
<tr>
<td>60</td>
<td>HAS_FORCE_NS</td>
</tr>
<tr>
<td>59</td>
<td>HAS_TIDR</td>
</tr>
<tr>
<td>58</td>
<td>VPMR_MAX</td>
</tr>
<tr>
<td>57</td>
<td>HAS_HCR</td>
</tr>
<tr>
<td>56-47</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>46-37</td>
<td>PMG_MAX</td>
</tr>
<tr>
<td>36-27</td>
<td>PARTID_MAX</td>
</tr>
</tbody>
</table>

MPAMIDR_EL1 indicates the MPAM implementation parameters of the PE.

**Bits [63:62]**

Reserved, RES0.

**HAS_SDEFLT, bit [61]**

HAS_SDEFLT indicates support for MPAM3_EL3.SDEFLT bit. Defined values are:

<table>
<thead>
<tr>
<th>HAS_SDEFLT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The SDEFLT bit is not implemented in MPAM3_EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>The SDEFLT bit is implemented in MPAM3_EL3.</td>
</tr>
</tbody>
</table>

When MPAM3_EL3.SDEFLT == 1, accesses from the Secure execution state use the default PARTID, PARTID == 0.

**HAS_FORCE_NS, bit [60]**

HAS_FORCE_NS indicates support for MPAM3_EL3.FORCE_NS bit. Defined values are:

<table>
<thead>
<tr>
<th>HAS_FORCE_NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The FORCE_NS bit is not implemented in MPAM3_EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>The FORCE_NS bit is implemented in MPAM3_EL3.</td>
</tr>
</tbody>
</table>

When MPAM3_EL3.FORCE_NS == 1, accesses from the Secure execution state have MPAM_NS == 1.

**Bit [59]**

Reserved, RES0.
HAS_TIDR, bit [58]

HAS_TIDR indicates support for MPAM2_EL2.TIDR bit. Defined values are:

<table>
<thead>
<tr>
<th>HAS_TIDR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The TIDR bit is not implemented in MPAM2_EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>The TIDR bit is implemented in MPAM2_EL2.</td>
</tr>
</tbody>
</table>

Bits [57:40]

Reserved, RES0.

PMG_MAX, bits [39:32]

The largest value of PMG that the implementation can generate. The PMG_I and PMG_D fields of every MPAMn_ELx must implement at least enough bits to represent PMG_MAX.

Bits [31:21]

Reserved, RES0.

VPMR_MAX, bits [20:18]

When MPAMIDR_EL1.HAS_HCR == 1:

Indicates the maximum register index n for the MPAMVPM<n>_EL2 registers.

Otherwise:

Reserved, RAZ.

HAS_HCR, bit [17]

HAS_HCR indicates that the PE implementation supports MPAM virtualization, including MPAMHCR_EL2, MPAMVPMV_EL2 and MPAMVPVM<n>_EL2 with n in the range 0 to VPMR_MAX. Must be 0 if EL2 is not implemented in either security state.

<table>
<thead>
<tr>
<th>HAS_HCR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>MPAM virtualization is not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>MPAM virtualization is supported.</td>
</tr>
</tbody>
</table>

Bit [16]

Reserved, RES0.

PARTID_MAX, bits [15:0]

The largest value of PARTID that the implementation can generate. The PARTID_I and PARTID_D fields of every MPAMn_ELx must implement at least enough bits to represent PARTID_MAX.

Accessing the MPAMIDR_EL1

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b1010</td>
<td>0b0100</td>
<td>0b100</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    UNDEFINED;
elif PSTATE.EL == EL1 then
    if HaveEL(EL3) && MPAM3_EL3.TRAPLOWER == '1' then
        if Halted() && EDSCR.SDD == '1' then
            UNDEFINED;
        else
            AArch64.SystemAccessTrap(EL3, 0x18);
    elsif EL2Enabled() && MPAMIDR_EL1.HAS_HCR == '1' && MPAMHCR_EL2.TRAP_MPAMIDR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && MPAMIDR_EL1.HAS_TIDR == '1' && MPAM2_EL2.TIDR == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return MPAMIDR_EL1;
    endif
else
    return MPAMIDR_EL1;
elif PSTATE.EL == EL2 then
    if HaveEL(EL3) && MPAM3_EL3.TRAPLOWER == '1' then
        if Halted() && EDSCR.SDD == '1' then
            UNDEFINED;
        else
            AArch64.SystemAccessTrap(EL3, 0x18);
        endif
    else
        return MPAMIDR_EL1;
    endif
elsiif PSTATE.EL == EL3 then
    return MPAMIDR_EL1;
The MPAMVPM0_EL2 characteristics are:

**Purpose**

MPAMVPM0_EL2 provides mappings from virtual PARTIDs 0 - 3 to physical PARTIDs.

**MPAMIDR_EL1.VPMR_MAX** field gives the index of the highest implemented MPAMVPM<n>_EL2 register. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If **MPAMIDR_EL1.VPMR_MAX == 0**, there is only a single MPAMVPM<n>_EL2 register, **MPAMVPM0_EL2**.

Virtual PARTID mapping is enabled by **MPAMHCR_EL2.EL1_VPMEN** for PARTIDs in **MPAM1_EL1** and by **MPAMHCR_EL2.EL0_VPMEN** for PARTIDs in **MPAM0_EL1**.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is only valid when the **MPAMVPMV_EL2.VPM_V** bit in bit position n is set to 1.

**Configuration**

This register is present only when FEAT_MPAM is implemented and **MPAMIDR_EL1.HAS_HCR == 1**. Otherwise, direct accesses to **MPAMVPM0_EL2** are **UNDEFINED**.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MPAMVPM0_EL2 is a 64-bit register.

**Field descriptions**

The MPAMVPM0_EL2 bit assignments are:

<table>

</table>

Virtual PARTID Mapping Entry for virtual PARTID 3. PhyPARTID3 gives the mapping of virtual PARTID 3 to a physical PARTID.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

PhyPARTID2, bits [47:32] |

Virtual PARTID Mapping Entry for virtual PARTID 2. PhyPARTID2 gives the mapping of virtual PARTID 2 to a physical PARTID.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

PhyPARTID1, bits [31:16] |

Virtual PARTID Mapping Entry for virtual PARTID 1. PhyPARTID1 gives the mapping of virtual PARTID 1 to a physical PARTID.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**PhyPARTID0, bits [15:0]**

Virtual PARTID Mapping Entry for virtual PARTID 0. PhyPARTID0 gives the mapping of virtual PARTID 0 to a physical PARTID.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

    MPAMVPM0_EL2 = X[t];
  end
elsif PSTATE.EL == EL3 then
  MPAMVPM0_EL2 = X[t];
The MPAMVPM1_EL2 characteristics are:

**Purpose**

MPAMVPM1_EL2 provides mappings from virtual PARTIDs 4 - 7 to physical PARTIDs.

The MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM0_EL2 to MPAMVPM7_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register; MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1.VPMEN for PARTIDs in MPAM1_EL1 and by MPAMHCR_EL2.EL0.VPMEN for PARTIDs in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is only valid when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

**Configuration**

This register is present only when FEAT_MPAM is implemented, MPAMIDR_EL1.HAS_HCR == 1 and MPAMIDR_EL1.VPMR_MAX > 0. Otherwise, direct accesses to MPAMVPM1_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MPAMVPM1_EL2 is a 64-bit register.

**Field descriptions**

The MPAMVPM1_EL2 bit assignments are:

<table>
<thead>
<tr>

The MPAMVPM5_EL2 characteristics are:

**Purpose**

MPAMVPM5_EL2 provides mappings from virtual PARTIDs 20 - 23 to physical PARTIDs.

- **MPAMIDR_EL1**.VPMR_MAX field gives the index of the highest implemented MPAMVPM<n>_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for PARTIDs in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for PARTIDs in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is only valid when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

**Configuration**

This register is present only when FEAT_MPAM is implemented, MPAMIDR_EL1.HAS_HCR == 1 and MPAMIDR_EL1.VPMR_MAX > 4. Otherwise, direct accesses to MPAMVPM5_EL2 are **UNDEFINED**.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

MPAMVPM5_EL2 is a 64-bit register.

**Field descriptions**

The MPAMVPM5_EL2 bit assignments are:

#### Bits [63:32]

Reserved, RES0.

**VPM_V<m>**, bit [m], for m = 31 to 0

Contains valid bit for virtual PARTID mapping entry corresponding to virtual PARTID<m>.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Accessing the MPAMVPMV_EL2

Accesses to this register use the following encodings:

**MRS <Xt>, MPAMVPMV_EL2**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

MSR MPAMVPMV_EL2, <Xt>
The MPIDR_EL1 characteristics are:

**Purpose**

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

**Configuration**

AArch64 System register MPIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MPIDR[31:0].

In a uniprocessor system Arm recommends that each Aff<n> field of this register returns a value of 0.

**Attributes**

MPIDR_EL1 is a 64-bit register.

**Field descriptions**

The MPIDR_EL1 bit assignments are:

**Bits [63:40]**

Reserved, RES0.

**Aff3, bits [39:32]**

Affinity level 3. See the description of Aff0 for more information.

Aff3 is not supported in AArch32 state.

**Bit [31]**

Reserved, RES1.

**U, bit [30]**

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Processor is part of a multiprocessor system.</td>
</tr>
<tr>
<td>0b1</td>
<td>Processor is part of a uniprocessor system.</td>
</tr>
</tbody>
</table>

**Bits [29:25]**

Reserved, RES0.
Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels. The possible values of this bit are:

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Performance of PEs at the lowest affinity level, or PEs with MPIDR_EL1.MT set to 1, different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.</td>
</tr>
<tr>
<td>0b1</td>
<td>Performance of PEs at the lowest affinity level, or PEs with MPIDR_EL1.MT set to 1, different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.</td>
</tr>
</tbody>
</table>

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

Aff0, bits [7:0]

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

**Accessing the MPIDR_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, MPIDR_EL1

```c
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && ():HaveEL(EL3) || SCR_EL3.FGTEn == '1' && HFRGRTR_EL2.MPIDR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled then
        return VMPIDR_EL2;
    else
        return MPIDR_EL1;
elsif PSTATE.EL == EL2 then
    return MPIDR_EL1;
eis PSTATE.EL == EL3 then
    return MPIDR_EL1;
```

**MVFR0_EL1, AArch32 Media and VFP Feature Register 0**

The MVFR0_EL1 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR1_EL1 and MVFR2_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register MVFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR0[31:0].

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

**Attributes**

MVFR0_EL1 is a 64-bit register.

**Field descriptions**

The MVFR0_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

<table>
<thead>
<tr>
<th>Bit</th>

<tr>
<td>33</td>
<td></td>
</tr>
<tr>
<td>32</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**FPRound, bits [31:28]**

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes. Defined values are:

<table>
<thead>
<tr>
<th>FPRound</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the FPSCR setting.</td>
</tr>
<tr>
<td>0b0001</td>
<td>All rounding modes supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.
FPShVec, bits [27:24]

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors. Defined values are:

<table>
<thead>
<tr>
<th>FPShVec</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Short vectors not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Short vector operation supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

FPSqrt, bits [23:20]

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations. Defined values are:

<table>
<thead>
<tr>
<th>FPSqrt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPDivide, bits [19:16]

Indicates whether the floating-point implementation provides support for VFP divide operations. Defined values are:

<table>
<thead>
<tr>
<th>FPDivide</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPTrap, bits [15:12]

Floating Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping. Defined values are:

<table>
<thead>
<tr>
<th>FPTrap</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported.</td>
</tr>
</tbody>
</table>

All other values are reserved.

A value of 0b0001 indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

FPDP, bits [11:8]

Double Precision. Indicates whether the floating-point implementation provides support for double-precision operations. Defined values are:
FPDP, bits [7:4]

Single Precision. Indicates whether the floating-point implementation provides support for single-precision operations. Defined values are:

<table>
<thead>
<tr>
<th>FPSP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not supported in hardware.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Supported, VFPv2.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Supported, VFPv3, or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0b0001.
- VDIV.F32 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank. Defined values are:

<table>
<thead>
<tr>
<th>SIMDReg</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The implementation has no Advanced SIMD and floating-point support.</td>
</tr>
<tr>
<td>0b0001</td>
<td>The implementation includes floating-point support with 16 x 64-bit registers.</td>
</tr>
<tr>
<td>0b0010</td>
<td>The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.
**Bits [63:0]**

</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**SIMDLS, bits [11:8]**

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions. Defined values are:

<table>
<thead>
<tr>
<th>SIMDLS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**FPDNaN, bits [7:4]**

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode. Defined values are:

<table>
<thead>
<tr>
<th>FPDNaN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented, or hardware supports only the Default NaN mode.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Hardware supports propagation of NaN values.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**FPFtZ, bits [3:0]**

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation. Defined values are:

<table>
<thead>
<tr>
<th>FPFtZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Not implemented, or hardware supports only the Flush-to-Zero mode of operation.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Hardware supports full denormalized number arithmetic.</td>
</tr>
</tbody>
</table>

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**Otherwise:**

<table>
<thead>
<tr>
<th>bit position</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-31</td>
<td>UNKNOWN</td>
</tr>
<tr>
<td>30-0</td>
<td>UNKNOWN</td>
</tr>
</tbody>
</table>
Bits [63:0]

Reserved, UNKNOWN.

Accessing the MVFR1_EL1

Accesses to this register use the following encodings:

MRS <Xt>, MVFR1_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>

elsif PSTATE.EL == EL2 then
  return MVFR1_EL1;
elsif PSTATE.EL == EL3 then
  return MVFR1_EL1;
The MVFR2_EL1 characteristics are:

**Purpose**

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR0_EL1 and MVFR1_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

**Configuration**

AArch64 System register MVFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR2[31:0].

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

**Attributes**

MVFR2_EL1 is a 64-bit register.

**Field descriptions**

The MVFR2_EL1 bit assignments are:

**When AArch32 is supported at any Exception level:**

NZCV, Condition Flags

The NZCV characteristics are:

**Purpose**

Allows access to the condition flags.

**Configuration**

There are no configuration notes.

**Attributes**

NZCV is a 64-bit register.

**Field descriptions**

The NZCV bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>62</td>
<td>Negative condition flag (N)</td>
</tr>
<tr>

</tr>
<tr>
<td>55</td>
<td>Set to 1 if last instruction resulted in overflow.</td>
</tr>
<tr>
<td>54</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative condition flag. Set to 1 if the result of the last flag-setting instruction was negative.

**Z, bit [30]**

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

**C, bit [29]**

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

**V, bit [28]**

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

**Bits [27:0]**

Reserved, RES0.

OSDLR_EL1, OS Double Lock Register

The OSDLR_EL1 characteristics are:

### Purpose

Used to control the OS Double Lock.

### Configuration

AArch64 System register OSDLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSDLR[31:0].

### Attributes

OSDLR_EL1 is a 64-bit register.

### Field descriptions

The OSDLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>62</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>61</td>
<td>DLK, bit[0]</td>
</tr>
<tr>
<td>60</td>
<td>OS Double Lock control bit.</td>
</tr>
</tbody>
</table>

When FEAT_DoubleLock is implemented:

<table>
<thead>
<tr>
<th>DLK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>OS Double Lock unlocked.</td>
</tr>
<tr>
<td>0b1</td>
<td>OS Double Lock locked, if DBGPRCR_EL1.CORENPDRQ (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RAZ/WI.

OSDTRRX_EL1, OS Lock Data Transfer Register, Receive

The OSDTRRX_EL1 characteristics are:

**Purpose**

Used for save/restore of DBGDTRRX_EL0. It is a component of the Debug Communications Channel.

**Configuration**

AArch64 System register OSDTRRX_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRRXext[31:0].

**Attributes**

OSDTRRX_EL1 is a 64-bit register.

**Field descriptions**

The OSDTRRX_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit(s)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:32]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>[31:0]</td>
<td>Update DTRRX without side-effect.</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**Bits [31:0]**

Update DTRRX without side-effect.

 Writes to this register update the value in DTRRX and do not change RXfull.

 Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

**Accessing the OSDTRRX_EL1**

Arm deprecates reads and writes of OSDTRRX_EL1 when the OS Lock is unlocked.

Accesses to this register use the following encodings:

\[
\text{MRS} \ <\!Xt>, \ OSDTRRX\_EL1
\]

OSDTRTX_EL1, OS Lock Data Transfer Register, Transmit

The OSDTRTX_EL1 characteristics are:

Purpose

Used for save/restore of DBGDTRTX_EL0. It is a component of the Debug Communications Channel.

Configuration

AArch64 System register OSDTRTX_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXext[31:0].

Attributes

OSDTRTX_EL1 is a 64-bit register.

Field descriptions

The OSDTRTX_EL1 bit assignments are:

| Bit 63 | Bit 62 | Bit 61 | Bit 60 | Bit 59 | Bit 58 | Bit 57 | Bit 56 | Bit 55 | Bit 54 | Bit 53 | Bit 52 | Bit 51 | Bit 50 | Bit 49 | Bit 48 | Bit 47 | Bit 46 | Bit 45 | Bit 44 | Bit 43 | Bit 42 | Bit 41 | Bit 40 | Bit 39 | Bit 38 | Bit 37 | Bit 36 | Bit 35 | Bit 34 | Bit 33 | Bit 32 |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
|  RES0  | Return DTRTX without side-effect |

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Return DTRTX without side-effect.

Reads of this register return the value in DTRTX and do not change TXfull.

Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

Accessing the OSDTRTX_EL1

Arm deprecates reads and writes of OSDTRTX_EL1 when the OS Lock is unlocked.

Accesses to this register use the following encodings:

MRS <Xt>, OSDTRTX_EL1

OSECCR_EL1, OS Lock Exception Catch Control Register

The OSECCR_EL1 characteristics are:

**Purpose**

Provides a mechanism for an operating system to access the contents of EDECCR that are otherwise invisible to software, so it can save/restore the contents of EDECCR over powerdown on behalf of the external debugger.

**Configuration**

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSECCR[31:0].

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to External register EDECCR[31:0].

If OSLSR_EL1.OSLK == 0, then OSECCR_EL1 returns an UNKNOWN value on reads and ignores writes.

**Attributes**

OSECCR_EL1 is a 64-bit register.

**Field descriptions**

The OSECCR_EL1 bit assignments are:

**When OSLSR_EL1.OSLK == 1:**

<table>

OSLSR_EL1, OS Lock Status Register

The OSLSR_EL1 characteristics are:

**Purpose**

Provides the status of the OS Lock.

**Configuration**

AArch64 System register OSLSR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSLSR[31:0].

**Attributes**

OSLSR_EL1 is a 64-bit register.

**Field descriptions**

The OSLSR_EL1 bit assignments are:

**Bits [63:4]**

Reserved, RES0.

**OSLM, bits [3, 0]**

OS lock model implemented. Identifies the form of OS save and restore mechanism implemented.

<table>
<thead>
<tr>
<th>OSLM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>OS Lock not implemented.</td>
</tr>
<tr>
<td>0b10</td>
<td>OS Lock implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

The OSLM field is split as follows:

- OSLM[1] is OSLSR_EL1[3].
- OSLM[0] is OSLSR_EL1[0].

**nTT, bit [2]**

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

**OSLK, bit [1]**

OS Lock Status.

<table>
<thead>
<tr>
<th>OSLK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>OS Lock unlocked.</td>
</tr>
<tr>
<td>0b1</td>
<td>OS Lock locked.</td>
</tr>
</tbody>
</table>
The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

On a Cold reset, this field resets to 1.

**Accessing the OSLR_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, OSLR_EL1

<table>

PAR_EL1, Physical Address Register

The PAR_EL1 characteristics are:

**Purpose**

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

**Configuration**

AArch64 System register PAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register PAR[63:0].

**Attributes**

PAR_EL1 is a 64-bit register.

**Field descriptions**

The PAR_EL1 bit assignments are:

**When PAR_EL1.F == 0:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ATTR | RES0 | PA[51:48] | PA[47:12] | RES1 | IMPLEMENTATION DEFINED | NS | SH | RES0 | F |

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- The PAR_EL1.{ATTR, SH} fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors.
- See the PAR_EL1.NS bit description for constraints on the value it returns.

**ATTR, bits [63:56]**

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR_EL1, MAIR_EL2, and MAIR_EL3.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [55:52]**

Reserved, RES0.
**PA[51:48], bits [51:48]**

When FEAT_LPA is implemented:

Extension to PA[47:12]. See PA[47:12] for more details.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**PA[47:12], bits [47:12]**

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[47:12].

When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, the PA[51:48] bits form the upper part of the address value. Otherwise the PA[51:48] bits are RES0.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [11]**

Reserved, RES1.

**IMPLEMENTATION DEFINED, bit [10]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**NS, bit [9]**

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit reflects the Security state of the intermediate physical address space of the translation for the instructions:

- In AArch64 state: **AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP, AT S1E0R, and AT S1E0W**.
- In AArch32 state: **ATS1CPR, ATS1CPW, ATS1CPRP, ATS1CPWP, ATS1CUR, and ATS1CUW**.

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NTable bits of earlier levels of the translation table walk if those NTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is **UNKNOWN**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**SH, bits [8:7]**

Shareability attribute, for the returned output address. Permitted values are:

<table>
<thead>
<tr>
<th>SH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

The value 0b01 is reserved.

**Note**
This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [6:1]**

Reserved, RES0.

**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Address translation completed successfully.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**When PAR_EL1.F == 1:**

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

**IMPLEMENTATION DEFINED, bits [63:56]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IMPLEMENTATION DEFINED, bits [55:52]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IMPLEMENTATION DEFINED, bits [51:48]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [47:12]**

Reserved, RES0.

**Bit [11]**

Reserved, RES1.
**Bit [10]**

Reserved, RES0.

**S, bit [9]**

Indicates the translation stage at which the translation aborted:

<table>
<thead>
<tr>
<th>S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Translation aborted because of a fault in the stage 1 translation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Translation aborted because of a fault in the stage 2 translation.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PTW, bit [8]**

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [7]**

Reserved, RES0.

**FST, bits [6:1]**

Fault status code, as shown in the Data Abort ESR encoding.
<table>

</tbody>
</table>
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>Address translation aborted.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the PAR_EL1**

Accesses to this register use the following encodings:

**MRS <Xt>, PAR_EL1**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>0b000</td>

    elsif PSTATE.EL == EL2 then
        PAR_EL1 = X[t];
    elsif PSTATE.EL == EL3 then
        PAR_EL1 = X[t];
```
PMBIDR_EL1, Profiling Buffer ID Register

The PMBIDR_EL1 characteristics are:

**Purpose**

Provides information to software as to whether the buffer can be programmed at the current Exception level.

**Configuration**

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBIDR_EL1 are UNDEFINED.

**Attributes**

PMBIDR_EL1 is a 64-bit register.

**Field descriptions**

The PMBIDR_EL1 bit assignments are:

</tbody>
</table>

Bits [63:6]

Reserved, RES0.

F, bit [5]

Flag updates. Defines whether the address translation performed by the Profiling Buffer manages the Access Flag and dirty state.

<table>
<thead>
<tr>
<th>F</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hardware management of the Access Flag and dirty state for accesses made by the Statistical Profiling Extension is always disabled for all translation stages.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hardware management for the Access Flag and dirty state for accesses made by the Statistical Profiling Extension is controlled in the same way as explicit memory accesses in the owning translation regime.</td>
</tr>
</tbody>
</table>

If hardware management of the Access Flag is disabled for a stage of translation, an access to Page or Block with the Access flag bit not set in the descriptor will generate an Access Flag fault.

If hardware management of the dirty state is disabled for a stage of translation, an access to a Page or Block will ignore the Dirty Bit Modifier in the descriptor might generate a Permission fault, depending on the values of the access permission bits in the descriptor.

P, bit [4]

Programming not allowed. The Profiling Buffer is owned by a higher Exception level or the other Security state.
Meaning

0b0  Profiling Buffer is owned by the current or a lower Exception level in the current Security state.

0b1  Profiling Buffer is owned by a higher Exception level or the other Security state.

The value read from this field depends on the current Exception level and the Effective values of MDCR_EL3.NSPB and MDCR_EL2.E2PB:

- If EL3 is implemented, and either MDCR_EL3.NSPB == 0b00 or MDCR_EL3.NSPB == 0b01, this bit reads as one from:
  - Non-secure EL1.
  - Non-secure EL2.
  - If Secure EL2 is implemented and enabled, and MDCR_EL2.E2PB == 0b00, Secure EL1.
- If EL3 is implemented, and either MDCR_EL3.NSPB == 0b10 or MDCR_EL3.NSPB == 0b11, this bit reads as one from:
  - Secure EL1.
  - If Secure EL2 is implemented, Secure EL2.
  - If EL2 is implemented and MDCR_EL2.E2PB == 0b00, Non-secure EL1.
- If EL3 is not implemented, EL2 is implemented, and MDCR_EL2.E2PB == 0b00, this bit reads as one from EL1.
- Otherwise, this bit reads as zero.

Align, bits [3:0]

Defines the minimum alignment constraint for PMBPTR_EL1. If this field is non-zero, then the PE must pad every record up to a multiple of this size.

<table>
<thead>
<tr>
<th>Align</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Byte</td>
</tr>
<tr>
<td>0b0001</td>
<td>Halfword.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Word.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Doubleword.</td>
</tr>
<tr>
<td>0b0100</td>
<td>16 Bytes.</td>
</tr>
<tr>
<td>0b0101</td>
<td>32 Bytes.</td>
</tr>
<tr>
<td>0b0110</td>
<td>64 Bytes.</td>
</tr>
<tr>
<td>0b0111</td>
<td>128 Bytes.</td>
</tr>
<tr>
<td>0b1000</td>
<td>256 Bytes.</td>
</tr>
<tr>
<td>0b1001</td>
<td>512 Bytes.</td>
</tr>
<tr>
<td>0b1010</td>
<td>1KB.</td>
</tr>
<tr>
<td>0b1011</td>
<td>2KB.</td>
</tr>
</tbody>
</table>

For more information, see 'Restrictions on the current write pointer'.

Accessing the PMBIDR_EL1

Accesses to this register use the following encodings:

MRS <Xt>, PMBIDR_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b1001</td>
<td>0b1010</td>
<td>0b111</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
 UNDEFINED;
elsif PSTATE.EL == EL1 then
 return PMBIDR_EL1;
elsif PSTATE.EL == EL2 then
 return PMBIDR_EL1;
elsif PSTATE.EL == EL3 then
 return PMBIDR_EL1;
The PMBLIMITR_EL1 characteristics are:

**Purpose**

Defines the upper limit for the profiling buffer, and enables the profiling buffer

**Configuration**

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBLIMITR_EL1 are UNDEFINED.

**Attributes**

PMBLIMITR_EL1 is a 64-bit register.

**Field descriptions**

The PMBLIMITR_EL1 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**LIMIT, bits [63:12]**

Limit address. PMBLIMITR_EL1.LIMIT:Zeros(12) is the address of the first byte in memory after the last byte in the profiling buffer. If the smallest implemented translation granule is not 4KB, then bits[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value, Log2(smallest implemented translation granule).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [11:6]**

Reserved, RES0.

**PMFZ, bit [5]**

When FEAT_SPEv1p2 is implemented:

Freeze PMU on SPE event. Stop PMU event counters when PMBSR_EL1.S == 0b1.

<table>
<thead>
<tr>
<th>PMFZ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not freeze PMU event counters on Statistical Profiling Buffer Management event.</td>
</tr>
<tr>
<td>0b1</td>
<td>Freeze PMU event counters on Statistical Profiling Buffer Management event.</td>
</tr>
</tbody>
</table>

The PMU event counters affected by this control is controlled by PMCR_EL0.FZS and, if EL2 is implemented, MDCR_EL2.HPMFZS. See the descriptions of these control bits for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**Bits [4:3]**

Reserved, RES0.

**FM, bits [2:1]**

Fill mode.

<table>
<thead>
<tr>
<th>FM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Fill mode. Stop collection and raise maintenance interrupt on buffer fill.</td>
</tr>
<tr>
<td>0b10</td>
<td>Discard mode. All output is discarded.</td>
</tr>
</tbody>
</table>

All other values are reserved.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**E, bit [0]**

Profiling Buffer enable

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All output is discarded.</td>
</tr>
<tr>
<td>0b1</td>
<td>Profiling buffer enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

PMBPTR_EL1, Profiling Buffer Write Pointer Register

The PMBPTR_EL1 characteristics are:

Purpose

Defines the current write pointer for the profiling buffer.

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBPTR_EL1 are UNDEFINED.

Attributes

PMBPTR_EL1 is a 64-bit register.

Field descriptions

The PMBPTR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

PTR, bits [63:0]

Current write address. Defines the virtual address of the next entry to be written to the buffer.

The architecture places restrictions on the values software can write to the pointer. For more information see 'Restrictions on the current write pointer'.

Note

As a result, an implementation might treat some of bits[M:0], where M is defined by PMBDIR_EL1.Align, as RES0.

On a management interrupt, PMBPTR_EL1 is frozen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMBPTR_EL1

Accesses to this register use the following encodings:

MRS <Xt>, PMBPTR_EL1

PMBSR_EL1, Profiling Buffer Status/syndrome Register

The PMBSR_EL1 characteristics are:

Purpose

Provides syndrome information to software when the buffer is disabled because the management interrupt has been raised.

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBSR_EL1 are UNDEFINED.

Attributes

PMBSR_EL1 is a 64-bit register.

Field descriptions

The PMBSR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| RES0 | EC | RES0 | DL | EA | S | COLL | | MSS |

Bits [63:32]

Reserved, RES0.

EC, bits [31:26]

Exception class

Top-level description of the cause of the buffer management event

<table>
<thead>
<tr>
<th>EC</th>
<th>Meaning</th>
<th>MSS</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000000</td>
<td>Other buffer management event. All buffer management events other than those described by other defined Exception class codes.</td>
<td>MSS encoding for other buffer management events</td>
</tr>
<tr>
<td>0b011111</td>
<td>Buffer management event for an IMPLEMENTATION DEFINED reason.</td>
<td>MSS encoding for a buffer management event for an IMPLEMENTATION DEFINED reason</td>
</tr>
<tr>
<td>0b100100</td>
<td>Stage 1 Data Abort on write to Profiling Buffer.</td>
<td>MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer</td>
</tr>
<tr>
<td>0b100101</td>
<td>Stage 2 Data Abort on write to Profiling Buffer.</td>
<td>MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer</td>
</tr>
</tbody>
</table>

All other values are reserved. Reserved values might be defined in a future version of the architecture.
Writing a reserved value to this field will make the value of this field **UNKNOWN**. Values that are not supported act as reserved values when writing to this register.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [25:20]**

Reserved, RES0.

**DL, bit [19]**

Partial record lost.

Following a buffer management event other than an asynchronous External abort, indicates whether the last record written to the Profiling Buffer is complete.

<table>
<thead>
<tr>
<th>DL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PMBPTR_EL1 points to the first byte after the last complete record written to the Profiling Buffer.</td>
</tr>
<tr>
<td>0b1</td>
<td>Part of a record was lost because of a buffer management event or synchronous External abort. PMBPTR_EL1 might not point to the first byte after the last complete record written to the buffer, and so restarting collection might result in a data record stream that software cannot parse. All records prior to the last record have been written to the buffer.</td>
</tr>
</tbody>
</table>

When the buffer management event was because of an asynchronous external abort, this bit is set to 1 and software must not assume that any valid data has been written to the Profiling Buffer.

This bit is RES0 if the PE never sets this bit as a result of a buffer management event caused by an asynchronous External abort.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EA, bit [18]**

External abort.

<table>
<thead>
<tr>
<th>EA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An external abort has not been asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>An external abort has been asserted and detected by the Statistical Profiling Extension.</td>
</tr>
</tbody>
</table>

This bit is RES0 if the PE never sets this bit as the result of an External abort.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**S, bit [17]**

Service

<table>
<thead>
<tr>
<th>S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PMBIRQ is not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMBIRQ is asserted. All profiling data has either been written to the buffer or discarded.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**COLL, bit [16]**

Collision detected.

<table>
<thead>
<tr>
<th>COLL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No collision events detected.</td>
</tr>
<tr>
<td>0b1</td>
<td>At least one collision event was recorded.</td>
</tr>
</tbody>
</table>
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**MSS, bits [15:0]**

Management Event Specific Syndrome.
Contains syndrome specific to the management event.
The syndrome contents for each management event are described in the following sections.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer**

PMCCFILTR_EL0, Performance Monitors Cycle Count Filter Register

The PMCCFILTR_EL0 characteristics are:

**Purpose**

Determines the modes in which the Cycle Counter, `PMCCNTR_EL0`, increments.

**Configuration**

AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register `PMCCFILTR[31:0]`.

AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to External register `PMCCFILTR_EL0[31:0]`.

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR_EL0 are UNDEFINED.

**Attributes**

PMCCFILTR_EL0 is a 64-bit register.

**Field descriptions**

The PMCCFILTR_EL0 bit assignments are:

</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**P, bit [31]**

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count cycles in EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in EL1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**U, bit [30]**

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.
Meaning

<table>
<thead>
<tr>
<th>U</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count cycles in EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NSK, bit [29]**

*When EL3 is implemented:*

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**NSU, bit [28]**

*When EL3 is implemented:*

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**NSH, bit [27]**

*When EL2 is implemented:*

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

<table>
<thead>
<tr>
<th>NSH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not count cycles in EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count cycles in EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**M, bit [26]**

*When EL3 is implemented:*

Secure EL3 filtering bit.
If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted. Otherwise, cycles in Secure EL3 are not counted. Most applications can ignore this field and set its value to 0.

**Note**

This field is not visible in the AArch32 PMCCFILTR System register.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bit [25]**

Reserved, RES0.

**SH, bit [24]**

*When FEAT_SEL2 is implemented and EL3 is implemented:*

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted. Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is disabled, this field is RES0.

**Note**

This field is not visible in the AArch32 PMCCFILTR System register.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**T, bit [23]**

*When FEAT_TME is implemented:*

Non-transactional state filtering bit.

<table>
<thead>
<tr>
<th>T</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This bit has no effect on filtering of cycles.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in Non-transactional state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.
Reserved, RES0.

## Accessing the PMCCFILTR_EL0

PMCCFILTR_EL0 can also be accessed by using PMXEVTYPER_EL0 with PMSELR_EL0.SEL set to 0b11111.

PMCCNTR_EL0, Performance Monitors Cycle Count Register

The PMCCNTR_EL0 characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See 'Time as measured by the Performance Monitors cycle counter' for more information.

PMCCFILTR_EL0 determines the modes and states in which the PMCCNTR_EL0 can increment.

Configuration

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register PMCCNTR[63:0].

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to External register PMCCNTR_EL0[63:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCNTR_EL0 are UNDEFINED.

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR_EL0 continues to increment when clocks are stopped by WFI and WFE instructions.

Attributes

PMCCNTR_EL0 is a 64-bit register.

Field descriptions

The PMCCNTR_EL0 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

CCNT, bits [63:0]

Cycle count. Depending on the values of PMCR_EL0.{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR_EL0.C sets this field to 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMCCNTR_EL0

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then
    if Halted() & HaveEL(EL3) & EDSCR.SDD == '1' & boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1'" & MDCR_EL3.TPM == '1' then

  PMCCNTR\_EL0 = X[t];
eendif

The PMCEID0_EL0 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0000 to 0x001F and 0x4000 to 0x401F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

**Note**

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEID<n>_EL0 registers see 'The PMU event number space and common events'.

**Configuration**

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCEID0[31:0].

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to AArch32 System register PMCEID2[31:0].

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to External register PMCEID0[31:0].

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to External register PMCEID2[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID0_EL0 are UNDEFINED.

**Attributes**

PMCEID0_EL0 is a 64-bit register.

**Field descriptions**

The PMCEID0_EL0 bit assignments are:

| ID31 | ID30 | ID29 | ID28 | ID27 | ID26 | ID25 | ID24 | ID23 | ID22 | ID21 | ID20 | ID19 | ID18 | ID17 | ID16 | ID15 | ID14 | ID13 | ID12 | ID11 | ID10 | ID9  | ID8  | ID7  | ID6  | ID5  | ID4  | ID3  | ID2  | ID1  | ID0  |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|

IDh<i>n>, bit [n+32], for n = 31 to 0

When FEAT_PMUv3p1 is implemented:

IDh[i]n] corresponds to common event (0x4000 + n).

For each bit:
A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Otherwise:

Reserved, RES0.

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to common event n.

For each bit:

<table>
<thead>
<tr>
<th>ID&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The common event is not implemented, or not counted.</td>
</tr>
<tr>
<td>0b1</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Accessing the PMCEID0_EL0

Accesses to this register use the following encodings:

MRS <Xt>, PMCEID0_EL0

PMCEID0_EL0, Performance Monitors Common Event Identification register 0

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
PMCEID1_EL0, Performance Monitors Common Event Identification register 1

The PMCEID1_EL0 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0020 to 0x003F and 0x4020 to 0x403F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

**Note**

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEID<n>_EL0 registers see 'The PMU event number space and common events'.

**Configuration**

AArch64 System register PMCEID1_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCEID1[31:0].

AArch64 System register PMCEID1_EL0 bits [63:32] are architecturally mapped to AArch32 System register PMCEID3[31:0].

AArch64 System register PMCEID1_EL0 bits [31:0] are architecturally mapped to External register PMCEID1[31:0].

AArch64 System register PMCEID1_EL0 bits [63:32] are architecturally mapped to External register PMCEID3[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID1_EL0 are UNDEFINED.

**Attributes**

PMCEID1_EL0 is a 64-bit register.

**Field descriptions**

The PMCEID1_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>
<th>55</th>
<th>54</th>
<th>53</th>
<th>52</th>
<th>51</th>
<th>50</th>
<th>49</th>
<th>48</th>
<th>47</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dhi31</td>
<td>Dhi30</td>
<td>Dhi29</td>
<td>Dhi28</td>
<td>Dhi27</td>
<td>Dhi26</td>
<td>Dhi25</td>
<td>Dhi24</td>
<td>Dhi23</td>
<td>Dhi22</td>
<td>Dhi21</td>
<td>Dhi20</td>
<td>Dhi19</td>
<td>Dhi18</td>
<td>Dhi17</td>
<td>Dhi16</td>
<td>Dhi15</td>
</tr>
</tbody>
</table>

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**IDhi<n>, bit [n+32], for n = 31 to 0**

When FEAT_PMUv3p1 is implemented:

IDhi[n] corresponds to common event (0x4020 + n).

For each bit:
A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Otherwise:

Reserved, RES0.

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to common event (0x0020 + n).

For each bit:

<table>
<thead>
<tr>
<th>ID&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The common event is not implemented, or not counted.</td>
</tr>
<tr>
<td>0b1</td>
<td>The common event is implemented.</td>
</tr>
</tbody>
</table>

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:32]

Reserved, RES0.

C, bit [31]

**PMCCNTR_EL0** disable bit. Disables the cycle counter register. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter is enabled. When written, disables the cycle counter.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter disable bit for PMEVCNTR<n>_EL0.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.
Meaning

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>0b0</th>
<th>0b1</th>
</tr>
</thead>
<tbody>

**PMCNTENSET_EL0, Performance Monitors Count Enable Set register**

The PMCNTENSET_EL0 characteristics are:

**Purpose**

Enables the Cycle Count Register, **PMCCNTR_EL0**, and any implemented event counters **PMEVCNTR<n>**. Reading this register shows which counters are enabled.

**Configuration**

AArch64 System register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register **PMCNTENSET[31:0]**.

AArch64 System register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to External register **PMCNTENSET_EL0[31:0]**.

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENSET_EL0 are UNDEFINED.

**Attributes**

PMCNTENSET_EL0 is a 64-bit register.

**Field descriptions**

The PMCNTENSET_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:32]**

Reserved, RES0.

**C, bit [31]**

**PMCCNTR_EL0** enable bit. Enables the cycle counter register. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter is enabled. When written, enables the cycle counter.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**P<n>, bit [n], for n = 30 to 0**

Event counter enable bit for **PMEVCNTR<n>_EL0**.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in **MDCR_EL2.HPMN**. Otherwise, N is the value in **PMCR_EL0.N**.
PMEVCNTR_0 (EL0 is disabled. When written, has no effect.

0b1
When read, means that PMEVCNTR_0 event counter is enabled. When written, enables PMEVCNTR_0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

**Purpose**

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

**Configuration**

AArch64 System register PMCR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCR[31:0].

AArch64 System register PMCR_EL0 bits [7:0] are architecturally mapped to External register PMCR_EL0[7:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCR_EL0 are **UNDEFINED**.

**Attributes**

PMCR_EL0 is a 64-bit register.

**Field descriptions**

The PMCR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>32</td>
<td>FZS, bit [32]</td>
</tr>
</tbody>
</table>

**FZS, bit [32]**

When FEAT_SPEv1p2 is implemented:

Freeze-on-SPE event. Stop counters when PMBLIMITR_EL1. {PMFZ,E} == {1,1} and PMBSR_EL1.S == 0b1.

<table>
<thead>
<tr>
<th>FZS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not freeze on Statistical Profiling Buffer Management event.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event counters do not count following a Statistical Profiling Buffer Management event.</td>
</tr>
</tbody>
</table>

If EL2 is implemented, then:

- This bit affects the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)].
- If MDCR_EL2.HPMN is less than PMCR_EL0.N:
  - This bit does not affect the operation of event counters in the range [MDCR_EL2.HPMN .. (PMCR_EL0.N-1)].
- This applies even when EL2 is disabled in the current Security state.

This bit does not affect the operation of PMCCNTR_EL0.

On a Warm reset, when AArch32 is supported at any Exception level, this field resets to 0.

On a Warm reset, when the implementation only supports execution in AArch64 state, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**IMP, bits [31:24]**

When FEAT_PMUv3p7 is not implemented:

Implementer code.

If this field is zero, then PMCR_EL0.IDCODE is RES0 and software must use \texttt{MIDR_EL1} to identify the PE.

Otherwise, this field and PMCR_EL0.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as \texttt{MIDR_EL1}.Implementer.

Use of this field is deprecated.

This field reads as an \texttt{IMPLEMENTATION DEFINED} value.

Access to this field is \texttt{RO}.

Otherwise:

Reserved, RAZ.

**IDCODE, bits [23:16]**

When PMCR_EL0.IMP != 0x00:

Identification code. Use of this field is deprecated. This field has an \texttt{IMPLEMENTATION DEFINED} value.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

Access to this field is \texttt{RO}.

Otherwise:

Reserved, RES0.

**N, bits [15:11]**

Indicates the number of event counters implemented. This value is in the range of \texttt{0b00000}-\texttt{0b11111}. If the value is \texttt{0b00000} then only \texttt{PMCCNTR_EL0} is implemented. If the value is \texttt{0b11111} \texttt{PMCCNTR_EL0} and 31 event counters are implemented.

When EL2 is implemented and enabled for the current Security state, reads of this field from EL1 and EL0 return the value of \texttt{MDCR_EL2}.HPMN.

Access to this field is \texttt{RO}.

**Bit [10]**

Reserved, RES0.

**FZO, bit [9]**

When FEAT_PMUv3p7 is implemented:

Freeze-on-overflow. Stop event counters on overflow.
Meaning

0b0  Do not freeze on overflow.
0b1  Event counters do not count when PMOVSCLR_EL0[(N-1):0] is nonzero, where N is the value of MDCR_EL2.HPMN if EL2 is implemented, and PMCR_EL0.N otherwise.

If EL2 is implemented, then:

- This bit affects the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)].
- If MDCR_EL2.HPMN is less than PMCR_EL0.N:
  - This bit does not affect the operation of event counters in the range [MDCR_EL2.HPMN .. (PMCR_EL0.N-1)].
  - The operation of this bit ignores the values of PMOVSCLR_EL0[(PMCR_EL0.N-1)-MDCR_EL2.HPMN].
- This applies even when EL2 is disabled in the current Security state.

This bit does not affect the operation of PMCCNTR_EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]

When FEAT_PMUv3p5 is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

Meaning

0b0  Event counter overflow on increment that causes unsigned overflow of PMEVCTR<n>_EL0[31:0].
0b1  Event counter overflow on increment that causes unsigned overflow of PMEVCTR<n>_EL0[63:0].

If EL2 is implemented and MDCR_EL2.HPMN or HDCR.HPMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [HDCR.HPMN..(PMCR_EL0.N-1)] or [MDCR_EL2.HPMN..(PMCR_EL0.N-1)].

Note

The effect of MDCR_EL2.HPMN or HDCR.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of MDCR_EL2.HPMN or HDCR.HPMN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LC, bit [6]

When AArch32 is supported at any Exception level:

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.
**PMCR_EL0, Performance Monitors Control Register**

<table>
<thead>
<tr>
<th>LC</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[31:0].</td>
</tr>
<tr>
<td>0b1</td>
<td>Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[63:0].</td>
</tr>
</tbody>
</table>

Arm deprecates use of PMCR_EL0, LC = 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**DP, bit [5]**

When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):

Disable cycle counter when event counting is prohibited.

<table>
<thead>
<tr>
<th>DP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Cycle counting by PMCCNTR_EL0 is not affected by this bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>When event counting for counters in the range [0..(MDCR_EL2.HPMN-1)] is prohibited, cycle counting by PMCCNTR_EL0 is disabled.</td>
</tr>
</tbody>
</table>

For more information see 'Prohibiting event counting'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**X, bit [4]**

When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

<table>
<thead>
<tr>
<th>X</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not export events.</td>
</tr>
<tr>
<td>0b1</td>
<td>Export events where not prohibited.</td>
</tr>
</tbody>
</table>

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RAZ/WI.

**D, bit [3]**

When AArch32 is supported at any Exception level:

Clock divider.
When enabled, `PMCCNTR_EL0` counts every clock cycle.

When enabled, `PMCCNTR_EL0` counts once every 64 clock cycles.

If `PMCR_EL0.LC == 1`, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of `PMCR_EL0.D = 1`.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, `RES0`.

**C, bit [2]**

Cycle counter reset. The effects of writing to this bit are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset <code>PMCCNTR_EL0</code> to zero.</td>
</tr>
</tbody>
</table>

**Note**

Resetting `PMCCNTR_EL0` does not change the cycle counter overflow bit.

The value of `PMCR_EL0.LC` is ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

**P, bit [1]**

Event counter reset. The effects of writing to this bit are:

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action.</td>
</tr>
<tr>
<td>0b1</td>
<td>Reset all event counters accessible in the current Exception level, not including <code>PMCCNTR_EL0</code> to zero.</td>
</tr>
</tbody>
</table>

In EL0 and EL1:

- If EL2 is implemented and enabled in the current Security state, and `MDCR_EL2.HPMN` is less than `PMCR_EL0.N`, a write of 1 to this bit does not reset event counters in the range `[MDCR_EL2.HPMN..(PMCR_EL0.N-1)]`.
- If EL2 is not implemented, EL2 is disabled in the current Security state, or `MDCR_EL2.HPMN` equals `PMCR_EL0.N`, a write of 1 to this bit resets all the event counters.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

**Note**

Resetting the event counters does not change the event counter overflow bits.

If FEAT PMUv3p5 is implemented, the values of `MDCR_EL2.HLP` and `PMCR_EL0(LP` are ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

**E, bit [0]**

Enable.
### PMCR_EL0, Performance Monitors Control Register

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All event counters in the range [0..(PMN-1)] and <strong>PMCCNTR_EL0</strong> are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>All event counters in the range [0..(PMN-1)] and <strong>PMCCNTR_EL0</strong> are enabled by <strong>PMCNTENSET_EL0</strong>.</td>
</tr>
</tbody>
</table>

If EL2 is implemented, then:

- If EL2 is using AArch32, PMN is **HDCR.HPMN**.
- If EL2 is using AArch64, PMN is **MDCR_EL2.HPMN**.
- If PMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [PMN..(PMCR_EL0.N-1)].

If EL2 is not implemented, PMN is PMCR_EL0.N.

**Note**

The effect of **MDCR_EL2.HPMN** or **HDCR.HPMN** on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of **MDCR_EL2.HPMN** or **HDCR.HPMN**.

On a Warm reset, this field resets to 0.

### Accessing the PMCR_EL0

Accesses to this register use the following encodings:

**MRS <Xt>, PMCR_EL0**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

**Purpose**

Holds event counter n, which counts events, where n is 0 to 30.

**Configuration**

AArch64 System register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVCNTR<n>[31:0].

AArch64 System register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to External register PMEVCNTR<n>_EL0[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVCNTR<n>_EL0 are UNDEFINED.

**Attributes**

PMEVCNTR<n>_EL0 is a 64-bit register.

**Field descriptions**

The PMEVCNTR<n>_EL0 bit assignments are:

**When FEAT_PMUv3p5 is implemented:**

<table>
<thead>
<tr>
<th>Bit (63:0)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

<table>
<thead>
<tr>
<th>Bit (63:32)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing the PMEVCNTR\(<n>\) _EL0_

PMEVCNTR\(<n>\) _EL0_ can also be accessed by using PMXEVCTR_EL0 with PMSELR_EL0.SEL set to the value of \(<n>\).

If FEAT_FGT is implemented and \(<n>\) is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of PMEVCNTR\(<n>\) _EL0_ is as follows:

- If \(<n>\) is an unimplemented event counter, the access is **UNDEFINED**.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and \(<n>\) is greater than or equal to the number of accessible counters, then reads and writes of PMEVCNTR\(<n>\) _EL0_ are **CONSTRAINED UNPREDICTABLE**, and the following behaviors are permitted:

- Accesses to the register are **UNDEFINED**.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a **NOP**.
- If EL2 is implemented and enabled in the current Security state, and \(<n>\) is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

---

**Note**

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.{ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. See MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings:

**MRS <Xt>, PMEVCNTR\(<n>\) _EL0_**

PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

**Purpose**

Configures event counter n, where n is 0 to 30.

**Configuration**

AArch64 System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVTYPER<n>[31:0].

AArch64 System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to External register PMEVTYPER<n>_EL0[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPER<n>_EL0 are UNDEFINED.

**Attributes**

PMEVTYPER<n>_EL0 is a 64-bit register.

**Field descriptions**

The PMEVTYPER<n>_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
<td>0</td>
<td>Reserved</td>
</tr>
<tr>
<td>31</td>
<td>P</td>
<td>0/1</td>
<td>Privileged filtering bit</td>
</tr>
<tr>
<td>30</td>
<td>U</td>
<td>0/1</td>
<td>User filtering bit</td>
</tr>
<tr>
<td>29</td>
<td>NSK</td>
<td>0/1</td>
<td>Non-secure Filtering bit</td>
</tr>
<tr>
<td>28</td>
<td>NSU</td>
<td>0/1</td>
<td>Secure Filtering bit</td>
</tr>
<tr>
<td>27</td>
<td>M</td>
<td>0/1</td>
<td>Memory Filtering bit</td>
</tr>
<tr>
<td>26</td>
<td>MTH</td>
<td>0/1</td>
<td>Memory Type Filtering bit</td>
</tr>
<tr>
<td>25</td>
<td>T</td>
<td>0/1</td>
<td>Task Filtering bit</td>
</tr>
<tr>
<td>32</td>
<td>evtCount[9:0]</td>
<td>0/255</td>
<td>Event Count</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**P, bit [31]**

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit.

<table>
<thead>
<tr>
<th>P</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Count events in EL1.</td>
</tr>
<tr>
<td>1</td>
<td>Do not count events in EL1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**U, bit [30]**

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit.
### NSK, bit [29]

**When EL3 is implemented:**

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

### NSU, bit [28]

**When EL3 is implemented:**

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

### NSH, bit [27]

**When EL2 is implemented:**

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<n>_EL0.SH bit.

<table>
<thead>
<tr>
<th>NSH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not count events in EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count events in EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

### M, bit [26]

**When EL3 is implemented:**

Secure EL3 filtering bit.
If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Secure EL3 are counted. Otherwise, events in Secure EL3 are not counted. Most applications can ignore this field and set its value to 0b0.

**Note**

This field is not visible in the AArch32 PMEVTYPER<n> System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**MT, bit [25]**

When FEAT_MTPMU is implemented or an IMPLEMENTATION DEFINED multi-threaded PMU extension is implemented:

Multithreading.

<table>
<thead>
<tr>
<th>MT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count events only on controlling PE.</td>
</tr>
<tr>
<td>0b1</td>
<td>Count events from any PE with the same affinity at level 1 and above as this PE.</td>
</tr>
</tbody>
</table>

From Armv8.6, the IMPLEMENTATION DEFINED multi-threaded PMU extension is not permitted, meaning if FEAT_MTPMU is not implemented, this bit is RES0. See ID_AA64DFR0_EL1.MTPMU.

This bit is ignored by the PE and treated as zero when FEAT_MTPMU is implemented and Disabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SH, bit [24]**

When FEAT_SEL2 is implemented and EL3 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Secure EL2 are counted. Otherwise, events in Secure EL2 are not counted.

**Note**

This field is not visible in the AArch32 PMEVTYPER<n> System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**T, bit [23]**
When FEAT_TME is implemented:

Transactional state filtering bit. Controls counting in Transactional state. The possible values of this bit are:

<table>
<thead>
<tr>
<th>T</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This bit has no effect on the filtering of events.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count events in Transactional state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [22:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

When FEAT_PMUv3p1 is implemented:

Extension to evtCount[9:0]. See evtCount[9:0] for more details.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter PMEVCNTR<n>_EL0.

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- If 16-bit evtCount is implemented, for the range 0x4000 to 0x403F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on(evtCount is the value written.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMEVTYPER<n>_EL0

PMEVTYPER<n>_EL0 can also be accessed by using PMXEVTPERC_EL0 with PMSEL0_EL0 SEL set to n.
If FEAT_FGT is implemented and \(<n>\) is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of \(\text{PMEVTYPER}<n>._\text{EL}0\) is as follows:

- If \(<n>\) is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and \(<n>\) is greater than or equal to the number of accessible counters, then reads and writes of \(\text{PMEVTYPER}<n>._\text{EL}0\) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- If EL2 is implemented and enabled in the current Security state, and \(<n>\) is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

**Note**

In EL0, an access is permitted if it is enabled by \(\text{PMUSERENR}_{\text{EL}0}.\text{EN}\).

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, \(\text{MDCR}_{\text{EL}2}.\text{HPMN}\) identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. See \(\text{MDCR}_{\text{EL}2}.\text{HPMN}\) for more details.

Accesses to this register use the following encodings:

\[
\text{MRS} \ <\text{Xt}>, \ \text{PMEVTYPER}<n>._\text{EL}0
\]

The PMINTENCLR_EL1 characteristics are:

**Purpose**

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Configuration**

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENCLR[31:0].

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to External register PMINTENCLR_EL1[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENCLR_EL1 are UNDEFINED.

**Attributes**

PMINTENCLR_EL1 is a 64-bit register.

**Field descriptions**

The PMINTENCLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>62</td>
<td>C, bit [31]</td>
<td>0b0</td>
<td>When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0b1</td>
<td>When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**C, bit [31]**

PMCCNTR_EL0 overflow interrupt request disable bit. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.</td>
</tr>
</tbody>
</table>

**P<n>, bit [n], for n = 30 to 0**

Event counter overflow interrupt request disable bit for PMEVCNTR<n>_EL0.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.
<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>

The PMINTENSET_EL1 characteristics are:

**Purpose**

Enables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Configuration**

AArch64 System register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENSET[31:0].

AArch64 System register PMINTENSET_EL1 bits [31:0] are architecturally mapped to External register PMINTENSET_EL1[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENSET_EL1 are UNDEFINED.

**Attributes**

PMINTENSET_EL1 is a 64-bit register.

**Field descriptions**

The PMINTENSET_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**Bits [63:32]**

Reserved, RES0.

**C, bit [31]**

PMCCNTR_EL0 overflow interrupt request enable bit. Possible values are:

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 30 to 0**

Event counter overflow interrupt request enable bit for PMEVCNTR<n>_EL0.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.
PMINTENSEL_EL1, Performance Monitors Interrupt Enable Set register

<table>

### PMMIR_EL1, Performance Monitors Machine Identification Register

The PMMIR_EL1 characteristics are:

**Purpose**

Describes Performance Monitors parameters specific to the implementation to software.

**Configuration**

This register is present only when FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR_EL1 are **UNDEFINED**.

**Attributes**

PMMIR_EL1 is a 64-bit register.

### Field descriptions

The PMMIR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Range</th>
<th>Bit Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:20]</td>
<td>RES0</td>
</tr>
<tr>
<td>[19:16]</td>
<td>BUS_WIDTH</td>
</tr>
<tr>
<td>[15:6]</td>
<td>BUS_SLOTS</td>
</tr>
<tr>
<td>[5:0]</td>
<td>SLOTS</td>
</tr>
</tbody>
</table>

**Bits [63:20]**

Reserved, RES0.

**BUS_WIDTH, bits [19:16]**

*From Armv8.7:*

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as \( \log_2(\text{number of bytes}) \), plus one. Defined values are:

<table>
<thead>
<tr>
<th>BUS_WIDTH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>The information is not available.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Four bytes.</td>
</tr>
<tr>
<td>0b0100</td>
<td>8 bytes.</td>
</tr>
<tr>
<td>0b0101</td>
<td>16 bytes.</td>
</tr>
<tr>
<td>0b0110</td>
<td>32 bytes.</td>
</tr>
<tr>
<td>0b0111</td>
<td>64 bytes.</td>
</tr>
<tr>
<td>0b1000</td>
<td>128 bytes.</td>
</tr>
<tr>
<td>0b1001</td>
<td>256 bytes.</td>
</tr>
<tr>
<td>0b1010</td>
<td>512 bytes.</td>
</tr>
<tr>
<td>0b1011</td>
<td>1024 bytes.</td>
</tr>
<tr>
<td>0b1100</td>
<td>2048 bytes.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.
Otherwise:

Reserved, RAZ.

**BUS_SLOTS, bits [15:8]**

From Armv8.7:

Bus count. The largest value by which the BUS_ACCESS event might increment by in a single BUS_CYCLES cycle.

If the information is not available, this field will read as zero.

Otherwise:

Reserved, RAZ.

**SLOTS, bits [7:0]**

Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL SLOT event is not implemented, this field might read as zero.

**Accessing the PMMIR_EL1**

Accesses to this register use the following encodings:

```
MRS <Xt>, PMMIR_EL1
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>

     end
elsif PSTATE.EL == EL3 then
     return PMMIR_EL1;
```
PMOVSLR_EL0, Performance Monitors Overflow Flag Status Clear Register

The PMOVSLR_EL0 characteristics are:

**Purpose**

Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<n>. Writing to this register clears these bits.

**Configuration**

AArch64 System register PMOVSLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSR[31:0].

AArch64 System register PMOVSLR_EL0 bits [31:0] are architecturally mapped to External register PMOVSLR_EL0[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSLR_EL0 are UNDEFINED.

**Attributes**

PMOVSLR_EL0 is a 64-bit register.

**Field descriptions**

The PMOVSLR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>Cycle counter overflow clear bit.</td>
</tr>
<tr>
<td>P29, bit[29]</td>
<td>When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>P28, bit[28]</td>
<td>When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.</td>
</tr>
</tbody>
</table>

PMCR_EL0,LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit[n], for n = 30 to 0

Event counter overflow clear bit for PMEVCNTR<n>_EL0.
If \( N \) is less than 31, then bits \([30:N]\) are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, \( N \) is the value in \texttt{MDCR_EL2.HPMN}. Otherwise, \( N \) is the value in \texttt{PMCR_EL0.N}.

<table>
<thead>
<tr>
<th>( P&lt;n&gt; )</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that \texttt{PMEVCNTR&lt;n&gt; _EL0} has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that \texttt{PMEVCNTR&lt;n&gt; _EL0} has overflowed since this bit was last cleared. When written, clears the \texttt{PMEVCNTR&lt;n&gt; _EL0} overflow bit to 0.</td>
</tr>
</tbody>
</table>

If \texttt{FEAT_PMUv3p5} is implemented, \texttt{MDCR_EL2.HLP} and \texttt{PMCR_EL0.LP} control whether an overflow is detected from unsigned overflow of \texttt{PMEVCNTR<n> _EL0[31:0]} or unsigned overflow of \texttt{PMEVCNTR<n> _EL0[63:0]}.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET_EL0 characteristics are:

**Purpose**

Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<n>.

**Configuration**

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSSET[31:0].

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to External register PMOVSSET_EL0[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSSET_EL0 are UNDEFINED.

**Attributes**

PMOVSSET_EL0 is a 64-bit register.

**Field descriptions**

The PMOVSSET_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:32</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>31</td>
<td>Cycle counter overflow set bit.</td>
</tr>
</tbody>
</table>

**C, bit [31]**

Cycle counter overflow set bit.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.</td>
</tr>
</tbody>
</table>

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 30 to 0**

Event counter overflow set bit for PMEVCNTR<n>_EL0.
If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When read, means that PMEVCNTR&lt;n&gt;_EL0 has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>0b1</td>
<td>When read, means that PMEVCNTR&lt;n&gt;_EL0 has overflowed since this bit was last cleared. When written, sets the PMEVCNTR&lt;n&gt;_EL0 overflow bit to 1.</td>
</tr>
</tbody>
</table>

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMEVCNTR<n>_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMOVSSET_EL0**

Accesses to this register use the following encodings:

MRS <Xt>, PMOVSSET_EL0

<table>
<thead>
<tr>

The PMSCR_EL1 characteristics are:

**Purpose**

Provides EL1 controls for Statistical Profiling.

**Configuration**

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSCR_EL1 are UNDEFINED.

**Attributes**

PMSCR_EL1 is a 64-bit register.

**Field descriptions**

The PMSCR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:8]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
</table>

When EL2 is implemented:

Physical Timestamp. If timestamp sampling is enabled and the Profiling Buffer is owned by EL1, requests which timestamp counter value is collected.

If FEAT_ECV is implemented, this is a two-bit field as shown. Otherwise, bit[7] is RES0.

<table>
<thead>
<tr>
<th>PCT</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Virtual timestamp. The collected timestamp is the physical counter minus the value of CNTPOFF_EL2.</td>
<td></td>
</tr>
<tr>
<td>0b01</td>
<td>Physical timestamp. The collected timestamp is the physical counter.</td>
<td></td>
</tr>
<tr>
<td>0b11</td>
<td>Guest physical timestamp. The collected timestamp is the physical counter minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2:</td>
<td></td>
</tr>
</tbody>
</table>

- SCR_EL3.ECSVn == 0b0.
- CNTHCTL_EL2.ECV == 0b0.

When FEAT_ECV is implemented

If EL2 is enabled in the current Security state, then the value of PMSCR_EL2.PCT might override or modify the meaning of this field.

This field is ignored by the PE when the Profiling Buffer owning Exception level is EL2.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Otherwise:

Physical Timestamp. Reserved. This field reads as **0b01** and ignores writes. Software should treat this field as UNK/SBZP.

When EL2 is not implemented, the Effective values of **CNTVOFF_EL2** and **CNTPOFF_EL2** are zero, meaning the virtual counter and physical counter have the same value.

#### TS, bit [5]

Timestamp enable.

<table>
<thead>
<tr>
<th>TS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timestamp sampling disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timestamp sampling enabled.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE if EL2 is implemented and the Profiling Buffer is owned by EL2. For more information, see 'Controlling the data that is collected'.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

#### PA, bit [4]

Physical Address sample enable.

<table>
<thead>
<tr>
<th>PA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Physical addresses are not collected.</td>
</tr>
<tr>
<td>0b1</td>
<td>Physical addresses are collected.</td>
</tr>
</tbody>
</table>

If EL2 is implemented:

- If the Profiling Buffer is owned by EL1, this bit is combined with **PMSCR_EL2**.PA to determine which address is collected. For more information, see 'Controlling the data that is collected'.
- If the Profiling Buffer is owned by EL2, this bit is ignored by the PE.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

#### CX, bit [3]

**CONTEXTIDR_EL1** sample enable.

<table>
<thead>
<tr>
<th>CX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>CONTEXTIDR_EL1</strong> is not collected.</td>
</tr>
<tr>
<td>0b1</td>
<td><strong>CONTEXTIDR_EL1</strong> is collected.</td>
</tr>
</tbody>
</table>

If EL2 is implemented and enabled in the current Security state when an operation is sampled:

- If the PE is at EL2, this bit is ignored by the PE.
- If **HCR_EL2.TGE == 1**, this bit is ignored by the PE.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

#### Bit [2]

Reserved, **RES0**.

#### E1SPE, bit [1]

EL1 Statistical Profiling Enable.
### E1SPE, bit [0]

EL1 Statistical Profiling Enable. Controls sampling at EL1 when HCR_EL2.TGE == 0 or if EL2 is disabled or not implemented.

<table>
<thead>
<tr>
<th>E1SPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sampling disabled at EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sampling enabled at EL1.</td>
</tr>
</tbody>
</table>

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when HCR_EL2.TGE == 1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### E0SPE, bit [0]

EL0 Statistical Profiling Enable. Controls sampling at EL0 when HCR_EL2.TGE == 0 or if EL2 is disabled or not implemented.

<table>
<thead>
<tr>
<th>E0SPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sampling disabled at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sampling enabled at EL0.</td>
</tr>
</tbody>
</table>

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when HCR_EL2.TGE == 1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Attributes**

PMSCR_EL2 is a 64-bit register.

**Field descriptions**

The PMSCR_EL2 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | PCT | TS | PA | CX | RES0 | E2SPE | E0HSPE |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:8]**

Reserved, RES0.

**PCT, bits [7:6]**

Physical Timestamp. If timestamp sampling is enabled, determines which counter is collected. The behavior depends on the Profiling Buffer owning Exception level.

If FEAT_ECV is implemented, this is a two-bit field as shown. Otherwise, bit[7] is RES0.
### PMSCR_EL2, Statistical Profiling Control Register (EL2)

<table>
<thead>
<tr>
<th>PCT</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
</table>
| 0b00  | Virtual timestamp. The collected timestamp is the physical counter minus a virtual offset. If any of the following are true, the virtual offset is zero, otherwise the virtual offset is the value of `CNTVOFF_EL2`:
|       | • The sampled operation executed at EL2 and `HCR_EL2.E2H == 0b1`.                               |                                                                              |
|       | • The sampled operation executed at EL0 and `HCR_EL2.{E2H,TGE} == {1,1}`.                       |                                                                              |
| 0b01  | If the Profiling Buffer owning Exception level is EL1, then the timestamp value is selected by `PMSCR_EL1.PCT`. Otherwise, physical timestamp. The collected timestamp is the physical counter. |                                                                              |
| 0b11  | If the Profiling Buffer owning Exception level is EL1 and `PMSCR_EL1.PCT == 0b00`, then guest virtual timestamp. The collected timestamp is the physical counter minus the value of `CNTVOFF_EL2`. Otherwise, guest physical timestamp. The collected timestamp is the physical counter minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of `CNTPOFF_EL2`:
|       | • `SCR_EL3.ECVEn == 0b0`.                                                                     |                                                                              |
|       | • `CNTHCTL_EL2.ECV == 0b0`.                                                                    |                                                                              |

#### Note
If the Profiling Buffer owning Exception level is EL1, the virtual offset is always `CNTVOFF_EL2`.

All other values are reserved.

If EL2 is not implemented or EL2 is disabled in the current Security state, then the Effective value of this field is `0b01`, other than for a direct read of the register.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

### TS, bit [5]

Timestamp Enable.

<table>
<thead>
<tr>
<th>TS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Timestamp sampling disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Timestamp sampling enabled.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when any of the following are true:

- The Profiling Buffer owning Exception level is EL1.
- In Secure state, and either FEAT_SEL2 is not implemented or Secure EL2 is disabled.

On a Warm reset, this field resets to an architecturally `UNKNOWN` value.

### PA, bit [4]

Physical Address Sample Enable.

<table>
<thead>
<tr>
<th>PA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Physical addresses are not collected.</td>
</tr>
<tr>
<td>0b1</td>
<td>Physical addresses are collected.</td>
</tr>
</tbody>
</table>

If the Profiling Buffer owning Exception level is EL1, and EL2 is enabled in the current Security state, this bit is combined with `PMSCR_EL1.PA` to determine which address is collected.
If EL2 is not implemented or EL2 is disabled in the current Security state, the PE ignores the value of this bit and behaves as if this bit is set to 1, other than for a direct read of the register.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**CX, bit [3]**

<table>
<thead>
<tr>
<th>CX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><code>CONTEXTIDR_EL2</code> is not collected.</td>
</tr>
<tr>
<td>0b1</td>
<td><code>CONTEXTIDR_EL2</code> is collected.</td>
</tr>
</tbody>
</table>

If EL2 is not implemented or EL2 is disabled in the current Security state, the PE ignores the value of this bit.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [2]**

Reserved, **RES0**.

**E2SPE, bit [1]**

EL2 Statistical Profiling Enable.

<table>
<thead>
<tr>
<th>E2SPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sampling disabled at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sampling enabled at EL2.</td>
</tr>
</tbody>
</table>

This bit is **RES0** if `MDCR_EL2.E2PB != 0b00`.

If EL2 is disabled in the current Security state, this bit is ignored by the PE.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**E0HSPE, bit [0]**

EL0 Statistical Profiling Enable.

<table>
<thead>
<tr>
<th>E0HSPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Sampling disabled at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Sampling enabled at EL0.</td>
</tr>
</tbody>
</table>

If `MDCR_EL2.E2PB != 0b00`, this bit is **RES0**.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when `HCR_EL2.TGE == 0`.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

PMSELR_EL0, Performance Monitors Event Counter Selection Register

The PMSELR_EL0 characteristics are:

**Purpose**

Selects the current event counter PMEVCNTR<\(_n\)>_EL0 or the cycle counter, CCNT.

PMSELR_EL0 is used in conjunction with PMXEVTYPER_EL0 to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with PMXEVCNTR_EL0, to determine the value of a selected event counter.

**Configuration**

AArch64 System register PMSELR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMSELR[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSELR_EL0 are UNDEFINED.

**Attributes**

PMSELR_EL0 is a 64-bit register.

**Field descriptions**

The PMSELR_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | SEL |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:5]**

Reserved, RES0.

**SEL, bits [4:0]**

Selects event counter, PMEVCNTR<\(_n\)>_EL0, where \(n\) is the value held in this field. This value identifies which event counter is accessed when a subsequent access to PMXEVTYPER_EL0 or PMXEVCNTR_EL0 occurs.

This field can take any value from 0 (0b00000) to (PMCR.N)-1, or 31 (0b11111).

When PMSELR_EL0.SEL is 0b11111, it selects the cycle counter and:

- A read of the PMXEVTYPER_EL0 returns the value of PMCCFILTR_EL0.
- A write of the PMXEVTYPER_EL0 writes to PMCCFILTR_EL0.
- A read or write of PMXEVCNTR_EL0 has CONSTRAINED UNPREDICTABLE effects. See PMXEVCNTR_EL0 for more details.

For details of the results of accesses to the event counters, see PMXEVTYPER_EL0 and PMXEVCNTR_EL0.

For information about the number of counters accessible at each Exception level, see MDCR_EL2.HPMN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMSEVFR_EL1, Sampling Event Filter Register

The PMSEVFR_EL1 characteristics are:

Purpose

Controls sample filtering by events. The overall filter is the logical AND of these filters. For example, if E[3] and E[5] are both set to 1, only samples that have both event 3 (Level 1 unified or data cache refill) and event 5 set (TLB walk) are recorded.

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSEVFR_EL1 are UNDEFINED.

Attributes

PMSEVFR_EL1 is a 64-bit register.

Field descriptions

The PMSEVFR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

E[<x>], bit [x], for x = 63 to 48, 31 to 24, 15 to 12

E[<x>] is the event filter for event <x>. If event <x> is not implemented, or filtering on event <x> is not supported, the corresponding bit is RAZ/WI.

<table>
<thead>
<tr>
<th>E[&lt;x&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event &lt;x&gt; is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have event &lt;x&gt; == 0.</td>
</tr>
</tbody>
</table>

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:32]

Reserved, RAZ/WI.

Bits [23:19]

Reserved, RAZ/WI.
E[18], bit [18]

When FEAT_SPEv1p1 is implemented and FEAT_SVE is implemented:

Empty predicate.

<table>
<thead>
<tr>
<th>E[18]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Empty predicate event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Empty predicate event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[17], bit [17]

When FEAT_SPEv1p1 is implemented and FEAT_SVE is implemented:

Partial predicate.

<table>
<thead>
<tr>
<th>E[17]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Partial predicate event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Partial predicate event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[16], bit [16]

When FEAT_TME is implemented:

Transactional

<table>
<thead>
<tr>
<th>E[16]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Transactional event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Transactional event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

When FEAT_SPEv1p1 is implemented:

Alignment.
### E[11], bit [11]

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when \texttt{PMSFCR_EL1.FE} == 0.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**Otherwise:**

Reserved, RAZ/WI.

### Bits [10:8]

Reserved, RAZ/WI.

### E[7], bit [7]

Mispredicted.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when \texttt{PMSFCR_EL1.FE} == 0.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

### E[6], bit [6]

**When FEAT SPEv1p2 is implemented:**

Not taken.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when \texttt{PMSFCR_EL1.FE} == \texttt{0b0}.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

**Otherwise:**

Reserved, RAZ/WI.

### E[5], bit [5]

TLB walk.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when \texttt{PMSFCR_EL1.FE} == 0.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

### Bit [4]

Reserved, RAZ/WI.
**E[3], bit [3]**

Level 1 data or unified cache refill.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Level 1 data or unified cache refill event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Level 1 data or unified cache</td>
</tr>
<tr>
<td></td>
<td>refill event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [2]**

Reserved, RAZ/WI.

**E[1], bit [1]**

When the PE supports sampling of speculative instructions:

Architecturally retired.

When the PE supports sampling of speculative instructions:

<table>
<thead>
<tr>
<th>E[1]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Architecturally retired event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the</td>
</tr>
<tr>
<td></td>
<td>Architecturally retired event == 0.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

If the PE does not support the sampling of speculative instructions, or always discards the sample record for speculative instructions, this bit reads as an UNKNOWN value and the PE ignores its value.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, UNKNOWN.

**Bit [0]**

Reserved, RAZ/WI.

PMSFCR_EL1, Sampling Filter Control Register

The PMSFCR_EL1 characteristics are:

**Purpose**

Controls sample filtering. The filter is the logical AND of the FL, FT and FE bits. For example, if FE == 1 and FT == 1 only samples including the selected operation types and the selected events will be recorded.

**Configuration**

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSFCR_EL1 are UNDEFINED.

**Attributes**

PMSFCR_EL1 is a 64-bit register.

**Field descriptions**

The PMSFCR_EL1 bit assignments are:

<table>
<thead>

</tr>
<tr>
<td>32</td>
<td></td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**Bits [63:19]**

Reserved, RES0.

**ST, bit [18]**

Store filter enable

<table>
<thead>
<tr>
<th>ST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not record store operations</td>
</tr>
<tr>
<td>0b1</td>
<td>Record all store operations, including vector stores and all atomic operations</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**LD, bit [17]**

Load filter enable

<table>
<thead>
<tr>
<th>LD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not record load operations</td>
</tr>
<tr>
<td>0b1</td>
<td>Record all load operations, including vector loads and atomic operations that return data</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
B, bit [16]

Branch filter enable

<table>
<thead>
<tr>
<th>B</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Do not record branch and exception return operations</td>
</tr>
<tr>
<td>0b1</td>
<td>Record all branch and exception return operations</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:4]

Reserved, RES0.

FnE, bit [3]

When FEAT_SPEv1p2 is implemented:

Filter by event, inverted.

<table>
<thead>
<tr>
<th>FnE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Inverted event filtering disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Inverted event filtering enabled. Samples including the events selected by PMSNEVFR_EL1 will not be recorded.</td>
</tr>
</tbody>
</table>

If any of the following are true, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FnE == 0b0:

- PMSFCR_EL1.FnE == 0b1 and PMSNEVFR_EL1 is zero.
- PMSFCR_EL1.FnE == 0b1, PMSFCR_EL1.FE == 0b1, and there exists a value x such that PMSEVFR_EL1.E[x] == 0b1 and PMSNEVFR_EL1.E[x] == 0b1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FL, bit [2]

Filter by latency

<table>
<thead>
<tr>
<th>FL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Latency filtering disabled</td>
</tr>
<tr>
<td>0b1</td>
<td>Latency filtering enabled. Samples with a total latency less than PMSLATFR_EL1.MINLAT will not be recorded</td>
</tr>
</tbody>
</table>

If this field is set to 1 and PMSLATFR_EL1.MINLAT is set to zero, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FL is set to 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

FT, bit [1]

Filter by operation type. The filter is the logical OR of the ST, LD and B bits. For example, if LD and ST are both set, both load and store operations are recorded

<table>
<thead>
<tr>
<th>FT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Type filtering disabled</td>
</tr>
<tr>
<td>0b1</td>
<td>Type filtering enabled. Samples not one of the selected operation types will not be recorded</td>
</tr>
</tbody>
</table>
If this field is set to 1 and the PMSFCR_EL1.{ST, LD, B} bits are all set to zero, it is **CONSTRAINED UNPREDICTABLE** whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FT is set to 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**FE, bit [0]**

Filter by event.

<table>
<thead>
<tr>
<th>FE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event filtering disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Event filtering enabled. Samples not including the events selected by PMSEVF EL1 will not be recorded.</td>
</tr>
</tbody>
</table>

If any of the following are true, it is **CONSTRAINED UNPREDICTABLE** whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FE == 0b0:

- PMSFCR_EL1.FE == 0b1 and PMSEVF EL1 is zero.
- FEAT_SPEv1p2 is implemented, PMSFCR_EL1.FnE == 0b1, PMSFCR_EL1.FE == 0b1, and there exists a value x such that PMSEVF EL1.E[x] == 0b1 and PMSEVF EL1.E[x] == 0b1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the PMSFCR_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, PMSFCR_EL1

<table>
<thead>

PMSICR_EL1, Sampling Interval Counter Register

The PMSICR_EL1 characteristics are:

**Purpose**

Software must write zero to PMSICR_EL1 before enabling sample profiling for a sampling session. Software must then treat PMSICR_EL1 as an opaque, 64-bit, read/write register used for context switches only.

**Configuration**

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSICR_EL1 are UNDEFINED.

The value of PMSICR_EL1 does not change whilst profiling is disabled.

**Attributes**

PMSICR_EL1 is a 64-bit register.

**Field descriptions**

The PMSICR_EL1 bit assignments are:

<table>

ECOUNT, bits [63:56]

When PMSIDR_EL1.ERnd == 1:

Secondary sample interval counter.

This field provides the secondary counter used after the primary counter reaches zero. Whilst the secondary counter is nonzero and profiling is enabled, the secondary counter decrements by 1 for each member of the sample population. The primary counter also continues to decrement since it is also nonzero. When the secondary counter reaches zero, a member of the sampling population is selected for sampling.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [55:32]**

Reserved, RES0.

**COUNT, bits [31:0]**

Primary sample interval counter

Provides the primary counter used for sampling.
The primary counter is reloaded when the value of this register is zero and the PE moves from a state or Exception level where profiling is disabled to a state or Exception level where profiling is enabled.

Whilst the primary counter is nonzero and sampling is enabled, the primary counter decrements by 1 for each member of the sample population.

When the counter reaches zero, the behavior depends on the values of PMSIDR_EL1.ERnd and PMSIRR_EL1.RND:

- If PMSIRR_EL1.RND == 0 or PMSIDR_EL1.ERnd == 0:
  - A member of the sampling population is selected for sampling
  - The primary counter is reloaded

- If PMSIRR_EL1.RND == 1 and PMSIDR_EL1.ERnd == 1:
  - The secondary counter is set to a random or pseudorandom value in the range 0x00 to 0xFF
  - The primary counter is reloaded

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMSICR_EL1

Accesses to this register use the following encodings:

\[ \text{MRS } <Xt>, \text{ PMSICR_EL1} \]

**Bits [63:24]**

Reserved, RES0.

**Format, bits [23:20]**

From Armv8.7:

Defines the format of the sample records. Defined values are:

<table>
<thead>
<tr>
<th>Format</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Format 0.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Otherwise:

Reserved, RAZ.

**CountSize, bits [19:16]**

Defines the size of the counters. Defined values are:

<table>
<thead>
<tr>
<th>CountSize</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0010</td>
<td>12-bit saturating counters.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Reserved values might be defined in a future version of the architecture.
MaxSize, bits [15:12]

Defines the largest size for a single record, rounded up to a power-of-two. If this is the same as the minimum alignment (PMBIDR_EL1.Align), then each record is exactly this size. Defined values are:

<table>
<thead>
<tr>
<th>MaxSize</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0100</td>
<td>16 bytes</td>
</tr>
<tr>
<td>0b0101</td>
<td>32 bytes</td>
</tr>
<tr>
<td>0b0110</td>
<td>64 bytes</td>
</tr>
<tr>
<td>0b0111</td>
<td>128 bytes</td>
</tr>
<tr>
<td>0b1000</td>
<td>256 bytes</td>
</tr>
<tr>
<td>0b1001</td>
<td>512 bytes</td>
</tr>
<tr>
<td>0b1010</td>
<td>1024 bytes</td>
</tr>
<tr>
<td>0b1011</td>
<td>2KB</td>
</tr>
</tbody>
</table>

All other values are reserved.

Reserved values might be defined in a future version of the architecture.

Interval, bits [11:8]

Recommended minimum sampling interval. This provides guidance from the implementer to the smallest minimum sampling interval, N. Defined values are:

<table>
<thead>
<tr>
<th>Interval</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>256</td>
</tr>
<tr>
<td>0b0010</td>
<td>512</td>
</tr>
<tr>
<td>0b0011</td>
<td>768</td>
</tr>
<tr>
<td>0b0100</td>
<td>1,024</td>
</tr>
<tr>
<td>0b0101</td>
<td>1,536</td>
</tr>
<tr>
<td>0b0110</td>
<td>2,048</td>
</tr>
<tr>
<td>0b0111</td>
<td>3,072</td>
</tr>
<tr>
<td>0b1000</td>
<td>4,096</td>
</tr>
</tbody>
</table>

All other values are reserved.

Reserved values might be defined in a future version of the architecture.

Bit [7]

Reserved, RES0.

FnE, bit [6]

Filtering by events, inverted. Defined values are:

<table>
<thead>
<tr>
<th>FnE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PMSNEVFR_EL1 is not implemented and PMSFCR_EL1.FnE is RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>PMSNEVFR_EL1 and PMSFCR_EL1.FnE are implemented.</td>
</tr>
</tbody>
</table>

The value 0b1 indicates support for the FEAT_SPEv1p2 feature.

ERnd, bit [5]

Defines how the random number generator is used in determining the interval between samples, when enabled by PMSIRR_EL1.RND. Defined values are:

<table>
<thead>
<tr>
<th>ERnd</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The random number is added at the start of the interval, and the sample is taken and a new interval started when the combined interval expires.</td>
</tr>
<tr>
<td>0b1</td>
<td>The random number is added and the new interval started after the interval programmed in PMSIRR_EL1.INTERVAL expires, and the sample is taken when the random interval expires.</td>
</tr>
</tbody>
</table>
LDS, bit [4]

Data source indicator for sampled load instructions. Defined values are:

<table>
<thead>
<tr>
<th>LDS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Loaded data source not implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Loaded data source implemented.</td>
</tr>
</tbody>
</table>

ArchInst, bit [3]

Architectural instruction profiling. Defined values are:

<table>
<thead>
<tr>
<th>ArchInst</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Micro-op sampling implemented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Architecture instruction sampling implemented.</td>
</tr>
</tbody>
</table>

FL, bit [2]

Filtering by latency. This bit is RAO.

FT, bit [1]

Filtering by operation type. This bit is RAO.

FE, bit [0]

Filtering by events. This bit is RAO.

Accessing the PMSIDR_EL1

Accesses to this register use the following encodings:

MRS <Xt>, PMSIDR_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>

The PMSIRR_EL1 characteristics are:

**Purpose**

Defines the interval between samples.

**Configuration**

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSIRR_EL1 are UNDEFINED.

**Attributes**

PMSIRR_EL1 is a 64-bit register.

**Field descriptions**

The PMSIRR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>INTERVAL, bits [31:8]</td>
</tr>
<tr>
<td>31-24</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>23-16</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>15-8</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>7-0</td>
<td>RND, bit [0]</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**INTERVAL, bits [31:8]**

Bits [31:8] of the PMSICR_EL1 interval counter reload value. Software must set this to a non-zero value. If software sets this to zero, an UNKNOWN sampling interval is used. Software should set this to a value greater than the minimum indicated by PMSIDR_EL1.Interval.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [7:1]**

Reserved, RES0.

**RND, bit [0]**

Controls randomization of the sampling interval.

<table>
<thead>
<tr>
<th>RND</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disable randomization of sampling interval.</td>
</tr>
<tr>
<td>0b1</td>
<td>Add (pseudo-)random jitter to sampling interval.</td>
</tr>
</tbody>
</table>

The random number generator is not architected.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The PMSNEVFR_EL1 characteristics are:

## Purpose

Controls sample filtering by events. The overall filter is the logical AND of these filters. For example, if E[3] and E[5] are both set to 0b1, only samples that have both event 3 (Level 1 unified or data cache refill) and event 5 (TLB walk) clear are recorded.

## Configuration

This register is present only when FEAT_SPEv1p2 is implemented. Otherwise, direct accesses to PMSNEVFR_EL1 are UNDEFINED.

## Attributes

PMSNEVFR_EL1 is a 64-bit register.

## Field descriptions

The PMSNEVFR_EL1 bit assignments are:

### E[<x>], bit [x], for x = 63 to 48, 31 to 24, 15 to 12

E[<x>] is the event filter for IMPLEMENTATION DEFINED event <x>.

<table>
<thead>
<tr>
<th>E[&lt;x&gt;]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Event &lt;x&gt; is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have event &lt;x&gt; == 1.</td>
</tr>
</tbody>
</table>

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

When event <x> is not implemented, or filtering on event <x> is not supported, access to this field is RAZ/WI.

### Bits [47:32]

Reserved, RAZ/WI.

### Bits [23:19]

Reserved, RAZ/WI.

### E[18], bit [18]

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>18</td>
<td>RAZ/WI</td>
</tr>
</tbody>
</table>
When **FEAT_SVE** is implemented and **FEAT_SPEv1p1** is implemented:

Not empty predicate.

<table>
<thead>
<tr>
<th>E[18]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Empty predicate event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Empty predicate event == 1.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

**E[17], bit [17]**

When **FEAT_SVE** is implemented and **FEAT_SPEv1p1** is implemented:

Not partial predicate.

<table>
<thead>
<tr>
<th>E[17]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Partial predicate event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Partial predicate event == 1.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

**E[16], bit [16]**

When **FEAT_TME** is implemented:

Not transactional.

<table>
<thead>
<tr>
<th>E[16]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Transactional event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Transactional event == 1.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

**E[11], bit [11]**

When **FEAT_SPEv1p1** is implemented:

Aligned.
### E[11], bit [11]

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Misalignment event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Misalignment event == 1.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

### Bits [10:8]

Reserved, RAZ/WI.

### E[7], bit [7]

Correctly predicted.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Mispredicted event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Mispredicted event == 1.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### E[6], bit [6]

Taken.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Not taken event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Not taken event == 1.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### E[5], bit [5]

TLB hit.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TLB walk event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the TLB walk event == 1.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bit [4]

Reserved, RAZ/WI.

### E[3], bit [3]

Level 1 data or unified cache hit.
Meaning

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Level 1 data or unified cache refill event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Level 1 data or unified cache refill event == 1.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bit [2]

Reserved, RAZ/WI.

### E[1], bit [1]

Speculative.

<table>
<thead>
<tr>
<th>E[1]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Architecturally retired event is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not record samples that have the Architecturally retired event == 1.</td>
</tr>
</tbody>
</table>

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0b0. This bit is RES0 if the PE does not support sampling of speculative instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bit [0]

Reserved, RAZ/WI.

PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

**Purpose**

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see ‘SW_INCR’.

**Configuration**

AArch64 System register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMSWINC[31:0].

AArch64 System register PMSWINC_EL0 bits [31:0] are architecturally mapped to External register PMSWINC_EL0[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSWINC_EL0 are UNDEFINED.

**Attributes**

PMSWINC_EL0 is a 64-bit register.

**Field descriptions**

The PMSWINC_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>P&lt;n&gt;, bit [n], for n = 30 to 0</td>
<td>Event counter software increment bit for PMEVCNTR&lt;n&gt;_EL0.</td>
</tr>
</tbody>
</table>

If N is less than 31, then bits [30:N] are WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN. Otherwise, N is the value in PMCR_EL0.N.

<table>
<thead>
<tr>
<th>P&lt;n&gt;</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No action. The write to this bit is ignored.</td>
</tr>
<tr>
<td>0b1</td>
<td>If PMEVCNTR&lt;n&gt;_EL0 is enabled and configured to count the software increment event, increments PMEVCNTR&lt;n&gt;_EL0 by 1. If PMEVCNTR&lt;n&gt;_EL0 is disabled, or not configured to count the software increment event, the write to this bit is ignored.</td>
</tr>
</tbody>
</table>

**Accessing the PMSWINC_EL0**

Accesses to this register use the following encodings:
if PSTATE.EL == EL0 then

        PMSWINC_EL0 = X[t];
    end
elsif PSTATE.EL == EL3 then
    PMSWINC_EL0 = X[t];
The PMUSERENR_EL0 characteristics are:

**Purpose**

Enables or disables EL0 access to the Performance Monitors.

**Configuration**

AArch64 System register PMUSERENR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMUSERENR[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMUSERENR_EL0 are UNDEFINED.

**Attributes**

PMUSERENR_EL0 is a 64-bit register.

**Field descriptions**

The PMUSERENR_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | RES0 | ER | CR | SW | EN |

**Bits [63:4]**

Reserved, RES0.

**ER, bit [3]**

Event counter Read. Traps EL0 access to event counters to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.

In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.

In AArch32 state, trapped accesses are reported using EC syndrome value 0x03.

<table>
<thead>
<tr>
<th>ER</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 using AArch64: EL0 reads of the PMXEV CNTR_EL0 and PMEVCNTR&lt;n&gt;_EL0, and EL0 read/write accesses to the PMSELR_EL0, are trapped if PMUSERENR_EL0.EN is also 0. EL0 using AArch32: EL0 reads of the PMXEV CNTR and PMEVCNTR&lt;n&gt;, and EL0 read/write accesses to the PMSELR, are trapped if PMUSERENR_EL0.EN is also 0.</td>
</tr>
</tbody>
</table>
| 0b1 | Overrides PMUSERENR_EL0.EN and enables:  
  - RO access to PMXEV CNTR_EL0 and PMEVCNTR<n>_EL0 at EL0.  
  - RW access to PMSELR_EL0 at EL0.  
  - RW access to PMSELR at EL0. |

On a Warm reset, this field resets to an architecturally UNKNOWN value.
CR, bit [2]

Cycle counter Read. Traps EL0 access to cycle counter reads to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.

In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.

In AArch32 state, trapped MRC accesses are reported using EC syndrome value 0x03, trapped MRRC accesses are reported using EC syndrome value 0x04.

<table>
<thead>
<tr>
<th>CR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 using AArch64: EL0 read accesses to the PMCCNTR_EL0 are trapped if PMUSERENR_EL0.EN is also 0. EL0 using AArch32: EL0 read accesses to the PMCCNTR are trapped if PMUSERENR_EL0.EN is also 0.</td>
</tr>
</tbody>
</table>
| 0b1 |Overrides PMUSERENR_EL0.EN and enables access to:  
• PMCCNTR_EL0 at EL0.  
• PMCCNTR at EL0. |

SW, bit [1]

Traps Software Increment writes to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.

In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.

In AArch32 state, trapped accesses are reported using EC syndrome value 0x03.

<table>
<thead>
<tr>
<th>SW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 using AArch64: EL0 writes to the PMSWINC_EL0 are trapped if PMUSERENR_EL0.EN is also 0. EL0 using AArch32: EL0 writes to the PMSWINC are trapped if PMUSERENR_EL0.EN is also 0.</td>
</tr>
</tbody>
</table>
| 0b1 |Overrides PMUSERENR_EL0.EN and enables access to:  
• PMSWINC_EL0 at EL0.  
• PMSWINC at EL0. |

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Traps EL0 accesses to the Performance Monitor registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states as follows:

- In AArch64 state, MRS or MSR accesses to the following registers are reported using EC syndrome value 0x18:
  - PMCR_EL0, PMOVSCLR_EL0, PMSELR_EL0, PMCEID0_EL0, PMCEID1_EL0, PMCCNTR_EL0, PMXEVTYPE_EL0, PMXEVCNTR_EL0, PMCNTENSET_EL0, PMCNTENCLR_EL0, PMOVSSET_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMEVTYPER<n>_EL0, PMCCFILTR_EL0, PMSWINC_EL0.
  - If FEAT_PMUv3p4 is implemented, PMMIR_EL1.

- In AArch32 state, MRC or MCR accesses to the following registers are reported using EC syndrome value 0x03:
  - PMCR, PMOVSR, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTYPE, PMXEVCNTR, PMCNTENSET, PMCNTENCLR, PMOVSSET, PMEVCNTR<n>, PMEVTYPER<n>, PMCCFILTR, PMSWINC.
  - If FEAT_PMUv3p4 is implemented, PMMIR.
  - If FEAT_PMUv3p4 is implemented, in AArch32 state, PMCEID2, and PMCEID3.

- In AArch32 state, MRRC or MCRR accesses to PMCCNTR are reported using EC syndrome value 0x04.
### Accessing the PMUSERENR_EL0

Accesses to this register use the following encodings:

MRS <Xt>, PMUSERENR_EL0

<table>

PMXEVCNTR_EL0, Performance Monitors Selected Event Count Register

The PMXEVCNTR_EL0 characteristics are:

**Purpose**

Reads or writes the value of the selected event counter, `PMEVCNTR<n>_EL0`. `PMSELR_EL0`. SEL determines which event counter is selected.

**Configuration**

AArch64 System register PMXEVCNTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register `PMXEVCNTR[31:0]`.

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVCNTR_EL0 are UNDEFINED.

**Attributes**

PMXEVCNTR_EL0 is a 64-bit register.

**Field descriptions**

The PMXEVCNTR_EL0 bit assignments are:

**When FEAT_PMUv3p5 is implemented:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| PMEVCNTR<n> | PMEVCNTR<n> |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**PMEVCNTR<n>, bits [63:0]**

Value of the selected event counter, `PMEVCNTR<n>_EL0`, where n is the value stored in `PMSELR_EL0`. SEL.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| RES0 | PMEVCNTR<n> |

**Bits [63:32]**

Reserved, RES0.

**PMEVCNTR<n>, bits [31:0]**

Value of the selected event counter, `PMEVCNTR<n>_EL0`, where n is the value stored in `PMSELR_EL0`. SEL.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the PMXEVCNTR_EL0

If FEAT_FGT is implemented and PMSELR_EL0.SEL is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of PMXEVCNTR_EL0 is as follows:

- If PMSELR_EL0.SEL selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and PMSELR_EL0.SEL is greater than or equal to the number of accessible counters, then reads and writes of PMXEVCNTR_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if PMSELR_EL0.SEL has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- If EL2 is implemented and enabled in the current Security state, and PMSELR_EL0.SEL is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.{ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. See MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings:

PMXEVTYPER_EL0, Performance Monitors Selected Event Type Register

The PMXEVTYPER_EL0 characteristics are:

**Purpose**

When `PMSELR_EL0.SEEL` selects an event counter, this accesses a `PMEVTYPER<n>_EL0` register. When `PMSELR_EL0.SEEL` selects the cycle counter, this accesses `PMCCFILT_EL0`.

**Configuration**

AArch64 System register PMXEVTYPER_EL0 bits [31:0] are architecturally mapped to AArch32 System register `PMXEVTYPER[31:0]`.

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVTYPER_EL0 are UNDEFINED.

**Attributes**

PMXEVTYPER_EL0 is a 64-bit register.

**Field descriptions**

The PMXEVTYPER_EL0 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| RES0|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**Bits [63:32]**

Reserved, RES0.

**Bits [31:0]**

When `PMSELR_EL0.SEEL` == 31, this register accesses `PMCCFILT_EL0`.

Otherwise, this register accesses `PMEVTYPER<n>_EL0` where n is the value in `PMSELR_EL0.SEEL`.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMXEVTYPER_EL0**

If FEAT_FGT is implemented, and `PMSELR_EL0.SEEL` is not 31 and is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of `PMXEVTYPER_EL0` is as follows:

- If `PMSELR_EL0.SEEL` selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT FGT is not implemented, and `PMSELR_EL0.SEEL` is not 31 and is greater than or equal to the number of accessible counters, then reads and writes of `PMXEVTYPER_EL0` are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
• Accesses to the register execute as a NOP.
• Accesses to the register behave as if \texttt{PMSELR_EL0}.SEL has an \texttt{UNKNOWN} value less than the number of event counters accessible at the current Exception level and Security state.
• Accesses to the register behave as if \texttt{PMSELR_EL0}.SEL is 31.
• If EL2 is implemented and enabled in the current Security state, \texttt{PMSELR_EL0} is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

\textbf{Note}

In EL0, an access is permitted if it is enabled by \texttt{PMUSERENR_EL0}.EN.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, \texttt{MDCR_EL2}.HPMN identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. See \texttt{MDCR_EL2}.HPMN for more details.

Accesses to this register use the following encodings:

\textbf{MRS} <Xt>, \texttt{PMXEVTYPE}R\_EL0

PMXEVTYPER_EL0, Performance Monitors Selected Event Type Register
REVIDR_EL1, Revision ID Register

The REVIDR_EL1 characteristics are:

Purpose

Provides implementation-specific minor revision information.

Configuration

AArch64 System register REVIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register REVIDR[31:0].

If REVIDR_EL1 has the same value as MIDR_EL1, then its contents have no significance.

Attributes

REVIDR_EL1 is a 64-bit register.

Field descriptions

The REVIDR_EL1 bit assignments are:

RGSR_EL1, Random Allocation Tag Seed Register.

The RGSR_EL1 characteristics are:

**Purpose**

Random Allocation Tag Seed Register.

**Configuration**

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to RGSR_EL1 are UNDEFINED.

When GCR_EL1.RRND==0b1, updates to RGSR_EL1 are implementation-specific.

**Attributes**

RGSR_EL1 is a 64-bit register.

**Field descriptions**

The RGSR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

**Bits [63:24]**

Reserved, RES0.

**SEED, bits [23:8]**

Seed register used for generating values returned by RandomAllocationTag().

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [7:4]**

Reserved, RES0.

**TAG, bits [3:0]**

Tag generated by the most recent IRG instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

end
RMR_EL1, Reset Management Register (EL1)

The RMR_EL1 characteristics are:

**Purpose**

When this register is implemented:

- A write to the register at EL1 can request a Warm reset.
- If EL1 can use all Execution states, this register specifies the Execution state that the PE boots into on a Warm reset.

**Configuration**

AArch64 System register RMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register RMR[31:0] when the highest implemented Exception level is EL1.

This register is present only when the highest implemented Exception level is EL1. Otherwise, direct accesses to RMR_EL1 are **UNDEFINED**.

When EL1 is the highest implemented Exception level:

- If EL1 can use all Execution states then this register must be implemented.
- If EL1 cannot use AArch32 then it is **IMPLEMENTATION DEFINED** whether the register is implemented.

**Attributes**

RMR_EL1 is a 64-bit register.

**Field descriptions**

The RMR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>63-32</th>
<th>31-29</th>
<th>28-19</th>
<th>18-10</th>
<th>9-0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>RES0</td>
<td>R</td>
<td>A</td>
<td>A64</td>
</tr>
</tbody>
</table>

**Bits [63:2]**

Reserved, RES0.

**RR, bit [1]**

Reset Request. Setting this bit to 1 requests a Warm reset.

On a Warm reset, this field resets to 0.

**AA64, bit [0]**

*When EL1 is capable of using AArch32:*

When EL1 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

<table>
<thead>
<tr>
<th>AA64</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>AArch64.</td>
</tr>
</tbody>
</table>
On coming out of the Warm reset, execution starts at the implementation defined reset vector address of the specified Execution state.

If EL1 can only use AArch64 state, this bit is RAO/WI.

When implemented as a RW field, this field resets to 1 on a Cold reset.

Otherwise:

Reserved, RAO/WI.

**Accessing the RMR_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, RMR_EL1

<table>
<thead>
<tr>

else
UNDEFINED;
RMR_EL2, Reset Management Register (EL2)

The RMR_EL2 characteristics are:

**Purpose**

When this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use all Execution states, this register specifies the Execution state that the PE boots into on a Warm reset.

**Configuration**

AArch64 System register RMR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HRMR[31:0] when the highest implemented Exception level is EL2.

This register is present only when the highest implemented Exception level is EL2. Otherwise, direct accesses to RMR_EL2 are **UNDEFINED**.

When EL2 is the highest implemented Exception level:

- If EL2 can use all Execution states then this register must be implemented.
- If EL2 cannot use AArch32 then it is **IMPLEMENTATION DEFINED** whether the register is implemented.

**Attributes**

RMR_EL2 is a 64-bit register.

**Field descriptions**

The RMR_EL2 bit assignments are:

```

    RMR_EL3 = X[t];
else
    UNDEFINED;
```
RNDR, Random Number

The RNDR characteristics are:

**Purpose**

Random Number. Returns a 64-bit random number which is reseeded from the True Random Number source at an IMPLEMENTATION DEFINED rate.

If the hardware returns a genuine random number, PSTATE.NZCV is set to 0b0000.

If the instruction cannot return a genuine random number in a reasonable period of time, PSTATE.NZCV is set to 0b0100 and the data value returned is 0.

RNDR is a read-only register.

**Configuration**

This register is present only when FEAT_RNG is implemented. Otherwise, direct accesses to RNDR are UNDEFINED.

**Attributes**

RNDR is a 64-bit register.

**Field descriptions**

The RNDR bit assignments are:

| Bit 63 | Bit 62 | Bit 61 | Bit 60 | Bit 59 | Bit 58 | Bit 57 | Bit 56 | Bit 55 | Bit 54 | Bit 53 | Bit 52 | Bit 51 | Bit 50 | Bit 49 | Bit 48 | Bit 47 | Bit 46 | Bit 45 | Bit 44 | Bit 43 | Bit 42 | Bit 41 | Bit 40 | Bit 39 | Bit 38 | Bit 37 | Bit 36 | Bit 35 | Bit 34 | Bit 33 | Bit 32 |

    return RNDR;
elsif PSTATE.EL == EL2 then
    return RNDR;
elsif PSTATE.EL == EL3 then
    return RNDR;

**RNDRRS, Reseeded Random Number**

The RNDRRS characteristics are:

**Purpose**

Reseeded Random Number. Returns a 64-bit random number which is reseeded from the True Random Number source immediately before the read of the random number.

If the hardware returns a genuine random number, PSTATE.NZCV is set to 0b0000.

If the instruction cannot return a genuine random number in a reasonable period of time, PSTATE.NZCV is set to 0b0100 and the data value returned is 0.

RNDRRS is a read-only register.

**Configuration**

This register is present only when FEAT_RNG is implemented. Otherwise, direct accesses to RNDRRS are UNDEFINED.

**Attributes**

RNDRRS is a 64-bit register.

**Field descriptions**

The RNDRRS bit assignments are:

**RNDRRS, bits [63:0]**

Reseeded Random Number. Returns a 64-bit Random Number which is reseeded from the True Random Number source immediately before this read.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the RNDRRS**

Accesses to this register use the following encodings:

\[
\text{MRS } \langle Xt \rangle, \text{ RNDRRS}
\]

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b011</td>
<td>0b0010</td>
<td>0b0100</td>
<td>0b001</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
    return RNDRRS;
elsif PSTATE.EL == EL1 then
    return RNDRRS;
elsif PSTATE.EL == EL2 then
    return RNDRRS;
elsif PSTATE.EL == EL3 then
    return RNDRRS;
The RVBAR_EL1 characteristics are:

**Purpose**

If EL1 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

**Configuration**

This register is present only when the highest implemented Exception level is EL1. Otherwise, direct accesses to RVBAR_EL1 are UNDEFINED.

**Attributes**

RVBAR_EL1 is a 64-bit register.

**Field descriptions**

The RVBAR_EL1 bit assignments are:

|   |   |   |   |   | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| 63 | 62 | 61 | 60 | 59 |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

Reset Address

Bits [63:0]

Reset Address. The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

**Accessing the RVBAR_EL1**

Accesses to this register use the following encodings:

\[
\text{MRS <Xt>, RVBAR_EL1}
\]

\[
\begin{array}{|c|c|c|c|c|}
\hline
\text{op0} & \text{op1} & \text{CRn} & \text{CRm} & \text{op2} \\
\hline
0b11 & 0b000 & 0b1100 & 0b0000 & 0b001 \\
\hline
\end{array}
\]

\[
\text{if PSTATE.EL == EL1 && IsHighestEL(EL1) then return RVBAR_EL1; else UNDEFINED;}
\]
RVBAR_EL2, Reset Vector Base Address Register (if EL3 not implemented)

The RVBAR_EL2 characteristics are:

**Purpose**

If EL2 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

**Configuration**

This register is present only when the highest implemented Exception level is EL2. Otherwise, direct accesses to RVBAR_EL2 are UNDEFINED.

**Attributes**

RVBAR_EL2 is a 64-bit register.

**Field descriptions**

The RVBAR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reset Address</td>
</tr>
<tr>
<td>31</td>
<td>Reset Address</td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Reset Address. The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

**Accessing the RVBAR_EL2**

Accesses to this register use the following encodings:

```assembly
MRS <Xt>, RVBAR_EL2
```

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>

# SCR_EL3, Secure Configuration Register

The SCR_EL3 characteristics are:

## Purpose

Defines the configuration of the current Security state. It specifies:

- The Security state of EL0, EL1, and EL2. The Security state is either Secure or Non-secure.
- The Execution state at lower Exception levels.
- Whether IRQ, FIQ, SError interrupts, and External abort exceptions are taken to EL3.
- Whether various operations are trapped to EL3.

## Configuration

AArch64 System register SCR_EL3 bits [31:0] can be mapped to AArch32 System register SCR[31:0], but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to SCR_EL3 are undefined.

## Attributes

SCR_EL3 is a 64-bit register.

## Field descriptions

The SCR_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>62</td>
<td>EnCSR, bit [39]</td>
</tr>
<tr>
<td>61</td>
<td>When FEAT_CSRE is implemented:</td>
</tr>
<tr>
<td>60</td>
<td>Call Stack Recorder Enable. Controls access to the Call Stack Recorder registers from EL2, EL1, and EL0.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>EnCSR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trap read and write accesses to all Call Stack Recorder registers to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

The Call Stack Recorder registers trapped by this control are: CSRCR_EL0, CSRCR_EL1, CSRCR_EL2, CSRCR_EL12, CSRDR_EL0, CSRPRIDX_EL0, CSRPRIDX_EL1, CSRPRIDX_EL2, CSRPR_EL0, CSRPR_EL1, CSRPR_EL2, and CSRPR_EL12.

Traps are reported using an ESR_EL3, EC value of 0x18.

Traps are not taken if there is a higher priority exception generated by the access.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

**HXEn, bit [38]**

When FEAT_HCX is implemented:

Enables access to the **HCRX_EL2** register at EL2 from EL3.

<table>
<thead>
<tr>
<th>HXEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2 accesses to <strong>HCRX_EL2</strong> are trapped to EL3. Indirect reads of <strong>HCRX_EL2</strong> return 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:
Reserved, RES0.

**ADEn, bit [37]**

When FEAT_LS64 is implemented:

Enables access to the **ACCDATA_EL1** register at EL1 and EL2.

<table>
<thead>
<tr>
<th>ADEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to <strong>ACCDATA_EL1</strong> at EL1 and EL2 are trapped to EL3, unless the accesses are trapped to EL2 by the EL2 fine-grained trap.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause accesses to <strong>ACCDATA_EL1</strong> to be trapped.</td>
</tr>
</tbody>
</table>

If the **HFGWTR_EL2.nACCDATA_EL1** or **HFGRT_EL2.nACCDATA_EL1** traps are enabled, they take priority over this trap.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:
Reserved, RES0.

**EnAS0, bit [36]**

When FEAT_LS64 is implemented:

Traps execution of an ST64BV0 instruction at EL0, EL1, or EL2 to EL3.

<table>
<thead>
<tr>
<th>EnAS0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL1 by <strong>SCTLR_EL1.EnAS0</strong>, or to EL2 by either <strong>HCRX_EL2.EnAS0</strong> or <strong>SCTLR_EL2.EnAS0</strong>. EL1 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL2 by <strong>HCRX_EL2.EnAS0</strong>. EL2 execution of an ST64BV0 instruction is trapped to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**AMVOFFEN, bit [35]**

When FEAT_AMUv1p1 is implemented:

Activity Monitors Virtual Offsets Enable.

<table>
<thead>
<tr>
<th>AMVOFFEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to AMEVCntVOFF0(&lt;n&gt;_EL2 and AMEVCntVOFF1(&lt;n&gt;_EL2 at EL2 are trapped to EL3. Indirect reads of the virtual offset registers are zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to AMEVCntVOFF0(&lt;n&gt;_EL2 and AMEVCntVOFF1(&lt;n&gt;_EL2 are not affected by this field.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TME, bit [34]**

When FEAT_TME is implemented:

Enables access to the TSTART, TCOMMIT, TTEST and TCANCEL instructions at EL0, EL1 and EL2.

<table>
<thead>
<tr>
<th>TME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0, EL1 and EL2 accesses to TSTART, TCOMMIT, TTEST and TCANCEL instructions are UNDEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instruction to be UNDEFINED.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TWEDEL, bits [33:30]**

When FEAT_TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when SCR_EL3.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by SCR_EL3.TWE as $2^{(TWEDEL + 8)}$ cycles.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TWEDEn, bit [29]**

When FEAT_TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by SCR_EL3.TWE.
### TWEDEn

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>The delay for taking the trap is IMPLEMENTATION DEFINED.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Meaning</td>
<td>0b1</td>
<td>The delay for taking the trap is at least the number of cycles defined in SCR_EL3.TWDEL.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### ECVEn, bit [28]

**When FEAT_ECV is implemented:**

ECV Enable. Enables access to the `CNTPOFF_EL2` register.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>EL2 accesses to <code>CNTPOFF_EL2</code> are trapped to EL3, and the value of <code>CNTPOFF_EL2</code> is treated as 0 for all purposes other than direct reads or writes to the register from EL3.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Meaning</td>
<td>0b1</td>
<td>EL2 accesses to <code>CNTPOFF_EL2</code> are not trapped to EL3 by this mechanism.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### FGTEn, bit [27]

**When FEAT_FGT is implemented:**

Fine-Grained Traps Enable. When EL2 is implemented, enables access to `HAFGRTR_EL2`, `HDFGRTR_EL2`, `HDFGWTR_EL2`, `HFGITR_EL2`, `HFGITR_EL2` and `HFGWTR_EL2`.

**Note**

If EL2 is not implemented but EL3 is implemented, FEAT_FGT implements the `MDCR_EL3` TDCC traps.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>0b0</th>
<th>EL2 accesses to <code>HAFGRTR_EL2</code>, <code>HDFGRTR_EL2</code>, <code>HDFGWTR_EL2</code>, <code>HFGITR_EL2</code>, <code>HFGITR_EL2</code> and <code>HFGWTR_EL2</code> registers are trapped to EL3, and those registers behave as if all bits are set to 0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Meaning</td>
<td>0b1</td>
<td>EL2 accesses to <code>HAFGRTR_EL2</code>, <code>HDFGRTR_EL2</code>, <code>HDFGWTR_EL2</code>, <code>HFGITR_EL2</code>, <code>HFGITR_EL2</code> and <code>HFGWTR_EL2</code> registers are not trapped to EL3 by this mechanism.</td>
</tr>
</tbody>
</table>

Traps caused by accesses to the fine-grained trap registers are reported using an ESR_ELx.EC value of 0x18 and its associated ISS.

**Otherwise:**

Reserved, RES0.
ATA, bit [26]

When FEAT_MTE2 is implemented:

Allocation Tag Access. Controls access at EL2, EL1 and EL0 to Allocation Tags.

When access is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.
- MRS and MSR instructions at EL1 and EL2 using \texttt{GCR\_EL1}, \texttt{RGSR\_EL1}, \texttt{TFSR\_EL1}, \texttt{TFSR\_EL2} or \texttt{TFSRE0\_EL1} that are not \texttt{UNDEFINED} or trapped to a lower Exception level are trapped to EL3.
- MRS and MSR instructions at EL2 using \texttt{TFSR\_EL12} that are not \texttt{UNDEFINED} are trapped to EL3.

<table>
<thead>
<tr>
<th>ATA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access is not prevented.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

Otherwise:

Reserved, \texttt{RES0}.

EnSCXT, bit [25]

When FEAT_CSV2 is implemented:

Enable access to the \texttt{SCXTNUM\_EL2}, \texttt{SCXTNUM\_EL1}, and \texttt{SCXTNUM\_EL0} registers. The defined values are:

<table>
<thead>
<tr>
<th>EnSCXT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2, EL1 and EL0 access to \texttt{SCXTNUM_EL0}, EL2 and EL1 access to \texttt{SCXTNUM_EL1}, EL2 access to \texttt{SCXTNUM_EL2} registers are disabled by this mechanism, causing an exception to EL3, and the values of these registers to be treated as 0.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause accesses to \texttt{SCXTNUM_EL0}, \texttt{SCXTNUM_EL1}, \texttt{SCXTNUM_EL2} to be trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally \texttt{UNKNOWN} value.

Otherwise:

Reserved, \texttt{RES0}.

Bits [24:22]

Reserved, \texttt{RES0}. 
**FIEN, bit [21]**

When FEAT_RASv1p1 is implemented:

Fault Injection enable. Trap accesses to the registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1 from EL1 and EL2 to EL3, reported using an ESR_ELx.EC value of 0x18.

<table>
<thead>
<tr>
<th>FIEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

If EL3 is not implemented, the Effective value of SCR_EL3.FIEN is 0b1.

If ERRIDR_EL1.NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**NMEA, bit [20]**

When FEAT_DoubleFault is implemented:

Non-maskable External Aborts. When SCR_EL3.EA == 1, controls whether PSTATE.A masks SError interrupts at EL3.

<table>
<thead>
<tr>
<th>NMEA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>If SCR_EL3.EA == 1, asserted SError interrupts are not taken at EL3 if PSTATE.A == 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>If SCR_EL3.EA == 1, asserted SError interrupts are taken at EL3 regardless of the value of PSTATE.A.</td>
</tr>
</tbody>
</table>

When SCR_EL3.EA == 0:

- Asserted SError interrupts are not taken at EL3 regardless of the value of PSTATE.A and this field.
- This field is ignored and its Effective value is 0.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**EASE, bit [19]**

When FEAT_DoubleFault is implemented:

External aborts to SError interrupt vector.

<table>
<thead>
<tr>
<th>EASE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Synchronous External abort exceptions taken to EL3 are taken to the appropriate synchronous exception vector offset from VBAR_EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>Synchronous External abort exceptions taken to EL3 are taken to the appropriate SError interrupt vector offset from VBAR_EL3.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.
Otherwise:

Reserved, RES0.

**EEL2, bit [18]**

When FEAT_SEL2 is implemented:

Secure EL2 Enable.

<table>
<thead>
<tr>
<th>EEL2</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All behaviors associated with Secure EL2 are disabled. All registers, including timer registers, defined by FEAT_SEL2 are UNDEFINED, and those timers are disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>All behaviors associated with Secure EL2 are enabled.</td>
</tr>
</tbody>
</table>

When the value of this bit is 1, then:

- When SCR_EL3.NS == 0, the SCR_EL3.RW bit is treated as 1 for all purposes other than reading or writing the register.

  - If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2, using the EC value of ESR_EL2.EC == 0x3:
    - A read or write of the SCR.
    - A read or write of the NSACR.
    - A read or write of the MVBAR.
    - A read or write of the SDCR.
    - Execution of an ATS12NSO** instruction.

  - If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2 using the EC value of ESR_EL2.EC == 0x0:
    - Execution of an SRS instruction that uses R13_mon.
    - Execution of an MRS (Banked register) or MSR (Banked register) instruction that would access SPSR_mon, R13_mon, or R14_mon.

**Note**

If the Effective value of SCR_EL3.EEL2 is 0, then these operations executed in Secure EL1 using AArch32 are trapped to EL3.

A Secure only implementation that does not implement EL3 but implements EL2, behaves as if SCR_EL3.EEL2 == 1.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**API, bit [17]**

When FEAT_SEL2 is implemented and FEAT_PAuth is implemented:

Controls the use of the following instructions related to Pointer Authentication. Traps are reported using an ESR_ELx.EC value of 0x9:

- PACGA, which is always enabled.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, AUTIZ, AUTIZ, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRBZ, BLRAAZ, BLRABZ, RETAA, RETAB, LDRAA and LDRAB when:
  - In EL0, when HCR_EL2.TGE == 0 or HCR_EL2.E2H == 0, and the associated SCTLR_EL1.En<N><M> == 1.
In EL0, when $\text{HCR\_EL2}.\text{TGE} == 1$ and $\text{HCR\_EL2}.\text{E2H} == 1$, and the associated $\text{SCTL\_EL2}.\text{En}<N><M> == 1$.

In EL1, when the associated $\text{SCTL\_EL1}.\text{En}<N><M> == 1$.

In EL2, when the associated $\text{SCTL\_EL2}.\text{En}<N><M> == 1$.

### API

<table>
<thead>
<tr>
<th>API</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the $\text{HCR_EL2}.\text{API}$ bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

An instruction is trapped only if Pointer Authentication is enabled for that instruction, for more information, see 'System register control of pointer authentication'.

### Note

If $\text{FEAT\_PAuth}$ is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

---

### When FEAT\_SEL2 is not implemented and FEAT\_PAuth is implemented:

Controls the use of instructions related to Pointer Authentication:

- PACGA.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIBZ, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETTA, ERETAB, LDRAA and LDRAB when:
  - In Non-secure EL0, when $\text{HCR\_EL2}.\text{TGE} == 0$ or $\text{HCR\_EL2}.\text{E2H} == 0$, and the associated $\text{SCTL\_EL1}.\text{En}<N><M> == 1$.
  - In Non-secure EL0, when $\text{HCR\_EL2}.\text{TGE} == 1$ and $\text{HCR\_EL2}.\text{E2H} == 1$, and the associated $\text{SCTL\_EL2}.\text{En}<N><M> == 1$.
  - In Secure EL0, when the associated $\text{SCTL\_EL2}.\text{En}<N><M> == 1$.
  - In Secure or Non-secure EL1, when the associated $\text{SCTL\_EL1}.\text{En}<N><M> == 1$.
  - In EL2, when the associated $\text{SCTL\_EL2}.\text{En}<N><M> == 1$.

<table>
<thead>
<tr>
<th>API</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the $\text{HCR_EL2}.\text{API}$ bit.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

### Note

If $\text{FEAT\_PAuth}$ is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

---

### Otherwise:

Reserved, RES0.

### APK, bit [16]

When FEAT\_PAuth is implemented:

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers, using an ESR\_ELx.EC value of 0x18, from EL1 or EL2 to EL3 unless they are trapped to EL2 as a result of the $\text{HCR\_EL2}.\text{APK}$ bit or other traps:
• APIAKeyLo_EL1, APIAKeyHi_EL1, APIBKeyLo_EL1, APIBKeyHi_EL1.

• APDAKeyLo_EL1, APDAKeyHi_EL1, APDBKeyLo_EL1, APDBKeyHi_EL1.

• APGAKeyLo_EL1, and APGAKeyHi_EL1.

<table>
<thead>
<tr>
<th>APK</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to the registers holding &quot;key&quot; values for pointer authentication from EL1 or EL2 are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APIK bit or other traps.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

For more information, see 'System register control of pointer authentication'.

Note

If FEAT_PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TERR, bit [15]

When FEAT_RAS is implemented:

Trap Error record accesses. Accesses to the RAS ERR* and RAS ERX* registers from EL1 and EL2 to EL3 are trapped as follows:

• Accesses from EL1 and EL2 using AArch64 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x18:
  - ERRIDR_EL1, ERRSELR_EL1, ERXADDR_EL1, ERXCTLR_EL1, ERXFR_EL1, ERXMISC0_EL1, ERXMISC1_EL1, and ERXSTATUS_EL1.

• If FEAT_RASv1p1 is implemented, accesses from EL1 and EL2 using AArch64 to ERXMISC2_EL1, and ERXMISC3_EL1, are trapped and reported using an ESR_ELx.EC value of 0x18.

• Accesses from EL1 and EL2 using AArch32, to the following registers are trapped and reported using an ESR_ELx.EC value of 0x03:
  - ERRIDR, ERRSELR, ERXADDR, ERXADDR2, ERXCTLR, ERXCTLR2, ERXFR, ERXFR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, and ERXSTATUS.

• If FEAT_RASv1p1 is implemented, accesses from EL1 and EL2 using AArch32 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x03:
  - ERXMISC4, ERXMISC5, ERXMISC6, and ERXMISC7.

<table>
<thead>
<tr>
<th>TERR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLOR, bit [14]
When FEAT_LOR is implemented:

Trap LOR registers. Traps accesses to the LORSA_EL1, LOREA_EL1, LORN_EL1, LORC_EL1, and LORID_EL1 registers from EL1 and EL2 to EL3, unless the access has been trapped to EL2.

<table>
<thead>
<tr>
<th>TLR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1 and EL2 accesses to the LOR registers that are not UNDEFINED are trapped to EL3, unless it is trapped HCR_EL2.TLOR.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWE, bit [13]

Traps EL2, EL1, and EL0 execution of WFE instructions to EL3, from both Security states and both Execution states, reported using an ESR_ELx.EC value of 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

<table>
<thead>
<tr>
<th>TWE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt to execute a WFE instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE, HCR.TWE, SCTLR_EL1.nTWE, SCTLR_EL2.nTWE, or HCR_EL2.TWE.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TWI, bit [12]

Traps EL2, EL1, and EL0 execution of WFI instructions to EL3, from both Security states and both Execution states, reported using an ESR_ELx.EC value of 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction.

<table>
<thead>
<tr>
<th>TWI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt to execute a WFI instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI, HCR.TWI, SCTLR_EL1.nTWI, SCTLR_EL2.nTWI, or HCR_EL2.TWI.</td>
</tr>
</tbody>
</table>
In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFI instructions can cause the PE to enter a low-power state, see ‘Wait for Interrupt’.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ST, bit [11]**

Traps Secure EL1 accesses to the Counter-timer Physical Secure timer registers to EL3, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

<table>
<thead>
<tr>
<th>ST</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure EL1 using AArch64 accesses to the CNTPS_TVAL_EL1, CNTPS_CTL_EL1, and CNTPS_CVAL_EL1 are trapped to EL3 when Secure EL2 is disabled. If Secure EL2 is enabled, the behavior is as if the value of this field was 0b1.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

**Note**

Accesses to the Counter-timer Physical Secure timer registers are always enabled at EL3. These registers are not accessible at EL0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**RW, bit [10]**

When **AArch32 is supported at any Exception level**:

Execution state control for lower Exception levels.

<table>
<thead>
<tr>
<th>RW</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Lower levels are all AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>The next lower level is AArch64. If EL2 is present:</td>
</tr>
<tr>
<td></td>
<td>• EL2 is AArch64.</td>
</tr>
<tr>
<td></td>
<td>• EL2 controls EL1 and EL0 behaviors. If EL2 is not present:</td>
</tr>
<tr>
<td></td>
<td>• EL1 is AArch64.</td>
</tr>
<tr>
<td></td>
<td>• EL0 is determined by the Execution state described in the current process state when executing at EL0.</td>
</tr>
</tbody>
</table>

If AArch32 state is not supported by the implementation at EL2 and AArch32 state is not supported by the implementation at EL1, then this bit is RAO/WI.

If AArch32 state is supported by the implementation at EL1, SCR_EL3.NS == 1 and AArch32 state is not supported by the implementation at EL2, the Effective value of this bit is 1.

If AArch32 state is supported by the implementation at EL1, FEAT_SEL2 is implemented and SCR_EL3.{EEL2, NS} == {1, 0}, the Effective value of this bit is 1.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RAO/WI.

**SIF, bit [9]**

*When FEAT_SEL2 is implemented:*

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from memory marked in the first stage of translation as being Non-secure. The possible values for this bit are:

<table>
<thead>
<tr>
<th>SIF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state instruction fetches from memory marked in the first stage of translation as being Non-secure are permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure state instruction fetches from memory marked in the first stage of translation as being Non-secure are not permitted.</td>
</tr>
</tbody>
</table>

When FEAT_PAN3 is implemented, it is IMPLEMENTATION DEFINED whether SCR_EL3.SIF is also used to determine instruction access permission for the purpose of PAN.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory.

<table>
<thead>
<tr>
<th>SIF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Secure state instruction fetches from Non-secure memory are permitted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Secure state instruction fetches from Non-secure memory are not permitted.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**HCE, bit [8]**

Hypervisor Call instruction enable. Enables HVC instructions at EL3 and, if EL2 is enabled in the current Security state, at EL2 and EL1, in both Execution states, reported using an ESR_ELx.EC value of 0x00.

<table>
<thead>
<tr>
<th>HCE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>HVC instructions are <strong>UNDEFINED</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>HVC instructions are enabled at EL3, EL2, and EL1.</td>
</tr>
</tbody>
</table>

**Note**

HVC instructions are always **UNDEFINED** at EL0 and, if Secure EL2 is disabled, at Secure EL1. Any resulting exception is taken from the current Exception level to the current Exception level.

If EL2 is not implemented, this bit is **RES0**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**SMD, bit [7]**

Secure Monitor Call disable. Disables SMC instructions at EL1 and above, from both Security states and both Execution states, reported using an ESR_ELx.EC value of 0x00.
<table>
<thead>
<tr>
<th>SMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SMC instructions are enabled at EL3, EL2 and EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>SMC instructions are UNDEFINED.</td>
</tr>
</tbody>
</table>

**Note**

SMC instructions are always UNDEFINED at EL0. Any resulting exception is taken from the current Exception level to the current Exception level.

If `HCR_EL2.TSC` or `HCR.TSC` traps attempted EL1 execution of SMC instructions to EL2, that trap has priority over this disable.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [6]**

Reserved, RES0.

**Bits [5:4]**

Reserved, RES1.

**EA, bit [3]**

External Abort and SError interrupt routing.

<table>
<thead>
<tr>
<th>EA</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0    | When executing at Exception levels below EL3, External aborts and SError interrupts are not taken to EL3. In addition, when executing at EL3:
       | • SError interrupts are not taken.                                     |
       | • External aborts are taken to EL3.                                    |
| 0b1    | When executing at any Exception level, External aborts and SError interrupts are taken to EL3. |

For more information, see 'Asynchronous exception routing'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**FIQ, bit [2]**

Physical FIQ Routing.

<table>
<thead>
<tr>
<th>FIQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When executing at Exception levels below EL3, physical FIQ interrupts are not taken to EL3. When executing at EL3, physical FIQ interrupts are not taken.</td>
</tr>
<tr>
<td>0b1</td>
<td>When executing at any Exception level, physical FIQ interrupts are taken to EL3.</td>
</tr>
</tbody>
</table>

For more information, see 'Asynchronous exception routing'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IRQ, bit [1]**

Physical IRQ Routing.

<table>
<thead>
<tr>
<th>IRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When executing at Exception levels below EL3, physical IRQ interrupts are not taken to EL3. When executing at EL3, physical IRQ interrupts are not taken.</td>
</tr>
<tr>
<td>0b1</td>
<td>When executing at any Exception level, physical IRQ interrupts are taken to EL3.</td>
</tr>
</tbody>
</table>

For more information, see 'Asynchronous exception routing'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
For more information, see 'Asynchronous exception routing'.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**NS, bit [0]**

Non-secure bit.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Indicates that EL0 and EL1 are in Secure state.</td>
</tr>
<tr>
<td>0b1</td>
<td>Indicates that Exception levels lower than EL3 are in Non-secure state, so memory accesses from those Exception levels cannot access Secure memory.</td>
</tr>
</tbody>
</table>

When SCR_EL3.{EEL2, NS} == {1, 0}, then EL2 is using AArch64 and in Secure state.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the SCR_EL3**

Accesses to this register use the following encodings:

**MRS <Xt>, SCR_EL3**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

  SCR_EL3 = X[t];
SCTLR_EL1, System Control Register (EL1)

The SCTLR_EL1 characteristics are:

**Purpose**

Provides top level control of the system, including its memory system, at EL1 and EL0.

**Configuration**

AArch64 System register SCTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register SCTR[31:0].

**Attributes**

SCTLR_EL1 is a 64-bit register.

**Field descriptions**

The SCTLR_EL1 bit assignments are:

<table>

</tr>
</tbody>
</table>

Other values are reserved.
On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**EPAN, bit [57]**

**When FEAT_PAN3 is implemented:**

Enhanced Privileged Access Never. When PSTATE.PAN is 1, determines whether an EL1 data access to a page with stage 1 EL0 instruction access permission generates a Permission fault as a result of the Privileged Access Never mechanism.

<table>
<thead>
<tr>
<th>EPAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No additional Permission faults are generated by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>An EL1 data access to a page with stage 1 EL0 data access permission or stage 1 EL0 instruction access permission generates a Permission fault. Any speculative data accesses that would generate a Permission fault if the accesses were not speculative will not cause an allocation into a cache.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**EnALS, bit [56]**

**When FEAT_LS64 is implemented:**

When **HCR_EL2.{E2H, TGE} != {1, 1}**, traps execution of an LD64B or ST64B instruction at EL0 to EL1.

<table>
<thead>
<tr>
<th>EnALS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of an LD64B or ST64B instruction at EL0 is trapped to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

A trap of an LD64B or ST64B instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000002.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**EnAS0, bit [55]**

**When FEAT_LS64 is implemented:**

When **HCR_EL2.{E2H, TGE} != {1, 1}**, traps execution of an ST64BV0 instruction at EL0 to EL1.

<table>
<thead>
<tr>
<th>EnAS0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of an ST64BV0 instruction at EL0 is trapped to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000001.
On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**EnASR, bit [54]**

**When FEAT_LS64 is implemented:**

When \( HCR\_{EL2}.\{E2H, TGE\} \neq \{1, 1\} \), traps execution of an ST64BV instruction at EL0 to EL1.

<table>
<thead>
<tr>
<th>EnASR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of an ST64BV instruction at EL0 is trapped to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

A trap of an ST64BV instruction is reported using an ESR\_ELx.EC value of 0x0A, with an ISS code of 0x00000000.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TME, bit [53]**

**When FEAT_TME is implemented:**

Enables the Transactional Memory Extension at EL1.

<table>
<thead>
<tr>
<th>TME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a TSTART instruction at EL1 is trapped to EL1, unless ( HCR_{EL2}.TME ) or ( SCR_{EL3}.TME ) causes TSTART instructions to be <strong>UNDEFINED</strong> at EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any TSTART instruction to be trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TME0, bit [52]**

**When FEAT_TME is implemented:**

Enables the Transactional Memory Extension at EL0.

<table>
<thead>
<tr>
<th>TME0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a TSTART instruction at EL0 is trapped to EL1, unless ( HCR_{EL2}.TME ) or ( SCR_{EL3}.TME ) causes TSTART instructions to be <strong>UNDEFINED</strong> at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any TSTART instruction to be trapped.</td>
</tr>
</tbody>
</table>

If FEAT\_VHE is implemented, EL2 is implemented and enabled in the current Security state, and \( HCR\_{EL2}.\{E2H, TGE\} \neq \{1,1\} \), this field has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**TMT, bit [51]**

*When FEAT_TME is implemented:*

Forces a trivial implementation of the Transactional Memory Extension at EL1.

<table>
<thead>
<tr>
<th>TMT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any TSTART instruction to fail.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the TSTART instruction is executed at EL1, the transaction fails with a TRIVIAL failure cause.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TMT0, bit [50]**

*When FEAT_TME is implemented:*

Forces a trivial implementation of the Transactional Memory Extension at EL0.

<table>
<thead>
<tr>
<th>TMT0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any TSTART instruction to fail.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the TSTART instruction is executed at EL0, the transaction fails with a TRIVIAL failure cause.</td>
</tr>
</tbody>
</table>

*If FEAT_VHE is implemented, EL2 is implemented and enabled in the current Security state, and HCR_EL2.{E2H, TGE} == {1,1}, this field has no effect on execution at EL0.*

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TWEDEL, bits [49:46]**

*When FEAT_TWED is implemented:*

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL1.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by SCTLR_EL1.nTWE as $2^{(TWEDEL + 8)}$ cycles.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TWEDEn, bit [45]**

*When FEAT_TWED is implemented:*

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by SCTLR_EL1.nTWE.
### TWDEn

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>The delay for taking the trap is IMPLEMENTATION DEFINED.</td>
<td>0b0</td>
</tr>
<tr>
<td>The delay for taking the trap is at least the number of cycles defined in SCTLR_EL1.TWDE1.</td>
<td>0b1</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### DSSBS, bit [44]

When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry. The defined values are:

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>PSTATE.SSBS is set to 0 on an exception to EL1.</td>
<td>0b0</td>
</tr>
<tr>
<td>PSTATE.SSBS is set to 1 on an exception to EL1.</td>
<td>0b1</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL1, this field resets to an IMPLEMENTATION DEFINED value.

**Otherwise:**

Reserved, RES0.

### ATA, bit [43]

When FEAT_MTE2 is implemented:

Allocation Tag Access in EL1. When SCR_EL3.ATA=1 and HCR_EL2.ATA=1, controls EL1 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access to Allocation Tags is prevented.</td>
<td>0b0</td>
</tr>
<tr>
<td>Access to Allocation Tags is not prevented.</td>
<td>0b1</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### ATA0, bit [42]

When FEAT_MTE2 is implemented:

Allocation Tag Access in EL0. When SCR_EL3.ATA=1, HCR_EL2.ATA=1, and HCR_EL2.{E2H, TGE} != {1, 1}, controls EL0 access to Allocation Tags.
When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

<table>
<thead>
<tr>
<th>ATA0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to Allocation Tags is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to Allocation Tags is not prevented.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

**Note**
Software may change this control bit on a context switch.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TCF, bits [41:40]**

**When FEAT_MTE2 is implemented:**

Tag Check Fault in EL1. Controls the effect of Tag Check Faults due to Loads and Stores in EL1.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

<table>
<thead>
<tr>
<th>TCF</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Tag Check Faults have no effect on the PE.</td>
<td></td>
</tr>
<tr>
<td>0b01</td>
<td>Tag Check Faults cause a synchronous exception.</td>
<td></td>
</tr>
<tr>
<td>0b10</td>
<td>Tag Check Faults are asynchronously accumulated.</td>
<td></td>
</tr>
<tr>
<td>0b11</td>
<td>Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.</td>
<td>When FEAT_MTE3 is implemented</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TCF0, bits [39:38]**

**When FEAT_MTE2 is implemented:**

Tag Check Fault in EL0. When HCR_EL2.{E2H,TGE} ! = {1,1}, controls the effect of Tag Check Faults due to Loads and Stores in EL0.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

**Note**
Software may change this control bit on a context switch.

<table>
<thead>
<tr>
<th>TCF0</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Tag Check Faults have no effect on the PE.</td>
<td></td>
</tr>
<tr>
<td>0b01</td>
<td>Tag Check Faults cause a synchronous exception.</td>
<td></td>
</tr>
<tr>
<td>0b10</td>
<td>Tag Check Faults are asynchronously accumulated.</td>
<td>When FEAT_MTE3 is implemented</td>
</tr>
<tr>
<td>0b11</td>
<td>Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.</td>
<td></td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**ITFSB, bit [37]**

**When FEAT_MTE2 is implemented:**

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL1, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into **TFSRE0_EL1** and **TFSR_EL1** registers.

<table>
<thead>
<tr>
<th>ITFSB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tag Check Faults are not synchronized on entry to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tag Check Faults are synchronized on entry to EL1.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**BT1, bit [36]**

**When FEAT_BT1 is implemented:**

PAC Branch Type compatibility at EL1.

<table>
<thead>
<tr>
<th>BT1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When the PE is executing at EL1, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the PE is executing at EL1, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**BT0, bit [35]**

**When FEAT_BT0 is implemented:**

PAC Branch Type compatibility at EL0.
When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.

When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

When $\text{HCR\_EL2.E2H} == 1$ && $\text{HCR\_EL2.TGE} == 1$, the value of the SCTLR\_EL1.BT0 has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Reserved:**

Reserved, RES0.

**Bits [34:32]**

Reserved, RES0.

**EnIA, bit [31]**

When FEAT\_PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey\_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see ‘System register control of pointer authentication’.

<table>
<thead>
<tr>
<th>EnIA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Reserved:**

Reserved, RES0.

**EnIB, bit [30]**

When FEAT\_PAuth is implemented:

Controls enabling of pointer authentication (using the APIBKey\_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see ‘System register control of pointer authentication’.

<table>
<thead>
<tr>
<th>EnIB</th>
<th>Meaning</th>
</tr>

<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.
This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**LSMAOE, bit [29]**

**When FEAT_LSMAOC is implemented:**

Load Multiple and Store Multiple Atomicity and Ordering Enable.

<table>
<thead>
<tr>
<th>LSMAOE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered. The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.</td>
</tr>
<tr>
<td>0b1</td>
<td>This bit is permitted to be cached in a TLB.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.\{E2H, TGE\} is \{1,1\}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES1.

**nTLSMD, bit [28]**

**When FEAT_LSMAOC is implemented:**

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

<table>
<thead>
<tr>
<th>nTLSMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.</td>
</tr>
<tr>
<td>0b1</td>
<td>All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.\{E2H, TGE\} is \{1,1\}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES1.

**EnDA, bit [27]**

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see ‘System register control of pointer authentication’.

<table>
<thead>
<tr>
<th>EnDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**UCI, bit [26]**

Traps EL0 execution of cache maintenance instructions, to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

This applies to **DC CVAU, DC CIVAC, DC CVAC, DC CVAP**, and **IC IVAU**.

If FEAT_DPB2 is implemented, this trap also applies to **DC CVADP**.

If FEAT_MTE2 is implemented, this trap also applies to **DC CIGVAC, DC CIGDVAC, DC CGVAC, DC CGDVAC, DC CGVAP**, and **DC CGDVAP**.

If FEAT_DPB2 and FEAT_MTE2 are implemented, this trap also applies to **DC CGVADP** and **DC CGDVADP**.

<table>
<thead>
<tr>
<th>UCI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of the specified instructions at EL0 using AArch64 is trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

If the Point of Coherency is before any level of data cache, it is **IMPLEMENTATION DEFINED** whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is **IMPLEMENTATION DEFINED** whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.
If the Point of Unification is before any level of instruction cache, it is **IMPLEMENTATION DEFINED** whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**EE, bit [25]**

Endianness of data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime.

The possible values of this bit are:

<table>
<thead>
<tr>
<th>EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&amp;0 translation regime are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&amp;0 translation regime are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is **RES0**.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is **RES1**.

The EE bit is permitted to be cached in a TLB.

When **FEAT_VHE** is implemented, and the value of **HCR_EL2.(E2H, TGE)** is {1, 1}, this bit has no effect on the PE.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an **IMPLEMENTATION DEFINED** value.

**E0E, bit [24]**

Endianness of data accesses at EL0.

The possible values of this bit are:

<table>
<thead>
<tr>
<th>E0E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL0 are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL0 are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation only supports Little-endian accesses at EL0 then this bit is **RES0**. This option is not permitted when **SCTLR_EL1.EE** is **RES1**.

If an implementation only supports Big-endian accesses at EL0 then this bit is **RES1**. This option is not permitted when **SCTLR_EL1.EE** is **RES0**.

This bit has no effect on the endianness of **LDTR**, **LDTRH**, **LDTRSH**, **LDTRSW**, **STTR**, and **STTRH** instructions executed at EL1.

When **FEAT_VHE** is implemented, and the value of **HCR_EL2.(E2H, TGE)** is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**SPAN, bit [23]**

When **FEAT_PAN** is implemented:

Set Privileged Access Never, on taking an exception to EL1.

<table>
<thead>
<tr>
<th>SPAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.PAN is set to 1 on taking an exception to EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The value of PSTATE.PAN is left unchanged on taking an exception to EL1.</td>
</tr>
</tbody>
</table>

When **FEAT_VHE** is implemented, and the value of **HCR_EL2.(E2H, TGE)** is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES1.

**EIS, bit [22]**

When FEAT_ExS is implemented:

Exception Entry is Context Synchronizing. The defined values are:

<table>
<thead>
<tr>
<th>EIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The taking of an exception to EL1 is not a context synchronizing event.</td>
</tr>
<tr>
<td>0b1</td>
<td>The taking of an exception to EL1 is a context synchronizing event.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of **HCR_EL2**.E2H, TGE is {1,1}, this bit has no effect on execution at EL0.

If SCTLR_EL1.EIS is set to 0b0:

- Indirect writes to **ESR_EL1, FAR_EL1, SPSR_EL1, ELR_EL1** are synchronized on exception entry to EL1, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL1.EIS:

- Changes to the PSTATE information on entry to EL1.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

**IESB, bit [21]**

When FEAT_IESB is implemented:

Implicit Error Synchronization event enable. Possible values are:

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>An implicit error synchronization event is added:</td>
</tr>
<tr>
<td></td>
<td>• At each exception taken to EL1.</td>
</tr>
<tr>
<td></td>
<td>• Before the operational pseudocode of each ERET instruction executed at EL1.</td>
</tr>
</tbody>
</table>

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL1 and before each DRPS instruction executed at EL1, in addition to the other cases where it is added.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
SCTLR_EL1, System Control Register (EL1)

**TSCXT, bit [20]**

When FEAT_CSV2 is implemented:

Trap EL0 Access to the `SCXTNUM_EL0` register, when EL0 is using AArch64. The defined values are:

<table>
<thead>
<tr>
<th>TSCXT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 access to <code>SCXTNUM_EL0</code> is not disabled by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 access to <code>SCXTNUM_EL0</code> is disabled, causing an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and <code>HCR_EL2.TGE</code> is 1. The value of <code>SCXTNUM_EL0</code> is treated as 0.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of `HCR_EL2.{E2H, TGE}` is \{1,1\}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally `UNKNOWN` value.

**Otherwise:**

Reserved, `RES1`.

**WXN, bit [19]**

Write permission implies XN (Execute-never). For the EL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the EL1&amp;0 translation regime is forced to XN for accesses from software executing at EL1 or EL0.</td>
</tr>
</tbody>
</table>

This bit applies only when SCTLR_EL1.M bit is set.

The WXN bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of `HCR_EL2.{E2H, TGE}` is \{1,1\}, this bit has no effect on the PE.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally `UNKNOWN` value.

**nTWE, bit [18]**

Traps EL0 execution of WFE instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and `HCR_EL2.TGE` is 1, from both Execution states, reported using an ESR_ELx.EC value of 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

<table>
<thead>
<tr>
<th>nTWE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a WFE instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.
When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Bit [17]**

Reserved, RES0.

**nTWI, bit [16]**

Traps EL0 execution of WFI instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states, reported using an ESR_ELx.EC value of 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction.

<table>
<thead>
<tr>
<th>nTWI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a WFI instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**UCT, bit [15]**

Traps EL0 accesses to the CTR_EL0 to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

<table>
<thead>
<tr>
<th>UCT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to the CTR_EL0 from EL0 using AArch64 are trapped.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**DZE, bit [14]**

Traps EL0 execution of DC ZVA instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

If FEAT_MTE2 is implemented, this trap also applies to DC GVA and DC GZVA.

<table>
<thead>
<tr>
<th>DZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped.</td>
</tr>
<tr>
<td></td>
<td>Reading DCZID_EL0.DZP from EL0 returns 1, indicating that the instructions this trap applies to are not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>
When FEAT_VHE is implemented, and the value of \texttt{HCR_EL2} \{E2H, TGE\} is \{1, 1\}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally \texttt{UNKNOWN} value.

**EnDB, bit [13]**

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDBKey\_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see ‘System register control of pointer authentication’.

<table>
<thead>
<tr>
<th>EnDB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally \texttt{UNKNOWN} value.

Otherwise:

Reserved, \texttt{RES0}.

**I, bit [12]**

Stage 1 instruction access Cacheability control, for accesses at EL0 and EL1:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All instruction access to Stage 1 Normal memory from EL0 and EL1 are Stage 1 Non-cacheable. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&amp;0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control has no effect on the Stage 1 Cacheability of instruction access to Stage 1 Normal memory from EL0 and EL1. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&amp;0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.</td>
</tr>
</tbody>
</table>

When the value of the \texttt{HCR_EL2} DC bit is 1, then instruction access to Normal memory from EL0 and EL1 are Cacheable regardless of the value of the SCTLR\_EL1.1 bit.

When FEAT_VHE is implemented, and the value of \texttt{HCR_EL2} \{E2H, TGE\} is \{1, 1\}, this bit has no effect on the PE.

On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

**EOS, bit [11]**

When FEAT_ExS is implemented:

Exception Exit is Context Synchronizing. The defined values are:
<table>
<thead>
<tr>
<th>EOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An exception return from EL1 is not a context synchronizing event</td>
</tr>
<tr>
<td>0b1</td>
<td>An exception return from EL1 is a context synchronizing event</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is {1,1}, this bit has no effect on execution at EL0.

If SCTLR_EL1.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL1.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL1 and ELR_EL1 on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

**EnRCTX, bit [10]**

When FEAT_SPECRES is implemented:

Enable EL0 Access to the following instructions:

- AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions.
- AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions.

The defined values are:

<table>
<thead>
<tr>
<th>EnRCTX</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 access to these instructions is disabled, and these instructions are trapped to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 access to these instructions is enabled.</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is {1,1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**UMA, bit [9]**

User Mask Access. Traps EL0 execution of MSR and MRS instructions that access the PSTATE.(D, A, I, F) masks to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.
### UMA

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

When FEAT_VHE is implemented, and the value of `HCR_EL2.(E2H, TGE)` is `{1, 1}`, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

### SED, bit [8]

**When EL0 is capable of using AArch32:**

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

If the implementation does not support mixed-endian operation at any Exception level, this bit is **RES**.

When FEAT_VHE is implemented, and the value of `HCR_EL2.(E2H, TGE)` is `{1, 1}`, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES**.

### ITD, bit [7]

**When EL0 is capable of using AArch32:**

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.
<table>
<thead>
<tr>
<th>ITD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All IT instruction functionality is enabled at EL0 using AArch32.</td>
</tr>
</tbody>
</table>
| 0b1 | Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED and generates an exception, reported using an ESR_ELx.EC value of 0x00, to EL1 or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1:  
  - All encodings of the IT instruction with hw1[3:0]=1000.  
  - All encodings of the subsequent instruction with the following values for hw1:  
    - 0b11xxxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.  
    - 0b1011xxxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section F3.2.5.  
    - 0b10100xxxxxxxxxxx: ADD Rd, PC, #imm  
    - 0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm]  
    - 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.  
    - 0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.  
  These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.  
  It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:  
  - A 16-bit instruction, that can only be followed by another 16-bit instruction.  
  - The first half of a 32-bit instruction.  
  This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction. |

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAZ/WI.

When FEAT_VHE is implemented, and the value of HCR_EL2.({E2H, TGE}) is \{1, 1\}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nAA, bit [6]

When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL1 and EL0 under certain conditions.
nAA | Meaning
---|---
0b0 | LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLUR, STLURH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.
0b1 | This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLUR, STLURH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is \{1, 1\}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**CP15BEN, bit [5]**

When EL0 is capable of using AArch32:

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

<table>
<thead>
<tr>
<th>CP15BEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED and generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1. The exception is reported using an ESR_ELx.EC value of 0x80.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.</td>
</tr>
</tbody>
</table>

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAO/WI.

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is \{1, 1\}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**SA0, bit [4]**

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is \{1, 1\}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.
SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL1 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see ‘SP alignment checking’.

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is \{1, 1\}, this bit has no effect on the PE.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Stage 1 Cacheability control, for data accesses.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All data access to Stage 1 Normal memory from EL0 and EL1, and all Normal memory accesses from unified cache to the EL1&amp;0 Stage 1 translation tables, are treated as Stage 1 Non-cacheable.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control has no effect on the Stage 1 Cacheability of:</td>
</tr>
<tr>
<td></td>
<td>• Data access to Normal memory from EL0 and EL1.</td>
</tr>
<tr>
<td></td>
<td>• Normal memory accesses to the EL1&amp;0 Stage 1 translation tables.</td>
</tr>
</tbody>
</table>

When the value of the HCR_EL2.DC bit is 1, the PE ignores SCTLR.C. This means that Non-secure EL0 and Non-secure EL1 data accesses to Normal memory are Cacheable.

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is \{1, 1\}, this bit has no effect on the PE.

On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL1 and EL0.

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Alignment fault checking disabled when executing at EL1 or EL0.</td>
</tr>
<tr>
<td></td>
<td>Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Alignment fault checking enabled when executing at EL1 or EL0.</td>
</tr>
<tr>
<td></td>
<td>All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.</td>
</tr>
</tbody>
</table>

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is \{1, 1\}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL1&0 stage 1 address translation.

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL1&amp;0 stage 1 address translation disabled.</td>
</tr>
<tr>
<td></td>
<td>See the SCTLR_EL1.I field for the behavior of instruction accesses to Normal memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL1&amp;0 stage 1 address translation enabled.</td>
</tr>
</tbody>
</table>

If the value of HCR_EL2.(DC, TGE) is not \{0, 0\} then in Non-secure state the PE behaves as if the value of the SCTLR_EL1.M field is 0 for all purposes other than returning the value of a direct read of the field.
When \texttt{FEAT\_VHE} is implemented, and the value of \texttt{HCR\_EL2.\{E2H, TGE\}} is \{1, 1\}, this bit has no effect on the PE.

On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

### Accessing the SCTLR\_EL1

When \texttt{HCR\_EL2.E2H} is 1, without explicit synchronization, access from EL3 using the mnemonic SCTLR\_EL1 or SCTLR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

\begin{verbatim}
MRS <Xt>, SCTLR\_EL1
\end{verbatim}

\begin{tabular}{|c|c|c|c|c|}
\hline
op0 & op1 & CRn & CRm & op2 \\
\hline
0b11 & 0b000 & 0b0001 & 0b0000 & 0b000 \\
\hline
\end{tabular}

\begin{verbatim}
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR\_EL2.TVM == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);

SCTLR_EL2, System Control Register (EL2)

The SCTLR_EL2 characteristics are:

**Purpose**

Provides top level control of the system, including its memory system, at EL2.

When FEAT_VHE is implemented, and the value of HCR_EL2.(E2H, TGE) is \{1, 1\}, these controls apply also to execution at EL0.

**Configuration**

AArch64 System register SCTLR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSCTLR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

SCTLR_EL2 is a 64-bit register.

**Field descriptions**

The SCTLR_EL2 bit assignments are:

**When HCR_EL2.E2H != 1 or HCR_EL2.TGE != 1:**

This format applies in all Armv8.0 implementations, and from Armv8.1 when the Effective value of HCR_EL2.(E2H, TGE) != \{1, 1\}.

**Bits [63:54]**

Reserved, RES0.

**TME, bit [53]**

When FEAT_TME is implemented:

 Enables the Transactional Memory Extension at EL2.

<table>
<thead>
<tr>
<th>TME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a TSTART instruction at EL2 is trapped, unless HCR_EL2.TME or SCR_EL2.TME causes TSTART instructions to be UNDEFINED at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any TSTART instruction to be trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

**Bit [52]**
Reserved, RES0.

**TMT, bit [51]**

When **FEAT_TME** is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL2.

<table>
<thead>
<tr>
<th>TMT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any TSTART instruction to fail.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the TSTART instruction is executed at EL2, the transaction fails with a TRIVIAL failure cause.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

Otherwise:
Reserved, RES0.

**Bits [50:45]**
Reserved, RES0.

**DSSBS, bit [44]**

When **FEAT_SSBS** is implemented:

Default PSTATE.SSBS value on Exception Entry.

<table>
<thead>
<tr>
<th>DSSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.SSBS is set to 0 on an exception to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>PSTATE.SSBS is set to 1 on an exception to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an **IMPLEMENTATION DEFINED** value.

Otherwise:
Reserved, RES0.

**ATA, bit [43]**

When **FEAT_MTE2** is implemented:

Allocation Tag Access in EL2. When SCR_EL3.ATA is 1, controls EL2 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.
Access to Allocation Tags is prevented.

Access to Allocation Tags is not prevented.

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

TCF, bits [41:40]

When FEAT_MTE2 is implemented:

Tag Check Fault. Controls the effect of Tag Check Faults due to Loads and Stores in EL2.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

<table>
<thead>
<tr>
<th>TCF</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tag Check Faults have no effect on the PE.</td>
</tr>
<tr>
<td>0b01</td>
<td>Tag Check Faults cause a synchronous exception.</td>
</tr>
<tr>
<td>0b10</td>
<td>Tag Check Faults are asynchronously accumulated.</td>
</tr>
<tr>
<td>0b11</td>
<td>Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

ITFSB, bit [37]

When FEAT_MTE2 is implemented:

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL2, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into TFSRE0_EL1, TFSR_EL1, and TFSR_EL2 registers.

<table>
<thead>
<tr>
<th>ITFSB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tag Check Faults are not synchronized on entry to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tag Check Faults are synchronized on entry to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.
BT, bit [36]

When FEAT_BT1 is implemented:

PAC Branch Type compatibility at EL2.

<table>
<thead>
<tr>
<th>BT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>When the PE is executing at EL2, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the PE is executing at EL2, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:32]

Reserved, RES0.

EnIA, bit [31]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

<table>
<thead>
<tr>
<th>EnIA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.
Meaning

<table>
<thead>
<tr>
<th>EnIB</th>
<th>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:28]

Reserved, RES1.

EnDA, bit [27]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

Meaning

<table>
<thead>
<tr>
<th>EnDA</th>
<th>Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime.
## SCTLR_EL2, System Control Register (EL2)

### EE

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0b0</strong> Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&amp;0 translation regime, and stage 2 translation table walks in the EL1&amp;0 translation regime are little-endian.</td>
</tr>
<tr>
<td><strong>0b1</strong> Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&amp;0 translation regime, and stage 2 translation table walks in the EL1&amp;0 translation regime are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is `RES0`.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is `RES1`.

The EE bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an **IMPLEMENTATION DEFINED** value.

### Bit [24]

Reserved, `RES0`.

### Bit [23]

Reserved, `RES1`.

### EIS, bit [22]

**When FEAT_ExS is implemented:**

Exception entry is a context synchronization event.

<table>
<thead>
<tr>
<th>EIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0b0</strong></td>
<td>The taking of an exception to EL2 is not a context synchronization event.</td>
</tr>
<tr>
<td><strong>0b1</strong></td>
<td>The taking of an exception to EL2 is a context synchronization event.</td>
</tr>
</tbody>
</table>

If SCTLR_EL2.EIS is set to **0b0**:

- Indirect writes to `ESR_EL2`, `FAR_EL2`, `SPSR_EL2`, `ELR_EL2`, and `HPFAR_EL2` are synchronized on exception entry to EL2, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EIS:

- Changes to the PSTATE information on entry to EL2.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, `RES1`.

### IESB, bit [21]

**When FEAT_IESB is implemented:**

Implicit Error Synchronization event enable.
IESB

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disabled.</td>
</tr>
<tr>
<td>An implicit error synchronization event is added:</td>
</tr>
<tr>
<td>• At each exception taken to EL2.</td>
</tr>
<tr>
<td>• Before the operational pseudocode of each ERET instruction executed at EL2.</td>
</tr>
</tbody>
</table>

When the PE is in Debug state, the effect of this field is **CONSTRAINED UNPREDICTABLE**, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**Bit [20]**

Reserved, RES0.

**WXN, bit [19]**

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN.

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the EL2 or EL2&amp;0 translation regime is forced to XN for accesses from software executing at EL2.</td>
</tr>
</tbody>
</table>

This bit applies only when SCTLR_EL2.M bit is set.

The WXN bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Bit [18]**

Reserved, RES1.

**Bit [17]**

Reserved, RES0.

**Bit [16]**

Reserved, RES1.

**Bits [15:14]**

Reserved, RES0.

**EnDB, bit [13]**

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.
For more information, see ‘System register control of pointer authentication’.

<table>
<thead>
<tr>
<th>EnDB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**I, bit [12]**

Instruction access Cacheability control, for accesses at EL2:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All instruction accesses to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&amp;0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control has no effect on the Cacheability of instruction access to Normal memory from EL2. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&amp;0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.</td>
</tr>
</tbody>
</table>

This bit has no effect on the EL1&0 or EL3 translation regimes.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**EOS, bit [11]**

When FEAT_ExS is implemented:

Exception exit is a context synchronization event.

<table>
<thead>
<tr>
<th>EOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An exception return from EL2 is not a context synchronization event.</td>
</tr>
<tr>
<td>0b1</td>
<td>An exception return from EL2 is a context synchronization event.</td>
</tr>
</tbody>
</table>

If SCTLR_EL2.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EOS:

- The indirect write of the PSTATE and PC values from **SPSR_EL2** and **ELR_EL2** on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES1.

**Bits [10:7]**

Reserved, RES0.

**nAA, bit [6]**

When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL2 under certain conditions.

<table>
<thead>
<tr>
<th>nAA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLUR, STLURH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLUR, STLURH, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bits [5:4]**

Reserved, RES1.

**SA, bit [3]**

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see ‘SP alignment checking’.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**C, bit [2]**

Cacheability control, for data accesses.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All data accesses to Normal memory from EL2, and all Normal memory accesses to the EL2 translation tables, are Non-cacheable for all levels of data and unified cache.</td>
</tr>
</tbody>
</table>
| 0b1 | This control has no effect on the Cacheability of:  
|     | • Data access to Normal memory from EL2.  
|     | • Normal memory accesses to the EL2 translation tables. |

This bit has no effect on the EL1&0 or EL3 translation regimes.
On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**A, bit [1]**

Alignment check enable. This is the enable bit for Alignment fault checking at EL2:

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Alignment fault checking disabled when executing at EL2.</td>
</tr>
<tr>
<td></td>
<td>Instructions that load or store one or more registers, other than</td>
</tr>
<tr>
<td></td>
<td>load/store exclusive and load-acquire/store-release, do not check</td>
</tr>
<tr>
<td></td>
<td>that the address being accessed is aligned to the size of the data</td>
</tr>
<tr>
<td></td>
<td>element(s) being accessed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Alignment fault checking enabled when executing at EL2.</td>
</tr>
<tr>
<td></td>
<td>All instructions that load or store one or more registers have an</td>
</tr>
<tr>
<td></td>
<td>alignment check that the address being accessed is aligned to the</td>
</tr>
<tr>
<td></td>
<td>size of the data element(s) being accessed. If this check fails it</td>
</tr>
<tr>
<td></td>
<td>causes an Alignment fault, which is taken as a Data Abort exception.</td>
</tr>
</tbody>
</table>

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**M, bit [0]**

MMU enable for EL2 stage 1 address translation.

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2 stage 1 address translation disabled.</td>
</tr>
<tr>
<td></td>
<td>See the SCTLR_EL2.I field for the behavior of instruction accesses</td>
</tr>
<tr>
<td></td>
<td>to Normal memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2 stage 1 address translation enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

This format applies only from Armv8.1 when EL2 is enabled in the current Security state and **HCR_EL2.**{E2H, TGE} == {1, 1}.

**Bits [63:60]**

Reserved, RES0.

**EnCSR0, bits [59:58]**

When **FEAT_CSRE** is implemented:

EL0 Call Stack Recorder Enable.

Controls access to the EL0 Call Stack Recorder registers from EL0:

- When EL2 is implemented and enabled for the current Security state and **HCR_EL2.**{E2H, TGE} == {1, 1}, this field controls traps to EL2.
- Otherwise, this field has no effect.
## EnCSR0

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0b00</strong></td>
</tr>
<tr>
<td><strong>0b01</strong></td>
</tr>
<tr>
<td><strong>0b11</strong></td>
</tr>
</tbody>
</table>

All other values are reserved.

The EL0 Call Stack recorder registers trapped by this control are: `CSRCR_EL0`, `CSRIDR_EL0`, `CSRPRIDX_EL0`, and `CSRPTR_EL0`.

Traps are reported using an `ESR_EL2`.EC value of 0x18.

Traps are not taken if there is a higher priority exception generated by the access.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

## EPAN, bit [57]

### When FEAT_PAN3 is implemented:

Enhanced Privileged Access Never. When PSTATE.PAN is 1, determines whether an EL2 data access to a page with EL0 instruction access permission generates a Permission fault as a result of the Privileged Access Never mechanism.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0b0</strong></td>
</tr>
<tr>
<td><strong>0b1</strong></td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

## EnALS, bit [56]

### When FEAT_LS64 is implemented:

Traps execution of an LD64B or ST64B instruction at EL0 to EL2.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0b0</strong></td>
</tr>
<tr>
<td><strong>0b1</strong></td>
</tr>
</tbody>
</table>

A trap of an LD64B or ST64B instruction is reported using an `ESR_ELx`.EC value of 0x0A, with an ISS code of 0x00000002.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**EnAS0, bit [55]**

When FEAT_LS64 is implemented:

Traps execution of an ST64BV0 instruction at EL0 to EL2.

<table>
<thead>
<tr>
<th>EnAS0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of an ST64BV0 instruction at EL0 is trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x00000001.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**EnASR, bit [54]**

When FEAT_LS64 is implemented:

Traps execution of an ST64BV instruction at EL0 to EL2.

<table>
<thead>
<tr>
<th>EnASR</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Execution of an ST64BV instruction at EL0 is trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

A trap of an ST64BV instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x00000000.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**TME, bit [53]**

When FEAT_TME is implemented:

Enables the Transactional Memory Extension at EL2.

<table>
<thead>
<tr>
<th>TME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a TSTART instruction at EL2 is trapped, unless <strong>HCR_EL2.TME</strong> or <strong>SCR_EL3.TME</strong> causes TSTART instructions to be <strong>UNDEFINED</strong> at EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any TSTART instruction to be trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.
**TME0, bit [52]**

**When FEAT_TME is implemented:**

Enables the Transactional Memory Extension at EL0.

<table>
<thead>
<tr>
<th>TME0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a TSTART instruction at EL0 is trapped to EL2, unless \texttt{HCR_EL2.TME} or \texttt{SCR_EL3.TME} causes TSTART instructions to be UNDEFINED at EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any TSTART instruction to be trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TMT, bit [51]**

**When FEAT_TME is implemented:**

Forces a trivial implementation of the Transactional Memory Extension at EL2.

<table>
<thead>
<tr>
<th>TMT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any TSTART instruction to fail.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the TSTART instruction is executed at EL2, the transaction fails with a TRIVIAL failure cause.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TMT0, bit [50]**

**When FEAT_TME is implemented:**

Forces a trivial implementation of the Transactional Memory Extension at EL0.

<table>
<thead>
<tr>
<th>TMT0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any TSTART instruction to fail.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the TSTART instruction is executed at EL0, the transaction fails with a TRIVIAL failure cause.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TWEDEL, bits [49:46]**

**When FEAT_TWED is implemented:**

TWE Delay. A 4-bit unsigned number that, when SCTLR\_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by SCTLR\_EL2.nTWE as $2^{(TWEDEL + 8)}$ cycles.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
**TWEDEn, bit [45]**

When FEAT_TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by SCTLR_EL2.nTWE.

<table>
<thead>
<tr>
<th>TWEDEn</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The delay for taking a WFE trap is IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>0b1</td>
<td>The delay for taking a WFE trap is at least the number of cycles defined in SCTLR_EL2.TWEDEL.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**DSSBS, bit [44]**

When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

<table>
<thead>
<tr>
<th>DSSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.SSBS is set to 0 on an exception to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>PSTATE.SSBS is set to 1 on an exception to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

**ATA, bit [43]**

When FEAT_MTE2 is implemented:

Allocation Tag Access in EL2. When SCR_EL3.ATA is 1, controls EL2 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

<table>
<thead>
<tr>
<th>ATA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to Allocation Tags is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to Allocation Tags is not prevented.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**ATA0, bit [42]**

When **FEAT_MTE2** is implemented:

Allocation Tag Access in EL0. When **SCR_EL3.ATA** is 1, controls EL0 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

<table>
<thead>
<tr>
<th>ATA0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to Allocation Tags is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to Allocation Tags is not prevented.</td>
</tr>
</tbody>
</table>

This field is permitted to be cached in a TLB.

**Note**

Software may change this control bit on a context switch.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**TCF, bits [41:40]**

When **FEAT_MTE2** is implemented:

Tag Check Fault in EL2. Controls the effect of Tag Check Faults due to Loads and Stores in EL2.

If **FEAT_MTE3** is not implemented, the value 0b11 is reserved.

<table>
<thead>
<tr>
<th>TCF</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Tag Check Faults have no effect on the PE.</td>
<td></td>

<td>When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**Bits [34:32]**

Reserved, RES0.

**EnIA, bit [31]**

*When FEAT_PAuth is implemented:*

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

<table>
<thead>
<tr>
<th>EnIA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**EnIB, bit [30]**

*When FEAT_PAuth is implemented:*

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.
For more information, see 'System register control of pointer authentication'.

<table>
<thead>
<tr>
<th>EnIB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.</td>

<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**LSMAOE, bit [29]**

*When FEAT_LSMAOC is implemented:*

Load Multiple and Store Multiple Atomicity and Ordering Enable.

<table>
<thead>
<tr>
<th>LSMAOE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.</td>
</tr>
<tr>
<td>0b1</td>
<td>The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES1.

**nTLSMD, bit [28]**

*When FEAT_LSMAOC is implemented:*

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

<table>
<thead>
<tr>
<th>nTLSMD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.</td>
</tr>
<tr>
<td>0b1</td>
<td>All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES1.

**EnDA, bit [27]**

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see ‘System register control of pointer authentication’.

<table>
<thead>
<tr>
<th>EnDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**UCI, bit [26]**

Traps execution of cache maintenance instructions at EL0 to EL2, from AArch64 state only. This applies to DC_CVAU, DC_CIVAC, DC_CVAC, DC_CVAP, and IC_IVAU.

If FEAT_DPB2 is implemented, this trap also applies to DC_CVADP.

If FEAT_MTE2 is implemented, this trap also applies to DC_CIGVAC, DC_CIGDVAC, DC_CGVC, DC_CGDVC, DC_CGVAP, and DC_CGDVAP.

If FEAT_DPB2 and FEAT_MTE2 are implemented, this trap also applies to DC_CGVADP and DC_CGDVADP.

<table>
<thead>
<tr>
<th>UCI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
EE, bit [25]

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL2&0 translation regime.

<table>
<thead>
<tr>
<th>EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&amp;0 translation regime, and stage 2 translation table walks in the EL2&amp;0 translation regime are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&amp;0 translation regime, and stage 2 translation table walks in the EL2&amp;0 translation regime are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

E0E, bit [24]

Endianness of data accesses at EL0.

<table>
<thead>
<tr>
<th>E0E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL0 are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL0 are big-endian.</td>
</tr>
</tbody>
</table>

If an implementation only supports Little-endian accesses at EL0 then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0 then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

SPAN, bit [23]

Set Privileged Access Never, on taking an exception to EL2.

<table>
<thead>
<tr>
<th>SPAN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.PAN is set to 1 on taking an exception to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>The value of PSTATE.PAN is left unchanged on taking an exception to EL2.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

EIS, bit [22]

When FEAT_ExS is implemented:

Exception entry is a context synchronization event.

<table>
<thead>
<tr>
<th>EIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The taking of an exception to EL2 is not a context synchronization event.</td>
</tr>
<tr>
<td>0b1</td>
<td>The taking of an exception to EL2 is a context synchronization event.</td>
</tr>
</tbody>
</table>

If SCTLR_EL2.EIS is set to 0b0:

- Indirect writes to ESR_EL2, FAR_EL2, SPSR_EL2, ELR_EL2, and HPFAR_EL2 are synchronized on exception entry to EL2, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
• Memory transactions, including instruction fetches, from an Exception level always use the translation
resources associated with that translation regime.
• Exception Catch debug events are synchronous debug events.
• DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EIS:

• Changes to the PSTATE information on entry to EL2.
• Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and
data processing instructions.
• Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES1.

IESB, bit [21]

When FEAT_IESB is implemented:

Implicit Error Synchronization event enable.

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled.</td>
</tr>
</tbody>
</table>
| 0b1  | An implicit error synchronization event is added:  
|      | • At each exception taken to EL2. |
|      | • Before the operational pseudocode of each ERET instruction  
|      | executed at EL2. |

When the PE is in Debug state, the effect of this field is constrained unpredictable, and its Effective value might be 0
or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization
event is added after each DCPSX instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition
to the other cases where it is added.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]

When FEAT_CSV2 is implemented:

Trap EL0 Access to the SCXTNUM_EL0 register, when EL0 is using AArch64.

<table>
<thead>
<tr>
<th>TSCXT</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 0b0   | EL0 access to SCXTNUM_EL0 is not disabled by this  
|      | mechanism. |
| 0b1   | EL0 access to SCXTNUM_EL0 is disabled, causing an  
|      | exception to EL2, and the SCXTNUM_EL0 value is treated at 0. |

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES1.
WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN.

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the EL2 or EL2&amp;0 translation regime is forced to XN for accesses from software executing at EL2.</td>
</tr>
</tbody>
</table>

This bit applies only when SCTLR_EL2.M bit is set.

The WXN bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

Traps execution of WFE instructions at EL0 to EL2, from both Execution states.

<table>
<thead>
<tr>
<th>nTWE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a WFE instruction at EL0 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps execution of WFI instructions at EL0 to EL2, from both Execution states.

<table>
<thead>
<tr>
<th>nTWI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a WFI instruction at EL0 is trapped EL2, if the instruction would otherwise have caused the PE to enter a low-power state.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.
On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally unknown value.

**UCT, bit [15]**

Traps EL0 accesses to the CTR_EL0 to EL2, from AArch64 state only.

<table>
<thead>
<tr>
<th>UCT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Accesses to the CTR_EL0 from EL0 using AArch64 are trapped to EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally unknown value.

**DZE, bit [14]**

Traps execution of DC ZVA instructions at EL0 to EL2, from AArch64 state only.

If FEAT_MTE2 is implemented, this trap also applies to DC GVA and DC GZVA.

<table>
<thead>
<tr>
<th>DZE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2. Reading DCZID_EL0.DZP from EL0 returns 1, indicating that the instructions that this trap applies to are not supported.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any instructions to be trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally unknown value.

**EnDB, bit [13]**

*When FEAT_PAuth is implemented:*

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

<table>
<thead>
<tr>
<th>EnDB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

**Note**

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally unknown value.

**Otherwise:**

Reserved, RES0.

**I, bit [12]**

Instruction access Cacheability control, for accesses at EL2 and EL0:
Meaning
---
0b0 All instruction access to Normal memory from EL2 and EL0 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1 This control has no effect on the Cacheability of instruction access to Normal memory from EL2 and EL0. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL3 translation regimes.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

EOS, bit [11]
When FEAT_ExS is implemented:

Exception exit is a context synchronization event.

Meaning
---
0b0 An exception return from EL2 is not a context synchronization event.
0b1 An exception return from EL2 is a context synchronization event.

If SCTLR_EL2.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL2 and ELR_EL2 on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnRCTX, bit [10]
When FEAT_SPECRES is implemented:

Enable EL0 Access to the following instructions:

- AArch32 CPFRCTX, DVPRCTX and CPPRCTX instructions.
- AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions.

The defined values are:

Meaning
---
0b0 EL0 access to these instructions is disabled, and these instructions are trapped to EL1.
0b1 EL0 access to these instructions is enabled.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**Bit [9]**

Reserved, RES0.

**SED, bit [8]**

*When EL0 is capable of using AArch32:*

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

<table>
<thead>
<tr>
<th>SED</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SETEND instruction execution is enabled at EL0 using AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>SETEND instructions are UNDEFINED at EL0 using AArch32.</td>
</tr>
</tbody>
</table>

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

**ITD, bit [7]**

*When EL0 is capable of using AArch32:*

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

<table>
<thead>
<tr>
<th>ITD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All IT instruction functionality is enabled at EL0 using AArch32.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED:</td>
</tr>
<tr>
<td></td>
<td>• All encodings of the IT instruction with hw1[3:0]! = 1000.</td>
</tr>
<tr>
<td></td>
<td>• All encodings of the subsequent instruction with the following values for hw1:</td>
</tr>
<tr>
<td></td>
<td>◦ 0b11xxxxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.</td>
</tr>
<tr>
<td></td>
<td>◦ 0b1011xxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section F3.2.5.</td>
</tr>
<tr>
<td></td>
<td>◦ 0b10100xxxxxxxxxxx: ADD Rd, PC, #imm</td>
</tr>
<tr>
<td></td>
<td>◦ 0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm]</td>
</tr>
<tr>
<td></td>
<td>◦ 0b1001xx11111xxxx: ADD Rd, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.</td>
</tr>
<tr>
<td></td>
<td>◦ 0b010001xx1xxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn.</td>
</tr>
</tbody>
</table>

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block. It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

• A 16-bit instruction, that can only be followed by another 16-bit instruction.

• The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.
If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is **CONSTRAINED UNPREDICTABLE**. For more information see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the **SCTLR** then it must also be implemented in the **SCTLR_EL1**. If it is not implemented then this bit is RAZ/WI.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES1**.

**nAA, bit [6]**

When **FEAT_LSE2** is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL2 and EL0 under certain conditions.

<table>
<thead>
<tr>
<th>nAA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLUR, STLURH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLUR, STLURH, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**CP15BEN, bit [5]**

When **EL0** is capable of using AArch32:

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

<table>
<thead>
<tr>
<th>CP15BEN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL0 using AArch32: EL0 execution of the <strong>CP15DMB</strong>, <strong>CP15DSB</strong>, and <strong>CP15ISB</strong> instructions is <strong>UNDEFINED</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL0 using AArch32: EL0 execution of the <strong>CP15DMB</strong>, <strong>CP15DSB</strong>, and <strong>CP15ISB</strong> instructions is enabled.</td>
</tr>
</tbody>
</table>

CP15BEN is optional, but if it is implemented in the **SCTLR** then it must also be implemented in the **SCTLR_EL1**. If it is not implemented then this bit is RAO/WI.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**SA0, bit [4]**

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see ‘SP alignment checking’.
On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally unknown value.

**SA, bit [3]**

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally unknown value.

**C, bit [2]**

Cacheability control, for data accesses.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All data access to Normal memory from EL2 and EL0, and all Normal memory accesses to the EL2&amp;0 translation tables, are non-cacheable for all levels of data and unified cache.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control has no effect on the Cacheability of:</td>
</tr>
<tr>
<td></td>
<td>• Data access to Normal memory from EL2 and EL0.</td>
</tr>
<tr>
<td></td>
<td>• Normal memory accesses to the EL2&amp;0 translation tables.</td>
</tr>
</tbody>
</table>

This bit has no effect on the EL3 translation regimes.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**A, bit [1]**

Alignment check enable. This is the enable bit for Alignment fault checking at EL2 and EL0.

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Alignment fault checking disabled when executing at EL2 and EL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Alignment fault checking enabled when executing at EL2 and EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.</td>
</tr>
</tbody>
</table>

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally unknown value.

**M, bit [0]**

MMU enable for EL2&0 stage 1 address translation.

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL2&amp;0 stage 1 address translation disabled. See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL2&amp;0 stage 1 address translation enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Accessing the SCTLR_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SCTLR_EL2 or SCTLR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.
Accesses to this register use the following encodings:

MRS <Xt>, SCTLR_EL2

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>

SCTRL_EL3, System Control Register (EL3)

The SCTRL_EL3 characteristics are:

**Purpose**

Provides top level control of the system, including its memory system, at EL3.

**Configuration**

This register is present only when EL3 is implemented. Otherwise, direct accesses to SCTRL_EL3 are **UNDEFINED**.

**Attributes**

SCTRL_EL3 is a 64-bit register.

**Field descriptions**

The SCTRL_EL3 bit assignments are:

**Bits [63:54]**

Reserved, RES0.

**TME, bit [53]**

When **FEAT_TME** is implemented:

Enables the Transactional Memory Extension at EL3.

<table>
<thead>
<tr>
<th>TME</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Any attempt to execute a TSTART instruction at EL3 is trapped, unless <strong>HCR_EL2.TME</strong> or <strong>SCR_EL3.TME</strong> causes TSTART instructions to be <strong>UNDEFINED</strong> at EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control does not cause any TSTART instruction to be trapped.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bit [52]**

Reserved, RES0.
TMT, bit [51]

When FEAT_TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL3.

<table>
<thead>
<tr>
<th>TMT</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control does not cause any TSTART instruction to fail.</td>
</tr>
<tr>
<td>0b1</td>
<td>When the TSTART instruction is executed at EL3, the transaction fails with a TRIVIAL failure cause.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [50:45]

Reserved, RES0.

DSSBS, bit [44]

When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

<table>
<thead>
<tr>
<th>DSSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>PSTATE.SSBS is set to 0 on an exception to EL3.</td>

</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL3, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]

When FEAT_MTE2 is implemented:

Allocation Tag Access in EL3. Controls EL3 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

<table>
<thead>
<tr>
<th>ATA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Access to Allocation Tags is prevented.</td>
</tr>
<tr>
<td>0b1</td>
<td>Access to Allocation Tags is not prevented.</td>
</tr>
</tbody>
</table>

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**Bit [42]**

Reserved, RES0.

**TCF, bits [41:40]**

**When FEAT_MTE2 is implemented:**

Tag Check Fault in EL3. Controls the effect of Tag Check Faults due to Loads and Stores in EL3.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

<table>
<thead>
<tr>
<th>TCF</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Tag Check Faults have no effect on the PE.</td>
<td></td>
</tr>
<tr>
<td>0b01</td>
<td>Tag Check Faults cause a synchronous exception.</td>

<td>Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.</td>
<td>When FEAT_MTE3 is implemented</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [39:38]**

Reserved, RES0.

**ITFSB, bit [37]**

**When FEAT_MTE2 is implemented:**

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL3, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into TFSRE0_EL1 and TFSR_ELx registers.

<table>
<thead>
<tr>
<th>ITFSB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Tag Check Faults are not synchronized on entry to EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>Tag Check Faults are synchronized on entry to EL3.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**BT, bit [36]**

**When FEAT_BTI is implemented:**

PAC Branch Type compatibility at EL3.
When the PE is executing at EL3, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.

When the PE is executing at EL3, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bits [35:32]**

Reserved, RES0.

**EnIA, bit [31]**

*When FEAT_PAuth is implemented:*

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

<table>
<thead>
<tr>
<th>EnIA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

For more information, see 'System register control of pointer authentication'.

**Note**

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**EnIB, bit [30]**

*When FEAT_PAuth is implemented:*

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

<table>
<thead>
<tr>
<th>EnIB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.</td>
</tr>
</tbody>
</table>

For more information, see 'System register control of pointer authentication'.
This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:28]

Reserved, RES1.

EnDA, bit [27]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL3 translation regime.

<table>
<thead>
<tr>
<th>EnDA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

For more information, see 'System register control of pointer authentication'.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime.

<table>
<thead>
<tr>
<th>EE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are little-endian.</td>
</tr>
<tr>
<td>0b1</td>
<td>Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are big-endian.</td>
</tr>
</tbody>
</table>
If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an IMPLEMENTATION DEFINED value.

**Bit [24]**

Reserved, RES0.

**Bit [23]**

Reserved, RES1.

**EIS, bit [22]**

*When FEAT_ExS is implemented:*

Exception Entry is Context Synchronizing.

<table>
<thead>
<tr>
<th>EIS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The taking of an exception to EL3 is not a context synchronizing event.</td>
</tr>
<tr>
<td>0b1</td>
<td>The taking of an exception to EL3 is a context synchronizing event.</td>
</tr>
</tbody>
</table>

If SCTLR_EL3.EIS is set to 0b0:

- Indirect writes to ESR_EL3, FAR_EL3, SPSR_EL3, ELR_EL3 are synchronized on exception entry to EL3, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EIS:

- Changes to the PSTATE information on entry to EL3.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Debug state exit.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**IESB, bit [21]**

*When FEAT_IESB is implemented:*

Implicit Error Synchronization event enable.

<table>
<thead>
<tr>
<th>IESB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>An implicit error synchronization event is added:</td>
</tr>
<tr>
<td></td>
<td>• At each exception taken to EL3.</td>
</tr>
<tr>
<td></td>
<td>• Before the operational pseudocode of each ERET instruction executed at EL3.</td>
</tr>
</tbody>
</table>

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization
event is added after each DCPSX instruction taken to EL3 and before each DRPS instruction executed at EL3, in addition to the other cases where it is added.

When FEAT_DoubleFault is implemented, and the Effective value of SCR_EL3.NMEA is 1, this field is ignored and its Effective value is 1.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

**WXN, bit [19]**

Write permission implies XN (Execute-never). For the EL3 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

<table>
<thead>
<tr>
<th>WXN</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on memory access permissions.</td>
</tr>
<tr>
<td>0b1</td>
<td>Any region that is writable in the EL3 translation regime is forced to XN for accesses from software executing at EL3.</td>
</tr>
</tbody>
</table>

This bit applies only when SCTLR_EL3.M bit is set.

The WXN bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Bit [18]

Reserved, RES1.

Bit [17]

Reserved, RES0.

Bit [16]

Reserved, RES1.

Bits [15:14]

Reserved, RES0.

**EnDB, bit [13]**

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL3 translation regime.

<table>
<thead>
<tr>
<th>EnDB</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.</td>
</tr>
</tbody>
</table>

For more information, see ‘System register control of pointer authentication’. 
Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL3:

<table>
<thead>
<tr>
<th>I</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All instruction access to Normal memory from EL3 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control has no effect on the Cacheability of instruction access to Normal memory from EL3. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.</td>
</tr>
</tbody>
</table>

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

EOS, bit [11]

When FEAT_ExS is implemented:

Exception Exit is Context Synchronizing.

<table>
<thead>
<tr>
<th>EOS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An exception return from EL3 is not a context synchronizing event</td>
</tr>
<tr>
<td>0b1</td>
<td>An exception return from EL3 is a context synchronizing event</td>
</tr>
</tbody>
</table>

If SCTLR_EL3.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL3 and ELR_EL3 on exception return is synchronized.
- If the PE enters Debug state before the first instruction after an Exception return from EL3 to Non-secure state, any pending Halting debug event completes execution.
- The GIC behavior that allocates interrupts to FIQ or IRQ changes simultaneously with leaving the EL3 Exception level.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES1.

Bits [10:7]

Reserved, RES0.

nAA, bit [6]

When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL3 under certain conditions.

<table>
<thead>
<tr>
<th>nAA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLUR, STLURH, STLUR, STLURH, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLUR, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL3 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see ‘SP alignment checking’.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Cacheability control, for data accesses.

<table>
<thead>
<tr>
<th>C</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>All data access to Normal memory from EL3, and all Normal memory accesses to the EL3 translation tables, are Non-cacheable for all levels of data and unified cache.</td>
</tr>
</tbody>
</table>
| 0b1 | This control has no effect on the Cacheability of:   
|     | • Data access to Normal memory from EL3.   
|     | • Normal memory accesses to the EL3 translation tables. |

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.
Alignment check enable. This is the enable bit for Alignment fault checking at EL3.

<table>
<thead>
<tr>
<th>A</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Alignment fault checking disabled when executing at EL3.</td>
</tr>
<tr>
<td></td>
<td>Instructions that load or store one or more registers, other than</td>
</tr>
<tr>
<td></td>
<td>load/store exclusive and load-acquire/store-release, do not check</td>
</tr>
<tr>
<td></td>
<td>that the address being accessed is aligned to the size of the data</td>
</tr>
<tr>
<td></td>
<td>element(s) being accessed.</td>
</tr>
<tr>
<td>0b1</td>
<td>Alignment fault checking enabled when executing at EL3.</td>
</tr>
<tr>
<td></td>
<td>All instructions that load or store one or more registers have an</td>
</tr>
<tr>
<td></td>
<td>alignment check that the address being accessed is aligned to the</td>
</tr>
<tr>
<td></td>
<td>size of the data element(s) being accessed. If this check fails it</td>
</tr>
<tr>
<td></td>
<td>causes an Alignment fault, which is taken as a Data Abort exception.</td>
</tr>
</tbody>
</table>

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

MMU enable for EL3 stage 1 address translation. Possible values of this bit are:

<table>
<thead>
<tr>
<th>M</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>EL3 stage 1 address translation disabled.</td>
</tr>
<tr>
<td></td>
<td>See the SCTLR_EL3.I field for the behavior of instruction accesses</td>
</tr>
<tr>
<td></td>
<td>to Normal memory.</td>
</tr>
<tr>
<td>0b1</td>
<td>EL3 stage 1 address translation enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**Accessing the SCTLR_EL3**

Accesses to this register use the following encodings:

**MRS <Xt>, SCTLR_EL3**

<table>
<thead>
<tr>

  SCTLR_EL3 = X[t];
SCXTNUM_EL0, EL0 Read/Write Software Context Number

The SCXTNUM_EL0 characteristics are:

**Purpose**

Provides a number that can be used to separate out different context numbers with the EL0 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

**Configuration**

This register is present only when FEAT_CSV2 is implemented. Otherwise, direct accesses to SCXTNUM_EL0 are UNDEFINED.

**Attributes**

SCXTNUM_EL0 is a 64-bit register.

**Field descriptions**

The SCXTNUM_EL0 bit assignments are:

```

SCXTNUM_EL1, EL1 Read/Write Software Context Number

The SCXTNUM_EL1 characteristics are:

Purpose

Provides a number that can be used to separate out different context numbers with the EL1 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

Configuration

This register is present only when FEAT_CSV2 is implemented. Otherwise, direct accesses to SCXTNUM_EL1 are UNDEFINED.

Attributes

SCXTNUM_EL1 is a 64-bit register.

Field descriptions

The SCXTNUM_EL1 bit assignments are:

**Bits [63:0]**

 Software Context Number. A number to identify the context within the EL2 exception level.

 On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the SCXTNUM_EL2**

 When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SCXTNUM_EL2 or SCXTNUM_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

 Accesses to this register use the following encodings:

SCXTNUM_EL3, EL3 Read/Write Software Context Number

The SCXTNUM_EL3 characteristics are:

**Purpose**

Provides a number that can be used to separate out different context numbers with the EL3 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

**Configuration**

This register is present only when EL3 is implemented and FEAT_CSV2 is implemented. Otherwise, direct accesses to SCXTNUM_EL3 are **UNDEFINED**.

**Attributes**

SCXTNUM_EL3 is a 64-bit register.

**Field descriptions**

The SCXTNUM_EL3 bit assignments are:

SDER32_EL2, AArch32 Secure Debug Enable Register

The SDER32_EL2 characteristics are:

**Purpose**

Allows access to the AArch32 register SDER from Secure EL2 and EL3 only.

**Configuration**

This register is present only when EL2 is implemented, AArch32 is supported at any Exception level, FEAT_SEL2 is implemented and EL1 supports AArch32. Otherwise, direct accesses to SDER32_EL2 are **UNDEFINED**.

This register is ignored by the PE when one or more of the following are true:

- The PE is in Non-secure state.
- EL1 is using AArch64.

**Attributes**

SDER32_EL2 is a 64-bit register.

**Field descriptions**

SDER32_EL3, AArch32 Secure Debug Enable Register

The SDER32_EL3 characteristics are:

**Purpose**

Allows access to the AArch32 register SDER from AArch64 state only. Its value has no effect on execution in AArch64 state.

**Configuration**

AArch64 System register SDER32_EL3 bits [31:0] are architecturally mapped to AArch32 System register SDER[31:0].

This register is present only when EL3 is implemented, AArch32 is supported at any Exception level and EL1 supports AArch32. Otherwise, direct accesses to SDER32_EL3 are UNDEFINED.

This register is ignored by the PE when one or more of the following are true:

- The PE is in Non-secure state.
- EL1 is using AArch64.

**Attributes**

SDER32_EL3 is a 64-bit register.

```
SP_EL0, Stack Pointer (EL0)

The SP_EL0 characteristics are:

**Purpose**

Holds the stack pointer associated with EL0. At higher Exception levels, this is used as the current stack pointer when the value of `SPSel.SP` is 0.

**Configuration**

There are no configuration notes.

**Attributes**

SP_EL0 is a 64-bit register.

**Field descriptions**

The SP_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| **Stack pointer** | Stack pointer |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:0]**

Stack pointer:

On a Warm reset, this field resets to an architecturally *UNKNOWN* value.

**Accessing the SP_EL0**

When the value of PSTATE.SP is 0, this register is accessible at all Exception levels as the current stack pointer.

Accesses to this register use the following encodings:

**MRS <Xt>, SP_EL0**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b0100</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

    else
        return SP_EL0;
elsif PSTATE.EL == EL2 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        return SP_EL0;
elsif PSTATE.EL == EL3 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        return SP_EL0;

MSR SP_EL0, <Xt>

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>
<td>0b0100</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        SP_EL0 = X[t];
elsif PSTATE.EL == EL2 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        SP_EL0 = X[t];
elsif PSTATE.EL == EL3 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        SP_EL0 = X[t];
The SP_EL1 characteristics are:

**Purpose**

Holds the stack pointer associated with EL1. When executing at EL1, the value of SPSEL.SP determines the current stack pointer:

<table>
<thead>
<tr>
<th>SPSEL.SP</th>
<th>Current stack pointer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SP_EL0</td>
</tr>
<tr>
<td>0b1</td>
<td>SP_EL1</td>
</tr>
</tbody>
</table>

**Configuration**

There are no configuration notes.

**Attributes**

SP_EL1 is a 64-bit register.

**Field descriptions**

The SP_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Stack pointer</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Stack pointer</td>
</tr>
</tbody>
</table>

**Accessing the SP_EL1**

This accessibility information only applies to accesses using the MRS or MSR instructions.

When the value of SPSEL.SP is 1, this register is also accessible at EL1 as the current stack pointer.

**Note**

When the value of SPSEL.SP is 0, SP_EL0 is used as the current stack pointer at all Exception levels.

Accesses to this register use the following encodings:

**MRS <Xt>, SP_EL1**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

**Bits [63:0]**

Stack pointer.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the SP_EL2**

This accessibility information only applies to accesses using the MRS or MSR instructions.

When the value of SPSelp. SP is 1, this register is also accessible at EL2 as the current stack pointer.

**Note**

When the value of SPSelp. SP is 0, SP_EL0 is used as the current stack pointer at all Exception levels.

Accesses to this register use the following encodings:

MRS <Xt>, SP_EL2

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b110</td>
<td>0b0100</td>
<td>0b0001</td>
<td>0b000</td>
</tr>
</tbody>
</table>
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  UNDEFINED;
elsif PSTATE.EL == EL2 then
  UNDEFINED;
elsif PSTATE.EL == EL3 then
  return SP_EL2;

MSR SP_EL2, <Xt>

<table>

elsif PSTATE.EL == EL3 then
  SP_EL2 = X[t];
SP_EL3, Stack Pointer (EL3)

The SP_EL3 characteristics are:

**Purpose**

Holds the stack pointer associated with EL3. When executing at EL3, the value of `SPSel.SP` determines the current stack pointer:

<table>
<thead>
<tr>
<th><code>SPSel.SP</code></th>
<th>Current stack pointer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>SP_EL0</td>
</tr>
<tr>
<td>0b1</td>
<td>SP_EL3</td>
</tr>
</tbody>
</table>

**Configuration**

This register is present only when EL3 is implemented. Otherwise, direct accesses to SP_EL3 are UNDEFINED.

**Attributes**

SP_EL3 is a 64-bit register.

**Field descriptions**

The SP_EL3 bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**Bits [63:0]**

Stack pointer.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the SP_EL3**

This register is not accessible using MRS and MSR instructions.

When the value of `SPSel.SP` is 1, this register is accessible at EL3 as the current stack pointer.

### Note

When the value of `SPSel.SP` is 0, `SP_EL0` is used as the current stack pointer at all Exception levels.
SPSel, Stack Pointer Select

The SPSel characteristics are:

**Purpose**

Allows the Stack Pointer to be selected between SP_EL0 and SP_ELx.

**Configuration**

There are no configuration notes.

**Attributes**

SPSel is a 64-bit register.

**Field descriptions**

The SPSel bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:1]</th>
<th>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</th>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>

The SPSR_abt characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Abort mode.

**Configuration**

AArch64 System register SPSR_abt bits [31:0] are architecturally mapped to AArch32 System register SPSR_abt[31:0].

If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

**Attributes**

SPSR_abt is a 64-bit register.

**Field descriptions**

The SPSR_abt bit assignments are:

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
V, bit [28]
Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]
Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]
If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Abort mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Abort mode.
On executing an exception return operation in Abort mode SPSR_abt.IT must contain a value that is valid for the instruction being returned to.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]
RES0.
In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state.
Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:
Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Abort mode, and copied to PSTATE.SSBS on executing an exception return operation in Abort mode.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:
Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Abort mode, and copied to PSTATE.PAN on executing an exception return operation in Abort mode.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
**DIT, bit [21]**

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Abort mode, and copied to PSTATE.DIT on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Abort mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Abort mode.

SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.

If the implementation does not support big-endian operation, SPSR_abt.E is **RES0**. If the implementation does not support little-endian operation, SPSR_abt.E is **RES1**. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_abt.E is **RES0**, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_abt.E is **RES1**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Abort mode, and copied to PSTATE.T on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b10111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_abt.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the SPSR_abt**

Accesses to this register use the following encodings:

**MRS <Xt>, SPSR_abt**

```assembly
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return SPSR_abt;
elsif PSTATE.EL == EL3 then
    return SPSR_abt;
```

**MSR SPSR_abt, <Xt>**

```assembly
<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b100</td>
<td>0b0100</td>
<td>0b0011</td>
<td>0b001</td>
</tr>
</tbody>
</table>
```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    SPSR_abt = X[t];
elsif PSTATE.EL == EL3 then
    SPSR_abt = X[t];
SPSR_EL1, Saved Program Status Register (EL1)

The SPSR_EL1 characteristics are:

Purpose

Holds the saved process state when an exception is taken to EL1.

Configuration

AArch64 System register SPSR_EL1 bits [31:0] are architecturally mapped to AArch32 System register SPSR_svc[31:0].

Attributes

SPSR_EL1 is a 64-bit register.

Field descriptions

The SPSR_EL1 bit assignments are:

When AArch32 is supported at any Exception level and exception taken from AArch32 state:

<table>
<thead>
<tr>

</table>

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
V, bit [28]
Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]
Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL1, and copied to PSTATE.Q on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]
If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to EL1, and copied to PSTATE.IT[1:0] on executing an exception return operation in EL1.

On executing an exception return operation in EL1 SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]
When FEAT_DIT is implemented:
Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

SSBS, bit [23]
When FEAT_SSBS is implemented:
Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:
Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL1, and copied to PSTATE.GE on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to EL1, and copied to PSTATE.IT[7:2] on executing an exception return operation in EL1.

SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to EL1, and copied to PSTATE.E on executing an exception return operation in EL1.

If the implementation does not support big-endian operation, SPSR_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR_EL1.E is RES1. On executing an exception return operation in EL1, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL1.E is RES1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL1, and copied to PSTATE.T on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL1 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>AArch32 execution state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL1, and copied to PSTATE.M[3:0] on executing an exception return operation in EL1.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b0010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b1011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b1111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in ‘Illegal return events from AArch64 state’.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:

| 63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 | RES0 | CSR |
|--------------------------|--------------------------|
| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | RES0 | SSBS|BTYPE|D|A|I|F|RES0|M[4]|M[3:0] |

An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:33]

Reserved, RES0.

CSR, bit [32]

When FEAT_CSRE is implemented:

Call Stack Recording. Set to the value of PSTATE.CSR on taking an exception to EL1, and copied to PSTATE.CSR on executing an exception return operation in EL1.
On a Warm reset, this field resets to an architecturally unknown value.

**Otherwise:**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally unknown value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally unknown value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally unknown value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally unknown value.

**Bits [27:26]**

Reserved, RES0.

**TCO, bit [25]**

When FEAT_MTE is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL1, and copied to PSTATE.TCO on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally unknown value.

**Otherwise:**

Reserved, RES0.

**DIT, bit [24]**

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally unknown value.
Otherwise:

Reserved, RES0.

**UAO, bit [23]**

*When FEAT_UAO is implemented:*

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL1, and copied to PSTATE.UAO on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**PAN, bit [22]**

*When FEAT_PAN is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [19:13]**

Reserved, RES0.

**SSBS, bit [12]**

*When FEAT_SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.
**BTYPE, bits [11:10]**

*When FEAT_BTI is implemented:*

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL1, and copied to PSTATE.BTYPE on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**D, bit [9]**

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL1, and copied to PSTATE.D on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [5]**

Reserved, **RES0**.

**M[4], bit [4]**

Execution state. Set to **0b0**, the value of PSTATE.nRW, on taking an exception to EL1 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch64 execution state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**M[3:0], bits [3:0]**

AArch64 Exception level and selected Stack Pointer.
<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL0t.</td>
</tr>
<tr>
<td>0b0100</td>
<td>EL1t.</td>
</tr>
<tr>
<td>0b0101</td>
<td>EL1h.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL1 and copied to PSTATE.EL on executing an exception return operation in EL1.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL1 and copied to PSTATE.SP on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the SPSR_EL1**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic SPSR_EL1 or SPSR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**MRS <Xt>, SPSR_EL1**

SPSR_EL2, Saved Program Status Register (EL2)

The SPSR_EL2 characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to EL2.

**Configuration**

AArch64 System register SPSR_EL2 bits [31:0] are architecturally mapped to AArch32 System register SPSR_hyp[31:0].

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

SPSR_EL2 is a 64-bit register.

**Field descriptions**

The SPSR_EL2 bit assignments are:

**When AArch32 is supported at any Exception level and exception taken from AArch32 state:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

An exception return from EL2 using AArch64 makes SPSR_EL2 become **UNKNOWN**.

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL2, and copied to PSTATE.Q on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to EL2, and copied to PSTATE.IT[1:0] on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DIT, bit [24]**

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**SSBS, bit [23]**

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**PAN, bit [22]**

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL2, and copied to PSTATE.GE on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to EL2, and copied to PSTATE.IT[7:2] on executing an exception return operation in EL2.

SPSR_EL2.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to EL2, and copied to PSTATE.E on executing an exception return operation in EL2.

If the implementation does not support big-endian operation, SPSR_EL2.E is RES0. If the implementation does not support little-endian operation, SPSR_EL2.E is RES1. On executing an exception return operation in EL2, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL2.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL2.E is RES1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNDEFINED value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL2, and copied to PSTATE.T on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNDEFINED value.

M[4], bit [4]

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL2 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>AArch32 execution state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNDEFINED value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL2, and copied to PSTATE.M[3:0] on executing an exception return operation in EL2.

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>User.</td>
</tr>
<tr>
<td>0b0001</td>
<td>FIQ.</td>
</tr>
<tr>

</tr>
<tr>
<td>0b1011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b1111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in ‘Illegal return events from AArch64 state’.

On a Warm reset, this field resets to an architecturally UNDEFINED value.

When exception taken from AArch64 state:

An exception return from EL2 using AArch64 makes SPSR_EL2 become UNDEFINED.

Bits [63:33]

Reserved, RES0.

CSR, bit [32]

When FEAT_CSRE is implemented:

Call Stack Recording. Set to the value of PSTATE.CSR on taking an exception to EL2, and copied to PSTATE.CSR on executing an exception return operation in EL2.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

\(N\), bit \[31\]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

\(Z\), bit \[30\]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

\(C\), bit \[29\]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

\(V\), bit \[28\]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits \[27:26\]

Reserved, RES0.

\(TCO\), bit \[25\]

When \texttt{FEAT\_MTE} is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL2, and copied to PSTATE.TCO on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

\(DIT\), bit \[24\]

When \texttt{FEAT\_DIT} is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**UAO, bit [23]**

*When FEAT_UAO is implemented:*

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL2, and copied to PSTATE.UAO on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**PAN, bit [22]**

*When FEAT_PAN is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [19:13]**

Reserved, RES0.

**SSBS, bit [12]**

*When FEAT_SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.
**BTYPE, bits [11:10]**

When FEAT_BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL2, and copied to PSTATE.BTYPE on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**D, bit [9]**

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL2, and copied to PSTATE.D on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [5]**

Reserved, RES0.

**M[4], bit [4]**

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL2 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>AArch64 execution state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[3:0], bits [3:0]**

AArch64 Exception level and selected Stack Pointer.
### SPSR_EL2, Saved Program Status Register (EL2)

<table>
<thead>
<tr>
<th>M[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>EL0t.</td>
</tr>
<tr>
<td>0b0100</td>
<td>EL1t.</td>
</tr>
<tr>
<td>0b0101</td>
<td>EL1h.</td>
</tr>
<tr>
<td>0b1000</td>
<td>EL2t.</td>
</tr>
<tr>
<td>0b1001</td>
<td>EL2h.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL2 and copied to PSTATE.EL on executing an exception return operation in EL2.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL2 and copied to PSTATE.SP on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### Accessing the SPSR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SPSR_EL2 or SPSR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**MRS <Xt>, SPSR_EL2**

<table>
<thead>

The SPSR_EL3 characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to EL3.

**Configuration**

AArch64 System register SPSR_EL3 bits [31:0] can be mapped to AArch32 System register SPSR_mon[31:0], but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to SPSR_EL3 are **undefined**.

**Attributes**

SPSR_EL3 is a 64-bit register.

**Field descriptions**

The SPSR_EL3 bit assignments are:

**When AArch32 is supported at any Exception level and exception taken from AArch32 state:**

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

An exception return from EL3 using AArch64 makes SPSR_EL1 become **UNKNOWN**.

**Bits [63:32]**

Reserved, **RES0**.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL3, and copied to PSTATE.Q on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to EL3, and copied to PSTATE.IT[1:0] on executing an exception return operation in EL3.

On executing an exception return operation in EL3 SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**DIT, bit [24]**

*When FEAT_DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, **RES0**.

**SSBS, bit [23]**

*When FEAT_SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, **RES0**.

**PAN, bit [22]**

*When FEAT_PAN is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE_SS on taking an exception to EL3, and conditionally copied to PSTATE_SS on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE_IL on taking an exception to EL3, and copied to PSTATE_IL on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE_GE on taking an exception to EL3, and copied to PSTATE_GE on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE_IT[7:2] on taking an exception to EL3, and copied to PSTATE_IT[7:2] on executing an exception return operation in EL3.

SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**E, bit [9]**

Endianness. Set to the value of PSTATE_E on taking an exception to EL3, and copied to PSTATE_E on executing an exception return operation in EL3.

If the implementation does not support big-endian operation, SPSR_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR_EL1.E is RES1. On executing an exception return operation in EL3, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL1.E is RES1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL3, and copied to PSTATE.T on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[4], bit [4]**

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL3 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>AArch32 execution state.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[3:0], bits [3:0]**

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL3, and copied to PSTATE.M[3:0] on executing an exception return operation in EL3.

<table>
<thead>
<tr>
<th>M[3:0]</th>

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in ‘Illegal return events from AArch64 state’.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**When exception taken from AArch64 state:**

An exception return from EL3 using AArch64 makes SPSR_EL1 become UNKNOWN.

**Bits [63:33]**

Reserved, RES0.
**CSR, bit [32]**

When FEAT_CSRE is implemented:

Call Stack Recording. Set to the value of PSTATE.CSR on taking an exception to EL3, and copied to PSTATE.CSR on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [27:26]**

Reserved, RES0.

**TCO, bit [25]**

When FEAT_MTE is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL3, and copied to PSTATE.TCO on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.
DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]

When FEAT_UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL3, and copied to PSTATE.UAO on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:13]

Reserved, RES0.
SSBS, bit [12]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]

When FEAT_BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL3, and copied to PSTATE.BTYPE on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL3, and copied to PSTATE.D on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.
**M[4], bit [4]**

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL3 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

<table>
<thead>
<tr>
<th><strong>M[4]</strong></th>
<th><strong>Meaning</strong></th>

SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to FIQ mode.

**Configuration**

AArch64 System register SPSR_fiq bits [31:0] are architecturally mapped to AArch32 System register SPSR_fiq[31:0]. If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

**Attributes**

SPSR_fiq is a 64-bit register.

**Field descriptions**

The SPSR_fiq bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to FIQ mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in FIQ mode.

On executing an exception return operation in FIQ mode SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]**

*When FEAT_SSBS is implemented:*

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to FIQ mode, and copied to PSTATE.SSBS on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**PAN, bit [22]**

*When FEAT_PAN is implemented:*

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to FIQ mode, and copied to PSTATE.PAN on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

**DIT, bit [21]**

*When FEAT_DIT is implemented:*

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to FIQ mode, and copied to PSTATE.DIT on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and copied to PSTATE.IL on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode, and copied to PSTATE.GE on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to FIQ mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in FIQ mode.

SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR_fiq.E is RES0. If the implementation does not support little-endian operation, SPSR_fiq.E is RES1. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_fiq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_fiq.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to FIQ mode, and copied to PSTATE.T on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to FIQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in FIQ mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b10111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_fiq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in FIQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the SPSR_fiq**

SPSR_irq, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

Purpose

Holds the saved process state when an exception is taken to IRQ mode.

Configuration

AArch64 System register SPSR_irq bits [31:0] are architecturally mapped to AArch32 System register SPSR_irq[31:0].

If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

Attributes

SPSR_irq is a 64-bit register.

Field descriptions

The SPSR_irq bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| RES0 |
| N | Z | C | V | Q | IT(1:0) | J | SSBS | PAN | DIT | IL | GE | IT(7:2) | E | A | I | F | T | M(4:0) |

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to IRQ mode, and copied to PSTATE.Z on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Q**, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IT[1:0]**, bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to IRQ mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in IRQ mode.

On executing an exception return operation in IRQ mode SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**J**, bit [24]

RES0.

In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS**, bit [23]

When **FEAT_SSBS** is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to IRQ mode, and copied to PSTATE.SSBS on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**PAN**, bit [22]

When **FEAT_PAN** is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to IRQ mode, and copied to PSTATE.PAN on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**DIT**, bit [21]

When **FEAT_DIT** is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to IRQ mode, and copied to PSTATE.DIT on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to IRQ mode, and copied to PSTATE.IL on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally unknown value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally unknown value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to IRQ mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in IRQ mode.

SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally unknown value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR_irq.E is RES0. If the implementation does not support little-endian operation, SPSR_irq.E is RES1. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_irq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_irq.E is RES1.

On a Warm reset, this field resets to an architecturally unknown value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally unknown value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally unknown value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally unknown value.
**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to IRQ mode, and copied to PSTATE.T on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[4:0], bits [4:0]**

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to IRQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in IRQ mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b10111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_irq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in IRQ mode is an illegal return event, as described in ‘Illegal return events from AArch32 state’.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the SPSR_irq**

Accesses to this register use the following encodings:

**MRS <Xt>, SPSR_irq**

```plaintext
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

        UNDEFINED;
elsif PSTATE.EL == EL2 then
    SPSR_irq = X[t];
elsif PSTATE.EL == EL3 then
    SPSR_irq = X[t];
SPSR_und, Saved Program Status Register (Undefined mode)

The SPSR_und characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Undefined mode.

**Configuration**

AArch64 System register SPSR_und bits [31:0] are architecturally mapped to AArch32 System register SPSR_und[31:0].

If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

**Attributes**

SPSR_und is a 64-bit register.

**Field descriptions**

The SPSR_und bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>

</tr>
<tr>
<td>58</td>
<td>C, bit [29]</td>
</tr>
<tr>
<td>57</td>
<td>Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode. On a Warm reset, this field resets to an architecturally UNKNOWN value.</td>
</tr>
</tbody>
</table>

Bits [63:32]

Reserved, RES0.
V, bit [28]
Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]
Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]
If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Undefined mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Undefined mode.

On executing an exception return operation in Undefined mode SPSR_und.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]
RES0.

In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:
Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Undefined mode, and copied to PSTATE.SSBS on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:
Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Undefined mode, and copied to PSTATE.PAN on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.
**DIT, bit [21]**

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Undefined mode, and copied to PSTATE.DIT on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to PSTATE.IL on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to PSTATE.GE on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Undefined mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Undefined mode.

SPSR_und.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR_und.E is RES0. If the implementation does not support little-endian operation, SPSR_und.E is RES1. On executing an exception return operation in Undefined mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_und.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_und.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally unknown value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Undefined mode, and copied to PSTATE.T on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally unknown value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Undefined mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Undefined mode.

<table>
<thead>
<tr>
<th>M[4:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b10111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_und.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Undefined mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, this field resets to an architecturally unknown value.

</tr>
</tbody>
</table>

**Bits [63:13]**

Reserved, RES0.

**SSBS, bit [12]**

Speculative Store Bypass Safe.

Prohibits speculative loads or stores which might practically allow a cache timing side channel.

A cache timing side channel might be exploited where a load or store uses an address that is derived from a register that is being loaded from memory using a load instruction speculatively read from a memory location. If PSTATE.SSBS is enabled, the address derived from the load instruction might be from earlier in the coherence order than the latest store to that memory location with the same virtual address.

<table>
<thead>
<tr>
<th>SSBS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hardware is not permitted to load or store speculatively, in a manner that could practically give rise to a cache timing side channel, using an address derived from a register value that has been loaded from memory using a load instruction (L) that speculatively reads an entry from earlier in the coherence order from that location being loaded from than the entry generated by the latest store (S) to that location using the same virtual address as L.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hardware is permitted to load or store speculatively, in a manner that could practically give rise to a cache timing side channel, using an address derived from a register value that has been loaded from memory using a load instruction (L) that speculatively reads an entry from earlier in the coherence order from that location being loaded from than the entry generated by the latest store (S) to that location using the same virtual address as L.</td>
</tr>
</tbody>
</table>

The value of this bit is set to the value in the SCTLR_ELx.DSSBS field on taking an exception to ELx.
On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Any of the bits in TCR_EL1, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

**Bits [63:60]**

Reserved, RES0.

**DS, bit [59]**

When FEAT_LPA2 is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL1&0 translation regime.
Meaning

The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.

Output address[51:48] is 0b0000.

The shareability information of block and page descriptors for cacheable locations is determined by:

- TCR_EL1.SH0 if the VA is translated using tables pointed to by TTBR0_EL1.
- TCR_EL1.SH1 if the VA is translated using tables pointed to by TTBR1_EL1.

The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.

All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes. Bits[5:2] of TTBR0_EL1 or TTBR1_EL1 are used to hold bits[51:48] of the output address in all cases.

**Note**

As FEAT_LVA must be implemented if TCR_EL1.DS == 1, the minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12, as determined by that extension.

For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.

**Note**

This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TCMA1, bit [58]**

*When FEAT_MTE is implemented:*

Controls the generation of Unchecked accesses at EL1, and at EL0 if HCR_EL2.{E2H,TGE}!={1,1}, when address[59:55] = 0b111111.

<table>
<thead>
<tr>
<th>TCMA1</th>
<th>Meaning</th>
</tr>

<td>Unprivileged access to any address translated by ( \text{TTBR0_EL1} ) will generate a level 0 translation fault.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:
Reserved, RES0.
**NFD1, bit [54]**

*When FEAT_SVE is implemented or FEAT_TME is implemented:*

Non-fault translation table walk disable for stage 1 translations using TTBR1_EL1.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using TTBR1_EL1.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

<table>
<thead>
<tr>
<th>NFD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not disable stage 1 translation table walks using TTBR1_EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on a virtual address that is translated using TTBR1_EL1 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**NFD0, bit [53]**

*When FEAT_SVE is implemented or FEAT_TME is implemented:*

Non-fault translation table walk disable for stage 1 translations using TTBR0_EL1.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using TTBR0_EL1.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

<table>
<thead>
<tr>
<th>NFD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not disable stage 1 translation table walks using TTBR0_EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on a virtual address that is translated using TTBR0_EL1 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

**TBID1, bit [52]**

*When FEAT_PAuth is implemented:*

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

<table>
<thead>
<tr>
<th>TBID1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL1.TBI1 applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL1.TBI1 applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR1_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**TBID0, bit [51]**

*When FEAT_PAuth is implemented:*

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

<table>
<thead>
<tr>
<th>TBID0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL1.TBI0 applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL1.TBI0 applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

**HWU162, bit [50]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.
### HWU162

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### HWU161, bit [49]

**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using **TTBR1_EL1**.

<table>
<thead>
<tr>
<th>HWU161</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using <strong>TTBR1_EL1</strong>, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using <strong>TTBR1_EL1</strong>, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### HWU160, bit [48]

**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using **TTBR1_EL1**.

<table>
<thead>
<tr>
<th>HWU160</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using <strong>TTBR1_EL1</strong>, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using <strong>TTBR1_EL1</strong>, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
HWU159, bit [47]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

<table>
<thead>
<tr>
<th>HWU159</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR1_EL1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR1_EL1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU062, bit [46]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

<table>
<thead>
<tr>
<th>HWU062</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR0_EL1, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR0_EL1, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU061, bit [45]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

<table>
<thead>
<tr>
<th>HWU061</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR0_EL1, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR0_EL1, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HWU060, bit [44]**

When **FEAT_HPDS2** is implemented:

Hardware Use. Indicates **IMPLEMENTATION DEFINED** hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using **TTBR0_EL1**.

<table>
<thead>
<tr>
<th>HWU060</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using <strong>TTBR0_EL1</strong>, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using <strong>TTBR0_EL1</strong>, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose if the value of TCR_EL1.HPD0 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HWU059, bit [43]**

When **FEAT_HPDS2** is implemented:

Hardware Use. Indicates **IMPLEMENTATION DEFINED** hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using **TTBR0_EL1**.

<table>
<thead>
<tr>
<th>HWU059</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using <strong>TTBR0_EL1</strong>, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using <strong>TTBR0_EL1</strong>, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose if the value of TCR_EL1.HPD0 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HPD1, bit [42]**

When **FEAT_HPDS** is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by **TTBR1_EL1**.
Hierarchical permissions are enabled.

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HPD0, bit [41]**

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL1.

<table>
<thead>
<tr>
<th>HPD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled.</td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HD, bit [40]**

When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL0 and EL1.

<table>
<thead>
<tr>
<th>HD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 hardware management of dirty state disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HA, bit [39]**

When FEAT_HAFDBS is implemented:

Hardware Access flag update in stage 1 translations from EL0 and EL1.

<table>
<thead>
<tr>
<th>HA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 Access flag update disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 Access flag update enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**TBI1, bit [38]**

Top Byte ignored. Indicates whether the top byte of an address is used for address match for the TTBR1_EL1 region, or ignored and used for tagged addresses.

<table>
<thead>
<tr>
<th>TBI1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by TTBR1_EL1. It has an effect whether the EL1&0 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL1.TBID1 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**TBI0, bit [37]**

Top Byte ignored. Indicates whether the top byte of an address is used for address match for the TTBR0_EL1 region, or ignored and used for tagged addresses.

<table>
<thead>
<tr>
<th>TBI0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL1. It has an effect whether the EL1&0 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL1.TBID0 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**AS, bit [36]**

ASID Size.

<table>
<thead>
<tr>
<th>AS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>8 bit - the upper 8 bits of TTBR0_EL1 and TTBR1_EL1 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.</td>
</tr>
<tr>
<td>0b1</td>
<td>16 bit - the upper 16 bits of TTBR0_EL1 and TTBR1_EL1 are used for allocation and matching in the TLB.</td>
</tr>
</tbody>
</table>

If the implementation has only 8 bits of ASID, this field is RES0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Bit [35]

Reserved, RES0.

IPS, bits [34:32]

Intermediate Physical Address Size.

<table>
<thead>
<tr>
<th>IPS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>32 bits, 4GB.</td>
</tr>
<tr>
<td>0b001</td>
<td>36 bits, 64GB.</td>
</tr>
<tr>
<td>0b010</td>
<td>40 bits, 1TB.</td>
</tr>
<tr>
<td>0b011</td>
<td>42 bits, 4TB.</td>
</tr>
<tr>
<td>0b100</td>
<td>44 bits, 16TB.</td>
</tr>
<tr>
<td>0b101</td>
<td>48 bits, 256TB.</td>
</tr>
<tr>
<td>0b110</td>
<td>52 bits, 4PB.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is implementation defined whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL1 are 0b0000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG1, bits [31:30]

Granule size for the TTBR1_EL1.

<table>
<thead>
<tr>
<th>TG1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>16KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b11</td>
<td>64KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an implementation defined choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is implementation defined whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using TTBR1_EL1.

<table>
<thead>
<tr>
<th>SH1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is constrained unpredictable.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using TTBR1_EL1.

<table>
<thead>
<tr>
<th>ORGN1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using TTBR1_EL1.

<table>
<thead>
<tr>
<th>IRGN1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD1, bit [23]

Translation table walk disable for translations using TTBR1_EL1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1_EL1. The encoding of this bit is:

<table>
<thead>
<tr>
<th>EPD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using TTBR1_EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using TTBR1_EL1 generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

A1, bit [22]

Selects whether TTBR0_EL1 or TTBR1_EL1 defines the ASID. The encoding of this bit is:

<table>
<thead>
<tr>
<th>A1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TTBR0_EL1 ASID defines the ASID.</td>
</tr>
<tr>
<td>0b1</td>
<td>TTBR1_EL1 ASID defines the ASID.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

T1SZ, bits [21:16]

The size offset of the memory region addressed by TTBR1_EL1. The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.
For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TG0, bits [15:14]**

Granule size for the TTBR0_EL1.

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using TTBR0_EL1.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL1.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL1.
<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**EPD0, bit [7]**

Translation table walk disable for translations using TTBR0_EL1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0_EL1. The encoding of this bit is:

<table>
<thead>
<tr>
<th>EPD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using TTBR0_EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using TTBR0_EL1 generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [6]**

Reserved, RES0.

**T0SZ, bits [5:0]**

The size offset of the memory region addressed by TTBR0_EL1. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

**Note**

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the TCR_EL1**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic TCR_EL1 or TCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, TCR_EL1

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>

TCR_EL2, Translation Control Register (EL2)

The TCR_EL2 characteristics are:

**Purpose**

The control register for stage 1 of the EL2, or EL2&0, translation regime:

- When the Effective value of `HCR_EL2.E2H` is 0, this register controls stage 1 of the EL2 translation regime, that supports a single VA range, translated using `TTBR0_EL2`.
- When the value of `HCR_EL2.E2H` is 1, this register controls stage 1 of the EL2&0 translation regime, that supports both:
  - A lower VA range, translated using `TTBR0_EL2`.
  - A higher VA range, translated using `TTBR1_EL2`.

**Configuration**

AArch64 System register TCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register `HTCR[31:0]`.

If EL2 is not implemented, this register is `RES0` from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

TCR_EL2 is a 64-bit register.

**Field descriptions**

The TCR_EL2 bit assignments are:

**When HCR_EL2.E2H == 0:**

Any of the bits in TCR_EL2, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

**Bits [63:33]**

Reserved, RES0.

**DS, bit [32]**

When FEAT_LPA2 is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL2 translation regime.
Meaning

0b0

Bits[49:48] of translation descriptors are \text{RES0}.
Bits[9:8] in block and page descriptors encode shareability
information in the SH[1:0] field. Bits[9:8] in table descriptors are
ignored by hardware.
The minimum value of TCR_EL2.T0SZ is 16. Any memory access
using a smaller value generates a stage 1 level 0 translation table
fault.
Output address[51:48] is \text{0b0000}.

0b1

Bits[49:48] of translation descriptors hold output address[49:48].
Bits[9:8] of translation table descriptors hold output
address[51:50].
The shareability information of block and page descriptors for
cacheable locations is determined by TCR_EL2.SH0.
The minimum value of TCR_EL2.T0SZ is 12. Any memory access
using a smaller value generates a stage 1 level 0 translation table
fault.
All calculations of the stage 1 base address are modified for tables
of fewer than 8 entries so that the table is aligned to 64 bytes.
Bits[5:2] of \text{TTBR0\_EL2} are used to hold bits[51:48] of the output
address in all cases.

\textbf{Note}
As FEAT\_LVA must be implemented if
TCR\_EL2.DS == 1, the minimum value of
the TCR\_EL2.T0SZ field is 12, as
determined by that extension.

For the TLBI Range instructions affecting VA, the format of the
argument is changed so that bits[36:0] hold BaseADDR[52:16]. For
the 4KB translation granule, bits[15:12] of BaseADDR are treated
as \text{0b0000}. For the 16KB translation granule, bits[15:14] of
BaseADDR are treated as \text{0b00}.

\textbf{Note}
This forces alignment of the ranges used
by the TLBI range instructions.

This field is \text{RES0} for a 64KB translation granule.

On a Warm reset, this field resets to an architecturally \text{UNKNOWN} value.

\textbf{Otherwise}:

Reserved, \text{RES0}.

\textbf{Bit [31]}

Reserved, \text{RES1}.

\textbf{TCMA, bit [30]}

\textbf{When FEAT\_MTE is implemented}:

Controls the generation of Unchecked accesses at EL2 when address [59:56] = \text{0b0000}.

\begin{center}
\begin{tabular}{|c|p{10cm}|}
\hline
TCMA & Meaning \\
\hline
0b0 & This control has no effect on the generation of Unchecked accesses. \\
0b1 & All accesses are Unchecked. \\
\hline
\end{tabular}
\end{center}

On a Warm reset, this field resets to an architecturally \text{UNKNOWN} value.

**Otherwise:**

Reserved, RES0.

**TBID, bit [29]**

*When FEAT_PAuth is implemented:*

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

<table>
<thead>
<tr>
<th>TBID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL2.TBI applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL2.TBI applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU62, bit [28]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU62</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>

<td>0b1</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU61, bit [27]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU61</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.</td>
</tr>
</tbody>
</table>
The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HWU60, bit [26]**

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates **IMPLEMENTATION DEFINED** hardware use of bit[60] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU60</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose if the value of TCR_EL2.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HWU59, bit [25]**

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates **IMPLEMENTATION DEFINED** hardware use of bit[59] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU59</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose if the value of TCR_EL2.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HPD, bit [24]**

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL2.
**HPD**

<table>
<thead>
<tr>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0b0</strong> Hierarchical permissions are enabled.</td>
<td></td>
</tr>
<tr>
<td><strong>0b1</strong> Hierarchical permissions are disabled.</td>
<td></td>
</tr>
</tbody>
</table>

**Note**

In this case, bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**Bit [23]**

Reserved, **RES1**.

**HD, bit [22]**

**When FEAT_HAFDBS is implemented:**

Hardware management of dirty state in stage 1 translations from EL2.

<table>
<thead>
<tr>
<th>HD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0b0</strong></td>
<td>Stage 1 hardware management of dirty state disabled.</td>
</tr>
<tr>
<td><strong>0b1</strong></td>
<td>Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**HA, bit [21]**

**When FEAT_HAFDBS is implemented:**

Hardware Access flag update in stage 1 translations from EL2.

<table>
<thead>
<tr>
<th>HA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>0b0</strong></td>
<td>Stage 1 Access flag update disabled.</td>
</tr>
<tr>
<td><strong>0b1</strong></td>
<td>Stage 1 Access flag update enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**TBI, bit [20]**

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the **TTBR0_EL2** region, or ignored and used for tagged addresses.
For more information, see 'Address tagging in AArch64 state'.

<table>
<thead>
<tr>
<th>TBI</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL2 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL2. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID is 1, then this field only applies to Data accesses.

If the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL2.
- An exception taken to EL2.
- An exception return to EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [19]**

Reserved, RES0.

**PS, bits [18:16]**

Physical Address Size.

<table>
<thead>
<tr>
<th>PS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>32 bits, 4GB.</td>
</tr>
<tr>
<td>0b001</td>
<td>36 bits, 64GB.</td>
</tr>
<tr>
<td>0b010</td>
<td>40 bits, 1TB.</td>
</tr>
<tr>
<td>0b011</td>
<td>42 bits, 4TB.</td>
</tr>
<tr>
<td>0b100</td>
<td>44 bits, 16TB.</td>
</tr>
<tr>
<td>0b101</td>
<td>48 bits, 256TB.</td>
</tr>
<tr>
<td>0b110</td>
<td>52 bits, 4PB.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is implementation defined whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are 0b0000.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**TG0, bits [15:14]**

Granule size for the TTBR0_EL2.

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an implementation defined choice of the sizes that has been implemented for all purposes other than the value read back from this register.
It is **IMPLEMENTATION DEFINED** whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using **TTBR0_EL2**.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is **CONSTRAINED UNPREDICTABLE**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using **TTBR0_EL2**.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using **TTBR0_EL2**.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [7:6]**

Reserved, **RES0**.

**T0SZ, bits [5:0]**

The size offset of the memory region addressed by **TTBR0_EL2**. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.
For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

## When FEAT_VHE is implemented and HCR_EL2.E2H == 1:

</table>

This view of the register is only valid from Armv8.1 when HCR_EL2.E2H is 1.

Any of the bits in TCR_EL2 are permitted to be cached in a TLB.

### Bits [63:60]

Reserved, RES0.

### DS, bit [59]

When FEAT_LPA2 is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL2&0 translation regime.

The minimum value of the TCR EL2, \{T0SZ, T1SZ\} fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.

Output address[51:48] is \texttt{0b0000}.

The shareability information of block and page descriptors for cacheable locations is determined by:

- TCR EL2.SH0 if the VA is an address that is translated using tables pointed to by TTBR0 EL2.
- TCR EL2.SH1 if the VA is an address that is translated using tables pointed to by TTBR1 EL2.

The minimum value of the TCR EL2, \{T0SZ, T1SZ\} fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.

All calculations of the stage 1 base address are modified for tables of fewer than 16 entries so that the table is aligned to 64 bytes. Bits[5:2] of TTBR0 EL2 or TTBR1 EL2 are used to hold bits[51:48] of the output address in all cases.

\textbf{Note}

As FEAT_LVA must be implemented if TCR EL2.DS == 1, the minimum value of the TCR EL2, \{T0SZ, T1SZ\} fields is 12, as determined by that extension.

For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as \texttt{0b0000}. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as \texttt{0b00}.

\textbf{Note}

This forces alignment of the ranges used by the TLBI range instructions.

This field is \texttt{RES0} for a 64KB translation granule.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

\textbf{Otherwise}:

Reserved, \texttt{RES0}.

\textbf{TCMA1, bit [58]}

\textbf{When FEAT_MTE is implemented}:

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR_EL2.TGE=1, when address[59:55] = \texttt{0b11111}.

<table>
<thead>
<tr>
<th>TCMA1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{0b0}</td>
<td>This control has no effect on the generation of Unchecked accesses at EL2 or EL0.</td>
</tr>
<tr>
<td>\texttt{0b1}</td>
<td>All accesses are Unchecked.</td>
</tr>
</tbody>
</table>

\textbf{Note}

Software may change this control bit on a context switch.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**TCMA0, bit [57]**

When FEAT_MTE is implemented:

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR_EL2.TGE=1, when address[59:55] = 0b00000.

<table>
<thead>
<tr>
<th>TCMA0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the generation of Unchecked accesses at EL2 or EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>All accesses are Unchecked.</td>
</tr>
</tbody>
</table>

**Note**

Software may change this control bit on a context switch.

On a Warm reset, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.

**E0PD1, bit [56]**

When FEAT_E0PD is implemented:

Faulting control for Unprivileged access to any address translated by TTBR1_EL2.

<table>
<thead>
<tr>
<th>E0PD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Unprivileged access to any address translated by TTBR1_EL2 will not generate a fault by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>Unprivileged access to any address translated by TTBR1_EL2 will generate a level 0 translation fault.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.

**E0PD0, bit [55]**

When FEAT_E0PD is implemented:

Faulting control for Unprivileged access to any address translated by TTBR0_EL2.

<table>
<thead>
<tr>
<th>E0PD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Unprivileged access to any address translated by TTBR0_EL2 will not generate a fault by this mechanism.</td>
</tr>
<tr>
<td>0b1</td>
<td>Unprivileged access to any address translated by TTBR0_EL2 will generate a level 0 translation fault.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally unknown value.

Otherwise:

Reserved, RES0.
**NFD1, bit [54]**

*When FEAT_SVE is implemented or FEAT_TME is implemented:*

Non-fault translation table walk disable for stage 1 translations using **TTBR1_EL2**.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using **TTBR1_EL2**.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

<table>
<thead>
<tr>
<th>NFD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not disable stage 1 translation table walks using <strong>TTBR1_EL2</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on a virtual address that is translated using <strong>TTBR1_EL2</strong> due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, **RES0**.

**NFD0, bit [53]**

*When FEAT_SVE is implemented or FEAT_TME is implemented:*

Non-fault translation table walk disable for stage 1 translations using **TTBR0_EL2**.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using **TTBR0_EL2**.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

<table>
<thead>
<tr>
<th>NFD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Does not disable stage 1 translation table walks using <strong>TTBR0_EL2</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on a virtual address that is translated using <strong>TTBR0_EL2</strong> due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
Otherwise:

Reserved, RES0.

**TBID1, bit [52]**

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

<table>
<thead>
<tr>
<th>TBID1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL2.TBI1 applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL2.TBI1 applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR1_EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**TBID0, bit [51]**

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For more information, see 'Address tagging in AArch64 state'.

<table>
<thead>
<tr>
<th>TBID0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL2.TBI0 applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL2.TBI0 applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL2.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**HWU162, bit [50]**

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates **IMPLEMENTATION DEFINED** hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.

<table>
<thead>
<tr>
<th>HWU162</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR1_EL2, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR1_EL2, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose if the value of TCR_EL2.HPD1 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU161, bit [49]**

When FEAT_HPDS2 is implemented:

<table>
<thead>
<tr>
<th>HWU161</th>
<th>Meaning</th>
</tr>
</thead>

<tr>
<td>0b0</td>
<td>For translations using TTBR1_EL2, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR1_EL2, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU160, bit [48]**

When FEAT_HPDS2 is implemented:

<table>
<thead>
<tr>
<th>HWU160</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR1_EL2, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR1_EL2, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HWU159, bit [47]**

When FEAT_HPDS2 is implemented:

<table>
<thead>
<tr>
<th>HWU159</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR1_EL2, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR1_EL2, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
HWU159

<table>
<thead>
<tr>
<th>Meaning</th>

</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU062, bit [46]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU061, bit [45]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

<table>
<thead>
<tr>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
</tr>
<tr>
<td>0b1</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
HWU060, bit [44]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

<table>
<thead>
<tr>
<th>HWU060</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>

<td>For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD1, bit [42]
When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR1_EL2.

<table>
<thead>
<tr>
<th>HPD1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled.</td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**HPD0, bit [41]**

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL2.

<table>
<thead>
<tr>
<th>HPD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Hierarchical permissions are enabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Hierarchical permissions are disabled.</td>
</tr>
</tbody>
</table>

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HD, bit [40]**

When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL2.

<table>
<thead>
<tr>
<th>HD</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 hardware management of dirty state disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HA, bit [39]**

When FEAT_HAFDBS is implemented:

Hardware Access flag update in stage 1 translations from EL2.

<table>
<thead>
<tr>
<th>HA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Stage 1 Access flag update disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Stage 1 Access flag update enabled.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TBI1, bit [38]**

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR1_EL2 region, or ignored and used for tagged addresses.
For more information, see 'Address tagging in AArch64 state'.

<table>
<thead>
<tr>
<th>TBI1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL2. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID1 is 1, then this field only applies to Data accesses.

If the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TBI0, bit [37]**

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR0_EL2 region, or ignored and used for tagged addresses.

For more information, see 'Address tagging in AArch64 state'.

<table>
<thead>
<tr>
<th>TBI0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Top Byte used in the address calculation.</td>
</tr>
<tr>
<td>0b1</td>
<td>Top Byte ignored in the address calculation.</td>
</tr>
</tbody>
</table>

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL2. It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID0 is 1, then this field only applies to Data accesses.

If the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**AS, bit [36]**

ASID Size.

<table>
<thead>
<tr>
<th>AS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>8 bit - the upper 8 bits of TTBR0_EL2 and TTBR1_EL2 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.</td>
</tr>
<tr>
<td>0b1</td>
<td>16 bit - the upper 16 bits of TTBR0_EL2 and TTBR1_EL2 are used for allocation and matching in the TLB.</td>
</tr>
</tbody>
</table>

If the implementation has only 8 bits of ASID, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [35]**

Reserved, RES0.
IPS, bits [34:32]

Intermediate Physical Address Size.

<table>
<thead>
<tr>
<th>IPS</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b000</td>
<td>32 bits, 4GB.</td>
<td></td>
</tr>
<tr>
<td>0b001</td>
<td>36 bits, 64GB.</td>
<td></td>
</tr>
<tr>
<td>0b010</td>
<td>40 bits, 1TB.</td>
<td></td>
</tr>
<tr>
<td>0b011</td>
<td>42 bits, 4TB.</td>
<td></td>
</tr>
<tr>
<td>0b100</td>
<td>44 bits, 16TB.</td>
<td></td>
</tr>
<tr>
<td>0b101</td>
<td>48 bits, 256TB.</td>
<td></td>
</tr>
<tr>
<td>0b110</td>
<td>52 bits, 4PB.</td>
<td>When FEAT_LPA is implemented</td>
</tr>
</tbody>
</table>

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are 0b0000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG1, bits [31:30]

Granule size for the TTBR1_EL2.

<table>
<thead>
<tr>
<th>TG1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b01</td>
<td>16KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b11</td>
<td>64KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using TTBR1_EL2.

<table>
<thead>
<tr>
<th>SH1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using TTBR1_EL2.
### ORGN1

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using **TTBR1_EL2**.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### EPD1, bit [23]

Translation table walk disable for translations using **TTBR1_EL2**. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using **TTBR1_EL2**. The encoding of this bit is:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using <strong>TTBR1_EL2</strong>.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using <strong>TTBR1_EL2</strong> generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### A1, bit [22]

Selects whether **TTBR0_EL2** or **TTBR1_EL2** defines the ASID. The encoding of this bit is:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td><strong>TTBR0_EL2</strong> ASID defines the ASID.</td>
</tr>
<tr>
<td>0b1</td>
<td><strong>TTBR1_EL2</strong> ASID defines the ASID.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### T1SZ, bits [21:16]

The size offset of the memory region addressed by **TTBR1_EL2**. The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

**Note**

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### TG0, bits [15:14]

Granule size for the **TTBR0_EL2**.

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB.</td>
</tr>
</tbody>
</table>

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an **IMPLEMENTATION DEFINED** choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is **IMPLEMENTATION DEFINED** whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using **TTBR0_EL2**.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is **CONSTRAINED UNPREDICTABLE**.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using **TTBR0_EL2**.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

### IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using **TTBR0_EL2**.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.
**EPD0, bit [7]**

Translation table walk disable for translations using TTBR0_EL2. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0_EL2. The encoding of this bit is:

<table>
<thead>
<tr>
<th>EPD0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Perform translation table walks using TTBR0_EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>A TLB miss on an address that is translated using TTBR0_EL2 generates a Translation fault. No translation table walk is performed.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [6]**

Reserved, RES0.

**T0SZ, bits [5:0]**

The size offset of the memory region addressed by TTBR0_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

**Note**

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the TCR_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TCR_EL2 or TCR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**MRS <Xt>, TCR_EL2**

```plaintext
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return TCR_EL2;
elsif PSTATE.EL == EL3 then
    return TCR_EL2;
```

TCR_EL3, Translation Control Register (EL3)

The TCR_EL3 characteristics are:

**Purpose**

The control register for stage 1 of the EL3 translation regime.

**Configuration**

This register is present only when EL3 is implemented. Otherwise, direct accesses to TCR_EL3 are UNDEFINED.

**Attributes**

TCR_EL3 is a 64-bit register.

**Field descriptions**

The TCR_EL3 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>62</th>
<th>61</th>
<th>60</th>
<th>59</th>
<th>58</th>
<th>57</th>
<th>56</th>

<td>25</td>
<td>24</td>
<td>23</td>
<td>22</td>
<td>21</td>
<td>20</td>
<td>19</td>
<td>18</td>
</tr>
</tbody>
</table>

Any of the bits in TCR_EL3 are permitted to be cached in a TLB.

**Bits [63:33]**

Reserved, RES0.

**DS, bit [32]**

When FEAT_LPA2 is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL3 translation regime.
Meaning

<table>
<thead>
<tr>
<th>DS</th>
<th>Bits[49:48] of translation descriptors are RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware. The minimum value of TCR_EL3.T0SZ is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. Output address[51:48] is 0b0000.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bits[49:48] of translation descriptors hold output address[49:48]. Bits[9:8] of table translation descriptors hold output address[51:50]. The shareability information of block and page descriptors for cacheable locations is determined by TCR_EL3.SH0. The minimum value of TCR_EL3.T0SZ is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes. Bits[5:2] of TTB0_EL3 are used to hold bits[51:48] of the output address in all cases.</td>
</tr>
</tbody>
</table>

**Note**
As FEAT_LVA must be implemented if TCR_EL3.DS == 1, the minimum value of the TCR_EL3.T0SZ field is 12, as determined by that extension.

For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.

**Note**
This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**Bit [31]**
Reserved, RES1.

**TCMA, bit [30]**

When FEAT_MTE is implemented:

Controls the generation of Unchecked accesses at EL3 when address [59:56] = 0b0000.

<table>
<thead>
<tr>
<th>TCMA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>This control has no effect on the generation of Unchecked accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>All accesses are Unchecked.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Otherwise:

Reserved, RES0.

**TBID, bit [29]**

*When FEAT_PAuth is implemented:*

Controls the use of the top byte of instruction addresses for address matching.

<table>
<thead>
<tr>
<th>TBID</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>TCR_EL3.TBI applies to Instruction and Data accesses.</td>
</tr>
<tr>
<td>0b1</td>
<td>TCR_EL3.TBI applies to Data accesses only.</td>
</tr>
</tbody>
</table>

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL3.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**HWU62, bit [28]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates **IMPLEMENTATION DEFINED** hardware use of bit[62] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU62</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose if the value of TCR_EL3.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

**HWU61, bit [27]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates **IMPLEMENTATION DEFINED** hardware use of bit[61] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU61</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose if the value of TCR_EL3.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HWU60, bit [26]**

When FEAT\_HPDS2 is implemented:

Hardware Use. Indicates **IMPLEMENTATION DEFINED** hardware use of bit[60] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU60</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose if the value of TCR_EL3.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR\_EL3.HPD is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HWU59, bit [25]**

When FEAT\_HPDS2 is implemented:

Hardware Use. Indicates **IMPLEMENTATION DEFINED** hardware use of bit[59] of the stage 1 translation table Block or Page entry.

<table>
<thead>
<tr>
<th>HWU59</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose.</td>
</tr>
<tr>
<td>0b1</td>
<td>Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an <strong>IMPLEMENTATION DEFINED</strong> purpose if the value of TCR_EL3.HPD is 1.</td>
</tr>
</tbody>
</table>

The Effective value of this field is 0 if the value of TCR\_EL3.HPD is 0.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HPD, bit [24]**

When FEAT\_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0\_EL3.
### HPD

<table>
<thead>
<tr>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0   Hierarchical permissions are enabled.</td>
<td></td>
</tr>
<tr>
<td>0b1  Hierarchical permissions are disabled.</td>
<td></td>
</tr>
</tbody>
</table>

**Note**

In this case, bit[61] (APTTable[0]) and bit[59] (PXNTTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**Bit [23]**

Reserved, RES1.

**HD, bit [22]**

*When FEAT_HAFDBS is implemented:*

Hardware management of dirty state in stage 1 translations from EL3.

<table>
<thead>
<tr>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0   Stage 1 hardware management of dirty state disabled.</td>
<td></td>
</tr>
<tr>
<td>0b1   Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.</td>
<td></td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**HA, bit [21]**

*When FEAT_HAFDBS is implemented:*

Hardware Access flag update in stage 1 translations from EL3.

<table>
<thead>
<tr>
<th>Meaning</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0   Stage 1 Access flag update disabled.</td>
<td></td>
</tr>
<tr>
<td>0b1   Stage 1 Access flag update enabled.</td>
<td></td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Otherwise:**

Reserved, RES0.

**TBI, bit [20]**

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the **TTBR0_EL3** region, or ignored and used for tagged addresses.
This affects addresses generated in EL3 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL3. It has an effect whether the EL3 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL3.TBID is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL3.
- A exception taken to EL3.
- An exception return to EL3.

For more information, see 'Address tagging in AArch64 state'.

### Note

This control determines the scope of address tagging. It never causes an exception to be generated.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

#### Bit [19]

Reserved, **RES0**.

#### **PS**, bits [18:16]

Physical Address Size.

<table>
<thead>
<tr>
<th>PS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>32 bits, 4GB.</td>
</tr>
<tr>
<td>0b01</td>
<td>36 bits, 64GB.</td>
</tr>
<tr>
<td>0b10</td>
<td>40 bits, 1TB.</td>
</tr>
<tr>
<td>0b11</td>
<td>42 bits, 4TB.</td>
</tr>
<tr>
<td>0b10</td>
<td>44 bits, 16TB.</td>
</tr>
<tr>
<td>0b11</td>
<td>48 bits, 256TB.</td>
</tr>
<tr>
<td>0b11</td>
<td>52 bits, 4PB.</td>
</tr>
</tbody>
</table>

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is **IMPLEMENTATION DEFINED** whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL3 are 0b0000.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

#### **TG0**, bits [15:14]

Granule size for the TTBR0_EL3.

<table>
<thead>
<tr>
<th>TG0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>4KB.</td>
</tr>
<tr>
<td>0b01</td>
<td>64KB.</td>
</tr>
<tr>
<td>0b10</td>
<td>16KB.</td>
</tr>
</tbody>
</table>
Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an implementation defined choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is implementation defined whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally unknown value.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using TTB0_EL3.

<table>
<thead>
<tr>
<th>SH0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

Other values are reserved. The effect of programming this field to a reserved value is that behavior is constrained unpredictable.

On a Warm reset, this field resets to an architecturally unknown value.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using TTB0_EL3.

<table>
<thead>
<tr>
<th>ORGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally unknown value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using TTB0_EL3.

<table>
<thead>
<tr>
<th>IRGN0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Normal memory, Inner Non-cacheable.</td>
</tr>
<tr>
<td>0b01</td>
<td>Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b10</td>
<td>Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
<tr>
<td>0b11</td>
<td>Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally unknown value.

**Bits [7:6]**

Reserved, RES0.

**T0SZ, bits [5:0]**

The size offset of the memory region addressed by TTB0_EL3. The region size is \(2^{(64-T0SZ)}\) bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.
Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the TCR_EL3

Accesses to this register use the following encodings:

MRS <Xt>, TCR_EL3

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>

The TFSR_EL1 characteristics are:

**Purpose**

Holds accumulated Tag Check Faults occurring in EL1 that are not taken precisely.

**Configuration**

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to TFSR_EL1 are **UNDEFINED**.

**Attributes**

TFSR_EL1 is a 64-bit register.

**Field descriptions**

The TFSR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Number</th>
<th>Bit Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-2</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>1</td>
<td>TF1</td>
</tr>
<tr>
<td>0</td>
<td>TF0</td>
</tr>
</tbody>
</table>

**Bits [63:2]**

Reserved, RES0.

**TF1, bit [1]**

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b1 occurs.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**TF0, bit [0]**

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b0 occurs.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the TFSR_EL1**

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b11</td>
<td>0b000</td>

TFSR_EL2, Tag Fault Status Register (EL2)

The TFSR_EL2 characteristics are:

**Purpose**

Holds accumulated Tag Check Faults occurring in EL2 that are not taken precisely.

**Configuration**

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to TFSR_EL2 are UNDEFINED.

**Attributes**

TFSR_EL2 is a 64-bit register.

**Field descriptions**

The TFSR_EL2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-2</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>1</td>
<td>TF1, bit [1]</td>
</tr>
<tr>
<td>0</td>
<td>TF0, bit [0]</td>
</tr>
</tbody>
</table>

**TF1, bit [1]**

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b1 occurs.

When HCR_EL2.E2H==0b0, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TF0, bit [0]**

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b0 occurs.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TFSR_EL2**

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TFSR_EL2 or TFSR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

**TF0, bit [0]**

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b0 occurs.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the TFSRE0_EL1**

TFSRE0_EL1, Tag Fault Status Register (EL0).
TFSRE0_EL1, Tag Fault Status Register (EL0).
The TLBI ALLE1, TLBI ALLE1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If `SCR_EL3.NS` is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
- If `SCR_EL3.NS` is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation only applies to the PE that executes this System instruction.

**Note**

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If `FEAT_XS` is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI ALLE1, TLBI ALLE1NXS is a 64-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by `<Xt>` is ignored.

**Executing the TLBI ALLE1, TLBI ALLE1NXS instruction**

When executing this instruction Xt should be encoded as \texttt{0b11111}. If the Xt field is not set to \texttt{0b11111}, it is **UNDEFINED** whether:

- The instruction is **UNDEFINED**.
- The instruction behaves as if the Xt field is set to \texttt{0b11111}.

Accesses to this instruction use the following encodings:

  else
    TLBI_ALL(SecurityStateAtEL(EL2), Regime_EL2, Shareability_Outer, TLBI_ExcludeXS);
The TLBI ALLE3, TLBI ALLE3NXS characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be required to translate an address using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI ALLE3, TLBI ALLE3NXS is a 64-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by &lt;Xt&gt; is ignored.

**Executing the TLBI ALLE3, TLBI ALLE3NXS instruction**

When executing this instruction Xt should be encoded as 0b11111. If the Xt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Xt field is set to 0b11111.

Accesses to this instruction use the following encodings:

The TLBI ASIDE1, TLBI ASIDE1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate an address using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI ASIDE1, TLBI ASIDE1NXS is a 64-bit System instruction.

**Field descriptions**

The TLBI ASIDE1, TLBI ASIDE1NXS input value bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |

end
TLBI ASIDE1OS, TLBI ASIDE1OSNXS, TLB Invalidate by ASID, EL1, Outer Shareable

The TLBI ASIDE1OS, TLBI ASIDE1OSNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3`.NS:
  - If `HCR_EL2.{E2H, TGE}` is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate an address using the EL1&0 translation regime.
  - If `HCR_EL2.{E2H, TGE}` is \{1, 1\}, the entry would be required to translate an address using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If `FEAT_XS` is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when `FEAT_TLBIOS` is implemented. Otherwise, direct accesses to TLBI ASIDE1OS, TLBI ASIDE1OSNXS are **UNDEFINED**.

**Attributes**

TLBI ASIDE1OS, TLBI ASIDE1OSNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI ASIDE1OS, TLBI ASIDE1OSNXS input value bit assignments are:

|   | 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|    |
| ASID | RES0 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
ASID, bits [63:48]

ASID value to match. Any appropriate TLB entries that match the ASID values will be affected by this System instruction.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Bits [47:0]

Reserved, RES0.

Executing the TLBI ASIDE1OS, TLBI ASIDE1OSNXS instruction

Accesses to this instruction use the following encodings:

TLBI IPAS2E1, TLBI IPAS2E1NXS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1

The TLBI IPAS2E1, TLBI IPAS2E1NXS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI IPAS2E1, TLBI IPAS2E1NXS is a 64-bit System instruction.

**NS, bit [63]**

When FEAT_SEL2 is implemented:

Not Secure. Specifies the IPA space.
<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented or is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:40]

Reserved, RES0.
IPA[51:48], bits [39:36]

When FEAT_LPA is implemented:

Extension to IPA[47:12]. See IPA[47:12] for more details.

Otherwise:

Reserved, RES0.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2E1, TLBI IPAS2E1NXS instruction

Accesses to this instruction use the following encodings:

  else
    TLBI_IPAS2(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_None, TLBILevel_Any,
                TLBI_ExcludeXS, X[t]);
The TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS input value bit assignments are:
**NS, bit [63]**

When FEAT_SEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>

TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable

The TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS are UNDEFINED.

**Attributes**

TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| NS | RES0 | TTL | RES0 | IPA[51:48] | IPA[47:12] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

NS, bit [63]
When FEAT_SEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented or is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:40]

Reserved, RES0.
**IPA[51:48], bits [39:36]**

Extension to IPA[47:12]. See IPA[47:12] for more details.

**IPA[47:12], bits [35:0]**

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

**Executing the TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS instruction**

Accesses to this instruction use the following encodings:

```
TLBI IPAS2E1OS{, <Xt>}
```

<table>

        //no operation
    else
        TLBI_IPAS2(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_Outer, TLBILevel_Any, TLBI_ExcludeXS, X[t]);
```
The TLBI IPAS2LE1, TLBI IPAS2LE1NXS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - \texttt{SCR\_EL3\_NS} is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - \texttt{SCR\_EL3\_NS} is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If \texttt{FEAT\_XS} is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI IPAS2LE1, TLBI IPAS2LE1NXS is a 64-bit System instruction.

TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS input value bit assignments are:
**NS, bit [63]**

When FEAT_SEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented or is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

**Bits [62:48]**

Reserved, RES0.

**TTL, bits [47:44]**

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.
Bits [43:40]  
Reserved, RES0.

IPA[51:48], bits [39:36]  
When FEAT_LPA is implemented:  
Extension to IPA[47:12]. See IPA[47:12] for more details.

Otherwise:  
Reserved, RES0.

IPA[47:12], bits [35:0]  
Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

end if
TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see ‘Invalidation of TLB entries from stage 2 translations’.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS are UNDEFINED.

**Attributes**

TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>NS</td>
</tr>
<tr>
<td>62</td>
<td>RES0</td>
</tr>
<tr>
<td>61</td>
<td>TTL</td>
</tr>
<tr>
<td>60</td>
<td>RES0</td>
</tr>
<tr>
<td>59</td>
<td>IPA[51:48]</td>
</tr>
<tr>
<td>58</td>
<td>IPA[47:12]</td>
</tr>
</tbody>
</table>

NS, bit [63]
When FEAT_SEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented or is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as:</td>
</tr>
<tr>
<td></td>
<td>0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00.</td>
</tr>
<tr>
<td></td>
<td>0b01 : Level 1.</td>
</tr>
<tr>
<td></td>
<td>0b10 : Level 2.</td>
</tr>
<tr>
<td></td>
<td>0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as:</td>
</tr>
<tr>
<td></td>
<td>0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00.</td>
</tr>
<tr>
<td></td>
<td>0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00.</td>
</tr>
<tr>
<td></td>
<td>0b10 : Level 2.</td>
</tr>
<tr>
<td></td>
<td>0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as:</td>
</tr>
<tr>
<td></td>
<td>0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00.</td>
</tr>
<tr>
<td></td>
<td>0b01 : Level 1.</td>
</tr>
<tr>
<td></td>
<td>0b10 : Level 2.</td>
</tr>
<tr>
<td></td>
<td>0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:40]

Reserved, RES0.
IPA[51:48], bits [39:36]

Extension to IPA[47:12]. See IPA[47:12] for more details.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS instruction

Accesses to this instruction use the following encodings:

TLBI IPAS2LE1OS{, <Xt>}

    //no operation
  else
    TLBI_IPAS2(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_Outer, TLBILevel_Last, TLBI_ExcludeXS, X[t]);
The TLBI RIPAS2E1, TLBI RIPAS2E1NXS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq VA < \text{BaseADDR} + ((\text{NUM } + 1) \times 2^{5 \times \text{SCALE } + 1} \times \text{Translation Granule Size})]\).

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL == 01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL == 10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL == 10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL == 01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
  - If TTL == 10 and BaseADDR[28:16] is not equal to 000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.
**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2E1, TLBI RIPAS2E1NXS are undefined.

**Attributes**

TLBI RIPAS2E1, TLBI RIPAS2E1NXS is a 64-bit System instruction.

**Field descriptions**

The TLBI RIPAS2E1, TLBI RIPAS2E1NXS input value bit assignments are:

<p>| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

The TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \[ \text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation\_Granule\_Size}) \].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 00000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.
Configuration

This instruction is present only when FEAT TLBIRANGE is implemented and FEAT TLBIOS is implemented. Otherwise, direct accesses to TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS are UNDEFINED.

Attributes

TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS is a 64-bit System instruction.

Field descriptions

The TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>NS</td>
</tr>
<tr>
<td>62</td>
<td>RES0</td>
</tr>
<tr>
<td>61</td>
<td>TG</td>
</tr>
<tr>
<td>60</td>
<td>SCALE</td>
</tr>
<tr>
<td>59</td>
<td>NUM</td>
</tr>
<tr>
<td>58</td>
<td>TTL</td>
</tr>
<tr>
<td>57</td>
<td>BaseADDR</td>
</tr>
</tbody>
</table>

NS, bit [63]

When FEAT_SEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented or is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.
NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

    else
        TLBI_RIPAS2(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_Outer, TLBILevel_Any, TLBIExcludeXS, X[t]);
The TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \[\text{[BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1) \times \text{Translation Granule Size}})).\]

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 0000000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS are undefined.

Attributes

TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS is a 64-bit System instruction.

    else
        TLBI_RIPAS2(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_None, TLBILevel_Last, TLBI_ExcludeXS, X[t]);
The TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)}) \times \text{Translation_Granule_Size})]\).

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 00000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see ‘Invalidation of TLB entries from stage 2 translations’.

If **FEAT_XS** is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS are UNDEFINED.

Attributes

TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS is a 64-bit System instruction.

Field descriptions

The TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>

    TLBI_RIPAS2(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_Inner, TLBILevel_Last, TLBI_ExcludeXS, X[t]);
endif
TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS characteristics are:

**Purpose**

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula \[\text{BaseADDR} \leq VA < \text{BaseADDR} + ((\text{NUM} + 1)*2^{(5\times\text{SCALE} + 1)} \times \text{Translation_Granule_Size})]\.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 00000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 0000000000000000000000000000000000.
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see ‘Invalidation of TLB entries from stage 2 translations’.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS are UNDEFINED.

**Attributes**

TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS is a 64-bit System instruction.

**NS, bit [63]**

When FEAT_SEL2 is implemented:

Not Secure. Specifies the IPA space.

<table>
<thead>
<tr>
<th>NS</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>IPA is in the Secure IPA space.</td>
</tr>
<tr>
<td>0b1</td>
<td>IPA is in the Non-secure IPA space.</td>
</tr>
</tbody>
</table>

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented or is disabled in the current Security state, this field is RES0.

**Otherwise:**

Reserved, RES0.

**Bits [62:48]**

Reserved, RES0.

**TG, bits [47:46]**

Translation granule size.
The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>

<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

**BaseADDR, bits [36:0]**

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVAAE1, TLBI RVAAE1NXS, TLB Range Invalidate by VA, All ASID, EL1

The TLBI RVAAE1, TLBI RVAAE1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(\text{5*SCALE} + 1)}) \times \text{Translation_Granule_Size}\].

The invalidation applies to the PE that executes this System instruction.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAAE1, TLBI RVAAE1NXS are **UNDEFINED**.
Attributes

TLBI RVAAE1, TLBI RVAAE1NXS is a 64-bit System instruction.

      TLBI_RVAA(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_None, TLBILevel_Any,
        TLBI_ExcludeXS, X[t]);
The TLBI RVAAE1IS, TLBI RVAAE1ISNXS, TLB Range Invalidate by VA, All ASID, EL1, Inner Shareable characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation_Granule_Size})\].

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is *UNPREDICTABLE* when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 0000000000000000000000000.
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAAE1IS, TLBI RVAAE1ISNXS are *UNDEFINED*.

**Attributes**

TLBI RVAAE1IS, TLBI RVAAE1ISNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI RVAAE1IS, TLBI RVAAE1ISNXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit positions</th>
<th>RES0</th>
<th>TG</th>
<th>SCALE</th>
<th>NUM</th>
<th>TTL</th>
<th>BaseADDR</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>BaseADDR</td>
</tr>
<tr>
<td>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:48]**

Reserved, RES0.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
### TTL

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation</td>
</tr>
<tr>
<td></td>
<td>table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>All entries to invalidate are Level 1 translation table entries.</td>
</tr>
<tr>
<td></td>
<td>If FEAT_LPA2 is not implemented, when using a 16KB translation</td>
</tr>
<tr>
<td></td>
<td>granule, this value is reserved and hardware should treat this</td>
</tr>
<tr>
<td></td>
<td>field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

### BaseADDR, bits [36:0]

**When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

- When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.
- When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

- When using a 4KB translation granule, this field is BaseADDR[48:12].
- When using a 16KB translation granule, this field is BaseADDR[50:14].
- When using a 64KB translation granule, this field is BaseADDR[52:16].

                   TLBI_ExcludeXS, X[t]);
    endif
endif
The TLBI RVAAE1OS, TLBI RVAAE1OSNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR EL3 NS:
  - If HCR_EL2 {E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2 {E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*2^5*SCALE +1) * Translation_Granule_Size]).

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3 EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3 EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 0000000000000000000000000000000000.
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAE1OS, TLBI RVAE1OSNXS are UNDEFINED.

Attributes

TLBI RVAE1OS, TLBI RVAE1OSNXS is a 64-bit System instruction.

Page 1799
The TLBI RVAALE1, TLBI RVAALE1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5\times\text{SCALE} + 1)} \times \text{Translation Granule Size})\].

The invalidation applies to the PE that executes this System instruction.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is *unpredictable* when:

- For the 4K translation granularity:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granularity:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granularity:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAALE1, TLBI RVAALE1NXS are *undefined*.
Attributes

TLBI RVALE1, TLBI RVALE1NXS is a 64-bit System instruction.

Field descriptions

The TLBI RVALE1, TLBI RVALE1NXS input value bit assignments are:

<td>0b00</td>
<td>0b00</td>
<td>0b00</td>
<td>0b00</td>
</tr>
</tbody>
</table>

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.
When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RVAALE1, TLBI RVAALE1NXS instruction**

          TLBI_ExcludeXS, X[t]);
The TLBI RVAALE1IS, TLBI RVAALE1ISNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1)2^{(5 \times \text{SCALE} + 1) \times \text{Translation Granule Size}})\].

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

---

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

---

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

---

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
If \( \text{TTL} == 01 \) and \( \text{BaseADDR}[41:16] \) is not equal to 0000000000000000000000000000000000.

- If \( \text{TTL} == 10 \) and \( \text{BaseADDR}[28:16] \) is not equal to 0000000000000000000000000000000000.

If \( \text{FEAT}_X \text{XS} \) is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

### Configuration

This instruction is present only when \( \text{FEAT}_\text{TLBIRANGE} \) is implemented. Otherwise, direct accesses to TLBI RVAALE1IS, TLBI RVAALE1ISNXS are **UNDEFINED**.

### Attributes

TLBI RVAALE1IS, TLBI RVAALE1ISNXS is a 64-bit System instruction.

### Field descriptions

The TLBI RVAALE1IS, TLBI RVAALE1ISNXS input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    | RES0 | TG | SCALE | NUM | TTL | BaseADDR |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:48]**

Reserved, RES0.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
### TTL

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
</tbody>
</table>
| 0b01 | All entries to invalidate are Level 1 translation table entries.  
If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

### BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

- When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.
- When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

- When using a 4KB translation granule, this field is BaseADDR[48:12].
- When using a 16KB translation granule, this field is BaseADDR[50:14].
- When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVAALE1ISNXS{}, <Xt>
The TLBI RVAALE1OS, TLBI RVAALE1OSNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*2^{5*SCALE} + Translation_Granule_Size)].

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.

If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAALE1OS, TLBI RVAALE1OSNXS are UNDEFINED.

**Attributes**

TLBI RVAALE1OS, TLBI RVAALE1OSNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI RVAALE1OS, TLBI RVAALE1OSNXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Bit Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RESERVED Res0</td>
</tr>
<tr>
<td>62</td>
<td>TG SCALE</td>
</tr>
<tr>
<td>61</td>
<td>NUM</td>
</tr>
<tr>
<td>60</td>
<td>TTL BaseADDR</td>
</tr>
</tbody>
</table>

**Bits [63:48]**

Reserved, Res0.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation</td>
</tr>
<tr>
<td></td>
<td>table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>All entries to invalidate are Level 1 translation table entries.</td>
</tr>
<tr>
<td></td>
<td>If FEAT_LPA2 is not implemented, when using a 16KB translation</td>
</tr>
<tr>
<td></td>
<td>granule, this value is reserved and hardware should treat this</td>
</tr>
<tr>
<td></td>
<td>field as 0b00.</td>
</tr>
<tr>

<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

**BaseADDR, bits [36:0]**

**When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RVAALE1OS, TLBI RVAALE1OSNXS instruction**

Accesses to this instruction use the following encodings:

```
TLBI RVAALE1OS{, <Xt>}
```

        end
      end
  end
end
The TLBI RVAE1, TLBI RVAE1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{5 \times \text{SCALE} + 1}) \times \text{Translation_Granule_Size}\].

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE1, TLBI RVAE1NXS are **UNDEFINED**.

**Attributes**

TLBI RVAE1, TLBI RVAE1NXS is a 64-bit System instruction.

</tbody>
</table>

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>

<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>

</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

**BaseADDR, bits [36:0]**

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.
When using a 4KB translation granule, BaseADDR[15:12] is treated as \(0b0000\).

When using a 16KB translation granule, BaseADDR[15:14] is treated as \(0b00\).

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVAE1IS, TLBI RVAE1ISNXS, TLB Range Invalidate by VA, EL1, Inner Shareable

The TLBI RVAE1IS, TLBI RVAE1ISNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{5 \times \text{SCALE} + 1}) \times \text{Translation Granule Size}\].

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.

If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE1IS, TLBI RVAE1ISNXS are UNDEFINED.

**Attributes**

TLBI RVAE1IS, TLBI RVAE1ISNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI RVAE1IS, TLBI RVAE1ISNXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit Field</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-48</td>
<td>ASID</td>
</tr>
<tr>
<td>47-46</td>
<td>TG</td>
</tr>
<tr>
<td>45-44</td>
<td>SCALE</td>
</tr>
<tr>
<td>43-39</td>
<td>NUM</td>
</tr>
<tr>
<td>38-37</td>
<td>TTL</td>
</tr>
<tr>
<td>32</td>
<td>BaseADDR</td>
</tr>
</tbody>
</table>

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
### TTL

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation</td>
</tr>
<tr>
<td></td>
<td>table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>All entries to invalidate are Level 1 translation table entries.</td>
</tr>
<tr>
<td></td>
<td>If FEAT_LPA2 is not implemented, when using a 16KB translation</td>
</tr>
<tr>
<td></td>
<td>granule, this value is reserved and hardware should treat this</td>
</tr>
<tr>
<td></td>
<td>field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

### BaseADDR, bits [36:0]

**When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:**

The starting address for the range of the maintenance instructions. This field is `BaseADDR[52:16]` for all translation granules.

- When using a 4KB translation granule, `BaseADDR[15:12]` is treated as `0b0000`.
- When using a 16KB translation granule, `BaseADDR[15:14]` is treated as `0b00`.

**Otherwise:**

The starting address for the range of the maintenance instruction.

- When using a 4KB translation granule, this field is `BaseADDR[48:12]`.
- When using a 16KB translation granule, this field is `BaseADDR[50:14]`.
- When using a 64KB translation granule, this field is `BaseADDR[52:16]`.

### Executing the TLBI RVAE1IS, TLBI RVAE1ISNXS instruction

endif
TLBI RVAE1OS, TLBI RVAE1OSNXS, TLB Range Invalidate by VA, EL1, Outer Shareable

The TLBI RVAE1OS, TLBI RVAE1OSNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3:NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{5\times\text{SCALE} + 1}) \times \text{Translation_Granule_Size})\].

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

---

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000000000000000.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAE1OS, TLBI RVAE1OSNXS are undefined.

**Attributes**

TLBI RVAE1OS, TLBI RVAE1OSNXS is a 64-bit System instruction.

**Field descriptions**

TLBI RVAE2, TLBI RVAE2NXS, TLB Range Invalidate by VA, EL2

The TLBI RVAE2, TLBI RVAE2NXS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula 
  \[ \text{[BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} +1)\times2^{(5\times\text{SCALE} +1) \times \text{Translation_Granule_Size}}) \],
  \]  using the EL2 or EL2&0 translation regime.
- If HCR_EL2.E2H == 0, the entry is from any level of the translation table walk.
- If HCR_EL2.E2H == 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBRANGE is implemented. Otherwise, direct accesses to TLBI RVAE2, TLBI RVAE2NXS are **UNDEFINED.**
Attributes

TLBI RVAE2, TLBI RVAE2NXS is a 64-bit System instruction.

Field descriptions

The TLBI RVAE2, TLBI RVAE2NXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-48</td>
<td>ASID</td>
</tr>
<tr>
<td>47-46</td>
<td>TG</td>
</tr>
<tr>
<td>45-44</td>
<td>SCALE</td>
</tr>
<tr>
<td>43-39</td>
<td>NUM</td>
</tr>
<tr>
<td>38-37</td>
<td>TTL</td>
</tr>
<tr>
<td>32-0</td>
<td>BaseADDR</td>
</tr>
</tbody>
</table>

**ASID, bits [63:48]**

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
### TTL

<table>

<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

### BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

```
The TLBI RVAE2IS, TLBI RVAE2ISNXS, TLB Range Invalidate by VA, EL2, Inner Shareable characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula
  \[ \text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1) \times \text{Translation_Granule_Size}}) \],
  using the EL2 or EL2&0 translation regime.
- If \text{HCR_EL2}.E2H == 0, the entry is from any level of the translation table walk.
- If \text{HCR_EL2}.E2H == 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 00000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

      TLBI_ExcludeXS, X[t]);

The TLBI RVAE3, TLBI RVAE3NXS characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation_Granule_Size})]\).

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If \(\text{TTL}==01\) and \(\text{BaseADDR}[29:12]\) is not equal to 000000000000000000.
  - If \(\text{TTL}==10\) and \(\text{BaseADDR}[20:12]\) is not equal to 00000000.

- For the 16K translation granule:
  - If \(\text{TTL}==10\) and \(\text{BaseADDR}[24:14]\) is not equal to 0000000000.

- For the 64K translation granule:
  - If \(\text{TTL}==01\) and \(\text{BaseADDR}[41:16]\) is not equal to 000000000000000000000000.
  - If \(\text{TTL}==10\) and \(\text{BaseADDR}[28:16]\) is not equal to 000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE3, TLBI RVAE3NXS are **UNDEFINED**.

**Attributes**

TLBI RVAE3, TLBI RVAE3NXS is a 64-bit System instruction.

**Field descriptions**

The TLBI RVAE3, TLBI RVAE3NXS input value bit assignments are:
Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>

TLBI RVALE1, TLBI RVALE1NXS, TLB Range Invalidate by VA, Last level, EL1

The TLBI RVALE1, TLBI RVALE1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.E2H, TGE is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.E2H, TGE is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{5 \times \text{SCALE} + 1} \times \text{Translation_Granule_Size})]\).

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE1, TLBI RVALE1NXS are UNDEFINED.

Attributes

TLBI RVALE1, TLBI RVALE1NXS is a 64-bit System instruction.

<td>3</td>
<td>2</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.
### TTL

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

### BaseADDR, bits [36:0]

**When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

    else
      TLBI_RVA(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_None, TLBILevel_Last,
                TLBI_ExcludeXS, X[t]);
The TLBI RVAE1IS, TLBI RVAE1ISNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \([\text{BaseADDR} <= \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1)\times2^{(5\times\text{SCALE} + 1)} \times \text{Translation_Granule_Size})]\).

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is *UNPREDICTABLE* when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000000000.
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE1IS, TLBI RVALE1ISNXS are UNDEFINED.

Attributes

TLBI RVALE1IS, TLBI RVALE1ISNXS is a 64-bit System instruction.

Field descriptions

The TLBI RVALE1IS, TLBI RVALE1ISNXS input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>

TLBI RVALE1OS, TLBI RVALE1OSNXS, TLB Range Invalidate by VA, Last level, EL1, Outer Shareable

The TLBI RVALE1OS, TLBI RVALE1OSNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula \([\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation\_Granule\_Size})]\).

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 0000000000000000000000000000000000.
If $TTL = 10$ and $BaseADDR[28:16]$ is not equal to $0000000000000000$.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVALE1OS, TLBI RVALE1OSNXS are **UNDEFINED**.

**Attributes**

TLBI RVALE1OS, TLBI RVALE1OSNXS is a 64-bit System instruction.

<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.
TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation</td>
</tr>
<tr>
<td></td>
<td>table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>All entries to invalidate are Level 1 translation table entries.</td>
</tr>
<tr>
<td></td>
<td>If FEAT_LPA2 is not implemented, when using a 16KB translation</td>
</tr>
<tr>

<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

      endif
    endif
  endif
endif
The TLBI RVALE2, TLBI RVALE2NXS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula $\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{\text{SCALE} + 1} \times \text{Translation Granule Size})$ using the EL2 or EL2&0 translation regime.
- If $\text{HCR}_{\text{EL2}}.E2H = 0$, the entry is from the final level of the translation table walk.
- If $\text{HCR}_{\text{EL2}}.E2H = 1$, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 00000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE2, TLBI RVALE2NXS are **UNDEFINED**.

**Attributes**

TLBI RVALE2, TLBI RVALE2NXS is a 64-bit System instruction.
Field descriptions

The TLBI RVALE2, TLBI RVALE2NXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>ASID</td>
</tr>
<tr>
<td>62</td>
<td>TG</td>
</tr>
<tr>
<td>61</td>
<td>SCALE</td>
</tr>
<tr>
<td>60</td>
<td>NUM</td>
</tr>
<tr>
<td>59</td>
<td>TTL</td>
</tr>
<tr>
<td>58</td>
<td>BaseADDR</td>
</tr>
</tbody>
</table>

**ASID, bits [63:48]**

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>

</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>
BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.
When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].
When using a 16KB translation granule, this field is BaseADDR[50:14].
When using a 64KB translation granule, this field is BaseADDR[52:16].

            end
end
The TLBI RVALE2OS, TLBI RVALE2OSNXS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula $\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation_Granule_Size})$ using the EL2 or EL2&0 translation regime.
- If $\text{HCR\_EL2.E2H} = 0$, the entry is from the final level of the translation table walk.
- If $\text{HCR\_EL2.E2H} = 1$, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVALE2OS, TLBI RVALE2OSNXS are UNDEFINED.

**Attributes**

TLBI RVALE2OS, TLBI RVALE2OSNXS is a 64-bit System instruction.
Field descriptions

The TLBI RVALE2OS, TLBI RVALE2OSNXS input value bit assignments are:

<td>2</td>
<td>1</td>
<td>0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

ASID, bits [63:48]

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>The entries in the range can be using any level for the translation table entries.</td>
</tr>
<tr>
<td>0b01</td>
<td>All entries to invalidate are Level 1 translation table entries.</td>
</tr>
<tr>
<td></td>
<td>If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</td>
</tr>
<tr>
<td>0b10</td>
<td>All entries to invalidate are Level 2 translation table entries.</td>
</tr>
<tr>
<td>0b11</td>
<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>
**BaseADDR, bits [36:0]**

When `FEAT_LPA2` is implemented and `TCR_EL2.DS == 1`:

The starting address for the range of the maintenance instructions. This field is `BaseADDR[52:16]` for all translation granules.

When using a 4KB translation granule, `BaseADDR[15:12]` is treated as `0b0000`.

When using a 16KB translation granule, `BaseADDR[15:14]` is treated as `0b00`.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is `BaseADDR[48:12]`.

When using a 16KB translation granule, this field is `BaseADDR[50:14]`.

When using a 64KB translation granule, this field is `BaseADDR[52:16]`.

TLBI RVALE3, TLBI RVALE3NXS, TLB Range Invalidate by VA, Last level, EL3

The TLBI RVALE3, TLBI RVALE3NXS characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula \[\text{BaseADDR} <= \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1) \times \text{Translation_Granule_Size}})\].

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.

- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 0000000000.

- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE3, TLBI RVALE3NXS are **UNDEFINED**.

**Attributes**

TLBI RVALE3, TLBI RVALE3NXS is a 64-bit System instruction.

   TLBI RVA(SEcurityStateAtEL(EL3), Regime_EL3, VMID[], Shareability_Inner, TLBILevel_Last, TLBI_ExcludeXS, X[t]);
The TLBI RVALE3OS, TLBI RVALE3OSNXS characteristics are:

**Purpose**

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula \( \text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) \times 2^{(5 \times \text{SCALE} + 1)} \times \text{Translation_Granule_Size}) \).

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is **UNPREDICTABLE** when:

- For the 4K translation granule:
  - If \( \text{TTL} == 01 \) and \( \text{BaseADDR}[29:12] \) is not equal to 0000000000000000.
  - If \( \text{TTL} == 10 \) and \( \text{BaseADDR}[20:12] \) is not equal to 00000000.
- For the 16K translation granule:
  - If \( \text{TTL} == 10 \) and \( \text{BaseADDR}[24:14] \) is not equal to 00000000.
- For the 64K translation granule:
  - If \( \text{TTL} == 01 \) and \( \text{BaseADDR}[41:16] \) is not equal to 000000000000000000000000.
  - If \( \text{TTL} == 10 \) and \( \text{BaseADDR}[28:16] \) is not equal to 000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVALE3OS, TLBI RVALE3OSNXS are **UNDEFINED**.

**Attributes**

TLBI RVALE3OS, TLBI RVALE3OSNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI RVALE3OS, TLBI RVALE3OSNXS input value bit assignments are:
**Bits [63:48]**

Reserved, RES0.

**TG, bits [47:46]**

Translation granule size.

<table>
<thead>
<tr>
<th>TG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Reserved.</td>
</tr>
<tr>
<td>0b01</td>
<td>4K translation granule.</td>
</tr>
<tr>
<td>0b10</td>
<td>16K translation granule.</td>
</tr>
<tr>
<td>0b11</td>
<td>64K translation granule.</td>
</tr>
</tbody>
</table>

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

<table>
<thead>
<tr>
<th>TTL</th>

<td>All entries to invalidate are Level 3 translation table entries.</td>
</tr>
</tbody>
</table>

**BaseADDR, bits [36:0]**

When FEAT_LPA2 is implemented and TCR_EL3.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].
When using a 16KB translation granule, this field is BaseADDR[50:14].
When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RVALE3OS, TLBI RVALE3OSNXS instruction**

  TLBI_ExcludeXS, X[t]);
The TLBI VAAE1, TLBI VAAE1NXS characteristics are:

### Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

---

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

---

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

### Configuration

There are no configuration notes.

### Attributes

TLBI VAAE1, TLBI VAAE1NXS is a 64-bit System instruction.

### Field descriptions

The TLBI VAAE1, TLBI VAAE1NXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td>62</td>
<td>TTL</td>
</tr>
<tr>
<td>61</td>
<td>VA[55:12]</td>
</tr>
</tbody>
</table>

**Bits [63:48]**

Reserved, RES0.
TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAAE1, TLBI VAAE1NXS instruction

TLBI VAAE1IS, TLBI VAAE1ISNXS, TLB Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI VAAE1IS, TLBI VAAE1ISNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VAAE1IS, TLBI VAAE1ISNXS is a 64-bit System instruction.
Field descriptions

The TLBI VAAE1IS, TLBI VAAE1ISNXS input value bit assignments are:

| Bits [63:48] | Reserved, RES0. |

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
• Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

• Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

    TLBI_ExecuteXS, X[t]);
The TLBI VAAE1OS, TLBI VAAE1OSNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAAE1OS, TLBI VAAE1OSNXS are UNDEFINED.
Attributes

TLBI VAAE1OS, TLBI VAAE1OSNXS is a 64-bit System instruction.

Field descriptions

The TLBI VAAE1OS, TLBI VAAE1OSNXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Bit Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved (RES0)</td>
</tr>
<tr>
<td>62</td>
<td>TTL</td>
</tr>
<tr>
<td>61-12</td>
<td>VA[55:12]</td>
</tr>
<tr>
<td>31-20</td>
<td>Reserved</td>
</tr>
<tr>
<td>19-0</td>
<td>VA[43:0]</td>
</tr>
</tbody>
</table>

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.
The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAAE1OS, TLBI VAAE1OSNXS instruction**

Accesses to this instruction use the following encodings:

\[
\text{TLBI VAAE1OS, TLBI VAAE1OSNXS} \quad \text{TLB Invalidate by VA, All ASID, EL1, Outer Shareable}
\]

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAAE1OS, TLBI VAAE1OSNXS instruction**

Accesses to this instruction use the following encodings:

\[
\text{TLBI VAAE1OS, TLBI VAAE1OSNXS} \quad \text{TLB Invalidate by VA, All ASID, EL1, Outer Shareable}
\]

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAAE1OS, TLBI VAAE1OSNXS instruction**

Accesses to this instruction use the following encodings:

\[
\text{TLBI VAAE1OS, TLBI VAAE1OSNXS} \quad \text{TLB Invalidate by VA, All ASID, EL1, Outer Shareable}
\]

  elsif PSTATE.EL == EL3 then
    if HCR_EL2.<E2H,TGE> == '11' then
      TLBI_VAA(SecurityStateAtEL(EL2), Regime_EL20, VMID_NONE, Shareability_None, TLBLevel_Last, TLBI_ExcludeXS, X[t]);
    else
      TLBI_VAA(SecurityStateAtEL(EL2), Regime_EL20, VMID_NONE, Shareability_None, TLBLevel_Last, TLBI_ExcludeXS, X[t]);
The TLBI VAALE1IS, TLBI VAALE1ISNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2,E2H,TGE is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2,E2H,TGE is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3,EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3,EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Bits [63:48]**

Reserved, RES0.

**TTL, bits [47:44]**

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b0. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b0. 0b01: If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b0. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b0. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAALE1IS, TLBI VAALE1ISNXS instruction

else
    TLBI VAALE1IS, TLBI VAALE1ISNXS, TLB Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

TLBI VAALE1OS, TLBI VAALE1OSNXS, TLB Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBI VAALE1OS, TLBI VAALE1OSNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Note**

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAALE1OS, TLBI VAALE1OSNXS are UNDEFINED.
Attributes

TLBI VAALE1OS, TLBI VAALE1OSNXS is a 64-bit System instruction.

Field descriptions

The TLBI VAALE1OS, TLBI VAALE1OSNXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:48]</th>
<th>Reserved, RES0.</th>
</tr>
</thead>
<tbody>
<tr>
<td>TTL, bits [47:44]</td>
<td></td>
</tr>
</tbody>
</table>

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.
The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

      TLBI_ExcludeXS, X[t]);
The TLBI VAE1, TLBI VAE1NXS, TLB Invalidate by VA, EL1

The TLBI VAE1, TLBI VAE1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3.NS`:
  - If `HCR_EL2.{E2H, TGE}` is not `{1, 1}`, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If `HCR_EL2.{E2H, TGE}` is `{1, 1}`, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VAE1, TLBI VAE1NXS is a 64-bit System instruction.

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.
Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**TTL, bits [47:44]**

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits [55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAE1, TLBI VAE1NXS instruction**

Accesses to this instruction use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then

endif
TLBI VAE1IS, TLBI VAE1ISNXS, TLB Invalidate by VA, EL1, Inner Shareable

The TLBI VAE1IS, TLBI VAE1ISNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.
Attributes

TLBI VAE1IS, TLBI VAE1ISNXS is a 64-bit System instruction.

Field descriptions

The TLBI VAE1IS, TLBI VAE1ISNXS input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|     |
| ASID | TTL | VA[55:12] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is res0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, res0.
**VA[55:12], bits [43:0]**

Bits [55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits [55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAE1IS, TLBI VAE1ISNXS instruction**

The TLBI VAE1OS, TLBI VAE1OSNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of \texttt{SCR\_EL3\_NS}:
  - If \texttt{HCR\_EL2\_E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1\&0 translation regime.
  - If \texttt{HCR\_EL2\_E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2\&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1\&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1\&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if \texttt{SCR\_EL3\_EEL2==1}, then:

- A PE with \texttt{SCR\_EL3\_EEL2==1} is not architecturally required to invalidate any entries in the Secure EL1\&0 translation of a PE in the same required shareability domain with \texttt{SCR\_EL3\_EEL2==0}.
- A PE with \texttt{SCR\_EL3\_EEL2==0} is not architecturally required to invalidate any entries in the Secure EL1\&0 translation of a PE in the same required shareability domain with \texttt{SCR\_EL3\_EEL2==1}.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1\&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If \texttt{FEAT\_XS} is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when \texttt{FEAT\_TLBIOS} is implemented. Otherwise, direct accesses to TLBI VAE1OS, TLBI VAE1OSNXS are \texttt{UNDEFINED}.
Attributes

TLBI VAE1OS, TLBI VAE1OSNXS is a 64-bit System instruction.

</tbody>
</table>

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is res0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, res0.
**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAE1OS, TLBI VAE1OSNXS instruction**

TLBI VAE2, TLBI VAE2NXS, TLB Invalidate by VA, EL2

The TLBI VAE2, TLBI VAE2NXS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be required to translate the specified VA using the EL2 or the EL2&0 translation regime.
- If $\text{HCR}_{\text{EL2}}.\text{E2H} == 0$, the entry is from any level of the translation table walk.
- If $\text{HCR}_{\text{EL2}}.\text{E2H} == 1$, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

If $\text{FEAT}_{\text{XS}}$ is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VAE2, TLBI VAE2NXS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE2, TLBI VAE2NXS input value bit assignments are:

| 63  | 62  | 61  | 60  | 59  | 58  | 57  | 56  | 55  | 54  | 53  | 52  | 51  | 50  | 49  | 48  | 47  | 46  | 45  | 44  | 43  | 42  | 41  | 40  | 39  | 38  | 37  | 36  | 35  | 34  | 33  | 32  |

| TTL  |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
| VA[55:12] |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.
If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**TTL, bits [47:44]**

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
</tbody>
</table>
| 0b01xx  | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as:  
  0b00  : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00.  
  0b01  : Level 1.  
  0b10  : Level 2.  
  0b11  : Level 3. |
| 0b10xx  | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as:  
  0b00  : Reserved. Treat as if TTL<3:2> is 0b00.  
  0b01  : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00.  
  0b10  : Level 2.  
  0b11  : Level 3. |
| 0b11xx  | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as:  
  0b00  : Reserved. Treat as if TTL<3:2> is 0b00.  
  0b01  : Level 1.  
  0b10  : Level 2.  
  0b11  : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAE2, TLBI VAE2NXS instruction**

Accesses to this instruction use the following encodings:
if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x10);
  else
    UNDEFINED;
elsif PSTATE.EL == EL2 then
  if HCR_EL2.E2H == '1' then
    TLBI_VA(SecurityStateAtEL(EL2), Regime_EL20, VMID_NONE, Shareability_None, TLBILevel_Any, TLBI_AllAttr, X[t]);
  else
    TLBI_VA(SecurityStateAtEL(EL2), Regime_EL2, VMID[], Shareability_None, TLBILevel_Any, TLBI_AllAttr, X[t]);
elsif PSTATE.EL == EL3 then
  if !EL2Enabled() then

  else
    TLBI_VA(SecurityStateAtEL(EL2), Regime_EL2, VMID[], Shareability_None, TLBILevel_Any, TLBI_ExcludeXS, X[t]);
TLBI VAE2IS, TLBI VAE2ISNXS, TLB Invalidate by VA, EL2, Inner Shareable

The TLBI VAE2IS, TLBI VAE2ISNXS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be required to translate the specified VA using the EL2 or the EL2&0 translation regime.
- If $HCR_EL2.E2H == 0$, the entry is from any level of the translation table walk.
- If $HCR_EL2.E2H == 1$, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VAE2IS, TLBI VAE2ISNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE2IS, TLBI VAE2ISNXS input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ASID | TTL | VA[55:12] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.
Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

### TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

### VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### Executing the TLBI VAE2IS, TLBI VAE2ISNXS instruction

Accesses to this instruction use the following encodings:
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
else
    if PSTATE.EL == EL2 then
        if HCR_EL2.E2H == '1' then
            TLBI_VA(SecurityStateAtEL(EL2), Regime_EL20, VMID_NONE, Shareability_Inner, TLBILevel_Any, TLBI_AllAttr, X[t]);
        else
            TLBI_VA(SecurityStateAtEL(EL2), Regime_EL2, VMID[], Shareability_Inner, TLBILevel_Any, TLBI_AllAttr, X[t]);
    elsif PSTATE.EL == EL3 then
        if !EL2Enabled() then
            UNDEFINED;
        elsif HCR_EL2.E2H == '1' then
            TLBI_VA(SecurityStateAtEL(EL2), Regime_EL20, VMID[], Shareability_Inner, TLBILevel_Any, TLBI_AllAttr, X[t]);
        else
            TLBI_VA(SecurityStateAtEL(EL2), Regime_EL2, VMID[], Shareability_Inner, TLBILevel_Any, TLBI_AllAttr, X[t]);
    end
    if !IsFeatureImplemented(FEAT_XS) then
        UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;

        TLBI_VA(SecurityStateAtEL(EL2), Regime_EL2, VMID[], Shareability_Inner, TLBILevel_Any, TLBI_ExcludeXS, X[t]);
TLBI VAE2OS, TLBI VAE2OSNXS, TLB Invalidate by VA, EL2, Outer Shareable

The TLBI VAE2OS, TLBI VAE2OSNXS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be required to translate the specified VA using the EL2 or the EL2&0 translation regime.
- If \( HCR_{EL2}.E2H == 0 \), the entry is from any level of the translation table walk.
- If \( HCR_{EL2}.E2H == 1 \), one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If \( FEAT\_XS \) is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when \( FEAT\_TLBIOS \) is implemented. Otherwise, direct accesses to TLBI VAE2OS, TLBI VAE2OSNXS are undefined.

**Attributes**

TLBI VAE2OS, TLBI VAE2OSNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI VAE2OS, TLBI VAE2OSNXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-62</td>
<td>ASID</td>
</tr>
<tr>
<td>61-60</td>

</tr>
<tr>
<td>59-54</td>
<td>VA[55:12]</td>
</tr>
<tr>
<td>31-30</td>
<td></td>
</tr>
<tr>
<td>25-22</td>
<td></td>
</tr>
<tr>
<td>19-16</td>
<td></td>
</tr>
<tr>
<td>15-12</td>
<td></td>
</tr>
<tr>
<td>11-8</td>
<td></td>
</tr>
<tr>
<td>7-4</td>
<td></td>
</tr>
<tr>
<td>3-0</td>
<td></td>
</tr>
</tbody>
</table>

Page 1930
** ASID, bits [63:48]  
When \(HCR\_EL2.E2H == 1\):  

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.  

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.  

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.  

Otherwise:  
Reserved, \(res0\).  

** TTL, bits [47:44]  
When \(FEAT\_TTL\) is implemented:  

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.  

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is (res0).</td>
</tr>
</tbody>
</table>
| 0b01xx    | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as:  
            | 0b00: If \(FEAT\_LPA2\) is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00.  
            | 0b01: Level 1.  
            | 0b10: Level 2.  
            | 0b11: Level 3.                                                 |
| 0b10xx    | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as:  
            | 0b00: Reserved. Treat as if TTL<3:2> is 0b00.  
            | 0b01: If \(FEAT\_LPA2\) is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00.  
            | 0b10: Level 2.  
            | 0b11: Level 3.                                                 |
| 0b11xx    | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as:  
            | 0b00: Reserved. Treat as if TTL<3:2> is 0b00.  
            | 0b01: Level 1.  
            | 0b10: Level 2.  
            | 0b11: Level 3.                                                 |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.  

Otherwise:  
Reserved, \(res0\).  

** VA[55:12], bits [43:0]  

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.  

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as \(res0\).  

The treatment of the low-order bits of this field depends on the translation granule size, as follows:
• Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.

• Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.

• Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

  end if
TLBI VAE3, TLBI VAE3NXS, TLB Invalidate by VA, EL3

The TLBI VAE3, TLBI VAE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined. Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAE3, TLBI VAE3NXS is a 64-bit System instruction.

Field descriptions

The TLBI VAE3, TLBI VAE3NXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
</tr>
<tr>
<td>62</td>
<td>TTL</td>
</tr>
<tr>
<td>59:12</td>
<td>VA[55:12]</td>
</tr>
</tbody>
</table>

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.
### TTL Meaning

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

### VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

### Executing the TLBI VAE3, TLBI VAE3NXS instruction

| RES0 | TTL | VA[55:12] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Bits [63:48]**

Reserved, RES0.

**TTL, bits [47:44]**

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.
TTL | Meaning
--- | ---
0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00.
0b01 : Level 1.
0b10 : Level 2.
0b11 : Level 3.
0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
0b00 : Reserved. Treat as if TTL<3:2> is 0b00.
0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00.
0b10 : Level 2.
0b11 : Level 3.
0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as:
0b00 : Reserved. Treat as if TTL<3:2> is 0b00.
0b01 : Level 1.
0b10 : Level 2.
0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

if !IsFeatureImplemented(FEAT_XS) then
  UNDEFINED;
elsif PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then
  UNDEFINED;
elsif PSTATE.EL == EL2 then
  UNDEFINED;
elsif PSTATE.EL == EL3 then
  TLBI VA(SecurityStateAtEL(EL3), Regime_EL3, VMID[], Shareability_Outer, TLBILevel_Any, TLBI_ExcludeXS, X[t]);
The TLBI VALE1, TLBI VALE1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.\{E2H, TGE\} is not \{1, 1\}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.\{E2H, TGE\} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VALE1, TLBI VALE1NXS is a 64-bit System instruction.

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.
Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**TTL, bits [47:44]**

*When FEAT_TTL is implemented:*

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

*Otherwise:*

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE1, TLBI VALE1NXS instruction**

Accesses to this instruction use the following encodings:
TLBI VALE1, TLBI VALE1NXS, TLB Invalidate by VA, Last level, EL1

    end
The TLBI VALE1IS, TLBI VALE1ISNXS characteristics are:

### Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of \( \text{SCR}_\text{EL3}.\text{NS} \):
  - If \( \text{HCR}_\text{EL2}.\{\text{E2H, TGE}\} \) is not \( \{1, 1\} \), the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If \( \text{HCR}_\text{EL2}.\{\text{E2H, TGE}\} \) is \( \{1, 1\} \), the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

### Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if \( \text{SCR}_\text{EL3}.\text{EEL}==1 \), then:

- A PE with \( \text{SCR}_\text{EL3}.\text{EEL}==1 \) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with \( \text{SCR}_\text{EL3}.\text{EEL}==0 \).
- A PE with \( \text{SCR}_\text{EL3}.\text{EEL}==0 \) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with \( \text{SCR}_\text{EL3}.\text{EEL}==1 \).
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

### Configuration

There are no configuration notes.

### Attributes

TLBI VALE1IS, TLBI VALE1ISNXS is a 64-bit System instruction.
Field descriptions

The TLBI VALE1IS, TLBI VALE1ISNXS input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ASID | TTL | VA[55:12] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is res0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, res0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.
If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

elsif PSTATE.EL == EL3 then
    if HCR_EL2.<E2H,TGE> == '11' then
        TLBI_VA(SecurityStateAtEL(EL2), Regime_EL20, VMID_NONE, Shareability_Inner,
        TLBILevel_Last, TLBIExcludeXS, X[t]);
    else
        TLBI_VA(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_Inner, TLBILevel_Last,
        TLBIExcludeXS, X[t]);
    endif
end
TLBI VALE1OS, TLBI VALE1OSNXS, TLB Invalidate by VA, Last level, EL1, Outer Shareable

The TLBI VALE1OS, TLBI VALE1OSNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3_NS:
  - If HCR_EL2_{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2_{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VALE1OS, TLBI VALE1OSNXS are **UNDEFINED.**
Attributes

TLBI VALE1OS, TLBI VALE1OSNXS is a 64-bit System instruction.

Field descriptions

The TLBI VALE1OS, TLBI VALE1OSNXS input value bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th>ASID</th>
<th>TTL</th>
<th>VA[55:12]</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>0</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.
VA[55:12], bits [43:0]

Bits [55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits [55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE1OS, TLBI VALE1OSNXS instruction**

end
TLBI VALE2, TLBI VALE2NXS, TLB Invalidate by VA, Last level, EL2

The TLBI VALE2, TLBI VALE2NXS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime.
- If $\text{HCR}_\text{EL2}.E2H == 0$, the entry is from the final level of the translation table walk.
- If $\text{HCR}_\text{EL2}.E2H == 1$, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

If $\text{FEAT}_\text{XS}$ is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VALE2, TLBI VALE2NXS is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE2, TLBI VALE2NXS input value bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|    |    |    |    |    |    |    |    | ASID |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| VA[55:12] | TTL |    |

**ASID, bits [63:48]**

When $\text{HCR}_\text{EL2}.E2H == 1$:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.
If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:
Reserved, RES0.

**TTL, bits [47:44]**

*When FEAT_TTL is implemented:*

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:
Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE2IS, TLBI VALE2ISNXS instruction**

Accesses to this instruction use the following encodings:
if PSTATE.EL == EL0 then

    TLBI_ExcludeXS, X[t]);
  else
    TLBI_VA(SecurityStateAtEL(EL2), Regime_EL2, VMID[], Shareability_Inner, TLBILevel_Last,
    TLBI_ExcludeXS, X[t]);
TLBI VALE2OS, TLBI VALE2OSNXS, TLB Invalidate by VA, Last level, EL2, Outer Shareable

The TLBI VALE2OS, TLBI VALE2OSNXS characteristics are:

**Purpose**

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime.
- If $\text{HCR}_{\text{EL2}}.\text{E2H} == 0$, the entry is from the final level of the translation table walk.
- If $\text{HCR}_{\text{EL2}}.\text{E2H} == 1$, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VALE2OS, TLBI VALE2OSNXS are UNDEFINED.

**Attributes**

TLBI VALE2OS, TLBI VALE2OSNXS is a 64-bit System instruction.

**Field descriptions**

The TLBI VALE2OS, TLBI VALE2OSNXS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>ASID</td>
</tr>
<tr>
<td>55-12</td>
<td>VA[55:12]</td>
</tr>
<tr>
<td>0</td>
<td>TTL</td>
</tr>
</tbody>
</table>

**ASID, bits [63:48]**

When $\text{HCR}_{\text{EL2}}.\text{E2H} == 1$:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.
Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

**TTL, bits [47:44]**

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

<td>0</td>
</tr>
</tbody>
</table>

**Bits [63:48]**

Reserved, RES0.

**TTL, bits [47:44]**

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.
<table>
<thead>
<tr>
<th>TTL</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00xx</td>
<td>No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL&lt;1:0&gt; is RES0.</td>
</tr>
<tr>
<td>0b01xx</td>
<td>The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b10xx</td>
<td>The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
<tr>
<td>0b11xx</td>
<td>The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00: Reserved. Treat as if TTL&lt;3:2&gt; is 0b00. 0b01: Level 1. 0b10: Level 2. 0b11: Level 3.</td>
</tr>
</tbody>
</table>

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE3OS, TLBI VALE3OSNXS instruction**

Accesses to this instruction use the following encodings:

```
TLBI VALE3OS{,<Xt>}
```

TLBI VMALLE1, TLBI VMALLE1NXS, TLB Invalidate by VMID, All at stage 1, EL1

The TLBI VMALLE1, TLBI VMALLE1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not \{1, 1\}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is \{1, 1\}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

**Note**

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VMALLE1, TLBI VMALLE1NXS is a 64-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by \(<Xt>\) is ignored.

**Executing the TLBI VMALLE1, TLBI VMALLE1NXS instruction**

When executing this instruction Xt should be encoded as \(0b11111\). If the Xt field is not set to \(0b11111\), it is **CONSTRAINED UNPREDICTABLE** whether:

- The instruction is **UNDEFINED**.
The instruction behaves as if the Xt field is set to 0b1111.

Accesses to this instruction use the following encodings:

        TLBI_VMALLE1(EL1, SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_None, TLBI_ExcludeXS);
The TLBI VMALLE1IS, TLBI VMALLE1ISNXS characteristics are:

**Purpose**

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled, in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Note**

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

else
  end
The TLBI VMALLE1OS, TLBI VMALLE1OSNXS characteristics are:

**Purpose**

Invalidate cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Note**

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VMALLE1OS, TLBI VMALLE1OSNXS are **UNDEFINED**.
Attributes

TLBI VMALLE1OS, TLBI VMALLE1OSNXS is a 64-bit System instruction.

TLBI VMALLS12E1, TLBI VMALLS12E1NXS, TLB Invalidate by VMID, All at Stage 1 and 2, EL1

The TLBI VMALLS12E1, TLBI VMALLS12E1NXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
  - If `SCR_EL3` NS is 0, then:
    - The entry would be required to translate an address using the Secure EL1&0 translation regime.
    - If `FEAT_SEL2` is implemented and enabled, the entry would be used with the current VMID.
  - If `SCR_EL3` NS is 1, then:
    - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
    - If Non-secure EL2 is implemented, the entry would be used with the current VMID.

The invalidation applies to the PE that executes this System instruction.

**Note**

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If `FEAT_XS` is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

**Attributes**

TLBI VMALLS12E1, TLBI VMALLS12E1NXS is a 64-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by `<Xt>` is ignored.

**Executing the TLBI VMALLS12E1, TLBI VMALLS12E1NXS instruction**

When executing this instruction Xt should be encoded as `0b11111`. If the Xt field is not set to `0b11111`, it is CONSTRAINED UNPREDICTABLE whether:
• The instruction is **UNDEFINED**.

• The instruction behaves as if the Xt field is set to 0b1111.

Accesses to this instruction use the following encodings:

**TLBI VMALLS12E1{, <Xt>**

The TLBI VMALLS12E1IS, TLBI VMALLS12E1ISNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If `SCR_EL3`.NS is 0, then:
  - The entry would be required to translate an address using the Secure EL1&0 translation regime.
  - If `FEAT_SEL2` is implemented and enabled, the entry would be used with the current VMID.
- If `SCR_EL3`.NS is 1, then:
  - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
  - If Non-secure EL2 is implemented, the entry would be used with the current VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Note**

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if `SCR_EL3`.EEL2==1, then:

- A PE with `SCR_EL3`.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with `SCR_EL3`.EEL2==0.
- A PE with `SCR_EL3`.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with `SCR_EL3`.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Note**

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If `FEAT_XS` is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

There are no configuration notes.

}
The TLBI VMALLS12E1OS, TLBI VMALLS12E1OSNXS characteristics are:

**Purpose**

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If `SCR_EL3.NS` is 0, then:
  - The entry would be required to translate an address using the Secure EL1&0 translation regime.
  - If `FEAT_SEL2` is implemented and enabled, the entry would be used with the current VMID.
- If `SCR_EL3.NS` is 1, then:
  - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
  - If Non-secure EL2 is implemented, the entry would be used with the current VMID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

**Note**

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if `SCR_EL3.EEL2==1`, then:

- A PE with `SCR_EL3.EEL2==1` is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with `SCR_EL3.EEL2==0`.
- A PE with `SCR_EL3.EEL2==0` is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with `SCR_EL3.EEL2==1`.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

**Note**

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If `FEAT_XS` is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

**Configuration**

This instruction is present only when `FEAT_TLBIOS` is implemented. Otherwise, direct accesses to TLBI VMALLS12E1OS, TLBI VMALLS12E1OSNXS are **UNDEFINED**.
Attributes

TLBI VMALLS12E1OS, TLBI VMALLS12E1OSNXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the TLBI VMALLS12E1OS, TLBI VMALLS12E1OSNXS instruction

When executing this instruction Xt should be encoded as 0b11111. If the Xt field is not set to 0b11111, it is constrained unpredictable whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Xt field is set to 0b11111.

Accesses to this instruction use the following encodings:

TPIDR_EL0, EL0 Read/Write Software Thread ID Register

The TPIDR_EL0 characteristics are:

**Purpose**

Provides a location where software executing at EL0 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

**Configuration**

AArch64 System register TPIDR_EL0 bits [31:0] are architecturally mapped to AArch32 System register TPIDRUR[31:0].

**Attributes**

TPIDR_EL0 is a 64-bit register.

**Field descriptions**

The TPIDR_EL0 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

TPIDR_EL2, EL2 Software Thread ID Register

The TPIDR_EL2 characteristics are:

**Purpose**

Provides a location where software executing at EL2 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

**Configuration**

AArch64 System register TPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HTPIDR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

**Attributes**

TPIDR_EL2 is a 64-bit register.

**Field descriptions**

The TPIDR_EL2 bit assignments are:

**BASE, bits [63:12]**

Trace Buffer Base pointer address. \((\text{TRBBASER\_EL1\.BASE } \ll 12)\) is the address of the first byte in the trace buffer. Bits [11:0] of the Base pointer address are always zero. If the smallest implemented translation granule is not 4KB, then TRBBASER\_EL1[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value \(\log_2(\text{smallest implemented translation granule})\).

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [11:0]**

Reserved, RES0.

**Accessing the TRBBASER\_EL1**

The PE might ignore a direct write to TRBBASER\_EL1 if TRBLIMITR\_EL1.E == 0b1.

Accesses to this register use the following encodings:

\[
\text{MRS <Xt>, TRBBASER\_EL1}
\]

The TRBIDR_EL1 characteristics are:

**Purpose**

Describes constraints on using the Trace Buffer Unit to software, including whether the Trace Buffer Unit can be programmed at the current Exception level.

**Configuration**

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBIDR_EL1 are **UNDEFINED**.

**Attributes**

TRBIDR_EL1 is a 64-bit register.

**Field descriptions**

The TRBIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Bit Assignment</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-6</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>5</td>
<td>F</td>
<td>Flag Updates. Defines whether the address translation performs the Access Flag and dirty state. Defined values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0b0: Trace buffer address translation does not manage the Access flag and dirty state in translation tables.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0b1: Trace buffer address translation manages the Access Flag and dirty state in the same way as the MMU on this PE.</td>
</tr>
<tr>
<td>4</td>
<td>P</td>
<td>Programming not allowed. The trace buffer is owned by a higher Exception level or by the other Security state. Defined values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0b0: The owning Exception level is the current Exception level or a lower Exception level, and the owning Security state is the current Security state.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0b1: The owning Exception level is a higher Exception level, or the owning Security state is not the current Security state.</td>
</tr>
</tbody>
</table>

The value read from this field depends on the current Exception level and the values of **MDCR_EL3.NSTB** and **MDCR_EL2.E2TB**.
• If EL3 is implemented and either MDCR_EL3.NSTB == 0b00 or MDCR_EL3.NSTB == 0b01, meaning the owning Security state is Secure state, this bit reads as one from:
  ◦ Non-secure EL2.
  ◦ Non-secure EL1.
  ◦ If Secure EL2 is implemented and enabled, and MDCR_EL2.E2TB == 0b00, Secure EL1.
• If EL3 is implemented and either MDCR_EL3.NSTB == 0b10 or MDCR_EL3.NSTB == 0b11, meaning the owning Security state is Non-secure state, this bit reads as one from:
  ◦ Secure EL1.
  ◦ If Secure EL2 is implemented, Secure EL2.
  ◦ If EL2 is implemented and MDCR_EL2.E2TB == 0b00, Non-secure EL1.
• If EL3 is not implemented, EL2 is implemented, and MDCR_EL2.E2TB == 0b00, this bit reads as one from EL1.
• Otherwise, this bit reads as zero.

Align, bits [3:0]

Defines the minimum alignment constraint for writes to TRBPTR_EL1 and TRBTRG_EL1. Defined values are:

<table>
<thead>
<tr>
<th>Align</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Byte.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Halfword.</td>
</tr>

TRBLIMITR_EL1, Trace Buffer Limit Address Register

The TRBLIMITR_EL1 characteristics are:

**Purpose**

Defines the top address for the trace buffer, and controls the trace buffer modes and enable.

**Configuration**

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBLIMITR_EL1 are undefined.

**Attributes**

TRBLIMITR_EL1 is a 64-bit register.

**Field descriptions**

The TRBLIMITR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:12</td>
<td>LIMIT</td>
</tr>
<tr>
<td>11:0</td>
<td>RES0</td>
</tr>
<tr>
<td>5</td>
<td>nVM</td>
</tr>
<tr>
<td>4:3</td>
<td>TM, bits [4:3]</td>
</tr>
<tr>
<td>2:1</td>
<td>FM, bits [2:1]</td>
</tr>
<tr>
<td>0</td>
<td>E</td>
</tr>
</tbody>
</table>

**LIMIT, bits [63:12]**

Trace Buffer Limit pointer address. (TRBLIMITR_EL1.LIMIT << 12) is the address of the last byte in the trace buffer plus one. Bits [11:0] of the Limit pointer address are always zero. If the smallest implemented translation granule is not 4KB, then TRBLIMITR_EL1[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value Log2(smallest implemented translation granule).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [11:6]**

Reserved, RES0.

**nVM, bit [5]**

Address mode.

<table>
<thead>
<tr>
<th>nVM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The trace buffer pointers are virtual addresses.</td>
</tr>
<tr>
<td>1</td>
<td>The trace buffer pointers are:</td>
</tr>
<tr>
<td></td>
<td>• Physical address in the owning security state if the owning</td>
</tr>
<tr>
<td></td>
<td>translation regime has no stage 2 translation.</td>
</tr>
<tr>
<td></td>
<td>• Intermediate physical addresses in the owning security</td>
</tr>
<tr>
<td></td>
<td>state if the owning translation regime has stage 2 translations.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**TM, bits [4:3]**

Trigger mode.
TRBLIMITR_EL1, Trace Buffer Limit Address Register

<table>
<thead>
<tr>
<th>TM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Stop on trigger. Flush then stop collection and raise maintenance interrupt on Trigger Event.</td>
</tr>
<tr>
<td>0b01</td>
<td>IRQ on trigger. Continue collection and raise maintenance interrupt on Trigger Event.</td>
</tr>
<tr>
<td>0b11</td>
<td>Ignore trigger. Continue collection and do not raise maintenance interrupt on Trigger Event.</td>
</tr>
</tbody>
</table>

All other values are reserved.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**FM, bits [2:1]**

Trace buffer mode.

<table>
<thead>
<tr>
<th>FM</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Fill mode. Stop collection and raise maintenance interrupt on current write pointer wrap.</td>
</tr>
<tr>
<td>0b01</td>
<td>Wrap mode. Continue collection and raise maintenance interrupt on current write pointer wrap.</td>
</tr>
<tr>
<td>0b11</td>
<td>Circular Buffer mode. Continue collection and do not raise maintenance interrupt on current write pointer wrap.</td>
</tr>
</tbody>
</table>

All other values are reserved.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**E, bit [0]**

Trace Buffer Unit enable.

<table>
<thead>
<tr>
<th>E</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Trace Buffer Unit disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Trace Buffer Unit enabled by this control.</td>
</tr>
</tbody>
</table>

Regardless of the value of this bit, the Trace Buffer Unit is disabled when SelfHostedTraceEnabled() == FALSE. All output is discarded by the Trace Buffer Unit when it is disabled.

On a Warm reset, this field resets to 0.

**Accessing the TRBLIMITR_EL1**

The PE might ignore a direct write to TRBLIMITR_EL1, other than a direct write that modifies TRBLIMITR_EL1.E, if TRBLIMITR_EL1.E == 0b1.

Accesses to this register use the following encodings:

**MRS <Xt>, TRBLIMITR_EL1**

<table>
<thead>
<tr>
<th>op0</th>
<th>op1</th>
<th>CRn</th>
<th>CRm</th>
<th>op2</th>
</tr>
</thead>
<tbody>

TRBMAR_EL1, Trace Buffer Memory Attribute Register

The TRBMAR_EL1 characteristics are:

**Purpose**

Controls Trace Buffer Unit accesses to memory.

If the trace buffer pointers specify virtual addresses, the address properties are defined by the translation tables and this register is ignored.

**Configuration**

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBMAR_EL1 are UNDEFINED.

**Attributes**

TRBMAR_EL1 is a 64-bit register.

**Field descriptions**

The TRBMAR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>9:8</td>
<td>SH</td>
<td>Trace buffer shareability domain. Defines the shareability domain for Normal memory used by the trace buffer.</td>
</tr>
<tr>
<td>7:4</td>
<td>Attr4</td>
<td>Trace buffer memory type and attributes. Defines the memory type and, for Normal memory, the Outer cacheability attributes, for memory addressed by the trace buffer.</td>
</tr>
</tbody>
</table>

### Bits [63:10]

Reserved, RES0.

### SH, bits [9:8]

Trace buffer shareability domain. Defines the shareability domain for Normal memory used by the trace buffer.

<table>
<thead>
<tr>
<th>SH</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Non-shareable.</td>
</tr>
<tr>
<td>10</td>
<td>Outer Shareable.</td>
</tr>
<tr>
<td>11</td>
<td>Inner Shareable.</td>
</tr>
</tbody>
</table>

All other values are reserved.

This field is ignored when TRBMAR_EL1.Attr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Attr[7:4], bits [7:4]

Trace buffer memory type and attributes. Defines the memory type and, for Normal memory, the Outer cacheability attributes, for memory addressed by the trace buffer.
<table>
<thead>
<tr>
<th>Attr[7:4]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device memory. The Device memory type is defined by TRBMAR_EL1.Attr[3:0].</td>
</tr>
<tr>
<td>0b0001</td>
<td>Normal memory, Outer Write-Through Transient, Write-allocate.</td>
</tr>
<tr>
<td>0b0010</td>
<td>Normal memory, Outer Write-Through Transient, Read-allocate.</td>
</tr>
<tr>
<td>0b0011</td>
<td>Normal memory, Outer Write-Through Transient, Read-allocate Write-allocate.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Normal memory, Outer Non-cacheable.</td>
</tr>
<tr>
<td>0b0101</td>
<td>Normal memory, Outer Write-Back Transient, Write-allocate.</td>
</tr>
<tr>
<td>0b0110</td>
<td>Normal memory, Outer Write-Back Transient, Read-allocate.</td>
</tr>
<tr>
<td>0b0111</td>
<td>Normal memory, Outer Write-Back Transient, Read-allocate Write-allocate.</td>
</tr>
<tr>
<td>0b1000</td>
<td>Normal memory, Outer Write-Through Non-transient, No allocate.</td>
</tr>
<tr>
<td>0b1001</td>
<td>Normal memory, Outer Write-Through Non-transient, Write-allocate.</td>
</tr>
<tr>
<td>0b1010</td>
<td>Normal memory, Outer Write-Through Non-transient, Read-allocate.</td>
</tr>
<tr>
<td>0b1011</td>
<td>Normal memory, Outer Write-Through Non-transient, Read-allocate Write-allocate.</td>
</tr>
<tr>
<td>0b1100</td>
<td>Normal memory, Outer Write-Back Non-transient, No allocate.</td>
</tr>
<tr>
<td>0b1101</td>
<td>Normal memory, Outer Write-Back Non-transient, Write-allocate.</td>
</tr>
<tr>
<td>0b1110</td>
<td>Normal memory, Outer Write-Back Non-transient, Read-allocate.</td>
</tr>
<tr>
<td>0b1111</td>
<td>When FEAT_MTE is not implemented or TRBMAR_EL1.Attr[3:0] != 0b0000:</td>
</tr>
<tr>
<td></td>
<td>• Normal memory, Outer Write-Back Non-transient, Read-allocate Write-allocate.</td>
</tr>
</tbody>
</table>

When FEAT_MTE is implemented and TRBMAR_EL1.Attr[3:0] == 0b0000:

• Tagged Normal memory, Outer Write-Back Non-transient, Read-allocate Write-allocate.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Attr[3:0], bits [3:0]

When TRBMAR_EL1.Attr[7:4] == 0b0000:

Trace buffer memory attributes. Defines the Device memory attributes for memory addressed by the trace buffer.

<table>
<thead>
<tr>
<th>Attr[3:0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Device-nGnRnE memory.</td>
</tr>
<tr>
<td>0b0100</td>
<td>Device-nGnRE memory.</td>
</tr>
<tr>
<td>0b1000</td>
<td>Device-nGRE memory.</td>
</tr>
<tr>
<td>0b1100</td>
<td>Device-GRE memory.</td>
</tr>
</tbody>
</table>

All other values are reserved.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TRBMAR_EL1.Attr[7:4] != 0b0000:

Trace buffer memory attributes. Defines the Inner cacheability attributes for memory addressed by the trace buffer.
<table>
<thead>
<tr>
<th>Attr[3:0]</th>
<th>Meaning</th>
<th>Applies when</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Tagged Normal memory, Inner Write-Back Non-transient, Read-allocate Write-allocate.</td>
<td>When FEAT_MTE is implemented and TRBMAR_EL1.Attr[7:4] == 0b1111</td>
</tr>
<tr>
<td>0b0001</td>
<td>Normal memory, Inner Write-Through Transient, Write-allocate.</td>
<td></td>
</tr>
<tr>
<td>0b0010</td>
<td>Normal memory, Inner Write-Through Transient, Read-allocate.</td>
<td></td>
</tr>
<tr>

TRBPTR_EL1, Trace Buffer Write Pointer Register

The TRBPTR_EL1 characteristics are:

**Purpose**

Defines the current write pointer for the trace buffer.

**Configuration**

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBPTR_EL1 are UNDEFINED.

**Attributes**

TRBPTR_EL1 is a 64-bit register.

**Field descriptions**

The TRBPTR_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| PTR | PTR |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**PTR, bits [63:0]**

Trace Buffer current write pointer address.

Defines the virtual address of the next entry to be written to the trace buffer.

The architecture places restrictions on the values that software can write to the pointer.

**Note**

As a result of the restrictions an implementation might treat some of PTR[M:0] as RES0, where M is defined by TRBIDR_EL1 Align.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the TRBPTR_EL1**

The PE might ignore a direct write to TRBPTR_EL1 if TRBLIMITR_EL1.E == 0b1.

Accesses to this register use the following encodings:

<tr>
<td>26</td>
<td>RES0</td>
<td></td>
</tr>
<tr>
<td>25</td>
<td>EA</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**EC, bits [31:26]**

Event class. Top-level description of the cause of the trace buffer management event.

<table>
<thead>
<tr>
<th>EC</th>
<th>Meaning</th>
<th>MSS</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b011111</td>
<td>Buffer management event for IMPLEMENTATION DEFINED reason.</td>
<td>MSS encoding for Buffer management event for IMPLEMENTATION DEFINED reason</td>
</tr>
<tr>
<td>0b100100</td>
<td>Stage 1 Data Abort on write to trace buffer.</td>
<td>MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer</td>
</tr>
<tr>
<td>0b100101</td>
<td>Stage 2 Data Abort on write to trace buffer.</td>
<td>MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer</td>
</tr>
<tr>
<td>0b000000</td>
<td>Other trace buffer management event. All trace buffer management events other than those described by the other defined Event class codes.</td>
<td>MSS encoding for other trace buffer management events</td>
</tr>
</tbody>
</table>

All other values are reserved.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
Bits [25:23]

Reserved, RES0.

IRQ, bit [22]

Maintenance interrupt status.

<table>
<thead>
<tr>
<th>IRQ</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Maintenance interrupt is not asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>Maintenance interrupt is asserted.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

TRG, bit [21]

Triggered.

<table>
<thead>
<tr>
<th>TRG</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>No Detected Trigger has been observed since this bit was last cleared to zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>A Detected Trigger has been observed since this bit was last cleared to zero.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally UNKNOWN value.

WRAP, bit [20]

Wrapped.

<table>
<thead>
<tr>
<th>WRAP</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The current write pointer has not wrapped since this bit was last cleared to zero.</td>
</tr>
<tr>
<td>0b1</td>
<td>The current write pointer has wrapped since this bit was last cleared to zero.</td>
</tr>
</tbody>
</table>

For each byte of trace the Trace Buffer Unit Accepts and writes to the trace buffer at the address in the current write pointer, if the current write pointer is equal to the Limit pointer minus one, the current write pointer is wrapped by setting it to the Base pointer, and this bit is set to 0b1.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

EA, bit [18]

External Abort.

<table>
<thead>
<tr>
<th>EA</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>An External Abort has not been asserted.</td>
</tr>
<tr>
<td>0b1</td>
<td>An External Abort has been asserted and detected by the Trace Buffer Unit.</td>
</tr>
</tbody>
</table>

This bit is RES0 if the PE never sets this bit as the result of an External Abort.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

S, bit [17]

Stopped.
Meaning

<table>
<thead>
<tr>
<th>S</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Collection has not been stopped.</td>
</tr>
<tr>
<td>0b1</td>
<td>Collection is stopped.</td>
</tr>
</tbody>
</table>

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [16]**

Reserved, RES0.

**MSS, bits [15:0]**

Management Event Specific Syndrome. Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

TRBTRG_EL1, Trace Buffer Trigger Counter Register

The TRBTRG_EL1 characteristics are:

Purpose

Specifies the number of bytes of trace to capture following a Detected Trigger before a Trigger Event.

Configuration

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBTRG_EL1 are UNDEFINED.

Attributes

TRBTRG_EL1 is a 64-bit register.

Field descriptions

The TRBTRG_EL1 bit assignments are:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

Bits [63:32]

Reserved, RES0.

TRG, bits [31:0]

Trigger count.

Specifies the number of bytes of trace to capture following a Detected Trigger before a Trigger Event.

TRBTRG_EL1 decrements by 1 for every byte of trace written to the trace buffer when all of the following are true:

- TRBTRG_EL1 is nonzero.
- TRBSR_EL1.TRG is set to 0b1.

The architecture places restrictions on the values that software can write to the counter.

Note

As a result of the restrictions an implementation might treat some of TRG[M:0] as RES0, where M is defined by TRBIDR_EL1.Align.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the TRBTRG_EL1

The PE might ignore a direct write to TRBTRG_EL1 if TRBLIMTR_EL1.E == 0b1.

Accesses to this register use the following encodings:

The TRCACATR\(n\) characteristics are:

**Purpose**

Defines the type of access for the corresponding TRCACVR\(n\) Register. This register configures the context type, Exception levels, alignment, masking that is applied by the Address Comparator, and how the Address Comparator behaves when it is one half of an Address Range Comparator.

**Configuration**

AArch64 System register TRCACATR\(n\) bits \([63:0]\) are architecturally mapped to External register TRCACATR\(n\)[63:0].

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMACPAIRS \(\times 2 > n\). Otherwise, direct accesses to TRCACATR\(n\) are **UNDEFINED**.

**Attributes**

TRCACATR\(n\) is a 64-bit register.

**Field descriptions**

The TRCACATR\(n\) bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Non-secure EL2.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Non-secure EL2.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.
EXLEVEL_NS_EL1, bit [13]
When Non-secure EL1 is implemented:

Non-secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Non-secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Non-secure EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Non-secure EL1.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL0, bit [12]
When Non-secure EL0 is implemented:

Non-secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Non-secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_NS_EL0</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Non-secure EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Non-secure EL0.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [11]
When EL3 is implemented:

Secure EL3 address comparison control. Controls whether a comparison can occur at EL3 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL3</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Secure EL3.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Secure EL3.</td>
</tr>
</tbody>
</table>

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [10]
When EL2 is implemented and FEAT_SEL2 is implemented:

Secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Secure state.
The Address Comparator performs comparisons in Secure EL2.

The Address Comparator does not perform comparisons in Secure EL2.

On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [9]

When Secure EL1 is implemented:

Secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Secure state.

<table>
<thead>
<tr>
<th>EXLEVEL_S_EL1</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>The Address Comparator performs comparisons in Secure EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>The Address Comparator does not perform comparisons in Secure EL1.</td>
</tr>
</tbody>
</table>
