  Elem[result, e, esize] = Elem[result, e, esize] + res;
V[d] = result;
UHADD

Unsigned Halving Add. This instruction adds corresponding unsigned integer values from the two source SIMD&FP registers, shifts each result right one bit, places the results into a vector, and writes the vector to the destination SIMD&FP register.

The results are truncated. For rounded results, see URHADD.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
Unsigned Maximum Pairwise. This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements in the two source SIMD&FP registers, writes the largest of each pair of unsigned integer values into a vector, and writes the vector to the destination SIMD&FP register. Depending on the settings in the \texttt{CPACR\_EL1}, \texttt{CPTR\_EL2}, and \texttt{CPTR\_EL3} registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
UMLAL, UMLAL2 (by element)

Unsigned Multiply-Add Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register and accumulates the results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The UMLAL instruction extracts vector elements from the lower half of the first source register, while the UMLAL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

V[d] = result;

Operational information

If PSTATE.DIT is 1:
• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
UMMLA (vector)

Unsigned 8-bit integer matrix multiply-accumulate. This instruction multiplies the 2x8 matrix of unsigned 8-bit integer values in the first source vector by the 8x2 matrix of unsigned 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator in the destination vector. This is equivalent to performing an 8-way dot product per destination element.

From Armv8.2, this is an optional instruction. ID_AA64ISAR0_EL1. I8MM indicates whether this instruction is supported.

UMOV

Unsigned Move vector element to general-purpose register. This instruction reads the unsigned integer from the source SIMD&FP register, zero-extends it to form a 32-bit or 64-bit value, and writes the result to the destination general-purpose register.

Depending on the settings in the \textit{CPACR_EL1}, \textit{CPTR_EL2}, and \textit{CPTR_EL3} registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias \textit{MOV (to general)}.

\end{center}

For the 64-reg, UMOV-64-reg variant: is an element size specifier, encoded in "imm5":

\begin{center}
\begin{tabular}{cc}
\texttt{imm5} & \texttt{<Ts>} \\
x0000 & RESERVED \\
xxxxx1 & RESERVED \\
xxx10 & RESERVED \\
xx100 & RESERVED \\
x1000 & D \\
\end{tabular}
\end{center}

\texttt{<index>} For the 32-bit variant: is the element index encoded in "imm5":

\begin{center}
\begin{tabular}{cc}
\texttt{imm5} & \texttt{<Ts>} \\
x0000 & RESERVED \\
xxxxx1 & RESERVED \\
xxx10 & RESERVED \\
xx100 & RESERVED \\
x1000 & D \\
\end{tabular}
\end{center}
For the 64-reg, UMOV-64-reg variant: is the element index encoded in "imm5<4>".

**Alias Conditions**

<table>
<thead>
<tr>
<th>Alias</th>
<th>Is preferred when</th>
</tr>
</thead>
<tbody>
<tr>
<td>MOV (to general)</td>
<td>imm5 == 'x1000'</td>
</tr>
<tr>
<td>MOV (to general)</td>
<td>imm5 == 'xx100'</td>
</tr>
</tbody>
</table>

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(idxdsize) operand = V[n];
X[d] = ZeroExtend(Elem[operand, index, esize], datasize);
```

**Operational information**

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
UMULL, UMULL2 (by element)

Unsigned Multiply Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The UMULL instruction extracts vector elements from the lower half of the first source register, while the UMULL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

UQADD

Unsigned saturating Add. This instruction adds the values of corresponding elements of the two source SIMD&FP registers, places the results into a vector, and writes the vector to the destination SIMD&FP register. If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

Unsigned saturating Rounding Shift Left (register). This instruction takes each vector element of the first source SIMD&FP register, shifts the vector element by a value from the least significant byte of the corresponding vector element of the second source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift. The results are rounded. For truncated results, see \textit{UQSHL}.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit \textit{FPSR}.QC is set.

Depending on the settings in the \textit{CPACR\_EL1}, \textit{CPTR\_EL2}, and \textit{CPTR\_EL3} registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: \textbf{Scalar} and \textbf{Vector}.

Unsigned saturating Rounded Shift Right Narrow (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are rounded. For truncated results, see \textit{UQSHRN}.

The \textit{UQRSHRN} instruction writes the vector to the lower half of the destination register and clears the upper half, while the \textit{UQRSHRN2} instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit \textit{FPSR}.QC is set.

Depending on the settings in the \textit{CPACR_EL1}, \textit{CPTR_EL2}, and \textit{CPTR_EL3} registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: \textit{Scalar} and \textit{Vector}

Operation

CheckFPAdvSIMDEnabled64();
bits(datasize*2) operand = \( V[n] \);
bits(datasize) result;
integer round_const = if round then \( (1 << (shift - 1)) \) else 0;
integer element;
boolean sat;

for e = 0 to elements-1
  element = (Int(Elem(operand, e, 2*esize), unsigned) + round_const) >> shift;
  (Elem(result, e, esize), sat) = SatQ(element, esize, unsigned);
  if sat then FPSR.QC = '1';

Vpart[d, part] = result;
**UQSHL (immediate)**

Unsigned saturating Shift Left (immediate). This instruction takes each vector element in the source SIMD&FP register, shifts it by an immediate value, places the results in a vector, and writes the vector to the destination SIMD&FP register. The results are truncated. For rounded results, see **UQRSHL**.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the **CPACR_EL1**, **CPTR_EL2**, and **CPTR_EL3** registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: **Scalar** and **Vector**

UQSHL (immediate)  Page 1281
**UQSHL (register)**

Unsigned saturating Shift Left (register). This instruction takes each element in the vector of the first source SIMD&FP register, shifts the element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift. The results are truncated. For rounded results, see **UQRSHL**.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit **FPSR.QC** is set.

Depending on the settings in the **CPACR_EL1**, **CPTR_EL2**, and **CPTR_EL3** registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

UQSHRN, UQSHRN2

Unsigned saturating Shift Right Narrow (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, saturates each shifted result to a value that is half the original width, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are truncated. For rounded results, see **UQRSHRN**.

The UQSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the UQSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit **FPSR.QC** is set.

Depending on the settings in the **CPACR_EL1, CPTR_EL2**, and **CPTR_EL3** registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: **Scalar** and **Vector**

</tr>
</tbody>
</table>

**Operation**

```plaintext
CheckFPAdvSIMDEnabled64();
bits(datasize*2) operand = V[n];
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;
boolean sat;
for e = 0 to elements-1
    element = (Int(Elem[operand, e, 2*esize], unsigned) + round_const) >> shift;
    (Elem[result, e, esize], sat) = SatQ(element, esize, unsigned);
    if sat then FPSR.QC = '1';
Vpart[d, part] = result;
```

UQSUB

Unsigned saturating Subtract. This instruction subtracts the element values of the second source SIMD&FP register from the corresponding element values of the first source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

UQXTN, UQXTN2

Unsigned saturating extract Narrow. This instruction reads each vector element from the source SIMD&FP register, saturates each value to half the original width, places the result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values.

If saturation occurs, the cumulative saturation bit FPSR.QC is set.

The UQXTN instruction writes the vector to the lower half of the destination register and clears the upper half, while the UQXTN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

Unsigned Rounding Shift Left (register). This instruction takes each element in the vector of the first source SIMD&FP register, shifts the vector element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register. If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a rounding right shift. Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: **Scalar** and **Vector**

**URSQRTE**

Unsigned Reciprocal Square Root Estimate. This instruction reads each vector element from the source SIMD&FP register, calculates an approximate inverse square root for each value, places the result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values.

Depending on the settings in the **CPACR_EL1**, **CPTR_EL2**, and **CPTR_EL3** registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

URSRA

Unsigned Rounding Shift Right and Accumulate (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, and accumulates the final results with the vector elements of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are rounded. For truncated results, see USRA.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

USHL

Unsigned Shift Left (register). This instruction takes each element in the vector of the first source SIMD&FP register, shifts each element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register. If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a truncating right shift. For a rounding shift, see URSHL.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

        if sat then FPSR.QC = '1';
    else
        Elem[result, e, esize] = element<esize-1:0>;
V[d] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**USHLL, USHLL2**

Unsigned Shift Left Long (immediate). This instruction reads each vector element in the lower or upper half of the source SIMD&FP register, shifts the unsigned integer value left by the specified number of bits, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

The USHLL instruction extracts vector elements from the lower half of the source register, while the USHLL2 instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias **UXTL, UXTL2**.

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = Vpart[n, part];
bits(datasize*2) result;
integer element;

for e = 0 to elements-1
    element = Int(Elem[operand, e, esize], unsigned) << shift;
    Elem[result, e, 2*esize] = element<2*esize-1:0>;

V[d] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
Unsigned Shift Right (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, writes the final result to a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are truncated. For rounded results, see URSHR.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

```

V[d] = result;

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
USMMLA (vector)

Unsigned and signed 8-bit integer matrix multiply-accumulate. This instruction multiplies the 2x8 matrix of unsigned 8-bit integer values in the first source vector by the 8x2 matrix of signed 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator in the destination vector. This is equivalent to performing an 8-way dot product per destination element.

From Armv8.2, this is an OPTIONAL instruction. ID_AA64ISAR0_EL1.18MM indicates whether this instruction is supported.

Vector (Armv8.6)

|   | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0 |

USQADD

Unsigned saturating Accumulate of Signed value. This instruction adds the signed integer values of the vector elements in the source SIMD&FP register to corresponding unsigned integer values of the vector elements in the destination SIMD&FP register, and accumulates the resulting unsigned integer values with the vector elements of the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

USUBL, USUBL2

Unsigned Subtract Long. This instruction subtracts each vector element in the lower or upper half of the second source SIMD&FP register from the corresponding vector element of the first source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The destination vector elements are twice as long as the source vector elements. The USUBL instruction extracts each source vector from the lower half of each source register, while the USUBL2 instruction extracts each source vector from the upper half of each source register. Depending on the settings in the \textit{CPACR EL1}, \textit{CPTR EL2}, and \textit{CPTR EL3} registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
UZP1

Unzip vectors (primary). This instruction reads corresponding even-numbered vector elements from the two source SIMD&FP registers, starting at zero, places the result from the first source register into consecutive elements in the lower half of a vector, and the result from the second source register into consecutive elements in the upper half of a vector, and writes the vector to the destination SIMD&FP register.

This instruction can be used with UZP2 to de-interleave two vectors.

The following figure shows an example of the operation of UZP1 and UZP2 with the arrangement specifier 8B.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Advanced SIMD

  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
### XAR

Exclusive OR and Rotate performs a bitwise exclusive OR of the 128-bit vectors in the two source SIMD&FP registers, rotates each 64-bit element of the resulting 128-bit vector right by the value specified by a 6-bit immediate value, and writes the result to the destination SIMD&FP register. This instruction is implemented only when **ARMv8.2-SHA** is implemented.

### Advanced SIMD (Armv8.2)

#### Advanced SIMD

XAR `<Vd>.2D, <Vn>.2D, <Vm>.2D, #<imm6>`

```plaintext
if !HaveSHA3Ext() then UNDEFINED;
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
```

#### Assembler Symbols

- `<Vd>` Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<Vn>` Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- `<Vm>` Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
- `<imm6>` Is a rotation right, encoded in "imm6".

#### Operation

```plaintext
AArch64.CheckFPAdvSIMDEnabled();

bits(128) Vm = V[m];
bits(128) Vn = V[n];
bits(128) tmp;
tmp = Vn EOR Vm;
V[d] = ROR(tmp<127:64>, UInt(imm6)) : ROR(tmp<63:0>, UInt(imm6));
```

#### Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
XTN, XTN2

Extract Narrow. This instruction reads each vector element from the source SIMD&FP register, narrows each value to half the original width, places the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements.

The XTN instruction writes the vector to the lower half of the destination register and clears the upper half, while the XTN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

\]
Operation

```c
CheckFPAdvSIMDEnabled64();
bhits(2*datasize) operand = \textbf{V}[n];
bhits(datasize) result;
bhits(2*esize) element;

for e = 0 to elements-1
    \textbf{elem} = Elem[operand, e, 2*esize];
    Elem[result, e, esize] = \textbf{elem}<esize-1:0>;
    Vpart[d, part] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**ZIP1**

Zip vectors (primary). This instruction reads adjacent vector elements from the upper half of two source SIMD&FP registers as pairs, interleaves the pairs and places them into a vector, and writes the vector to the destination SIMD&FP register. The first pair from the first source register is placed into the two lowest vector elements, with subsequent pairs taken alternately from each source register.

This instruction can be used with ZIP2 to interleave two vectors.

The following figure shows an example of the operation of ZIP1 and ZIP2 with the arrangement specifier 8B.

```
ZIP1.8, doubleword
Vd A7 A6 A5 A4 A3 A2 A1 A0
```

```
ZIP2.8, doubleword
Vn B7 B6 B5 B4 B3 B2 B1 B0
```

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

**Advanced SIMD**

ZIP1 `<Vd>`,`<T>`,`<Vn>`,`<T>`, `<Vm>`,`<T>`

A64 -- SVE Instructions (alphabetic order)

ABS: Absolute value (predicated).
ADCLB: Add with carry long (bottom).
ADCLT: Add with carry long (top).
ADD (immediate): Add immediate (unpredicated).
ADD (vectors, predicated): Add vectors (predicated).
ADD (vectors, unpredicated): Add vectors (unpredicated).
ADDHNB: Add narrow high part (bottom).
ADDHNT: Add narrow high part (top).
ADDP: Add pairwise.
ADDPL: Add multiple of predicate register size to scalar register.
ADDVL: Add multiple of vector register size to scalar register.
ADR: Compute vector address.
AESD: AES single round decryption.
AESE: AES single round encryption.
AESIMC: AES inverse mix columns.
AESMC: AES mix columns.
AND (immediate): Bitwise AND with immediate (unpredicated).
AND (vectors, predicated): Bitwise AND vectors (predicated).
AND (vectors, unpredicated): Bitwise AND vectors (unpredicated).
AND, ANDS (predicates): Bitwise AND predicates.
ANDV: Bitwise AND reduction to scalar.
ASR (immediate, predicated): Arithmetic shift right by immediate (predicated).
ASR (immediate, unpredicated): Arithmetic shift right by immediate (unpredicated).
ASR (vectors): Arithmetic shift right by vector (predicated).
ASR (wide elements, predicated): Arithmetic shift right by 64-bit wide elements (predicated).
ASR (wide elements, unpredicated): Arithmetic shift right by 64-bit wide elements (unpredicated).
ASRD: Arithmetic shift right for divide by immediate (predicated).
ASRR: Reversed arithmetic shift right by vector (predicated).
BCAX: Bitwise clear and exclusive OR.
BDEP: Scatter lower bits into positions selected by bitmask.
BEXT: Gather lower bits from positions selected by bitmask.
BFCVT: Floating-point down convert to BFloat16 format (predicated).
BFCVNT: Floating-point down convert and narrow to BFloat16 (top, predicated).
BFDOT (indexed): BFloat16 floating-point indexed dot product.
BFDOT (vectors): BFloat16 floating-point dot product.
BFMLALB (indexed): BFloat16 floating-point multiply-add long to single-precision (bottom, indexed).
BFMLALB (vectors): BFloat16 floating-point multiply-add long to single-precision (bottom).
BFMLALT (indexed): BFloat16 floating-point multiply-add long to single-precision (top, indexed).
BFMLALT (vectors): BFloat16 floating-point multiply-add long to single-precision (top).
BFMMLA: BFloat16 floating-point matrix multiply-accumulate.
BGRP: Group bits to right or left as selected by bitmask.
BIC (immediate): Bitwise clear bits using immediate (unpredicated): an alias of AND (immediate).
BIC (vectors, predicated): Bitwise clear vectors (predicated).
BIC (vectors, unpredicated): Bitwise clear vectors (unpredicated).
BIC, BICS (predicates): Bitwise clear predicates.
BRKA_BRKAS: Break after first true condition.
BRKB_BRKBS: Break before first true condition.
BRKN_BRKNS: Propagate break to next partition.
BRKPA_BRKPAS: Break after first true condition, propagating from previous partition.
BRKPB_BRKPBS: Break before first true condition, propagating from previous partition.
BSL: Bitwise select.
BSL1N: Bitwise select with first input inverted.
BSL2N: Bitwise select with second input inverted.
CADD: Complex integer add with rotate.
CDOT (indexed): Complex integer dot product (indexed).
CDOT (vectors): Complex integer dot product.
CLASTA (scalar): Conditionally extract element after last to general-purpose register.
CLASTA (SIMD&FP scalar): Conditionally extract element after last to SIMD&FP scalar register.
CLASTA (vectors): Conditionally extract element after last to vector register.
CLASTB (scalar): Conditionally extract last element to general-purpose register.
CLASTB (SIMD&FP scalar): Conditionally extract last element to SIMD&FP scalar register.
CLASTB (vectors): Conditionally extract last element to vector register.
CLS: Count leading sign bits (predicated).
CLZ: Count leading zero bits (predicated).
CMLA (indexed): Complex integer multiply-add with rotate (indexed).
CMLA (vectors): Complex integer multiply-add with rotate.
CMP<cc> (immediate): Compare vector to immediate.
CMP<cc> (vectors): Compare vectors.
CMP<cc> (wide elements): Compare vector to 64-bit wide elements.
CMPEQ (vectors): Compare signed less than or equal to vector, setting the condition flags: an alias of CMP<cc> (vectors).
**CMPLO (vectors):** Compare unsigned lower than vector, setting the condition flags: an alias of CMP<cc> (vectors).

**CMPLS (vectors):** Compare unsigned lower or same as vector, setting the condition flags: an alias of CMP<cc> (vectors).

**CMPLT (vectors):** Compare signed less than vector, setting the condition flags: an alias of CMP<cc> (vectors).

**CNOT:** Logically invert boolean condition in vector (predicated).

**CNT:** Count non-zero bits (predicated).

**CNTB, CNTD, CNTH, CNTW:** Set scalar to multiple of predicate constraint element count.

**CNTP:** Set scalar to count of true predicate elements.

**COMPACT:** Shuffle active elements of vector to the right and fill with zero.

**CPY (immediate, merging):** Copy signed integer immediate to vector elements (merging).

**CPY (immediate, zeroing):** Copy signed integer immediate to vector elements (zeroing).

**CPY (scalar):** Copy general-purpose register to vector elements (predicated).

**CPY (SIMD&FP scalar):** Copy SIMD&FP scalar register to vector elements (predicated).

**CTERMEQ, CTERMNE:** Compare and terminate loop.

**DECB, DECD, DECH, DECW (scalar):** Decrement scalar by multiple of predicate constraint element count.

**DECD, DECH, DECW (vector):** Decrement vector by multiple of predicate constraint element count.

**DECP (scalar):** Decrement scalar by count of true predicate elements.

**DECP (vector):** Decrement vector by count of true predicate elements.

**DUP (immediate):** Broadcast signed immediate to vector elements (unpredicated).

**DUP (indexed):** Broadcast indexed element to vector (unpredicated).

**DUP (scalar):** Broadcast general-purpose register to vector elements (unpredicated).

**DUPM:** Broadcast logical bitmask immediate to vector (unpredicated).

**EON:** Bitwise exclusive OR with inverted immediate (unpredicated): an alias of EOR (immediate).

**EOR (immediate):** Bitwise exclusive OR with immediate (unpredicated).

**EOR (vectors, predicated):** Bitwise exclusive OR vectors (predicated).

**EOR (vectors, unpredicated):** Bitwise exclusive OR vectors (unpredicated).

**EOR, EORS (predicates):** Bitwise exclusive OR predicates.

**EOR3:** Bitwise exclusive OR of three vectors.

**EORBT:** Interleaving exclusive OR (bottom, top).

**EORTB:** Interleaving exclusive OR (top, bottom).

**EORV:** Bitwise exclusive OR reduction to scalar.

**EXT:** Extract vector from pair of vectors.

**FABD:** Floating-point absolute difference (predicated).

**FABS:** Floating-point absolute value (predicated).

**FAC<cc>:** Floating-point absolute compare vectors.

**FACLE:** Floating-point absolute compare less than or equal: an alias of FAC<cc>.

**FACTL:** Floating-point absolute compare less than: an alias of FAC<cc>.
FADD (immediate): Floating-point add immediate (predicated).
FADD (vectors, predicated): Floating-point add vector (predicated).
FADD (vectors, unpredicated): Floating-point add vector (unpredicated).
FADDA: Floating-point add strictly-ordered reduction, accumulating in scalar.
FADDP: Floating-point add pairwise.
FADDV: Floating-point add recursive reduction to scalar.
FCADD: Floating-point complex add with rotate (predicated).
FCM<cc> (vectors): Floating-point compare vectors.
FCM<cc> (zero): Floating-point compare vector with zero.
FCMLA (indexed): Floating-point complex multiply-add by indexed values with rotate.
FCMLA (vectors): Floating-point complex multiply-add with rotate (predicated).
FCMLE (vectors): Floating-point compare less than or equal to vector: an alias of FCM<cc> (vectors).
FCMLT (vectors): Floating-point compare less than vector: an alias of FCM<cc> (vectors).
FCPY: Copy 8-bit floating-point immediate to vector elements (predicated).
FCVT: Floating-point convert precision (predicated).
FCVTLT: Floating-point up convert long (top, predicated).
FCVTNT: Floating-point down convert and narrow (top, predicated).
FCVTX: Floating-point down convert, rounding to odd (predicated).
FCVTXNT: Floating-point down convert, rounding to odd (top, predicated).
FCVTZS: Floating-point convert to signed integer, rounding toward zero (predicated).
FCVTZU: Floating-point convert to unsigned integer, rounding toward zero (predicated).
FDIV: Floating-point divide by vector (predicated).
FDIVR: Floating-point reversed divide by vector (predicated).
FDUP: Broadcast 8-bit floating-point immediate to vector elements (unpredicated).
FEEXPA: Floating-point exponential accelerator.
FLOGB: Floating-point base 2 logarithm as integer.
FMAD: Floating-point fused multiply-add vectors (predicated), writing multiplicand \[Zdn = Za + Zdn * Zm\].
FMAX (immediate): Floating-point maximum with immediate (predicated).
FMAX (vectors): Floating-point maximum (predicated).
FMAXNM (immediate): Floating-point maximum number with immediate (predicated).
FMAXNM (vectors): Floating-point maximum number (predicated).
FMAXNMP: Floating-point maximum number pairwise.
FMAXNMV: Floating-point maximum number recursive reduction to scalar.
FMAXP: Floating-point maximum pairwise.
FMAXV: Floating-point maximum recursive reduction to scalar.
FMIN (immediate): Floating-point minimum with immediate (predicated).
FMIN (vectors): Floating-point minimum (predicated).
FMINNM (immediate): Floating-point minimum number with immediate (predicated).
FMINNM (vectors): Floating-point minimum number (predicated).
FMINNMP: Floating-point minimum number pairwise.
FMINNNM: Floating-point minimum number recursive reduction to scalar.
FMINP: Floating-point minimum pairwise.
FMINV: Floating-point minimum recursive reduction to scalar.
FMLA (indexed): Floating-point fused multiply-add by indexed elements (Zda = Zda + Zn * Zm[indexed]).
FMLA (vectors): Floating-point fused multiply-add vectors (predicated), writing addend [Zda = Zda + Zn * Zm].
FMLALB (indexed): Half-precision floating-point multiply-add long to single-precision (bottom, indexed).
FMLALB (vectors): Half-precision floating-point multiply-add long to single-precision (bottom).
FMLALT (indexed): Half-precision floating-point multiply-add long to single-precision (top, indexed).
FMLALT (vectors): Half-precision floating-point multiply-add long to single-precision (top).
FMLLS (indexed): Floating-point fused multiply-subtract by indexed elements (Zda = Zda + -Zn * Zm[indexed]).
FMLLS (vectors): Floating-point fused multiply-subtract vectors (predicated), writing addend [Zda = Zda + -Zn * Zm].
FMLSLB (indexed): Half-precision floating-point multiply-subtract long from single-precision (bottom, indexed).
FMLSLB (vectors): Half-precision floating-point multiply-subtract long from single-precision (bottom).
FMLSLT (indexed): Half-precision floating-point multiply-subtract long from single-precision (top, indexed).
FMLSLT (vectors): Half-precision floating-point multiply-subtract long from single-precision (top).
FMMLA: Floating-point matrix multiply-accumulate.
FMOV (immediate, predicated): Move 8-bit floating-point immediate to vector elements (predicated): an alias of FCPY.
FMOV (immediate, unpredicated): Move 8-bit floating-point immediate to vector elements (unpredicated): an alias of FDUP.
FMOV (zero, predicated): Move floating-point +0.0 to vector elements (predicated): an alias of CPY (immediate, merging).
FMOV (zero, unpredicated): Move floating-point +0.0 to vector elements (unpredicated): an alias of DUP (immediate).
FMSB: Floating-point fused multiply-subtract vectors (predicated), writing multiplicand [Zdn = Za + -Zdn * Zm].
FMUL (immediate): Floating-point multiply by immediate (predicated).
FMUL (indexed): Floating-point multiply by indexed elements.
FMUL (vectors, predicated): Floating-point multiply vectors (predicated).
FMUL (vectors, unpredicated): Floating-point multiply vectors (unpredicated).
FMULX: Floating-point multiply-extended vectors (predicated).
FNEG: Floating-point negate (predicated).
FNMA: Floating-point negated fused multiply-add vectors (predicated), writing multiplicand [Zdn = -Za + -Zdn * Zm].
FNMA: Floating-point negated fused multiply-add vectors (predicated), writing addend [Zda = -Zda + -Zn * Zm].
FNMLA: Floating-point negated fused multiply-add vectors (predicated), writing addend [Zda = -Zda + Zn * Zm].
**FNMSB**: Floating-point negated fused multiply-subtract vectors (predicated), writing multiplicand \(Z_{dn} = -Z_a + Z_{dn} * Z_m\).

**FRECPE**: Floating-point reciprocal estimate (unpredicated).

**FRECPS**: Floating-point reciprocal step (unpredicated).

**FRECPX**: Floating-point reciprocal exponent (predicated).

**PRINT\(<r>\)**: Floating-point round to integral value (predicated).

**FRSORTE**: Floating-point reciprocal square root estimate (unpredicated).

**FRSORTS**: Floating-point reciprocal square root step (unpredicated).

**FSCALF**: Floating-point adjust exponent by vector (predicated).

**FSORT**: Floating-point square root (predicated).

**FSUB (immediate)**: Floating-point subtract immediate (predicated).

**FSUB (vectors, predicated)**: Floating-point subtract vectors (predicated).

**FSUB (vectors, unpredicated)**: Floating-point subtract vectors (unpredicated).

**FSUBR (immediate)**: Floating-point reversed subtract from immediate (predicated).

**FSUBR (vectors)**: Floating-point reversed subtract vectors (predicated).

**FTMAD**: Floating-point trigonometric multiply-add coefficient.

**FTSMUL**: Floating-point trigonometric starting value.

**FTSSFL**: Floating-point trigonometric select coefficient.

**HISTCNT**: Count matching elements in vector.

**HISTSEG**: Count matching elements in vector segments.

**INCB, INCD, INCH, INCW (scalar)**: Increment scalar by multiple of predicate constraint element count.

**INCD, INCH, INCW (vector)**: Increment vector by multiple of predicate constraint element count.

**INCP (scalar)**: Increment scalar by count of true predicate elements.

**INCP (vector)**: Increment vector by count of true predicate elements.

**INDEX (immediate, scalar)**: Create index starting from immediate and incremented by general-purpose register.

**INDEX (immediates)**: Create index starting from and incremented by immediate.

**INDEX (scalar, immediate)**: Create index starting from general-purpose register and incremented by immediate.

**INDEX (scalars)**: Create index starting from and incremented by general-purpose register.

**INSR (scalar)**: Insert general-purpose register in shifted vector.

**INSR (SIMD&FP scalar)**: Insert SIMD&FP scalar register in shifted vector.

**LASTA (scalar)**: Extract element after last to general-purpose register.

**LASTA (SIMD&FP scalar)**: Extract element after last to SIMD&FP scalar register.

**LASTB (scalar)**: Extract last element to general-purpose register.

**LASTB (SIMD&FP scalar)**: Extract last element to SIMD&FP scalar register.

**LD1B (scalar plus immediate)**: Contiguous load unsigned bytes to vector (immediate index).

**LD1B (scalar plus scalar)**: Contiguous load unsigned bytes to vector (scalar index).

**LD1B (scalar plus vector)**: Gather load unsigned bytes to vector (vector index).
LD1B (vector plus immediate): Gather load unsigned bytes to vector (immediate index).
LD1D (scalar plus immediate): Contiguous load doublewords to vector (immediate index).
LD1D (scalar plus scalar): Contiguous load doublewords to vector (scalar index).
LD1D (vector plus vector): Gather load doublewords to vector (vector index).
LD1D (vector plus immediate): Gather load doublewords to vector (immediate index).
LD1H (scalar plus immediate): Contiguous load unsigned halfwords to vector (immediate index).
LD1H (scalar plus scalar): Contiguous load unsigned halfwords to vector (scalar index).
LD1H (scalar plus vector): Gather load unsigned halfwords to vector (vector index).
LD1H (vector plus immediate): Gather load unsigned halfwords to vector (immediate index).
LD1RB: Load and broadcast unsigned byte to vector.
LD1RD: Load and broadcast doubleword to vector.
LD1RH: Load and broadcast unsigned halfword to vector.
LD1ROB (scalar plus immediate): Contiguous load and replicate thirty-two bytes (immediate index).
LD1ROB (scalar plus scalar): Contiguous load and replicate thirty-two bytes (scalar index).
LD1ROD (scalar plus immediate): Contiguous load and replicate four doublewords (immediate index).
LD1ROD (scalar plus scalar): Contiguous load and replicate four doublewords (scalar index).
LD1ROH (scalar plus immediate): Contiguous load and replicate sixteen halfwords (immediate index).
LD1ROH (scalar plus scalar): Contiguous load and replicate sixteen halfwords (scalar index).
LD1ROW (scalar plus immediate): Contiguous load and replicate eight words (immediate index).
LD1ROW (scalar plus scalar): Contiguous load and replicate eight words (scalar index).
LD1RQB (scalar plus immediate): Contiguous load and replicate sixteen bytes (immediate index).
LD1RQB (scalar plus scalar): Contiguous load and replicate sixteen bytes (scalar index).
LD1RQD (scalar plus immediate): Contiguous load and replicate two doublewords (immediate index).
LD1RQD (scalar plus scalar): Contiguous load and replicate two doublewords (scalar index).
LD1RQH (scalar plus immediate): Contiguous load and replicate eight halfwords (immediate index).
LD1RQH (scalar plus scalar): Contiguous load and replicate eight halfwords (scalar index).
LD1ROW (scalar plus immediate): Contiguous load and replicate four words (immediate index).
LD1ROW (scalar plus scalar): Contiguous load and replicate four words (scalar index).
LD1RSB: Load and broadcast signed byte to vector.
LD1RSH: Load and broadcast signed halfword to vector.
LD1RSW: Load and broadcast signed word to vector.
LD1RW: Load and broadcast unsigned word to vector.
LD1SB (scalar plus immediate): Contiguous load signed bytes to vector (immediate index).
LD1SB (scalar plus scalar): Contiguous load signed bytes to vector (scalar index).
LD1SB (scalar plus vector): Gather load signed bytes to vector (vector index).
LD1SB (vector plus immediate): Gather load signed bytes to vector (immediate index).
**LD1SH (scalar plus immediate)**: Contiguous load signed halfwords to vector (immediate index).

**LD1SH (scalar plus scalar)**: Contiguous load signed halfwords to vector (scalar index).

**LD1SH (scalar plus vector)**: Gather load signed halfwords to vector (vector index).

**LD1SH (vector plus immediate)**: Gather load signed halfwords to vector (immediate index).

**LD1SW (scalar plus immediate)**: Contiguous load signed words to vector (immediate index).

**LD1SW (scalar plus scalar)**: Contiguous load signed words to vector (scalar index).

**LD1SW (scalar plus vector)**: Gather load signed words to vector (vector index).

**LD1SW (vector plus immediate)**: Gather load signed words to vector (immediate index).

**LD1W (scalar plus immediate)**: Contiguous load unsigned words to vector (immediate index).

**LD1W (scalar plus scalar)**: Contiguous load unsigned words to vector (scalar index).

**LD1W (scalar plus vector)**: Gather load unsigned words to vector (vector index).

**LD1W (vector plus immediate)**: Gather load unsigned words to vector (immediate index).

**LD2B (scalar plus immediate)**: Contiguous load two-byte structures to two vectors (immediate index).

**LD2B (scalar plus scalar)**: Contiguous load two-byte structures to two vectors (scalar index).

**LD2B (vector plus immediate)**: Contiguous load two-byte structures to two vectors (immediate index).

**LD2B (scalar plus scalar)**: Contiguous load two-byte structures to two vectors (scalar index).

**LD2D (scalar plus immediate)**: Contiguous load two-doubleword structures to two vectors (immediate index).

**LD2D (scalar plus scalar)**: Contiguous load two-doubleword structures to two vectors (scalar index).

**LD2D (vector plus immediate)**: Contiguous load two-doubleword structures to two vectors (immediate index).

**LD2D (scalar plus scalar)**: Contiguous load two-doubleword structures to two vectors (scalar index).

**LD2H (scalar plus immediate)**: Contiguous load two-halfword structures to two vectors (immediate index).

**LD2H (scalar plus scalar)**: Contiguous load two-halfword structures to two vectors (scalar index).

**LD2H (vector plus immediate)**: Contiguous load two-halfword structures to two vectors (immediate index).

**LD2H (scalar plus scalar)**: Contiguous load two-halfword structures to two vectors (scalar index).

**LD2W (scalar plus immediate)**: Contiguous load two-word structures to two vectors (immediate index).

**LD2W (scalar plus scalar)**: Contiguous load two-word structures to two vectors (scalar index).

**LD3B (scalar plus immediate)**: Contiguous load three-byte structures to three vectors (immediate index).

**LD3B (scalar plus scalar)**: Contiguous load three-byte structures to three vectors (scalar index).

**LD3B (vector plus immediate)**: Contiguous load three-byte structures to three vectors (immediate index).

**LD3B (scalar plus scalar)**: Contiguous load three-byte structures to three vectors (scalar index).

**LD3D (scalar plus immediate)**: Contiguous load three-doubleword structures to three vectors (immediate index).

**LD3D (scalar plus scalar)**: Contiguous load three-doubleword structures to three vectors (scalar index).

**LD3D (vector plus immediate)**: Contiguous load three-doubleword structures to three vectors (immediate index).

**LD3D (scalar plus scalar)**: Contiguous load three-doubleword structures to three vectors (scalar index).

**LD3H (scalar plus immediate)**: Contiguous load three-halfword structures to three vectors (immediate index).

**LD3H (scalar plus scalar)**: Contiguous load three-halfword structures to three vectors (scalar index).

**LD3H (vector plus immediate)**: Contiguous load three-halfword structures to three vectors (immediate index).

**LD3H (scalar plus scalar)**: Contiguous load three-halfword structures to three vectors (scalar index).

**LD3W (scalar plus immediate)**: Contiguous load three-word structures to three vectors (immediate index).

**LD3W (scalar plus scalar)**: Contiguous load three-word structures to three vectors (scalar index).

**LD4B (scalar plus immediate)**: Contiguous load four-byte structures to four vectors (immediate index).

**LD4B (scalar plus scalar)**: Contiguous load four-byte structures to four vectors (scalar index).

**LD4B (vector plus immediate)**: Contiguous load four-byte structures to four vectors (immediate index).

**LD4B (scalar plus scalar)**: Contiguous load four-byte structures to four vectors (scalar index).

**LD4D (scalar plus immediate)**: Contiguous load four-doubleword structures to four vectors (immediate index).

**LD4D (scalar plus scalar)**: Contiguous load four-doubleword structures to four vectors (scalar index).

**LD4D (vector plus immediate)**: Contiguous load four-doubleword structures to four vectors (immediate index).

**LD4D (scalar plus scalar)**: Contiguous load four-doubleword structures to four vectors (scalar index).

**LD4H (scalar plus immediate)**: Contiguous load four-halfword structures to four vectors (immediate index).

**LD4H (scalar plus scalar)**: Contiguous load four-halfword structures to four vectors (scalar index).

**LD4H (vector plus immediate)**: Contiguous load four-halfword structures to four vectors (immediate index).

**LD4H (scalar plus scalar)**: Contiguous load four-halfword structures to four vectors (scalar index).

**LD4W (scalar plus immediate)**: Contiguous load four-word structures to four vectors (immediate index).

**LD4W (scalar plus scalar)**: Contiguous load four-word structures to four vectors (scalar index).
**LDFF1B (scalar plus scalar)**: Contiguous load first-fault unsigned bytes to vector (scalar index).

**LDFF1B (scalar plus vector)**: Gather load first-fault unsigned bytes to vector (vector index).

**LDFF1B (vector plus immediate)**: Gather load first-fault unsigned bytes to vector (immediate index).

**LDFF1D (scalar plus scalar)**: Contiguous load first-fault doublewords to vector (scalar index).

**LDFF1D (scalar plus vector)**: Gather load first-fault doublewords to vector (vector index).

**LDFF1D (vector plus immediate)**: Gather load first-fault doublewords to vector (immediate index).

**LDFF1H (scalar plus scalar)**: Contiguous load first-fault unsigned halfwords to vector (scalar index).

**LDFF1H (scalar plus vector)**: Gather load first-fault unsigned halfwords to vector (vector index).

**LDFF1H (vector plus immediate)**: Gather load first-fault unsigned halfwords to vector (immediate index).

**LDFF1SB (scalar plus scalar)**: Contiguous load first-fault signed bytes to vector (scalar index).

**LDFF1SB (scalar plus vector)**: Gather load first-fault signed bytes to vector (vector index).

**LDFF1SB (vector plus immediate)**: Gather load first-fault signed bytes to vector (immediate index).

**LDFF1SH (scalar plus scalar)**: Contiguous load first-fault signed halfwords to vector (scalar index).

**LDFF1SH (scalar plus vector)**: Gather load first-fault signed halfwords to vector (vector index).

**LDFF1SH (vector plus immediate)**: Gather load first-fault signed halfwords to vector (immediate index).

**LDFF1SW (scalar plus scalar)**: Contiguous load first-fault signed words to vector (scalar index).

**LDFF1SW (scalar plus vector)**: Gather load first-fault signed words to vector (vector index).

**LDFF1SW (vector plus immediate)**: Gather load first-fault signed words to vector (immediate index).

**LDFF1W (scalar plus scalar)**: Contiguous load first-fault unsigned words to vector (scalar index).

**LDFF1W (scalar plus vector)**: Gather load first-fault unsigned words to vector (vector index).

**LDFF1W (vector plus immediate)**: Gather load first-fault unsigned words to vector (immediate index).

**LDNF1B**: Contiguous load non-fault unsigned bytes to vector (immediate index).

**LDNF1D**: Contiguous load non-fault doublewords to vector (immediate index).

**LDNF1H**: Contiguous load non-fault unsigned halfwords to vector (immediate index).

**LDNF1SB**: Contiguous load non-fault signed bytes to vector (immediate index).

**LDNF1SH**: Contiguous load non-fault signed halfwords to vector (immediate index).

**LDNF1SW**: Contiguous load non-fault signed words to vector (immediate index).

**LDNF1W**: Contiguous load non-fault unsigned words to vector (immediate index).

**LDNT1B (scalar plus immediate)**: Contiguous load non-temporal bytes to vector (immediate index).

**LDNT1B (scalar plus scalar)**: Contiguous load non-temporal bytes to vector (scalar index).

**LDNT1B (vector plus scalar)**: Gather load non-temporal unsigned bytes.

**LDNT1D (scalar plus immediate)**: Contiguous load non-temporal doublewords to vector (immediate index).

**LDNT1D (scalar plus scalar)**: Contiguous load non-temporal doublewords to vector (scalar index).

**LDNT1D (vector plus scalar)**: Gather load non-temporal unsigned doublewords.

**LDNT1H (scalar plus immediate)**: Contiguous load non-temporal halfwords to vector (immediate index).

**LDNT1H (scalar plus scalar)**: Contiguous load non-temporal halfwords to vector (scalar index).
LDNT1H (vector plus scalar): Gather load non-temporal unsigned halfwords.

LDNT1SB: Gather load non-temporal signed bytes.

LDNT1SH: Gather load non-temporal signed halfwords.

LDNT1SW: Gather load non-temporal signed words.

LDNT1W (scalar plus immediate): Contiguous load non-temporal words to vector (immediate index).

LDNT1W (scalar plus scalar): Contiguous load non-temporal words to vector (scalar index).

LDNT1W (vector plus scalar): Gather load non-temporal unsigned words.

LDR (predicate): Load predicate register.

LDR (vector): Load vector register.

LSL (immediate, predicated): Logical shift left by immediate (predicated).

LSL (immediate, unpredicated): Logical shift left by immediate (unpredicated).

LSL (vectors): Logical shift left by vector (predicated).

LSL (wide elements, predicated): Logical shift left by 64-bit wide elements (predicated).

LSL (wide elements, unpredicated): Logical shift left by 64-bit wide elements (unpredicated).

LSLR: Reversed logical shift left by vector (predicated).

LSR (immediate, predicated): Logical shift right by immediate (predicated).

LSR (immediate, unpredicated): Logical shift right by immediate (unpredicated).

LSR (vectors): Logical shift right by vector (predicated).

LSR (wide elements, predicated): Logical shift right by 64-bit wide elements (predicated).

LSR (wide elements, unpredicated): Logical shift right by 64-bit wide elements (unpredicated).

LSRR: Reversed logical shift right by vector (predicated).

MAD: Multiply-add vectors (predicated), writing multipicand [Zdn = Za + Zdn * Zm].

MATCH: Detect any matching elements, setting the condition flags.

MLA (indexed): Multiply-add to accumulator (indexed).

MLA (vectors): Multiply-add vectors (predicated), writing addend [Zda = Zda + Zn * Zm].

MLS (indexed): Multiply-subtract from accumulator (indexed).

MLS (vectors): Multiply-subtract vectors (predicated), writing addend [Zda = Zda - Zn * Zm].

MOV: Move predicate (unpredicated): an alias of ORR, ORRS (predicates).

MOV: Move predicates (merging): an alias of SEL (predicates).

MOV (bitmask immediate): Move logical bitmask immediate to vector (unpredicated): an alias of DUPM.

MOV (immediate, predicated, merging): Move signed integer immediate to vector elements (merging): an alias of CPY (immediate, merging).

MOV (immediate, predicated, zeroing): Move signed integer immediate to vector elements (zeroing): an alias of CPY (immediate, zeroing).

MOV (immediate, unpredicated): Move signed immediate to vector elements (unpredicated): an alias of DUP (immediate).

MOV (scalar, predicated): Move general-purpose register to vector elements (predicated): an alias of CPY (scalar).
**MOV (scalar, unpredicated):** Move general-purpose register to vector elements (unpredicated): an alias of DUP (scalar).

**MOV (SIMD&FP scalar, predicated):** Move SIMD&FP scalar register to vector elements (predicated): an alias of CPY (SIMD&FP scalar).

**MOV (SIMD&FP scalar, unpredicated):** Move indexed element or SIMD&FP scalar to vector (unpredicated): an alias of DUP (indexed).

**MOV (vector, predicated):** Move vector elements (predicated): an alias of SEL (vectors).

**MOV (vector, unpredicated):** Move vector register (unpredicated): an alias of ORR (vectors, unpredicated).

**MOVPRFX (predicated):** Move prefix (predicated).

**MOVPRFX (unpredicated):** Move prefix (unpredicated).

**MOVS:** Move predicates (zeroing), setting the condition flags: an alias of AND, ANDS (predicates).

**MOVS:** Move predicate (unpredicated), setting the condition flags: an alias of ORR, ORRS (predicates).

**MSB:** Multiply-subtract vectors (predicated), writing multiplicand $[Zdn = Za - Zdn \times Zm]$.

**MUL (immediate):** Multiply by immediate (unpredicated).

**MUL (indexed):** Multiply (indexed).

**MUL (vectors, predicated):** Multiply vectors (predicated).

**MUL (vectors, unpredicated):** Multiply vectors (unpredicated).

**NAND, NANDS:** Bitwise NAND predicates.

**NBSL:** Bitwise inverted select.

**NEG:** Negate (predicated).

**NMATCH:** Detect no matching elements, setting the condition flags.

**NOR, NORS:** Bitwise NOR predicates.

**NOT (predicate):** Bitwise invert predicate: an alias of EOR, EORS (predicates).

**NOT (vector):** Bitwise invert vector (predicated).

**NOTS:** Bitwise invert predicate, setting the condition flags: an alias of EOR, EORS (predicates).

**ORN (immediate):** Bitwise inclusive OR with inverted immediate (unpredicated): an alias of ORR (immediate).

**ORN, ORNS (predicates):** Bitwise inclusive OR inverted predicate.

**ORR (immediate):** Bitwise inclusive OR with immediate (unpredicated).

**ORR (vectors, predicated):** Bitwise inclusive OR vectors (predicated).

**ORR (vectors, unpredicated):** Bitwise inclusive OR vectors (unpredicated).

**ORR, ORRS (predicates):** Bitwise inclusive OR predicate.

**ORV:** Bitwise inclusive OR reduction to scalar.

**PFALSE:** Set all predicate elements to false.

**PFIRST:** Set the first active predicate element to true.

**PMUL:** Polynomial multiply vectors (unpredicated).

**PMULLB:** Polynomial multiply long (bottom).

**PMULLT:** Polynomial multiply long (top).

**PNEXT:** Find next active predicate.
PRFB (scalar plus immediate): Contiguous prefetch bytes (immediate index).
PRFB (scalar plus scalar): Contiguous prefetch bytes (scalar index).
PRFB (scalar plus vector): Gather prefetch bytes (scalar plus vector).
PRFB (vector plus immediate): Gather prefetch bytes (vector plus immediate).
PRFD (scalar plus immediate): Contiguous prefetch doublewords (immediate index).
PRFD (scalar plus scalar): Contiguous prefetch doublewords (scalar index).
PRFD (scalar plus vector): Gather prefetch doublewords (scalar plus vector).
PRFD (vector plus immediate): Gather prefetch doublewords (vector plus immediate).
PRFH (scalar plus immediate): Contiguous prefetch halfwords (immediate index).
PRFH (scalar plus scalar): Contiguous prefetch halfwords (scalar index).
PRFH (scalar plus vector): Gather prefetch halfwords (scalar plus vector).
PRFH (vector plus immediate): Gather prefetch halfwords (vector plus immediate).
PRFW (scalar plus immediate): Contiguous prefetch words (immediate index).
PRFW (scalar plus scalar): Contiguous prefetch words (scalar index).
PRFW (scalar plus vector): Gather prefetch words (scalar plus vector).
PRFW (vector plus immediate): Gather prefetch words (vector plus immediate).

PTEST: Set condition flags for predicate.
PTRUE, PTRUES: Initialise predicate from named constraint.
PUNPKHI, PUNPKLO: Unpack and widen half of predicate.
RADDHNB: Rounding add narrow high part (bottom).
RADDHNT: Rounding add narrow high part (top).
RAXI: Bitwise rotate left by 1 and exclusive OR.
RBIT: Reverse bits (predicated).
RDFFR (unpredicated): Read the first-fault register.
RDFFR, RDFFRS (predicated): Return predicate of succesfully loaded elements.
RDVL: Read multiple of vector register size to scalar register.
REV (predicate): Reverse all elements in a predicate.
REV (vector): Reverse all elements in a vector (unpredicated).
REVB, REVH, REVW: Reverse bytes / halfwords / words within elements (predicated).
RSHRNH: Rounding shift right narrow by immediate (bottom).
RSHRNT: Rounding shift right narrow by immediate (top).
RSUBHNB: Rounding subtract narrow high part (bottom).
RSUBHNT: Rounding subtract narrow high part (top).
SABA: Signed absolute difference and accumulate.
SABALB: Signed absolute difference and accumulate long (bottom).
SABALT: Signed absolute difference and accumulate long (top).

</table>
**SMLALB (indexed):** Signed multiply-add long to accumulator (bottom, indexed).

**SMLALB (vectors):** Signed multiply-add long to accumulator (bottom).

**SMLALT (indexed):** Signed multiply-add long to accumulator (top, indexed).

**SMLALT (vectors):** Signed multiply-add long to accumulator (top).

**SMLSLB (indexed):** Signed multiply-subtract long from accumulator (bottom, indexed).

**SMLSLB (vectors):** Signed multiply-subtract long from accumulator (bottom).

**SMLSLT (indexed):** Signed multiply-subtract long from accumulator (top, indexed).

**SMLSLT (vectors):** Signed multiply-subtract long from accumulator (top).

**SMMLA:** Signed integer matrix multiply-accumulate.

**SMULH (predicated):** Signed multiply returning high half (predicated).

**SMULH (unpredicated):** Signed multiply returning high half (unpredicated).

**SMULLB (indexed):** Signed multiply long (bottom, indexed).

**SMULLB (vectors):** Signed multiply long (bottom).

**SMULLT (indexed):** Signed multiply long (top, indexed).

**SMULLT (vectors):** Signed multiply long (top).

**SPLICE:** Splice two vectors under predicate control.

**SQABS:** Signed saturating absolute value.

**SOADD (immediate):** Signed saturating add immediate (unpredicated).

**SOADD (vectors, predicated):** Signed saturating addition (predicated).

**SOADD (vectors, unpredicated):** Signed saturating add vectors (unpredicated).

**SQCADD:** Saturating complex integer add with rotate.

**SQDECB:** Signed saturating decrement scalar by multiple of 8-bit predicate constraint element count.

**SQDECD (scalar):** Signed saturating decrement scalar by multiple of 64-bit predicate constraint element count.

**SQDECD (vector):** Signed saturating decrement vector by multiple of 64-bit predicate constraint element count.

**SQDECH (scalar):** Signed saturating decrement scalar by multiple of 16-bit predicate constraint element count.

**SQDECH (vector):** Signed saturating decrement vector by multiple of 16-bit predicate constraint element count.

**SQDECP (scalar):** Signed saturating decrement scalar by count of true predicate elements.

**SQDECP (vector):** Signed saturating decrement vector by count of true predicate elements.

**SQDECW (scalar):** Signed saturating decrement scalar by multiple of 32-bit predicate constraint element count.

**SQDECW (vector):** Signed saturating decrement vector by multiple of 32-bit predicate constraint element count.

**SODMLALB (indexed):** Signed saturating doubling multiply-add long to accumulator (bottom, indexed).

**SODMLALB (vectors):** Signed saturating doubling multiply-add long to accumulator (bottom).

**SODMLALBT:** Signed saturating doubling multiply-add long to accumulator (bottom × top).

**SODMLALT (indexed):** Signed saturating doubling multiply-add long to accumulator (top, indexed).

**SODMLALT (vectors):** Signed saturating doubling multiply-add long to accumulator (top).

**SODMLSLB (indexed):** Signed saturating doubling multiply-subtract long from accumulator (bottom, indexed).
**SQDMLSLB (vectors)**: Signed saturating doubling multiply-subtract long from accumulator (bottom).

**SQDMLSLBT**: Signed saturating doubling multiply-subtract long from accumulator (bottom × top).

**SQDMLSLT (indexed)**: Signed saturating doubling multiply-subtract long from accumulator (top, indexed).

**SQDMLSLT (vectors)**: Signed saturating doubling multiply-subtract long from accumulator (top).

**SQDMULH (indexed)**: Signed saturating doubling multiply high (indexed).

**SQDMULH (vectors)**: Signed saturating doubling multiply high (unpredicated).

**SQDMLULB (indexed)**: Signed saturating doubling multiply long (bottom, indexed).

**SQDMLULB (vectors)**: Signed saturating doubling multiply long (bottom).

**SQDMLULT (indexed)**: Signed saturating doubling multiply long (top, indexed).

**SQDMLULT (vectors)**: Signed saturating doubling multiply long (top).

**SQINCB**: Signed saturating increment scalar by multiple of 8-bit predicate constraint element count.

**SQINCD (scalar)**: Signed saturating increment scalar by multiple of 64-bit predicate constraint element count.

**SQINCD (vector)**: Signed saturating increment vector by multiple of 64-bit predicate constraint element count.

**SQINCH (scalar)**: Signed saturating increment scalar by multiple of 16-bit predicate constraint element count.

**SQINCH (vector)**: Signed saturating increment vector by multiple of 16-bit predicate constraint element count.

**SQINCP (scalar)**: Signed saturating increment scalar by count of true predicate elements.

**SQINCP (vector)**: Signed saturating increment vector by count of true predicate elements.

**SQINCW (scalar)**: Signed saturating increment scalar by multiple of 32-bit predicate constraint element count.

**SQINCW (vector)**: Signed saturating increment vector by multiple of 32-bit predicate constraint element count.

**SQNEG**: Signed saturating negate.

**SQRDCMLAH (indexed)**: Saturating rounding doubling complex integer multiply-add high with rotate (indexed).

**SQRDCMLAH (vectors)**: Saturating rounding doubling complex integer multiply-add high with rotate.

**SQRDMMLAH (indexed)**: Signed saturating rounding doubling multiply-add high to accumulator (indexed).

**SQRDMMLAH (vectors)**: Signed saturating rounding doubling multiply-add high to accumulator (unpredicated).

**SQRDMMLSH (indexed)**: Signed saturating rounding doubling multiply-subtract high from accumulator (indexed).

**SQRDMMLSH (vectors)**: Signed saturating rounding doubling multiply-subtract high from accumulator (unpredicated).

**SQRDMULH (indexed)**: Signed saturating rounding doubling multiply high (indexed).

**SQRDMULH (vectors)**: Signed saturating rounding doubling multiply high (unpredicated).

**SQRSHL**: Signed saturating rounding shift left by vector (predicated).

**SQRSHLR**: Signed saturating rounding shift left reversed vectors (predicated).

**SQRSHRNP**: Signed saturating rounding shift right narrow by immediate (bottom).

**SQRSHRNT**: Signed saturating rounding shift right narrow by immediate (top).

**SQRSHRUNB**: Signed saturating rounding shift right unsigned narrow by immediate (bottom).

**SQRSHRUNT**: Signed saturating rounding shift right unsigned narrow by immediate (top).

**SQSHL (immediate)**: Signed saturating shift left by immediate.

**SQSHL (vectors)**: Signed saturating shift left by vector (predicated).
SOSHLR: Signed saturating shift left reversed vectors (predicated).
SOSHLU: Signed saturating shift left unsigned by immediate.
SOSHRNB: Signed saturating shift right narrow by immediate (bottom).
SOSHRNT: Signed saturating shift right narrow by immediate (top).
SOSHRUNB: Signed saturating shift right unsigned narrow by immediate (bottom).
SOSHRUNT: Signed saturating shift right unsigned narrow by immediate (top).
SOSUB (immediate): Signed saturating subtract immediate (unpredicated).
SOSUB (vectors, predicated): Signed saturating subtraction (predicated).
SOSUB (vectors, unpredicated): Signed saturating subtract vectors (unpredicated).
SOSUBR: Signed saturating subtraction reversed vectors (predicated).
SOTXNB: Signed saturating extract narrow (bottom).
SOTXTN: Signed saturating extract narrow (top).
SOTXUNB: Signed saturating unsigned extract narrow (bottom).
SOTXTUNT: Signed saturating unsigned extract narrow (top).
SRHADD: Signed rounding halving addition.
SRI: Shift right and insert (immediate).
SRSHL: Signed rounding shift left by vector (predicated).
SRSHLR: Signed rounding shift left reversed vectors (predicated).
SRSHR: Signed rounding shift right by immediate.
SRSRA: Signed rounding shift right and accumulate (immediate).
SSHLLB: Signed shift left long by immediate (bottom).
SSHLLT: Signed shift left long by immediate (top).
SSRA: Signed shift right and accumulate (immediate).
SSUBLB: Signed subtract long (bottom).
SSUBLBT: Signed subtract long (bottom - top).
SSUBLT: Signed subtract long (top).
SSUBLTB: Signed subtract long (top - bottom).
SSUBWB: Signed subtract wide (bottom).
SSUBWT: Signed subtract wide (top).
ST1B (scalar plus immediate): Contiguous store bytes from vector (immediate index).
ST1B (scalar plus scalar): Contiguous store bytes from vector (scalar index).
ST1B (scalar plus vector): Scatter store bytes from a vector (vector index).
ST1B (vector plus immediate): Scatter store bytes from a vector (immediate index).
ST1D (scalar plus immediate): Contiguous store doublewords from vector (immediate index).
ST1D (scalar plus scalar): Contiguous store doublewords from vector (scalar index).
ST1D (scalar plus vector): Scatter store doublewords from a vector (vector index).
ST1D (vector plus immediate): Scatter store doublewords from a vector (immediate index).
ST1H (scalar plus immediate): Contiguous store halfwords from vector (immediate index).
ST1H (scalar plus scalar): Contiguous store halfwords from vector (scalar index).
ST1H (vector plus immediate): Scatter store halfwords from a vector (immediate index).
ST1H (vector plus scalar): Scatter store halfwords from a vector (scalar index).
ST1W (scalar plus immediate): Contiguous store words from vector (immediate index).
ST1W (scalar plus scalar): Contiguous store words from vector (scalar index).
ST1W (vector plus immediate): Scatter store words from a vector (immediate index).
ST1W (vector plus scalar): Scatter store words from a vector (scalar index).
ST2B (scalar plus immediate): Contiguous store two-byte structures from two vectors (immediate index).
ST2B (scalar plus scalar): Contiguous store two-byte structures from two vectors (scalar index).
ST2D (scalar plus immediate): Contiguous store two-doubleword structures from two vectors (immediate index).
ST2D (scalar plus scalar): Contiguous store two-doubleword structures from two vectors (scalar index).
ST2H (scalar plus immediate): Contiguous store two-halfword structures from two vectors (immediate index).
ST2H (scalar plus scalar): Contiguous store two-halfword structures from two vectors (scalar index).
ST2W (scalar plus immediate): Contiguous store two-word structures from two vectors (immediate index).
ST2W (scalar plus scalar): Contiguous store two-word structures from two vectors (scalar index).
ST3B (scalar plus immediate): Contiguous store three-byte structures from three vectors (immediate index).
ST3B (scalar plus scalar): Contiguous store three-byte structures from three vectors (scalar index).
ST3D (scalar plus immediate): Contiguous store three-doubleword structures from three vectors (immediate index).
ST3D (scalar plus scalar): Contiguous store three-doubleword structures from three vectors (scalar index).
ST3H (scalar plus immediate): Contiguous store three-halfword structures from three vectors (immediate index).
ST3H (scalar plus scalar): Contiguous store three-halfword structures from three vectors (scalar index).
ST3W (scalar plus immediate): Contiguous store three-word structures from three vectors (immediate index).
ST3W (scalar plus scalar): Contiguous store three-word structures from three vectors (scalar index).
ST4B (scalar plus immediate): Contiguous store four-byte structures from four vectors (immediate index).
ST4B (scalar plus scalar): Contiguous store four-byte structures from four vectors (scalar index).
ST4D (scalar plus immediate): Contiguous store four-doubleword structures from four vectors (immediate index).
ST4D (scalar plus scalar): Contiguous store four-doubleword structures from four vectors (scalar index).
ST4H (scalar plus immediate): Contiguous store four-halfword structures from four vectors (immediate index).
ST4H (scalar plus scalar): Contiguous store four-halfword structures from four vectors (scalar index).
ST4W (scalar plus immediate): Contiguous store four-word structures from four vectors (immediate index).
ST4W (scalar plus scalar): Contiguous store four-word structures from four vectors (scalar index).
STNT1B (scalar plus immediate): Contiguous store non-temporal bytes from vector (immediate index).
STNT1B (scalar plus scalar): Contiguous store non-temporal bytes from vector (scalar index).
STNT1B (vector plus scalar): Scatter store non-temporal bytes.
STNT1D (scalar plus immediate): Contiguous store non-temporal doublewords from vector (immediate index).
STNT1D (scalar plus scalar): Contiguous store non-temporal doublewords from vector (scalar index).
STNT1D (vector plus scalar): Scatter store non-temporal doublewords.
STNT1H (scalar plus immediate): Contiguous store non-temporal halfwords from vector (immediate index).
STNT1H (scalar plus scalar): Contiguous store non-temporal halfwords from vector (scalar index).
STNT1H (vector plus scalar): Scatter store non-temporal halfwords.
STNT1W (scalar plus immediate): Contiguous store non-temporal words from vector (immediate index).
STNT1W (scalar plus scalar): Contiguous store non-temporal words from vector (scalar index).
STNT1W (vector plus scalar): Scatter store non-temporal words.
STR (predicate): Store predicate register.
STR (vector): Store vector register.
SUB (immediate): Subtract immediate (unpredicated).
SUB (vectors, predicated): Subtract vectors (predicated).
SUB (vectors, unpredicated): Subtract vectors (unpredicated).
SUBHNB: Subtract narrow high part (bottom).
SUBHNT: Subtract narrow high part (top).
SUBR (immediate): Reversed subtract from immediate (unpredicated).
SUBR (vectors): Reversed subtract vectors (predicated).
SUDOT: Signed by unsigned integer indexed dot product.
SUNPKHI, SUNPKLO: Signed unpack and extend half of vector.
SUQADD: Signed saturating addition of unsigned value.
SXTB, SXTH, SXTW: Signed byte / halfword / word extend (predicated).
TBL: Programmable table lookup in one or two vector table (zeroing).
TBX: Programmable table lookup in single vector table (merging).
TRN1, TRN2 (predicates): Interleave even or odd elements from two predicates.
TRN1, TRN2 (vectors): Interleave even or odd elements from two vectors.
UABA: Unsigned absolute difference and accumulate.
UABALB: Unsigned absolute difference and accumulate long (bottom).
UABALT: Unsigned absolute difference and accumulate long (top).
UABD: Unsigned absolute difference (predicated).
UABDLB: Unsigned absolute difference long (bottom).
UABDLT: Unsigned absolute difference long (top).
UADALP: Unsigned add and accumulate long pairwise.
UADDLB: Unsigned add long (bottom).
UADDLT: Unsigned add long (top).
UADDV: Unsigned add reduction to scalar.
UADDWP: Unsigned add wide (bottom).
UADDWT: Unsigned add wide (top).
UCVTF: Unsigned integer convert to floating-point (predicated).
UDIV: Unsigned divide (predicated).
UDIVR: Unsigned reversed divide (predicated).
UDOT (indexed): Unsigned integer indexed dot product.
UDOT (vectors): Unsigned integer dot product.
UHADD: Unsigned halving addition.
UHSUB: Unsigned halving subtract.
UHSUBR: Unsigned halving subtract reversed vectors.
UMAX (immediate): Unsigned maximum with immediate (unpredicated).
UMAX (vectors): Unsigned maximum vectors (predicated).
UMAXP: Unsigned maximum pairwise.
UMAXV: Unsigned maximum reduction to scalar.
UMIN (immediate): Unsigned minimum with immediate (unpredicated).
UMIN (vectors): Unsigned minimum vectors (predicated).
UMINP: Unsigned minimum pairwise.
UMINV: Unsigned minimum reduction to scalar.
UMLALB (indexed): Unsigned multiply-add long to accumulator (bottom, indexed).
UMLALB (vectors): Unsigned multiply-add long to accumulator (bottom).
UMLALT (indexed): Unsigned multiply-add long to accumulator (top, indexed).
UMLALT (vectors): Unsigned multiply-add long to accumulator (top).
UMLSLB (indexed): Unsigned multiply-subtract long from accumulator (bottom, indexed).
UMLSLB (vectors): Unsigned multiply-subtract long from accumulator (bottom).
UMLSLT (indexed): Unsigned multiply-subtract long from accumulator (top, indexed).
UMLSLT (vectors): Unsigned multiply-subtract long from accumulator (top).
UMMLA: Unsigned integer matrix multiply-accumulate.
UMULH (predicated): Unsigned multiply returning high half (predicated).
UMULH (unpredicated): Unsigned multiply returning high half (unpredicated).
UMULLB (indexed): Unsigned multiply long (bottom, indexed).
UMULLB (vectors): Unsigned multiply long (bottom).
UMULLT (indexed): Unsigned multiply long (top, indexed).
UMULLT (vectors): Unsigned multiply long (top).
UQADD (immediate): Unsigned saturating add immediate (unpredicated).
UQADD (vectors, predicated): Unsigned saturating addition (predicated).
UQADD (vectors, unpredicated): Unsigned saturating add vectors (unpredicated).
UQDECB: Unsigned saturating decrement scalar by multiple of 8-bit predicate constraint element count.
UQDECD (scalar): Unsigned saturating decrement scalar by multiple of 64-bit predicate constraint element count.
UQDECD (vector): Unsigned saturating decrement vector by multiple of 64-bit predicate constraint element count.
UQDECH (scalar): Unsigned saturating decrement scalar by multiple of 16-bit predicate constraint element count.
UQDECH (vector): Unsigned saturating decrement vector by multiple of 16-bit predicate constraint element count.
UQDECP (scalar): Unsigned saturating decrement scalar by count of true predicate elements.
UQDECP (vector): Unsigned saturating decrement vector by count of true predicate elements.
UQDECW (scalar): Unsigned saturating decrement scalar by multiple of 32-bit predicate constraint element count.
UQDECW (vector): Unsigned saturating decrement vector by multiple of 32-bit predicate constraint element count.
UQINCB: Unsigned saturating increment scalar by multiple of 8-bit predicate constraint element count.
UQINCD (scalar): Unsigned saturating increment scalar by multiple of 64-bit predicate constraint element count.
UQINCD (vector): Unsigned saturating increment vector by multiple of 64-bit predicate constraint element count.
UQINCH (scalar): Unsigned saturating increment scalar by multiple of 16-bit predicate constraint element count.
UQINCH (vector): Unsigned saturating increment vector by multiple of 16-bit predicate constraint element count.
UQINCP (scalar): Unsigned saturating increment scalar by count of true predicate elements.
UQINCP (vector): Unsigned saturating increment vector by count of true predicate elements.
UQINCW (scalar): Unsigned saturating increment scalar by multiple of 32-bit predicate constraint element count.
UQINCW (vector): Unsigned saturating increment vector by multiple of 32-bit predicate constraint element count.
UQRSHL: Unsigned saturating rounding shift left by vector (predicated).
UQRSHLR: Unsigned saturating rounding shift left reversed vectors (predicated).
UQSHRNB (bottom): Unsigned saturating shift right narrow by immediate.
UQSHRNT (top): Unsigned saturating shift right narrow by immediate.
UQSHL (immediate): Unsigned saturating shift left by immediate.
UQSHL (vectors): Unsigned saturating shift left by vector (predicated).
UQSHLR: Unsigned saturating shift left reversed vectors (predicated).
UQSUB (immediate): Unsigned saturating subtract immediate (unpredicated).
UQSUB (vectors, predicated): Unsigned saturating subtraction (predicated).
UQSUB (vectors, unpredicated): Unsigned saturating subtract vectors (unpredicated).
UQSUBR: Unsigned saturating subtraction reversed vectors (predicated).
UQXTNB (bottom): Unsigned saturating extract narrow.
UQXTNT (top): Unsigned saturating extract narrow.
URECPE: Unsigned reciprocal estimate (predicated).
URHADD: Unsigned rounding halving addition.
URSHL (vector): Unsigned rounding shift left by vector (predicated).
URSHLR: Unsigned rounding shift left reversed vectors (predicated).

URSHR: Unsigned rounding shift right by immediate.

URSORTE: Unsigned reciprocal square root estimate (predicated).

URSRA: Unsigned rounding shift right and accumulate (immediate).

USDOT (indexed): Unsigned by signed integer indexed dot product.

USDOT (vectors): Unsigned by signed integer dot product.

USHLLB: Unsigned shift left long by immediate (bottom).

USHLLT: Unsigned shift left long by immediate (top).

USMMLA: Unsigned by signed integer matrix multiply-accumulate.

USQADD: Unsigned saturating addition of signed value.

USRA: Unsigned shift right and accumulate (immediate).

USUBLB: Unsigned subtract long (bottom).

USUBLT: Unsigned subtract long (top).

USUBWB: Unsigned subtract wide (bottom).

USUBWT: Unsigned subtract wide (top).

UUNPKHI, UUNPKLO: Unsigned unpack and extend half of vector.

UXTB, UXTH, UXTW: Unsigned byte / halfword / word extend (predicated).

UZP1, UZP2 (predicates): Concatenate even or odd elements from two predicates.

UZP1, UZP2 (vectors): Concatenate even or odd elements from two vectors.

WHILEGE: While decrementing signed scalar greater than or equal to scalar.

WHILEGT: While decrementing signed scalar greater than scalar.

WHILEHI: While decrementing unsigned scalar higher than scalar.

WHILEHS: While decrementing unsigned scalar higher or same as scalar.

WHILELE: While incrementing signed scalar less than or equal to scalar.

WHILELO: While incrementing unsigned scalar lower than scalar.

WHILELS: While incrementing unsigned scalar lower or same as scalar.

WHILERW: While free of read-after-write conflicts.

WHILEWR: While free of write-after-read/write conflicts.

WRFFR: Write the first-fault register.

XAR: Bitwise exclusive OR and rotate right by immediate.

ZIP1, ZIP2 (predicates): Interleave elements from two half predicates.

ZIP1, ZIP2 (vectors): Interleave elements from two half vectors.
ABS

Absolute value (predicated).

Compute the absolute value of the signed integer in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 0  | 0  | 0  | 0  | 1  | 0  | 0  | 1  | 0  | 1  | 1  | 0  | 1  | 0  | 1  | 0  | 1  | 0  | 1  | 0  | 1  | 0  | 1  | 0  | 1  | 0  | 1  | 0  | 1  | 0  |

SVE

ABS <Zd>.<T>, <Pg>/M, <Zn>.<T>

if !HaveSVE() then UNDEFINED;

integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];

for e = 0 to elements-1
    integer element = SInt(Operand[operand, e, esize]);
    if ElemP[mask, e, esize] == '1' then
        element = Abs(element);
        Elem[result, e, esize] = element<esize-1:0>;

Z[d] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
ADCLB

Add with carry long (bottom).

Add the even-numbered elements of the first source vector and the 1-bit carry from the least-significant bit of the odd-numbered elements of the second source vector to the even-numbered elements of the destination and accumulator vector. The 1-bit carry output is placed in the corresponding odd-numbered element of the destination vector.

```
   31  30  29  28  27  26  25  24  23  22  21  20  19  18  17  16  15  14  13  12  11  10  9  8  7  6  5  4  3  2  1  0
   0  1  0  0  1  0  1  0  0  1  0  0  0  1  0  1  0  0  1  1  0  1  0  1  1  0
```

SVE2

ADCLB <Zda>.<T>, <Zn>.<T>, <Zm>.<T>

if !HaveSVE2() then UNDEFINED;
integer esize = 32 << UInt(sz);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);

Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.

<T> Is the size specifier, encoded in "sz":

```
sz  <T>
 0  S
 1  D
```

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckSVEEnabled();

    else
        Elem[result, e, esize] = Elem[operand1, e, esize];

Z[dn] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.

- The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
ADD (immediate)

Add immediate (unpredicated).

Add an unsigned immediate to each element of the source vector, and destructively place the results in the corresponding elements of the source vector. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is “#<imm8>, LSL #8”. However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as “#0, LSL #8”.

If PSTATE.DIT is 1:
• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  ◦ The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  ◦ The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:
• An unpredicated MOVPRFX instruction.
• A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
**ADDPL**

Add multiple of predicate register size to scalar register.

Add the current predicate register size in bytes multiplied by an immediate in the range -32 to 31 to the 64-bit source general-purpose register or current stack pointer and place the result in the 64-bit destination general-purpose register or current stack pointer.

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|-----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 0   | 0  | 0  | 0  | 0  | 1  | 0  | 0  | 0  | 1  | 1  | Rn | 0  | 1  | 0  | 1  | 0  | imm6 | Rd |
```

**SVE**

`ADDPL <Xd|SP>, <Xn|SP>, #<imm>`

if `!HaveSVE()` then UNDEFINED;
integer n = UInt(Rn);
integer d = UInt(Rd);
integer imm = SInt(imm6);

**Assembler Symbols**

- `<Xd|SP>` Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
- `<Xn|SP>` Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
- `<imm>` Is the signed immediate operand, in the range -32 to 31, encoded in the "imm6" field.

**Operation**

```
CheckSVEEnabled();
bits(64) operand1 = if n == 31 then SP[] else X[n];
bits(64) result = operand1 + (imm * (PL DIV 8));
if d == 31 then
    SP[] = result;
else
    X[d] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
ADDVL

Add multiple of vector register size to scalar register.

Add the current vector register size in bytes multiplied by an immediate in the range -32 to 31 to the 64-bit source general-purpose register or current stack pointer, and place the result in the 64-bit destination general-purpose register or current stack pointer.

<table>
<thead>

</table>

SVE

ADDVL <Xd|SP>, <Xn|SP>, #<imm>

if !HaveSVE() then UNDEFINED;
integer n = UInt(Rn);
integer d = UInt(Rd);
integer imm = SInt(imm6);

Assembler Symbols

<Xd|SP> Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.

<Xn|SP> Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

<imm> Is the signed immediate operand, in the range -32 to 31, encoded in the "imm6" field.

Operation

CheckSVEEnabled();
bits(64) operand1 = if n == 31 then SP[] else X[n];
bits(64) result = operand1 + (imm * (VL DIV 8));
if d == 31 then
    SP[] = result;
else
    X[d] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
ADR

Compute vector address.

Optionally sign or zero-extend the least significant 32-bits of each element from a vector of offsets or indices in the second source vector, scale each index by 2, 4 or 8, add to a vector of base addresses from the first source vector, and place the resulting addresses in the destination vector. This instruction is unpredicated.

It has encodings from 3 classes: Packed offsets, Unpacked 32-bit signed offsets and Unpacked 32-bit unsigned offsets

### Packed offsets

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

      \item The values of the NZCV flags.
    \end{itemize}
  \item The response of this instruction to asynchronous exceptions does not vary based on:
    \begin{itemize}
      \item The values of the data supplied in any of its registers.
      \item The values of the NZCV flags.
    \end{itemize}
\end{itemize}
AND, ANDS (predicates)

Bitwise AND predicates.

Bitwise AND active elements of the second source predicate with corresponding elements of the first source predicate and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Optionally sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

This instruction is used by the aliases MOVS, and MOV.

It has encodings from 2 classes: Not setting the condition flags and Setting the condition flags

Not setting the condition flags

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

Z[dn] = result;

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.

The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
AND (immediate)

Bitwise AND with immediate (unpredicated).

Bitwise AND an immediate with each 64-bit element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits. This instruction is unpredicated.

This instruction is used by the pseudo-instruction BIC (immediate).

<const> Is a 64, 32, 16 or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32 or 64 bit fields, each field containing a rotated run of non-zero bits, encoded in the “imm13” field.

Operation

CheckSVEEnabled();
integer elements = VL DIV 64;
bits(VL) operand = Z[dn];
bits(VL) result;
for e = 0 to elements-1
    bits(64) element1 = Elem[operand, e, 64];
    Elem[result, e, 64] = element1 AND imm;
Z[dn] = result;

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

• An unpredicated MOVPRFX instruction.
AND (vectors, unpredicated)

Bitwise AND vectors (unpredicated).

Bitwise AND all elements of the second source vector with corresponding elements of the first source vector and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

```
  31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0
```

  else
    Elem[result, e, esize] = Elem[operandl, e, esize];
  Z[dn] = result;
Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
ASRR

Reversed arithmetic shift right by vector (predicated).

Reversed shift right, preserving the sign bit, active elements of the second source vector by corresponding elements of the first source vector and destructively place the results in the corresponding elements of the first source vector. The shift amount operand is a vector of unsigned elements in which all bits are significant, and not used modulo the element size. Inactive elements in the destination vector register remain unmodified.

  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
BFCVT

Floating-point down convert to BFloat16 format (predicated).

Convert to BFloat16 from single-precision in each active floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

Since the result type is smaller than the input type, the results are zero-extended to fill each destination element. Unlike the BFloat16 matrix multiplication and dot product instructions, this instruction honors all of the FPCR bits that apply to single-precision arithmetic. It can also generate a floating-point exception that causes cumulative exception bits in the FPSR to be set, or a synchronous exception to be taken, depending on the enable bits in the FPCR.

ID_AA64ZFR0_EL1.BF16 indicates whether this instruction is implemented.

Z[d] = result;
BFDOT (vectors)

BFloat16 floating-point dot product.

The BFloat16 floating-point (BF16) dot product instruction computes the dot product of a pair of BF16 values held in each 32-bit element of the first source vector multiplied by a pair of BF16 values in the corresponding 32-bit element of the second source vector, and then destructively adds the single-precision dot product to the corresponding single-precision element of the destination vector.

This instruction is unpredicated.

All floating-point calculations performed by this instruction are performed with the following behaviors, irrespective of the value in FPCR:
* Uses the non-IEEE 754 Round-to-Odd mode, which forces bit 0 of an inexact result to 1, and rounds an overflow to an appropriately signed Infinity.
* The cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC and IOC) are not modified.
* Trapped floating-point exceptions are disabled, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE and IOE) are all zero.
* Denormalized inputs and results are flushed to zero, as if FPCR.FZ == 1.
* Only the Default NaN is generated, as if FPCR.DN == 1.

ID_AA64ZFR0_EL1.BF16 indicates whether this instruction is implemented.

• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

• An unpredicated MOVPRFX instruction.
BFMLALB (indexed)

BFLOAT16 floating-point multiply-add long to single-precision (bottom, indexed).

This BFLOAT16 floating-point multiply-add long instruction widens the even-numbered 16-bit BFLOAT16 elements in the first source vector and the indexed element from the corresponding 128-bit segment in the second source vector to single-precision format and then destructively multiplies and adds these values without intermediate rounding to the overlapping 32-bit single-precision elements of the addend and destination vector. This instruction is unpredicated. Unlike the BFLOAT16 matrix multiplication and dot product instructions, this instruction performs a fused multiply-add that honors all of the FPCR bits that apply to single-precision arithmetic. It can also generate a floating-point exception that causes cumulative exception bits in the FPSR to be set, or a synchronous exception to be taken, depending on the enable bits in the FPCR.

ID_AA64ZFR0_EL1.BF16 indicates whether this instruction is implemented.

BFMMLA

BFloat16 floating-point matrix multiply-accumulate.

This BFloat16 floating-point (BF16) matrix multiply-accumulate instruction multiplies the 2×4 matrix of BF16 values held in each 128-bit segment of the first source vector by the 4×2 BF16 matrix in the corresponding segment of the second source vector. The resulting 2×2 single-precision (FP32) matrix product is then destructively added to the FP32 matrix accumulator held in the corresponding segment of the addend and destination vector. This is equivalent to performing a 4-way dot product per destination element.

This instruction is unpredicated and vector length agnostic.

All floating-point calculations performed by this instruction are performed with the following behaviors, irrespective of the value in FPCR:

* Uses the non-IEEE 754 Round-to-Odd mode, which forces bit 0 of an inexact result to 1, and rounds an overflow to an appropriately signed Infinity.
* The cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC and IOC) are not modified.
* Trapped floating-point exceptions are disabled, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE and IOE) are all zero.
* Denormalized inputs and results are flushed to zero, as if FPCR.FZ == 1.
* Only the Default NaN is generated, as if FPCR.DN == 1.

ID_AA64ZFR0_EL1.BF16 indicates whether this instruction is implemented.

Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

CheckSVEEnabled();
integer segments = VL DIV 128;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) operand3 = Z[da];
bits(VL) result;
bits(128) op1, op2;
bits(128) res, addend;
for s = 0 to segments-1
  op1 = Elem[operand1, s, 128];
  op2 = Elem[operand2, s, 128];
  addend = Elem[operand3, s, 128];
  res = BFMatMulAdd(addend, op1, op2);
  Elem[result, s, 128] = res;
Z[da] = result;
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
BGRP

Group bits to right or left as selected by bitmask.

This instruction separates bits in each element of the first source vector by gathering from the bit positions indicated by non-zero bits in the corresponding mask element of the second source vector to the lowest-numbered contiguous bits of the corresponding destination element, and from positions indicated by zero bits to the highest-numbered bits of the destination element, preserving the bit order within each group. This instruction is unpredicated. ID_AA64ZFR0_EL1.BitPerm indicates whether this instruction is implemented.

### Setting the condition flags

```
0 0 1 0 0 1 0 1 | 0 1 0 1 0 0 0 0 1 | Pg | 0 | Pn | 0 | Pd
```

**Assembler Symbols**

- `<Pd>` Is the name of the destination scalable predicate register, encoded in the "Pd" field.
- `<Pg>` Is the name of the governing scalable predicate register, encoded in the "Pg" field.
- `<Pn>` Is the name of the source scalable predicate register, encoded in the "Pn" field.
- `<ZM>` Is the predication qualifier, encoded in "M":

| M | <ZM>
|---|---
| 0 | Z
| 1 | M

- BRKA `<Pd>`.B, `<Pg>`/<ZM>, `<Pn>`.B
- BRKAS `<Pd>`.B, `<Pg>`/<Z>, `<Pn>`.B
Operation

```c
CheckSVEEnabled();
integer elements = Vl DIV esize;
bits<PL> mask = P[g];
bits<PL> operand = P[n];
bits<PL> operand2 = P[d];
boolean break = FALSE;
bits<PL> result;
for e = 0 to elements-1
  boolean element = ElemP[operand, e, esize] == '1';
  if ElemP[mask, e, esize] == '1' then
    ElemP[result, e, esize] = if !break then '1' else '0';
    break = break || element;
  elsif merging then
    ElemP[result, e, esize] = ElemP[operand2, e, esize];
  else
    ElemP[result, e, esize] = '0';
  if setflags then
    PSTATE.<N,Z,C,V> = PredTest(mask, result, esize);
    P[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
**BRKB, BRKBS**

Break before first true condition.

Sets destination predicate elements up to but not including the first active and true source element to true, then sets subsequent elements to false. Inactive elements in the destination predicate register remain unmodified or are set to zero, depending on whether merging or zeroing predication is selected. Optionally sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

It has encodings from 2 classes: *Not setting the condition flags* and *Setting the condition flags*

### Not setting the condition flags

```
| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0 |
|-------------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| 0 0 1 0 0 1 0 1 1 0 0 0 0 0 1 | Pg | 0 | Pn | M | Pd |
```

**BRKB <Pd>.B, <Pg>/<ZM>, <Pn>.B**

```java
if !HaveSVE() then UNDEFINED;
integer esize = 8;
integer g = UInt(Pg);
integer n = UInt(Pn);
integer d = UInt(Pd);
boolean merging = (M == '1');
boolean setflags = FALSE;
```

### Setting the condition flags

```
| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0 |
|-------------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| 0 0 1 0 0 1 0 1 1 0 1 0 0 0 0 1 | Pg | 0 | Pn | 0 | Pd |
```

**BRKBS <Pd>.B, <Pg>/Z, <Pn>.B**

```java
if !HaveSVE() then UNDEFINED;
integer esize = 8;
integer g = UInt(Pg);
integer n = UInt(Pn);
integer d = UInt(Pd);
boolean merging = FALSE;
boolean setflags = TRUE;
```

### Assembler Symbols

- `<Pd>` is the name of the destination scalable predicate register, encoded in the "Pd" field.
- `<Pg>` is the name of the governing scalable predicate register, encoded in the "Pg" field.
- `<ZM>` is the predication qualifier, encoded in “M”:

```
<table>
<thead>
<tr>
<th>M</th>
<th>&lt;ZM&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Z</td>
</tr>
<tr>
<td>1</td>
<td>M</td>
</tr>
</tbody>
</table>
```

- `<Pn>` is the name of the source scalable predicate register, encoded in the "Pn" field.
Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(PL) operand = P[n];
bits(PL) operand2 = P[d];
boolean break = FALSE;
bits(PL) result;

for e = 0 to elements-1
    boolean element = ElemP[operand, e, esize] == '1';
    if ElemP[mask, e, esize] == '1' then
        break = break || element;
    endif merging then
        ElemP[result, e, esize] = ElemP[operand2, e, esize];
    else
        ElemP[result, e, esize] = '0';
    endif

if setflags then
    PSTATE.<N,Z,C,V> = PredTest(mask, result, esize);
P[d] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
BRKN, BRKNS

Propagate break to next partition.

If the last active element of the first source predicate is false then set the destination predicate to all-false. Otherwise leaves the destination and second source predicate unchanged. Inactive elements in the destination predicate register are set to zero. Optionally sets the FIRST (N), NONE (Z), LAST (C) condition flags based on the predicate result, and the V flag to zero.

It has encodings from 2 classes: Not setting the condition flags and Setting the condition flags

Not setting the condition flags

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
CADD

Complex integer add with rotate.

Add the real and imaginary components of the integral complex numbers from the first source vector to the complex numbers from the second source vector which have first been rotated by 90 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, equivalent to multiplying the complex numbers in the second source vector by ±\(j\) beforehand. Destructively place the results in the corresponding elements of the first source vector. This instruction is unpredicated.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

Complex integer dot product.

The complex integer dot product instructions delimit the source vectors into pairs of 8-bit or 16-bit signed integer complex numbers. Within each pair, the complex numbers in the first source vector are multiplied by the corresponding complex numbers in the second source vector and the resulting wide real or wide imaginary part of the product is accumulated into a 32-bit or 64-bit destination vector element which overlaps all four of the elements that comprise a pair of complex number values in the first source vector.

As a result each instruction implicitly deinterleaves the real and imaginary components of their complex number inputs, so that the destination vector accumulates 4×wide real sums or 4×wide imaginary sums. The complex numbers in the second source vector are rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, by performing the following transformations prior to the dot product operations:

* If the rotation is #0, the imaginary parts of the complex numbers in the second source vector are negated. The destination vector therefore accumulates the real parts of a complex dot product.
* If the rotation is #90, the real and imaginary parts of the complex numbers the second source vector are swapped. The destination vector therefore accumulates the imaginary parts of a complex dot product.
* If the rotation is #180, there is no transformation. The destination vector therefore accumulates the real parts of a complex conjugate dot product.
* If the rotation is #270, the real parts of the complex numbers in the second source vector are negated and then swapped with the imaginary parts. The destination vector therefore accumulates the imaginary parts of a complex conjugate dot product.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

Z[da] = result;

Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

• An unpredicated MOVPRFX instruction.
CDOT (indexed)

Complex integer dot product (indexed).

The complex integer dot product instructions delimit the source vectors into pairs of 8-bit or 16-bit signed integer complex numbers. Within each pair, the complex numbers in the first source vector are multiplied by the corresponding complex numbers in the second source vector and the resulting wide real or wide imaginary part of the product is accumulated into a 32-bit or 64-bit destination vector element which overlaps all four of the elements that comprise a pair of complex number values in the first source vector.

As a result each instruction implicitly deinterleaves the real and imaginary components of their complex number inputs, so that the destination vector accumulates 4×wide real sums or 4×wide imaginary sums.

The complex numbers in the second source vector are rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, by performing the following transformations prior to the dot product operations:

* If the rotation is #0, the imaginary parts of the complex numbers in the second source vector are negated. The destination vector therefore accumulates the real parts of a complex dot product.
* If the rotation is #90, the real and imaginary parts of the complex numbers the second source vector are swapped. The destination vector therefore accumulates the imaginary parts of a complex dot product.
* If the rotation is #180, there is no transformation. The destination vector therefore accumulates the real parts of a complex conjugate dot product.
* If the rotation is #270, the real parts of the complex numbers in the second source vector are negated and then swapped with the imaginary parts. The destination vector therefore accumulates the imaginary parts of a complex conjugate dot product.

The indexed form of these instructions select a single pair of complex numbers within each 128-bit segment of the second source vector as the multiplier for all pairs of complex numbers within the corresponding 128-bit segment of the first source vector. The complex number pairs within the second source vector are specified using an immediate index which selects the same complex number pair position within each 128-bit vector segment. The index range is from 0 to one less than the number of complex number pairs per 128-bit segment, encoded in 1 or 2 bits depending on the size of the complex number pair.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

It has encodings from 2 classes: 32-bit and 64-bit

### 32-bit

  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
CLASTB (SIMD&FP scalar)

Conditionally extract last element to SIMD&FP scalar register.

From the source vector register extract the last active element, and then zero-extend that element to destructively place in the destination and first source SIMD & floating-point scalar register. If there are no active elements then destructively zero-extend the least significant element-size bits of the destination and first source SIMD & floating-point scalar register.

CMLA (vectors)

Complex integer multiply-add with rotate.

Multiply the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of
the integral numbers in the first source vector by the corresponding complex number in the second source vector
rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis,
when considered in polar representation.
Then add the products to the corresponding components of the complex numbers in the addend vector. Destructively
place the results in the corresponding elements of the addend vector. This instruction is unpredicated.
These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex
numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees
apart.
Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the
even-numbered element and the imaginary part in the odd-numbered element.

### SVE2

CMLA `<Zda>,<T>, <Zn>,<T>, <Zm>,<T>, <const>`

**CMP<cc> (immediate)**

Compare vector to immediate.

Compare active integer elements in the source vector with an immediate, and place the boolean results of the specified comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

The <cc> symbol specifies one of the standard ARM condition codes: EQ, GE, GT, HI, HS, LE, LO, LS, LT or NE.

It has encodings from 10 classes: **Equal**, **Greater than**, **Greater than or equal**, **Higher**, **Higher or same**, **Less than**, **Less than or equal**, **Lower**, **Lower or same** and **Not equal**.

**Equal**

```
0 0 1 0 0 1 0 1 | size 0 | imm5 1 0 0 | Pg | Zn | 0 | Pd
```

**Greater than**

```
0 0 1 0 0 1 0 1 | size 0 | imm5 0 0 0 | Pg | Zn 1 | Pd
```

**Greater than or equal**

```
0 1 0 0 1 0 1 | size 0 | imm5 0 0 0 | Pg | Zn 0 | Pd
```

```plaintext

<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<imm> For the equal, greater than, greater than or equal, less than, less than or equal and not equal variant: is the signed immediate operand, in the range -16 to 15, encoded in the "imm5" field.

For the higher, higher or same, lower and lower or same variant: is the unsigned immediate operand, in the range 0 to 127, encoded in the “imm7” field.
Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[n];
bits(PL) result;

for e = 0 to elements-1
  integer element1 = Int(Elem[operand1, e, esize], unsigned);
  if ElemP[mask, e, esize] == '1' then
    boolean cond;
    case op of
      when Cmp_EQ cond = element1 == imm;
      when Cmp_NE cond = element1 != imm;

  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.

\texttt{CMP\<cc> (vectors)}
The values of the NZCV flags.
CNOT

Logically invert boolean condition in vector (predicated).

Logically invert the boolean value in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

Boolean TRUE is any non-zero value in a source, and one in a result element. Boolean FALSE is always zero.

CNTB, CNTD, CNTH, CNTW

Set scalar to multiple of predicate constraint element count.

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then places the result in the scalar destination.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 4 classes: Byte, Doubleword, Halfword and Word

Byte

  - The values of the NZCV flags.
**CPY (immediate, zeroing)**

Copy signed integer immediate to vector elements (zeroing).

Copy a signed integer immediate to each active element in the destination vector. Inactive elements in the destination vector register are set to zero.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<simm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This instruction is used by the alias **MOV (immediate, predicated, zeroing).**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Z[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
**CPY (scalar)**

Copy general-purpose register to vector elements (predicated).

Copy the general-purpose scalar source register to each active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

This instruction is used by the alias **MOV (scalar, predicated)**.

</table>

<n|SP> Is the number [0-30] of the general-purpose source register or the name SP (31), encoded in the "Rn" field.

**Operation**

*CheckSVEEnabled();*
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(64) operand1;
if n == 31 then
    operand1 = SP[];
else
    operand1 = X[n];
bits(VL) result = Z[d];
for e = 0 to elements-1
    if Elem[mask, e, esize] == '1' then
        Elem[result, e, esize] = operand1<esize-1:0>;
Z[d] = result;
**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
**CPY (SIMD&FP scalar)**

Copy SIMD&FP scalar register to vector elements (predicated).

Copy the SIMD & floating-point scalar source register to each active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

This instruction is used by the alias MOV (SIMD&FP scalar, predicated).

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0
 0  0  0  0  0  1  0  1  size  1  0  0  0  0  1  0  0  Pg  Vn  Zd
```

**SVE**

CPY <Zd>.<T>, <Pg>/M, <V><n>

if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Vn);
integer d = UInt(Zd);

**Assembler Symbols**

<Zd> Is the name of the destination scalable vector register, encoded in the “Zd” field.

<T> Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<V> Is a width specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;V&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<n> Is the number [0-31] of the source SIMD&FP register, encoded in the "Vn" field.

**Operation**

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bite(P) mask = P[g];
bite(esize) operand1 = V[n];
bite(VL) result = Z[d];

for e = 0 to elements-1
    if ElemP[mask, e, esize] == '1' then
        Elem[result, e, esize] = operand1;

Z[d] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
CTERMEQ, CTERMNE

Compare and terminate loop.

Detect termination conditions in serialized vector loops. Tests whether the comparison between the scalar source operands holds true and if not tests the state of the !LAST condition flag (C) which indicates whether the previous flag-setting predicate instruction selected the last element of the vector partition.

The Z and C condition flags are preserved by this instruction. The N and V condition flags are set as a pair to generate one of the following conditions for a subsequent conditional instruction:

* GE (N=0 & V=0): continue loop (compare failed and last element not selected);
* LT (N=0 & V=1): terminate loop (last element selected);
* LT (N=1 & V=0): terminate loop (compare succeeded);

The scalar source operands are 32-bit or 64-bit general-purpose registers of the same size.

It has encodings from 2 classes: Equal and Not equal

### Equal

```
| 31 | 0 | 0 | 1 | 0 | 0 | 1 | 1 | sz | 1 | Rm | 0 | 0 | 1 | 0 | 0 | 0 | Rn | 0 | 0 | 0 | 0 |

DECB, DECD, DECH, DECW (scalar)

Decrement scalar by multiple of predicate constraint element count.

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 4 classes: Byte, Doubleword, Halfword and Word

**Byte**

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
icnt = DecodePredCount(pat, esize);
X[dn] = operand1 - (cnt * imm);
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
DECD, DECH, DECW (vector)

Decrement vector by multiple of predicate constraint element count.

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement all destination vector elements.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 3 classes: **Doubleword**, **Halfword** and **Word**

**Doubleword**

```
0 0 0 0 0 1 0 0 1 1 1 0 0 0 1

\[Z[\text{dn}] = \text{result};\]

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
DECP (scalar)

Decrement scalar by count of true predicate elements.

Counts the number of true elements in the source predicate and then uses the result to decrement the scalar destination.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

</tbody>
</table>

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(64) operand1 = X[dn];
bits(PL) operand2 = P[m];
integer count = 0;
for e = 0 to elements-1
  if ElemP[operand2, e, esize] == '1' then
    count = count + 1;
X[dn] = operand1 - count;

Operational information

If PSTATE.DIT is 1:
  • The execution time of this instruction is independent of:
    ◦ The values of the data supplied in any of its registers.
    ◦ The values of the NZCV flags.
  • The response of this instruction to asynchronous exceptions does not vary based on:
    ◦ The values of the data supplied in any of its registers.
    ◦ The values of the NZCV flags.
DECP (vector)

Decrement vector by count of true predicate elements.

Counts the number of true elements in the source predicate and then uses the result to decrement all destination vector elements.

The predicate size specifier may be omitted in assembler source code, but this is deprecated and will be prohibited in a future release of the architecture.

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | size | 1 0 1 1 0 1 1 0 1 1 0 0 0 0 0 0 0 0 Pm | Zdn |

  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
DUP (immediate)

Broadcast signed immediate to vector elements (unpredicated).

Unconditionally broadcast the signed integer immediate into each element of the destination vector. This instruction is unpredicated.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<simm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This instruction is used by the aliases FMOV (zero, unpredicated), and MOV (immediate, unpredicated).

</table>

<imm> Is a signed immediate in the range -128 to 127, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in "sh":

<table>
<thead>
<tr>
<th>sh</th>
<th>&lt;shift&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>LSL #0</td>
</tr>
<tr>
<td>1</td>
<td>LSL #8</td>
</tr>
</tbody>
</table>

Operation

CheckSVEEnabled();
bits(VL) result = Replicate(imm<esize-1:0>);
Z[d] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**DUP (scalar)**

Broadcast general-purpose register to vector elements (unpredicated).

Unconditionally broadcast the general-purpose scalar source register into each element of the destination vector. This instruction is unpredicated.

This instruction is used by the alias **MOV (scalar, unpredicated)**.

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
DUP (indexed)

Broadcast indexed element to vector (unpredicated).

Unconditionally broadcast the indexed source vector element into each element of the destination vector. This instruction is unpredicated.

The immediate element index is in the range of 0 to 63 (bytes), 31 (halfwords), 15 (words), 7 (doublewords) or 3 (quadwords). Selecting an element beyond the accessible vector length causes the destination vector to be set to zero.

This instruction is used by the alias MOV (SIMD&FP scalar, unpredicated).

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
DUPM

Broadcast logical bitmask immediate to vector (unpredicated).

Unconditionally broadcast the logical bitmask immediate into each element of the destination vector. This instruction
is unpredicated. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16,
32 or 64 bits.

This instruction is used by the alias MOV (bitmask immediate).

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

EOR, EORS (predicates)

Bitwise exclusive OR predicates.

Bitwise exclusive OR active elements of the second source predicate with corresponding elements of the first source predicate and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Optionally sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

This instruction is used by the aliases NOTS, and NOT (predicate).

It has encodings from 2 classes: Not setting the condition flags and Setting the condition flags

Not setting the condition flags

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0 |

    else
        Elem[result, e, esize] = Elem[operand1, e, esize];
Z[dn] = result;

**Operational information**

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.

- The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
**EOR (immediate)**

Bitwise exclusive OR with immediate (unpredicated).

Bitwise exclusive OR an immediate with each 64-bit element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits. This instruction is unpredicated.

This instruction is used by the pseudo-instruction **EON**.

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 0 0 0 0 1 0 1 0 1 0 0 0 0 imm13 Zdn
```

**SVE**

**EOR <Zdn>,<T>, <Zdn>,<T>, #<const>**

if !HaveSVE() then UNDEFINED;
integer dn = UInt(Zdn);
bits(64) imm;
(imm, -) = DecodeBitMasks(imm13<12>, imm13<5:0>, imm13<11:6>, TRUE);

**Assembler Symbols**

- `<Zdn>` is the name of the source and destination scalable vector register, encoded in the "Zdn" field.
- `<T>` is the size specifier, encoded in “imm13<12>:imm13<5:0>”:

<table>
<thead>
<tr>

  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

• An unpredicated MOVPRFX instruction.
EOR (vectors, unpredicated)

Bitwise exclusive OR vectors (unpredicated).

Bitwise exclusive OR all elements of the second source vector with corresponding elements of the first source vector and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(esize) result = Zeros(esize);

for e = 0 to elements-1
  if ElemP[mask, e, esize] == '1' then
    result = result EOR Elem[operand, e, esize];

V[d] = result;

Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its operand registers when its governing predicate
    register contains the same value for each execution.
  ◦ The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.

The values of the NZCV flags.
EXT

Extract vector from pair of vectors.

Copy the indexed byte up to the last byte of the first source vector to the bottom of the result vector, then fill the remainder of the result starting from the first byte of the second source vector. The result is placed destructively in the destination and first source vector, or constructively in the destination vector. This instruction is unpredicated.

An index that is greater than or equal to the vector length in bytes is treated as zero, resulting in the first source vector being copied to the result unchanged.

It has encodings from 2 classes: **Constructive** and **Destructive**

**Constructive**

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | imm8h | 0 0 0 | imm8l | Zn | Zd |

        Elem[result, e, esize] = element1;

Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand
register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

• An unpredicated MOVPRFX instruction.
• A predicated MOVPRFX instruction using the same governing predicate register and source element size as this
instruction.
FADD (vectors, predicated)

Floating-point add vector (predicated).

Add active floating-point elements of the second source vector to corresponding floating-point elements of the first source vector and destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

FADDA

Floating-point add strictly-ordered reduction, accumulating in scalar.

Floating-point add a SIMD&FP scalar source and all active lanes of the vector source and place the result destructively in the SIMD&FP scalar source register. Vector elements are processed strictly in order from low to high, with the scalar source providing the initial value. Inactive elements in the source vector are ignored.

Operation

CheckSVEEnabled();
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(esize) identity = FPZero('0');
V[d] = ReducePredicated(ReduceOp_FADD, operand, mask, identity);
**FCADD**

Floating-point complex add with rotate (predicated).

Add the real and imaginary components of the active floating-point complex numbers from the first source vector to the complex numbers from the second source vector which have first been rotated by 90 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, equivalent to multiplying the complex numbers in the second source vector by ±\(j\) beforehand. Destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

```
| 0 | 1 | 1 | 0 | 1 | 0 | 0 | size: | 0 | 0 | 0 | 0 | 0 | 0 | rot: 1 | 0 | 0 | Pg | Zm | Zdn |
```

**SVE**

```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is \textbf{UNPREDICTABLE}:

\begin{itemize}
  \item The MOVPRFX instruction must specify the same destination register as this instruction.
  \item The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
\end{itemize}

The MOVPRFX instructions that can be used with this instruction are as follows:

\begin{itemize}
  \item An unpredicated MOVPRFX instruction.
  \item A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
\end{itemize}
**FCM<cc> (zero)**

Floating-point compare vector with zero.

Compare active floating-point elements in the source vector with zero, and place the boolean results of the specified comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Does not set the condition flags.

The <cc> symbol specifies one of the standard ARM condition codes: EQ, GE, GT, LE, LT, or NE.

It has encodings from 6 classes: **Equal**, **Greater than**, **Greater than or equal**, **Less than**, **Less than or equal** and **Not equal**

### Equal

```
0 1 1 0 0 1 1 0 1 0 0 0 0 1 0 0 0 1 1 0 0 0 1 0 0 0 1 0 0 0 0 0 1

FCM<cc> (vectors)

Floating-point compare vectors.

Compare active floating-point elements in the first source vector with corresponding elements in the second source vector, and place the boolean results of the specified comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Does not set the condition flags. The <cc> symbol specifies one of the standard ARM condition codes: EQ, GE, GT, or NE, with the addition of UO for an unordered comparison.

This instruction is used by the pseudo-instructions FCMLE (vectors), and FCMLT (vectors).

It has encodings from 5 classes: Equal, Greater than, Greater than or equal, Not equal, and Unordered.

  end;

P[d] = result;
FCMLA (vectors)

Floating-point complex multiply-add with rotate (predicated).

Multiply the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of the floating-point complex numbers in the first source vector by the corresponding complex number in the second source vector rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation.

Then destructively add the products to the corresponding components of the complex numbers in the addend and destination vector, without intermediate rounding.

These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees apart.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.Inactive elements in the destination vector register remain unmodified.

  Elem[result, 2 * p + 1, esize] = addend_i;
Z[da] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
FCMLA (indexed)

Floating-point complex multiply-add by indexed values with rotate.

Multiply the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of the floating-point complex numbers in each 128-bit segment of the first source vector by the specified complex number in the corresponding the second source vector segment rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation.

Then destructively add the products to the corresponding components of the complex numbers in the addend and destination vector, without intermediate rounding.

These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees apart.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

The complex numbers within the second source vector are specified using an immediate index which selects the same complex number position within each 128-bit vector segment. The index range is from 0 to one less than the number of complex numbers per 128-bit segment, encoded in 1 to 2 bits depending on the size of the complex number. This instruction is unpredicated.

It has encodings from 2 classes: **Half-precision** and **Single-precision**

### Half-precision

```plaintext

if !HaveSVE() then UNDEFINED;
integer esize = 16;
integer index = UInt(i2);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
integer sel_a = UInt(rot<0>);
integer sel_b = UInt(NOT(rot<0>));
boolean neg_i = (rot<1> == '1');
boolean neg_r = (rot<0> != rot<1>);
```

### Single-precision

```plaintext
FCMLA <Zda>.S, <Zn>.S, <Zm>.S[<imm>], <const>

if !HaveSVE() then UNDEFINED;
integer esize = 32;
integer index = UInt(i1);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
integer sel_a = UInt(rot<0>);
integer sel_b = UInt(NOT(rot<0>));
boolean neg_i = (rot<1> == '1');
boolean neg_r = (rot<0> != rot<1>);
```
Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> For the half-precision variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field.

For the single-precision variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.

<imm> For the half-precision variant: is the index of a Real and Imaginary pair, in the range 0 to 3, encoded in the "i2" field.

For the single-precision variant: is the index of a Real and Imaginary pair, in the range 0 to 1, encoded in the "i1" field.

<const> Is the const specifier, encoded in "rot":

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

• An unpredicated MOVPRFX instruction.
FCPY

Copy 8-bit floating-point immediate to vector elements (predicated).

Copy a floating-point immediate into each active element in the destination vector. Inactive elements in the destination
vector register remain unmodified.

This instruction is used by the alias FMOV (immediate, predicated).

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the
following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand
  register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
• A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
FCVT

Floating-point convert precision (predicated).

Convert the size and precision of each active floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

Since the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are zero-extended to fill each destination element.

### Assembler Symbols

- `<Zd>` Is the name of the destination scalable vector register, encoded in the "Zd" field.
- `<Pg>` Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<Zn>` Is the name of the first source scalable vector register, encoded in the "Zn" field.

### Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];
for e = 0 to elements-1
  if ElemP[mask, e, esize] == '1' then
    bits(esize) element = Elem[operand, e, esize];
    Elem[result, 2*e + 1, esize DIV 2] = FPConvertSVE(element, FPCR);
Z[d] = result;
```
FCVTX

Floating-point down convert, rounding to odd (predicated).

Convert active double-precision floating-point elements from the source vector to single-precision, rounding to Odd, and place the results in the even-numbered 32-bit elements of the destination vector, while setting the odd-numbered elements to zero. Inactive elements in the destination vector register remain unmodified.

Rounding to Odd (aka Von Neumann rounding) permits a two-step conversion from double-precision to half-precision without incurring intermediate rounding errors.

Double-precision to single-precision

Z[d] = result;
**FCVTZS**

Floating-point convert to signed integer, rounding toward zero (predicated).

Convert to the signed integer nearer to zero from each active floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

If the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are sign-extended to fill each destination element.

It has encodings from 7 classes: Half-precision to 16-bit, Half-precision to 32-bit, Half-precision to 64-bit, Single-precision to 32-bit, Single-precision to 64-bit, Double-precision to 32-bit and Double-precision to 64-bit

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[dn];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
    bits(esize) element2 = Elem[operand2, e, esize];
    if ElemP[mask, e, esize] == '1' then
        Elem[result, e, esize] = FPDIV(element1, element2, FPCR);
    else
        Elem[result, e, esize] = element1;
Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:
• An unpredicated MOVPRFX instruction.
• A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
FDIVR

Floating-point reversed divide by vector (predicated).

Reversed divide active floating-point elements of the second source vector by corresponding floating-point elements of the first source vector and destructively place the quotient in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:
• An unpredicated MOVPRFX instruction.
• A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
FDUP

Broadcast 8-bit floating-point immediate to vector elements (unpredicated).

Unconditionally broadcast the floating-point immediate into each element of the destination vector. This instruction is unpredicated.

This instruction is used by the alias FMOV (immediate, unpredicated).

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

</tbody>
</table>

<const> Is a floating-point immediate value expressable as ±n+16×2^r, where n and r are integers such that 16 ≤ n ≤ 31 and -3 ≤ r ≤ 4, i.e. a normalized binary floating-point encoding with 1 sign bit, 3-bit exponent, and 4-bit fractional part, encoded in the "imm8" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) result;

for e = 0 to elements-1
    Elem[result, e, esize] = imm;

Z[d] = result;
**FEXPA**

Floating-point exponential accelerator.

The FEXPA instruction accelerates the polynomial series calculation of the \( \exp(x) \) function. The double-precision variant copies the low 52 bits of an entry from a hard-wired table of 64-bit coefficients, indexed by the low 6 bits of each element of the source vector, and prepends to that the next 11 bits of the source element (src<16:6>), setting the sign bit to zero.

The single-precision variant copies the low 23 bits of an entry from hard-wired table of 32-bit coefficients, indexed by the low 6 bits of each element of the source vector, and prepends to that the next 8 bits of the source element (src<13:6>), setting the sign bit to zero.

The half-precision variant copies the low 10 bits of an entry from hard-wired table of 16-bit coefficients, indexed by the low 5 bits of each element of the source vector, and prepends to that the next 5 bits of the source element (src<9:5>), setting the sign bit to zero.

A coefficient table entry with index \( M \) holds the floating-point value \( 2^{(m/64)} \), or for the half-precision variant \( 2^{(m/32)} \).

This instruction is unpredicated.

FLOGB

Floating-point base 2 logarithm as integer.

This instruction returns the signed integer base 2 logarithm of each floating-point input element |x| after normalization.

This is the unbiased exponent of x used in the representation of the floating-point value, such that, for positive x, \( x = \text{significand} \times 2^{\text{exponent}} \).

The integer results are placed in elements of the destination vector which have the same width (ESIZE) as the floating-point input elements:

* If x is normal, the result is the base 2 logarithm of x.
* If x is subnormal, the result corresponds to the normalized representation.
* If x is infinite, the result is \( 2^{(\text{esize}-1)} \).
* If x is ±0.0 or NaN, the result is \(-2^{(\text{esize}-1)}\).

Inactive elements in the destination vector register remain unmodified.

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:
- The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

• An unpredicated MOVPRFX instruction.
• A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
FMAXNM (vectors)

Floating-point maximum number (predicated).

Determine the maximum number value of active floating-point elements of the second source vector and corresponding floating-point elements of the first source vector and destructively place the results in the corresponding elements of the first source vector. If one element value is NaN then the result is the numeric value. Inactive elements in the destination vector register remain unmodified.

**FMAXNMP**

Floating-point maximum number pairwise.

Compute the maximum value of each pair of adjacent floating-point elements within each source vector, and interleave the results from corresponding lanes. The interleaved result values are destructively placed in the first source vector. NaNs are handled according to the IEEE 754-2008 standard. If one vector element is numeric and the other is a quiet NaN, the result is the numerical value.

```

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

• An unpredicated MOVPRFX instruction.
• A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
FMINNM (vectors)

Floating-point minimum number (predicated).

Determine the minimum number value of active floating-point elements of the second source vector and corresponding floating-point elements of the first source vector and destructively place the results in the corresponding elements of the first source vector. If one element value is NaN then the result is the numeric value. Inactive elements in the destination vector register remain unmodified.

```

FMINNMP

Floating-point minimum number pairwise.

Compute the minimum value of each pair of adjacent floating-point elements within each source vector, and interleave the results from corresponding lanes. The interleaved result values are destructively placed in the first source vector. NaNs are handled according to the IEEE 754-2008 standard. If one vector element is numeric and the other is a quiet NaN, the result is the numerical value.

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
FMLA (indexed)

Floating-point fused multiply-add by indexed elements (Zda = Zda + Zn * Zm[indexed]).

Multiply all floating-point elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively added without intermediate rounding to the corresponding elements of the addend and destination vector. The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element. This instruction is unpredicated.

It has encodings from 3 classes: **Half-precision**, **Single-precision** and **Double-precision**

### Half-precision

```plaintext
            31  30  29  28  27  26  25  24  23  22  21  20  19  18  17  16  15  14  13  12  11  10 9  8  7  6  5  4  3  2  1  0

The MOVPRFX instructions that can be used with this instruction are as follows:  
  • An unpredicated MOVPRFX instruction.
FMLALB (vectors)

Half-precision floating-point multiply-add long to single-precision (bottom).

This half-precision floating-point multiply-add long instruction widens the even-numbered 16-bit half-precision elements in the first source vector and the corresponding elements in the second source vector to single-precision format and then destructively multiplies and adds these values without intermediate rounding to the overlapping 32-bit single-precision elements of the addend and destination vector. This instruction is unpredicated.

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
FMLALB (indexed)

Half-precision floating-point multiply-add long to single-precision (bottom, indexed).

This half-precision floating-point multiply-add long instruction widens the even-numbered 16-bit half-precision elements in the first source vector and the indexed element from the corresponding 128-bit segment in the second source vector to single-precision format and then destructively multiplies and adds these values without intermediate rounding to the overlapping 32-bit single-precision elements of the addend and destination vector. This instruction is unpredicated.

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 1 1 0 0 1 0 0 1 0 1 0 3h  Zm 0 1 0 0 i3l 0  Zn  Zda
```

Single-precision

if !HaveSVE2() then UNDEFINED;
integer esize = 32;

FMLS (indexed)

Floating-point fused multiply-subtract by indexed elements ($Zda = Zda + -Zn * Zm[indexed]$).

Multiply all floating-point elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively subtracted without intermediate rounding from the corresponding elements of the addend and destination vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element. This instruction is unpredicated.

It has encodings from 3 classes: Half-precision, Single-precision and Double-precision

Half-precision

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:
- An unpredicated MOVPRFX instruction.
FMMLA

Floating-point matrix multiply-accumulate.

The floating-point matrix multiply-accumulate instruction supports single-precision and double-precision data types in a 2×2 matrix contained in segments of 128 or 256 bits, respectively. It multiplies the 2×2 matrix in each segment of the first source vector by the 2×2 matrix in the corresponding segment of the second source vector. The resulting 2×2 matrix product is then destructively added to the matrix accumulator held in the corresponding segment of the addend and destination vector. This is equivalent to performing a 2-way dot product per destination element. This instruction is unpredicated. The single-precision variant is vector length agnostic. The double-precision variant requires that the current vector length is at least 256 bits, and if the current vector length is not an integer multiple of 256 bits then the trailing bits are set to zero.

ID_AA64ZFR0_EL1.F32MM indicates whether the single-precision variant is implemented.
ID_AA64ZFR0_EL1.F64MM indicates whether the double-precision variant is implemented.

It has encodings from 2 classes: 32-bit element and 64-bit element

32-bit element

    Elem[result, e, esize] = FPMul(element1, element2, FPCR);
Z[d] = result;
**FMUL (indexed)**

Floating-point multiply by indexed elements.

Multiply all floating-point elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The results are placed in the corresponding elements of the destination vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element. This instruction is unpredicated.

It has encodings from 3 classes: **Half-precision**, **Single-precision** and **Double-precision**

### Half-precision

```
0 1 1 0 0 1 0 0 |i3h| i3l| Zm | 0 0 1 0 0 0 | Zn | Zd
```

```
```

if !HaveSVE() then UNDEFINED;
integer esize = 16;
integer index = UInt(i3h:i3l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);

### Single-precision

```
0 1 1 0 0 1 0 0 |i2| Zm | 0 0 1 0 0 0 | Zn | Zd
```

```
FMUL <Zd>.S, <Zn>.S, <Zm>.S[<imm>]
```

if !HaveSVE() then UNDEFINED;
integer esize = 32;
integer index = UInt(i2);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);

### Double-precision

```
0 1 1 0 0 1 0 0 |i1| Zm | 0 0 1 0 0 0 | Zn | Zd
```

```
```

if !HaveSVE() then UNDEFINED;
integer esize = 64;
integer index = UInt(i1);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the “Zd” field.

<Zn> Is the name of the first source scalable vector register, encoded in the “Zn” field.

<Zm> For the half-precision and single-precision variant: is the name of the second source scalable vector register Z0-Z7, encoded in the “Zm” field.

For the double-precision variant: is the name of the second source scalable vector register Z0-Z15, encoded in the “Zm” field.

<imm> For the half-precision variant: is the immediate index, in the range 0 to 7, encoded in the “i3h:i3l” fields.

For the single-precision variant: is the immediate index, in the range 0 to 3, encoded in the “i2” field.

For the double-precision variant: is the immediate index, in the range 0 to 1, encoded in the “i1” field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
integer eltspersegment = 128 DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result;

- **<Z_a>** Is the name of the third source scalable vector register, encoded in the "Za" field.

### Operation

\[
\text{CheckSVEEnabled}();
\]

integer elements = VL DIV esize;

bits(PL) mask = P[g];

bits(VL) operand1 = Z[dn];

bits(VL) operand2 = Z[m];

bits(VL) operand3 = Z[a];

bits(VL) result;

for e = 0 to elements-1

\[
\begin{align*}
\text{bits}(esize) \text{ element1} &= \text{Elem}[\text{operand1}, e, esize]; \\
\text{bits}(esize) \text{ element2} &= \text{Elem}[\text{operand2}, e, esize]; \\
\text{bits}(esize) \text{ element3} &= \text{Elem}[\text{operand3}, e, esize]; \\
\end{align*}
\]

if ElemP[mask, e, esize] == '1' then

if op1_neg then element1 = FPNeg(element1);
if op3_neg then element3 = FPNeg(element3);

Elem[result, e, esize] = FPMulAdd(element3, element1, element2, FPCR);
else

Elem[result, e, esize] = element1;

Z[dn] = result;
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
Floating-point negated fused multiply-add vectors (predicated), writing addend \(Zda = -Zda + -Zn \times Zm\).

Multiply the corresponding active floating-point elements of the first and second source vectors and add to elements of the third source (addend) vector without intermediate rounding. Destructively place the negated results in the destination and third source (addend) vector. Inactive elements in the destination vector register remain unmodified.

**FRECPS**

Floating-point reciprocal step (unpredicated).

Multiply corresponding floating-point elements of the first and second source vectors, subtract the products from 2.0 without intermediate rounding and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

This instruction can be used to perform a single Newton-Raphson iteration for calculating the reciprocal of a vector of floating-point values.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
• A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
**FRINT<r>**

Floating-point round to integral value (predicated).

Round to an integral floating-point value with the specified rounding option from each active floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

The `<r>` symbol specifies one of the following rounding options: N (to nearest, with ties to even), A (to nearest, with ties away from zero), M (toward minus Infinity), P (toward plus Infinity), Z (toward zero), I (current FPCR rounding mode), or X (current FPCR rounding mode, signalling inexact).

It has encodings from 7 classes: Current mode, Current mode signalling inexact, Nearest with ties to away, Nearest with ties to even, Toward zero, Toward minus infinity and Toward plus infinity.

**Current mode**

Z[d] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE.
The MOVPRFX instruction must specify the same destination register as this instruction. The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
Floating-point reciprocal square root estimate (unpredicated).

Find the approximate reciprocal square root of each active floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

FRSQRTS

Floating-point reciprocal square root step (unpredicated).

Multiply corresponding floating-point elements of the first and second source vectors, subtract the products from 3.0 and divide the results by 2.0 without any intermediate rounding and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

This instruction can be used to perform a single Newton-Raphson iteration for calculating the reciprocal square root of a vector of floating-point values.

Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:
• An unpredicated MOVPRFX instruction.
• A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
**FTMAD**

Floating-point trigonometric multiply-add coefficient.

The **FTMAD** instruction calculates the series terms for either \( \sin(x) \) or \( \cos(x) \), where the argument \( x \) has been adjusted to be in the range \(-\pi/4 < x \leq \pi/4\).

To calculate the series terms of \( \sin(x) \) and \( \cos(x) \) the initial source operands of **FTMAD** should be zero in the first source vector and \( x^2 \) in the second source vector. The **FTMAD** instruction is then executed eight times to calculate the sum of eight series terms, which gives a result of sufficient precision.

The **FTMAD** instruction multiplies each element of the first source vector by the absolute value of the corresponding element of the second source vector and performs a fused addition of each product with a value obtained from a table of hard-wired coefficients, and places the results destructively in the first source vector.

The coefficients are different for \( \sin(x) \) and \( \cos(x) \), and are selected by a combination of the sign bit in the second source element and an immediate index in the range 0 to 7.

This instruction is unpredicated.

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
FTSMUL

Floating-point trigonometric starting value.

The FTSMUL instruction calculates the initial value for the FTMAD instruction. The instruction squares each element in the first source vector and then sets the sign bit to a copy of bit 0 of the corresponding element in the second source register, and places the results in the destination vector. This instruction is unpredicated.

To compute \( \sin(x) \) or \( \cos(x) \) the instruction is executed with elements of the first source vector set to \( x \), adjusted to be in the range \(-\pi/4 < x \leq \pi/4\).

The elements of the second source vector hold the corresponding value of the quadrant \( q \) number as an integer not a floating-point value. The value \( q \) satisfies the relationship \((2q-1) \times \pi/4 < x \leq (2q+1) \times \pi/4\).

SVE

FTSMUL <Zd>.<T>, <Zn>.<T>, <Zm>.<T>

if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);

Assembler Symbols

   bits(esize) element2 = Elem[operand2, e, esize];
   Elem[result, e, esize] = FPTrigSMul(element1, element2, FPCR);
Z[d] = result;
FTSSEL

Floating-point trigonometric select coefficient.

The FTSSEL instruction selects the coefficient for the final multiplication in the polynomial series approximation. The instruction places the value 1.0 or a copy of the first source vector element in the destination element, depending on bit 0 of the quadrant number \( Q \) held in the corresponding element of the second source vector. The sign bit of the destination element is copied from bit 1 of the corresponding value of \( Q \). This instruction is unpredicated.

To compute \( \sin(x) \) or \( \cos(x) \) the instruction is executed with elements of the first source vector set to \( x \), adjusted to be in the range \(-\pi/4 < x \leq \pi/4\).

The elements of the second source vector hold the corresponding value of the quadrant \( Q \) number as an integer not a floating-point value. The value \( Q \) satisfies the relationship: \((2q-1) \times \pi/4 < x \leq (2q+1) \times \pi/4\).

**INCB, INCD, INCH, INCW (scalar)**

Increment scalar by multiple of predicate constraint element count.

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination.

The named predicate constraint limits the number of active elements in a single predicate to:

* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 4 classes: Byte, Doubleword, Halfword and Word

</tbody>
</table>

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(64) operand1 = X[dn];
bits(PL) operand2 = P[m];
integer count = 0;
for e = 0 to elements-1
   if ElemP[operand2, e, esize] == '1' then
      count = count + 1;
X[dn] = operand1 + count;

Operational information

If PSTATE.DIT is 1:
  • The execution time of this instruction is independent of:
    ◦ The values of the data supplied in any of its registers.
    ◦ The values of the NZCV flags.
  • The response of this instruction to asynchronous exceptions does not vary based on:
    ◦ The values of the data supplied in any of its registers.
    ◦ The values of the NZCV flags.
INCP (vector)

Increment vector by count of true predicate elements.

Counts the number of true elements in the source predicate and then uses the result to increment all destination vector elements.

The predicate size specifier may be omitted in assembler source code, but this is deprecated and will be prohibited in a future release of the architecture.

Operational information

If PSTATE.DIT is 1:
  • The execution time of this instruction is independent of:
- The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
- The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
**LASTB (scalar)**

Extract last element to general-purpose register.

If there is an active element then extract the last active element from the final source vector register. If there are no active elements, extract the highest-numbered element. Then zero-extend and place the extracted element in the destination general-purpose register.

<table>

LD1D (scalar plus immediate)

Contiguous load doublewords to vector (immediate index).

Contiguous load of doublewords to elements of a vector register from the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements will not read Device memory or signal a fault, and are set to zero in the destination vector.

```
LD1D (scalar plus scalar)
LD1D (scalar plus vector)

Gather load doublewords to vector (vector index).

Gather load of doublewords to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 8. Inactive elements will not read Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 4 classes: 32-bit unpacked scaled offset, 32-bit unpacked unscaled offset, 64-bit scaled offset and 64-bit unscaled offset.

32-bit unpacked scaled offset

**LD1H (scalar plus vector)**

Gather load unsigned halfwords to vector (vector index).

Gather load of unsigned halfwords to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 2. Inactive elements will not read Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 6 classes: 32-bit scaled offset, 32-bit unpacked scaled offset, 32-bit unpacked unscaled offset, 32-bit unscaled offset, 64-bit scaled offset and 64-bit unscaled offset.

### 32-bit scaled offset

```
1 0 0 0 0 1 0 1 0 0 1 xs 1 Zm 0 1 0 Pg Rn Zt
```

### 32-bit scaled offset

```java
if (!HaveSVE()) then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer m = UInt(Zm);
integer g = UInt(Pg);
integer esize = 32;
integer msize = 16;
integer offs_size = 32;
boolean unsigned = TRUE;
boolean offs_unsigned = xs == '0';
integer scale = 1;
```

### 32-bit unpacked scaled offset

```
1 1 0 0 0 1 0 1 0 0 1 xs 1 Zm 0 1 0 Pg Rn Zt
```

### 32-bit unpacked scaled offset

```java
if (!HaveSVE()) then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer m = UInt(Zm);
integer g = UInt(Pg);
integer esize = 64;
integer msize = 16;
integer offs_size = 32;
boolean unsigned = TRUE;
boolean offs_unsigned = xs == '0';
integer scale = 1;
```

### 32-bit unpacked unscaled offset

```
1 1 0 0 1 0 0 1 xs 0 Zm 0 1 0 Pg Rn Zt
```

### 32-bit unpacked unscaled offset

```java
if (!HaveSVE()) then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer m = UInt(Zm);
integer g = UInt(Pg);
integer esize = 32;
integer msize = 16;
integer offs_size = 32;
boolean unsigned = TRUE;
boolean offs_unsigned = xs == '0';
integer scale = 1;

**LD1ROB (scalar plus immediate)**

Contiguous load and replicate thirty-two bytes (immediate index).

Load thirty-two contiguous bytes to elements of a 256-bit (octaword) vector from the memory address generated by a 64-bit scalar base address and immediate index that is a multiple of 32 in the range -256 to +224 added to the base address.

Inactive elements will not read Device memory or signal a fault, and are set to zero. The resulting 256-bit vector is then replicated to fill the destination vector. The instruction requires that the current vector length is at least 256 bits, and if the current vector length is not an integer multiple of 256 bits then the trailing bits in the destination vector are set to zero.

Only the first thirty-two predicate elements are used and higher numbered predicate elements are ignored. ID_AA64ZFR0_EL1.F64MM indicates whether this instruction is implemented.

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 1  | 0  | 1  | 0  | 0  | 1  | 0  | 0  | 0  | 1  | 0  | imm4 | 0  | 0  | 1  | Pg | Rn  | Zt  |
```

**LD1ROD (scalar plus immediate)**

Contiguous load and replicate four doublewords (immediate index).

Load four contiguous doublewords to elements of a 256-bit (octaword) vector from the memory address generated by a 64-bit scalar base address and immediate index that is a multiple of 32 in the range -256 to +224 added to the base address.

Inactive elements will not read Device memory or signal a fault, and are set to zero.

The resulting 256-bit vector is then replicated to fill the destination vector. The instruction requires that the current vector length is at least 256 bits, and if the current vector length is not an integer multiple of 256 bits then the trailing bits in the destination vector are set to zero.

Only the first four predicate elements are used and higher numbered predicate elements are ignored.

ID_AA64ZFR0_EL1.F64MM indicates whether this instruction is implemented.

LD1RQD (scalar plus scalar)

Contiguous load and replicate two doublewords (scalar index).

Load two contiguous doublewords to elements of a short, 128-bit (quadword) vector from the memory address generated by a 64-bit scalar base address and scalar index which is multiplied by 8 and added to the base address. Inactive elements will not read Device memory or signal a fault, and are set to zero. The resulting short vector is then replicated to fill the long destination vector. Only the first two predicate elements are used and higher numbered predicate elements are ignored.

LD1RW

Load and broadcast unsigned word to vector.

Load a single unsigned word from a memory address generated by a 64-bit scalar base address plus an immediate offset which is a multiple of 4 in the range 0 to 252.

Broadcast the loaded data into all active elements of the destination vector, setting the inactive elements to zero. If all elements are inactive then the instruction will not perform a read from Device memory or cause a data abort.

It has encodings from 2 classes: **32-bit element** and **64-bit element**

### 32-bit element

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

integer offset = UInt(imm6);

### Assembler Symbols

- **<Zt>** Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
- **<Pg>** Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- **<Xn|SP>** Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- **<imm>** Is the optional unsigned immediate byte offset, a multiple of 4 in the range 0 to 252, defaulting to 0, encoded in the "imm6" field.
Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(64) base;
bits(64) addr;
bits(PL) mask = P[g];
bits(VL) result;
bits(msize) data;
constant integer mbytes = msize DIV 8;

if HaveMTEExt() then SetNotTagCheckedInstruction(FALSE);

if n == 31 then
    CheckSPAlignment();
    base = SP[];
else
    base = X[n];

integer last = LastActiveElement(mask, esize);
if last >= 0 then
    addr = base + offset * mbytes;
    data = Mem[addr, mbytes, AccType_NORMAL];
for e = 0 to elements-1
    if ElemP[mask, e, esize] == '1' then
        Elem[result, e, esize] = Extend(data, esize, unsigned);
    else
        Elem[result, e, esize] = Zeros();
Z[t] = result;
LD1SB (vector plus immediate)

Gather load signed bytes to vector (immediate index).

Gather load of signed bytes to active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is in the range 0 to 31. Inactive elements will not read Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 2 classes: 32-bit element and 64-bit element

32-bit element

32-bit element

LD1SB { <Zt>.S }, <Pg>/Z, [<Zn>.S{, #<imm>}]

if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);

64-bit element

64-bit element

LD1SB { <Zt>.D }, <Pg>/Z, [<Zn>.D{, #<imm>}]

if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
integer esize = 64;
integer msize = 8;
boolean unsigned = FALSE;
integer offset = UInt(imm5);

Assembler Symbols

<Zt> Is the name of the scalable vector register to be transferred, encoded in the “Zt” field.
<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn> Is the name of the base scalable vector register, encoded in the “Zn” field.
<imm> Is the optional unsigned immediate byte offset, in the range 0 to 31, defaulting to 0, encoded in the "imm5" field.
Operation

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) base = Z[n];
bits(64) addr;
bits(PL) mask = P[g];
bits(VL) result;
bits(msize) data;
constant integer mbytes = msize DIV 8;
if HaveMTEExt() then SetNotTagCheckedInstruction(FALSE);
for e = 0 to elements-1
  if ElemP[mask, e, esize] == '1' then
    addr = ZeroExtend(Elem[base, e, esize], 64) + offset * mbytes;
    data = Mem[addr, mbytes, AccType_NORMAL];
    Elem[result, e, esize] = Extend(data, esize, unsigned);
  else
    Elem[result, e, esize] = Zeros();
Z[t] = result;
```
**LD1SB (scalar plus immediate)**

Contiguous load signed bytes to vector (immediate index).

Contiguous load of signed bytes to elements of a vector register from the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements will not read Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 3 classes: 16-bit element, 32-bit element and 64-bit element

    else
        Elem[result, e, esize] = Zeros();
    offset = offset + 1;
Z[t] = result;
```
LD1SW (scalar plus vector)

Gather load signed words to vector (vector index).

Gather load of signed words to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 4. Inactive elements will not read Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 4 classes: 32-bit unpacked scaled offset, 32-bit unpacked unscaled offset, 64-bit scaled offset and 64-bit unscaled offset.

32-bit unpacked scaled offset

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

LD2B (scalar plus immediate)

Contiguous load two-byte structures to two vectors (immediate index).

Contiguous load two-byte structures, each to the same element number in two vector registers from the memory address generated by a 64-bit scalar base and an immediate index which is a multiple of 2 in the range -16 to 14 that is multiplied by the vector's in-memory size, irrespective of predication.

Each predicate element applies to the same element number in each of the two vector registers, or equivalently to the two consecutive bytes in memory which make up each structure. Inactive elements will not read Device memory or signal a fault, and the corresponding element is set to zero in each of the two destination vector registers.

LDFF1B (scalar plus scalar)

Contiguous load first-fault unsigned bytes to vector (scalar index).

Contiguous load with first-faulting behavior of unsigned bytes to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index which is added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements will not read Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 4 classes: 8-bit element, 16-bit element, 32-bit element and 64-bit element

8-bit element

```

LDFF1H (vector plus immediate)

Gather load first-fault unsigned halfwords to vector (immediate index).

Gather load with first-faulting behavior of unsigned halfwords to active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is a multiple of 2 in the range 0 to 62. Inactive elements will not read Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 2 classes: **32-bit element** and **64-bit element**

**LDFF1H (scalar plus scalar)**

Contiguous load first-fault unsigned halfwords to vector (scalar index).

Contiguous load with first-faulting behavior of unsigned halfwords to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index which is multiplied by 2 and added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements will not read Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 3 classes: 16-bit element, 32-bit element and 64-bit element.

LDFF1H (scalar plus vector)

Gather load first-fault unsigned halfwords to vector (vector index).

Gather load with first-faulting behavior of unsigned halfwords to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 2. Inactive elements will not read Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 6 classes: 32-bit scaled offset, 32-bit unpacked scaled offset, 32-bit unpacked unscaled offset, 32-bit unscaled offset, 64-bit scaled offset and 64-bit unscaled offset

32-bit scaled offset

LDFF1SB (scalar plus scalar)

Contiguous load first-fault signed bytes to vector (scalar index).

Contiguous load with first-faulting behavior of signed bytes to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index which is added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements will not read Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 3 classes: 16-bit element, 32-bit element and 64-bit element

16-bit element

LDFF1SB {
  <Zt>.H }, <Pg>/Z, [<Xn|SP>{, <Xm}]

  if !HaveSVE() then UNDEFINED;

LDFF1SW (vector plus immediate)

Gather load first-fault signed words to vector (immediate index).

Gather load with first-faulting behavior of signed words to active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is a multiple of 4 in the range 0 to 124. Inactive elements will not read Device memory or signal faults, and are set to zero in the destination vector.

LDFF1SW (scalar plus scalar)

Contiguous load first-fault signed words to vector (scalar index).

Contiguous load with first-faulting behavior of signed words to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index which is multiplied by 4 and added to the base address. After each element access the index value is incremented, but the index register is not updated.Inactive elements will not read Device memory or signal a fault, and are set to zero in the destination vector.

LDFF1SW (scalar plus vector)

Gather load first-fault signed words to vector (vector index).

Gather load with first-faulting behavior of signed words to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 4. Inactive elements will not read Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 4 classes: **32-bit unpacked scaled offset**, **32-bit unpacked unscaled offset**, **64-bit scaled offset** and **64-bit unscaled offset**

LDFF1W (vector plus immediate)

Gather load first-fault unsigned words to vector (immediate index).

Gather load with first-faulting behavior of unsigned words to active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is a multiple of 4 in the range 0 to 124. Inactive elements will not read Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 2 classes: 32-bit element and 64-bit element

32-bit element

LDFF1W (scalar plus scalar)

Contiguous load first-fault unsigned words to vector (scalar index).

Contiguous load with first-faulting behavior of unsigned words to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index which is multiplied by 4 and added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements will not read Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 2 classes: 32-bit element and 64-bit element

### 32-bit element

```

```
LDFF1W (scalar plus vector)

Gather load first-fault unsigned words to vector (vector index).

Gather load with first-faulting behavior of unsigned words to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 4. Inactive elements will not read Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 6 classes: 32-bit scaled offset, 32-bit unpacked scaled offset, 32-bit unpacked unscaled offset, 32-bit unscaled offset, 64-bit scaled offset and 64-bit unscaled offset

LDNF1H

Contiguous load non-fault unsigned halfwords to vector (immediate index).

Contiguous load with non-faulting behavior of unsigned halfwords to elements of a vector register from the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements will not read Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 3 classes: 16-bit element, 32-bit element and 64-bit element

LDNT1B (vector plus scalar)

Gather load non-temporal unsigned bytes.

Gather load non-temporal of unsigned bytes to active elements of a vector register from memory addresses generated by a vector base plus a 64-bit unscaled scalar register offset. Inactive elements will not read Device memory or signal faults, and are set to zero in the destination vector.

A non-temporal load is a hint to the system that this data is unlikely to be referenced again soon.

It has encodings from 2 classes: 32-bit unscaled offset and 64-bit unscaled offset

32-bit unscaled offset

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
1 0 0 0 0 1 0 | 0 0 0 0 | Rm  | 1 0 1 | Pg  | Zn  | Zt
```

32-bit unscaled offset

```
LDNT1B { <Zt>.S }, <Pg>/Z, [<Zn>.S{, <Xm}>]
```

```
if !HaveSVE2() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer m = UInt(Rm);
integer g = UInt(Pg);
integer esize = 32;
integer msize = 8;
boolean unsigned = TRUE;
```

64-bit unscaled offset

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
1 1 0 0 0 1 0 | 0 0 0 0 | Rm  | 1 1 0 | Pg  | Zn  | Zt
```

64-bit unscaled offset

```
LDNT1B { <Zt>.D }, <Pg>/Z, [<Zn>.D{, <Xm}>]
```

```
if !HaveSVE2() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer m = UInt(Rm);
integer g = UInt(Pg);
integer esize = 64;
integer msize = 8;
boolean unsigned = TRUE;
```

Assembler Symbols

- `<Zt>` Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.

</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the “Pg” field.
<const> Is the immediate shift amount, in the range 0 to number of bits per element minus 1, encoded in “tsz:imm3”.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(PL) mask = P[g];
bits(VL) result;
for e = 0 to elements-1
   bits(esize) element1 = Elem[operand1, e, esize];
   if ElemP[mask, e, esize] == '1' then
      Elem[result, e, esize] = LSL(element1, shift);
   else
      Elem[result, e, esize] = Elem[operand1, e, esize];
Z[dn] = result;

Operational information

If PSTATE.DIT is 1:
• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  ◦ The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  ◦ The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

• An unpredicated MOVPRFX instruction.
• A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
Logical shift left by 64-bit wide elements (predicated).

Shift left active elements of the first source vector by corresponding overlapping 64-bit elements of the second source vector and destructively place the results in the corresponding elements of the first source vector. The shift amount is a vector of unsigned 64-bit doubleword elements in which all bits are significant, and not used modulo the destination element size. Inactive elements in the destination vector register remain unmodified.

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its operand registers when its governing predicate
    register contains the same value for each execution.
  ◦ The values of the NZCV flags.
This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the
following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand
  register of this instruction.
The MOVPRFX instructions that can be used with this instruction are as follows:

• An unpredicated MOVPRFX instruction.
• A predicated MOVPRFX instruction using the same governing predicate register and source element size as this
  instruction.
LSR (Immediate, unpredicated)

Logical shift right by immediate (unpredicated).

Shift right by immediate, inserting zeroes, each element of the source vector, and place the results in the corresponding elements of the destination vector. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
MATCH

Detect any matching elements, setting the condition flags.

This instruction compares each active 8-bit or 16-bit character in the first source vector with all of the characters in the corresponding 128-bit segment of the second source vector. Where the first source element detects any matching characters in the second segment it places true in the corresponding element of the destination predicate, otherwise false. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
MLA (indexed)

Multiply-add to accumulator (indexed).

Multiply all integer elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively added to the corresponding elements of the addend and destination vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element. This instruction is unpredicated.

It has encodings from 3 classes: 16-bit, 32-bit and 64-bit

16-bit

if !HaveSVE2() then UNDEFINED;

Operational information

If PSTATE.DIT is 1:
  • The execution time of this instruction is independent of:
    ◦ The values of the data supplied in any of its registers.
    ◦ The values of the NZCV flags.
  • The response of this instruction to asynchronous exceptions does not vary based on:
    ◦ The values of the data supplied in any of its registers.
    ◦ The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

  • The MOVPRFX instruction must specify the same destination register as this instruction.
  • The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

  • An unpredicated MOVPRFX instruction.
**MLS (vectors)**

Multiply-subtract vectors (predicated), writing addend \([Zda = Zda - Zn \times Zm]\).

Multiply the corresponding active elements of the first and second source vectors and subtract from elements of the third source (addend) vector. Destructively place the results in the destination and third source (addend) vector. Inactive elements in the destination vector register remain unmodified.

    Z[da] = result;
```
Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
**MLS (indexed)**

Multiply-subtract from accumulator (indexed).

Multiply all integer elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively subtracted from the corresponding elements of the addend and destination vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element. This instruction is unpredicated.

It has encodings from 3 classes: **16-bit**, **32-bit** and **64-bit**

### 16-bit

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 1 0 0 0 1 0 0 |i3h:i3l| Zm 0 0 0 0 1 1 | Zn | Zda
```

**16-bit**

```mls
```

```plaintext
if !HaveSVE2() then UNDEFINED;
integer esize = 16;
integer index = UInt(i3h:i3l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
```

### 32-bit

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 1 0 0 0 1 0 0 |i2| Zm 0 0 0 0 1 1 | Zn | Zda
```

**32-bit**

```mls
MLS <Zda>.S, <Zn>.S, <Zm>.S[<imm>]
```

```plaintext
if !HaveSVE2() then UNDEFINED;
integer esize = 32;
integer index = UInt(i2);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
```

### 64-bit

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

bits(\text{VL}) \text{result} = Z[da];

for e = 0 to elements-1
    integer segmentbase = e - e \mod eltspersegment;
    integer s = segmentbase + index;
    integer \text{element1} = \text{UInt}(\text{Elem}[^{\text{operand1}}, e, \text{esize}]);
    integer \text{element2} = \text{UInt}(\text{Elem}[^{\text{operand2}}, s, \text{esize}]);
    integer \text{element3} = \text{UInt}(\text{Elem}[^{\text{result}}, e, \text{esize}]);
    integer \text{res} = \text{element3} - \text{element1} \times \text{element2};
    \text{Elem}[^{\text{result}}, e, \text{esize}] = \text{res}<\text{esize}-1:0>;

Z[da] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
MOVPRFX (predicated)

Move prefix (predicated).

The predicated MOVPRFX instruction is a hint to hardware that the instruction may be combined with the destructive instruction which follows it in program order to create a single constructive operation. Since it is a hint it is also permitted to be implemented as a discrete vector copy, and the result of executing the pair of instructions with or without combining is identical. The choice of combined versus discrete operation may vary dynamically.

Although the operation of the instruction is defined as a simple predicated vector copy, it is required that the prefixed instruction at PC+4 must be an SVE destructive binary or ternary instruction encoding, or a unary operation with merging predication, but excluding other MOVPRFX instructions. The prefixed instruction must specify the same predicate register, and have the same maximum element size (ignoring a fixed 64-bit "wide vector" operand), and the same destination vector as the MOVPRFX instruction. The prefixed instruction must not use the destination register in any other operand position, even if they have different names but refer to the same architectural register state. Any other use is UNPREDICTABLE.

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
  0 0 0 0 0 1 0 0 | size  | 0 1 0 0 0 | M 0 0 | Pg  | Zn  |  Zd
SVE
MOVPRFX <Zd>.<T>, <Pg>/<ZM>, <Zn>.<T>
```

if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
boolean merging = (M == '1');

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<ZM> Is the predication qualifier, encoded in "M":

<table>
<thead>
<tr>
<th>M</th>
<th>&lt;ZM&gt;</th>

<imm> Is the signed immediate operand, in the range -128 to 127, encoded in the "imm8" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(VL) result;
for e = 0 to elements-1
  integer element1 = SInt(Elem[operand1, e, esize]);
  Elem[result, e, esize] = (element1 * imm)<esize-1:0>;
Z[dn] = result;

Operational information

If PSTATE.DIT is 1:
  • The execution time of this instruction is independent of:
    ◦ The values of the data supplied in any of its registers.
    ◦ The values of the NZCV flags.
  • The response of this instruction to asynchronous exceptions does not vary based on:
    ◦ The values of the data supplied in any of its registers.
    ◦ The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:
  • The MOVPRFX instruction must specify the same destination register as this instruction.
  • The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:
  • An unpredicated MOVPRFX instruction.
MUL (vectors, unpredicated)

Multiply vectors (unpredicated).

Multiply all elements of the first source vector by corresponding elements of the second source vector and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

---

SVE2

MUL <Zd>.<T>, <Zn>.<T>, <Zm>.<T>

if !HaveSVE2() then UNDEFINED;

• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
MUL (indexed)

Multiply (indexed).

Multiply all integer elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The results are placed in the corresponding elements of the destination vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element. This instruction is unpredicated.

It has encodings from 3 classes: 16-bit, 32-bit and 64-bit

16-bit

```
 0 1 0 0 0 1 0 0 | i3h | i3l | Zm | 1 1 1 1 1 1 0 | Zn | Zd
```

16-bit

```

if !HaveSVE2() then UNDEFINED;

NBSL

Bitwise inverted select.

Selects bits from the first source vector where the corresponding bit in the third source vector is '1', and from the second source vector where the corresponding bit in the third source vector is '0'. The inverted result is placed destructively in the destination and first source vector. This instruction is unpredicated.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Z[d] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

• An unpredicated MOVPRFX instruction.
• A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
**NMATCH**

Detect no matching elements, setting the condition flags.

This instruction compares each active 8-bit or 16-bit character in the first source vector with all of the characters in the corresponding 128-bit segment of the second source vector. Where the first source element detects no matching characters in the second segment it places true in the corresponding element of the destination predicate, otherwise false. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N), NONE (Z), LAST (C) condition flags based on the predicate result, and the V flag to zero.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];

for e = 0 to elements-1
    bits(esize) element = Elem[operand, e, esize];
    if ElemP[mask, e, esize] == '1' then
        Elem[result, e, esize] = NOT element;

Z[d] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
The MOVPRFX instructions that can be used with this instruction are as follows:

• An unpredicated MOVPRFX instruction.
• A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
ORN, ORNS (predicates)

Bitwise inclusive OR inverted predicate.

Bitwise inclusive OR inverted active elements of the second source predicate with corresponding elements of the first source predicate and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Optionally sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

It has encodings from 2 classes: Not setting the condition flags and Setting the condition flags

Not setting the condition flags

Z[dn] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.

The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
ORR (immediate)

Bitwise inclusive OR with immediate (unpredicated).

Bitwise inclusive OR an immediate with each 64-bit element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits. This instruction is unpredicated.

This instruction is used by the pseudo-instruction ORN (immediate).

```

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
    bits(esize) element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = PolynomialMult(element1, element2)<esize-1:0>;
Z[d] = result;

Operational information

If PSTATE.DIT is 1:
• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
PMULLB

Polynomial multiply long (bottom).

Polynomial multiply over [0, 1] the corresponding even-numbered elements of the first and second source vectors, and place the results in the overlapping double-width elements of the destination vector. This instruction is unpredicated. ID_AA64ZFR0_EL1.AES indicates whether the instruction variant with 64-bit source and 128-bit destination elements is implemented.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
Find next active predicate.

An instruction used to construct a loop which iterates over all active elements in a predicate. If all source predicate elements are false it sets the first active predicate element in the destination predicate to true. Otherwise it determines the next active predicate element following the last true source predicate element, and if one is found sets the corresponding destination predicate element to true. All other destination predicate elements are set to false. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

### SVE

PRFB (scalar plus vector)

Gather prefetch bytes (scalar plus vector).

Gather prefetch of bytes from the active memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally sign or zero-extended from 32 to 64 bits. Inactive addresses are not prefetched from memory.

The <prfop> symbol specifies the prefetch hint as a combination of three options: access type PLD for load or PST for store; target cache level L1, L2 or L3; temporality (KEEP for temporal or STRM for non-temporal).

It has encodings from 3 classes: **32-bit scaled offset**, **32-bit unpacked scaled offset** and **64-bit scaled offset**

### 32-bit scaled offset

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|  0 |  0 |  1 |  0 |  0 |  0 |  0 |  1 |  Zm|  0 |  0 |  0 |  Pg|  Rn|  0 |  prfop|
```

### 32-bit scaled offset

```
PRFB <prfop>, <Pg>, [<Xn|SP>, <Zm>.S, <mod>]
if !HaveSVE() then UNDEFINED;
integer esize = 32;
integer g = UInt(Pg);
integer n = UInt(Rn);
integer m = UInt(Zm);
integer level = UInt(prfop<2:1>);
boolean stream = (prfop<0> == '1')
pref_hint = if prfop<3> == '0' then Prefetch_READ else Prefetch_WRITE;
integer offs_size = 32;
boolean offs_unsigned = (xs == '0');
integer scale = 0;
```

### 32-bit unpacked scaled offset

```

PRFD (scalar plus immediate)

Contiguous prefetch doublewords (immediate index).

Contiguous prefetch of doubleword elements from the memory address generated by a 64-bit scalar base and immediate index in the range -32 to 31 which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

The predicate may be used to suppress prefetches from unwanted addresses.

**Operation**

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) base;
bits(64) addr;
base = Z[n];
for e = 0 to elements-1
  if ElemP[mask, e, esize] == '1' then
    addr = ZeroExtend(Elem[base, e, esize], 64) + (offset << scale);
    Hint_Prefetch(addr, pref_hint, level, stream);
```

<pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the base scalable vector register, encoded in the "Zn" field.

<imm> Is the optional unsigned immediate byte offset, a multiple of 2 in the range 0 to 62, defaulting to 0, encoded in the "imm5" field.
**PRFH (scalar plus immediate)**

Contiguous prefetch halfwords (immediate index).

Contiguous prefetch of halfword elements from the memory address generated by a 64-bit scalar base and immediate index in the range -32 to 31 which is multiplied by the vector’s in-memory size, irrespective of predication, and added to the base address.

The predicate may be used to suppress prefetches from unwanted addresses.

```

<td>SXTW</td>
</tr>
</tbody>
</table>

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(64) base;
bits(64) addr;
bits(VL) offset;
if n == 31 then
    base = SP[];
else
    base = X[n];
offset = Z[m];
for e = 0 to elements-1
    if ElemP[mask, e, esize] == '1' then
        integer off = Int(Elem[offset, e, esize]<offs_size-1:0>, offs_unsigned);
        addr = base + (off << scale);
        Hint_Prefetch(addr, pref_hint, level, stream);
PTEST

Set condition flags for predicate.

Sets the **FIRST**(N), **NONE**(Z), !**LAST**(C) condition flags based on the predicate source register, and the V flag to zero.

|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

SVE

PTEST <Pg>, <Pn>.

if !HaveSVE() then UNDEFINED;
integer esize = 8;
integer g = UInt(Pg);
integer n = UInt(Pn);

Assembler Symbols

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn> Is the name of the source scalable predicate register, encoded in the "Pn" field.

Operation

*CheckSVEEnabled();*

bits(PL) mask = P[g];
bits(PL) result = P[n];
PSTATE.<N,Z,C,V> = PredTest(mask, result, esize);

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
PTRUE, PTRUES

Initialise predicate from named constraint.

Set elements of the destination predicate to true if the element number satisfies the named predicate constraint, or to false otherwise. If the constraint specifies more elements than are available at the current vector length then all elements of the destination predicate are set to false.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception. Optionally sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

It has encodings from 2 classes: Not setting the condition flags and Setting the condition flags

Not setting the condition flags

```
Not setting the condition flags

PTRUE <Pd>.<T>{, <pattern>}

if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer d = UInt(Pd);
boolean setflags = FALSE;
bits(5) pat = pattern;
```

Setting the condition flags

```
Setting the condition flags

PTRUES <Pd>.<T>{, <pattern>}

if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer d = UInt(Pd);
boolean setflags = TRUE;
bits(5) pat = pattern;
```

Assembler Symbols

```
Asmber Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<T>  Is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>

</table>

**Operation**

```plaintext
CheckSVEEnabled();
integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
bits(PL) result;

for e = 0 to elements-1
    ElemP[result, e, esize] = if e < count then '1' else '0';

if setflags then
    PSTATE.<N,Z,C,V> = PredTest(result, result, esize);
    P[d] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
PUNPKHI, PUNPKLO

Unpack and widen half of predicate.

Unpack elements from the lowest or highest half of the source predicate and place in elements of twice their size within the destination predicate. This instruction is unpredicated.

It has encodings from 2 classes: **High half** and **Low half**

### High half

```
[31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0]
[0 0 0 0 0 1 0 1 0 0 1 1 0 0 0 1 0 1 0 0 0 0 0 | Pn 0 | Pd]
```

**PUNPKHI <Pd>.H, <Pn>.B**

if !HaveSVE() then UNDEFINED;
integer esize = 16;
integer n = UInt(Pn);
integer d = UInt(Pd);
boolean hi = TRUE;

### Low half

```
[31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0]
[0 0 0 0 0 1 0 1 0 0 1 1 0 0 0 1 0 1 0 0 0 0 0 | Pn 0 | Pd]
```

**PUNPKLO <Pd>.H, <Pn>.B**

if !HaveSVE() then UNDEFINED;
integer esize = 16;
integer n = UInt(Pn);
integer d = UInt(Pd);
boolean hi = FALSE;

### Assembler Symbols

- **<Pd>** Is the name of the destination scalable predicate register, encoded in the "Pd" field.
- **<Pn>** Is the name of the source scalable predicate register, encoded in the "Pn" field.

### Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) operand = P[n];
bits(PL) result;
for e = 0 to elements-1
    ElemP[result, e, esize] = ElemP[operand, if hi then e + elements else e, esize DIV 2];
P[d] = result;
```

### Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
• The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  • The values of the data supplied in any of its registers.
  • The values of the NZCV flags.
RADDHNB

Rounding add narrow high part (bottom).

Add each vector element of the first source vector to the corresponding vector element of the second source vector, and place the most significant rounded half of the result in the even-numbered half-width destination elements, while setting the odd-numbered elements to zero. This instruction is unpredicated.

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];
for e = 0 to elements-1
    bits(esize) element = Elem[operand, e, esize];
    if ElemP[mask, e, esize] == '1' then
        Elem[result, e, esize] = BitReverse(element);

Z[d] = result;

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:
- The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

• An unpredicated MOVPRFX instruction.
• A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
**RDFFR (unpredicated)**

Read the first-fault register.

Read the first-fault register (FFR) and place in the destination predicate without predication.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**SVE**

RDFFR <Pd>.B

```plaintext
if !HaveSVE() then UNDEFINED;
integer d = UInt(Pd);
```

**Assembler Symbols**

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.

**Operation**

```
CheckSVEEnabled();
bits(PL) ffr = FFR[];
P[d] = ffr;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
RDFFR, RDFFRS (predicated)

Return predicate of successfully loaded elements.

Read the first-fault register (FFR) and place active elements in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Optionally sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

It has encodings from 2 classes: Not setting the condition flags and Setting the condition flags

Setting the condition flags

RDFFRS <Pd>.B, <Pg>/Z

if !HaveSVE() then UNDEFINED;
integer g = UInt(Pg);
integer d = UInt(Pd);
boolean setflags = TRUE;

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

Operation

CheckSVEEnabled();
bits(PL) mask = P[g];
bits(PL) ffr = FFR[];
bits(PL) result = ffr AND mask;

if setflags then
  PSTATE.<N,Z,C,V> = PredTest(mask, result, 8);
  P[d] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its operand registers when its governing predicate
    register contains the same value for each execution.
  ◦ The values of the NZCV flags.
RDVL

Read multiple of vector register size to scalar register.

Multiply the current vector register size in bytes by an immediate in the range -32 to 31 and place the result in the 64-bit destination general-purpose register.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

SVE

RDVL <Xd>, #<imm>

if !HaveSVE() then UNDEFINED;
integer d = UInt(Rd);
integer imm = SInt(imm6);

Assembler Symbols

Xd Is the 64-bit name of the destination general-purpose register, encoded in the "Rd" field.
imm Is the signed immediate operand, in the range -32 to 31, encoded in the "imm6" field.

Operation

CheckSVEEnabled();
integer len = imm * (VL DIV 8);
Xd[d] = len<63:0>;

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**REV (predicate)**

Reverse all elements in a predicate.

Reverse the order of all elements in the source predicate and place in the destination predicate. This instruction is unpredicated.

```
| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0 |

</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Zn> Is the name of the source scalable vector register, encoded in the “Zn” field.

Operation

CheckSVEEnabled();

bits(VL) operand = Z[n];

bits(VL) result = Reverse(operand, esize);

Z[d] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
REVB, REVH, REVW

Reverse bytes / halfwords / words within elements (predicated).

Reverse the order of 8-bit bytes, 16-bit halfwords or 32-bit words within each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

It has encodings from 3 classes: Byte, Halfword and Word

Byte

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0 |

<td>S</td>
</tr>
<tr>
<td>1</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the “Pg” field.

<Zn> Is the name of the source scalable vector register, encoded in the “Zn” field.

Operation

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];
for e = 0 to elements-1
  if ElemP[mask, e, esize] == '1' then
    bits(esize) element = Elem[operand, e, esize];
    Elem[result, e, esize] = Reverse(element, swsize);
Z[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
RSHRNB

Rounding shift right narrow by immediate (bottom).

Shift each unsigned integer value in the source vector elements right by an immediate value, and place the rounded results in the even-numbered half-width destination elements, while setting the odd-numbered elements to zero. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

Operational information

If PSTATE.DIT is 1:
• The execution time of this instruction is independent of:
- The values of the data supplied in any of its registers.
- The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
Signed add and accumulate long pairwise.

Add pairs of adjacent signed integer values and accumulate the results into the overlapping double-width elements of the destination vector.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicate MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
SADDLB

Signed add long (bottom).

Add the corresponding even-numbered signed elements of the first and second source vectors, and place the results in the overlapping double-width elements of the destination vector. This instruction is unpredicated.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
- The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
SBCLT

Subtract with carry long (top).

Subtract the odd-numbered elements of the first source vector and the inverted 1-bit carry from the least-significant bit of the odd-numbered elements of the second source vector from the even-numbered elements of the destination and accumulator vector. The 1-bit carry output is placed in the corresponding odd-numbered element of the destination vector.

SCVTF

Signed integer convert to floating-point (predicated).

Convert to floating-point from the signed integer in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

If the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are zero-extended to fill each destination element.

It has encodings from 7 classes: 16-bit to half-precision, 32-bit to half-precision, 32-bit to single-precision, 32-bit to double-precision, 64-bit to half-precision, 64-bit to single-precision and 64-bit to double-precision

• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

• An unpredicated MOVPRFX instruction.
SDOT (indexed)

Signed integer indexed dot product.

The signed integer indexed dot product instruction computes the dot product of a group of four signed 8-bit or 16-bit integer values held in each 32-bit or 64-bit element of the first source vector multiplied by a group of four signed 8-bit or 16-bit integer values in an indexed 32-bit or 64-bit element of the second source vector, and then destructively adds the widened dot product to the corresponding 32-bit or 64-bit element of the destination vector.

The groups within the second source vector are specified using an immediate index which selects the same group position within each 128-bit vector segment. The index range is from 0 to one less than the number of groups per 128-bit segment, encoded in 1 to 2 bits depending on the size of the group. This instruction is unpredicated.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

```assembly
```

if !HaveSVE() then UNDEFINED;
integer esize = 32;
integer index = UInt(i2);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);

64-bit

```assembly
SDOT <Zda>.D, <Zn>.H, <Zm>.H[i1]
```

if !HaveSVE() then UNDEFINED;
integer esize = 64;
integer index = UInt(i1);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);

Assembler Symbols

- `<Zda>` Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
- `<Zn>` Is the name of the first source scalable vector register, encoded in the "Zn" field.
- `<Zm>` For the 32-bit variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field.
  For the 64-bit variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
- `<imm>` For the 32-bit variant: is the immediate index of a quadtuplet of four 8-bit elements within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field.
  For the 64-bit variant: is the immediate index of a quadtuplet of four 16-bit elements within each 128-bit vector segment, in the range 0 to 1, encoded in the "i1" field.
Operation

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
integer eltspersegment = 128 DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) operand3 = Z[da];
bits(VL) result;

for e = 0 to elements-1
    integer segmentbase = e - e MOD eltspersegment;
    integer s = segmentbase + index;
    bits(esize) res = Elem[operand3, e, esize];
    for i = 0 to 3
        integer element1 = SInt(Elem[operand1, 4 * e + i, esize DIV 4]);
        integer element2 = SInt(Elem[operand2, 4 * s + i, esize DIV 4]);
        res = res + element1 * element2;
    Elem[result, e, esize] = res;
Z[da] = result;
```

Operational information

If PSTATE.DIT is 1:

SEL (vectors)

Conditionally select elements from two vectors.

Read active elements from the first source vector and inactive elements from the second source vector and place in the corresponding elements of the destination vector.

This instruction is used by the alias MOV (vector, predicated).

Alien Conditions

<table>
<thead>
<tr>
<th>Alias</th>

  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
SM4E

SM4 encryption and decryption.

The SM4E instruction reads 16 bytes of input data from each 128-bit segment of the first source vector, together with four iterations of 32-bit round keys from the corresponding 128-bit segments of the second source vector. Each block of data is encrypted by four rounds in accordance with the SM4 standard, and destructively placed in the corresponding segments of the first source vector. This instruction is unpredicated.

ID_AA64ZFR0_EL1.SM4 indicates whether this instruction is implemented.

• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
SM4EKEY

SM4 key updates.

The SM4EKEY instruction reads four rounds of 32-bit input key values from each 128-bit segment of the first source vector, along with four rounds of 32-bit constants from the corresponding 128-bit segment of the second source vector. The four rounds of output key values are derived in accordance with the SM4 standard, and placed in the corresponding segments of the destination vector. This instruction is unpredicated.

ID_AA64ZFR0_EL1.SM4 indicates whether this instruction is implemented.

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
SMINV

Signed minimum reduction to scalar.

Signed minimum horizontally across all lanes of a vector, and place the result in the SIMD&FP scalar destination register. Inactive elements in the source vector are treated as the maximum signed integer for the element size.

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

```

#### 64-bit

SMLSLB \(<Zda>.D, <Zn>.S, <Zm>.S[<imm>]\)

```c
if !HaveSVE2() then UNDEFINED;
integer esize = 32;
integer index = UInt(i2h:i2l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
integer sel = 0;
```

### Assembler Symbols

- `<Zda>` Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
- `<Zn>` Is the name of the first source scalable vector register, encoded in the "Zn" field.
- `<Zm>` For the 32-bit variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field.
  
  For the 64-bit variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
- `<imm>` For the 32-bit variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields.
  
  For the 64-bit variant: is the element index, in the range 0 to 3, encoded in the "i2h:i2l" fields.
Operation

```
CheckSVEEnabled();
integer elements = VL DIV (2 * esize);
integer eltspersegment = 128 DIV (2 * esize);
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result = Z[da];

for e = 0 to elements - 1
    integer s = e - e MOD eltspersegment;
    integer element1 = SInt(Elem[operand1, 2 * e + sel, esize]);
    integer element2 = SInt(Elem[operand2, 2 * s + index, esize]);
    integer element3 = SInt(Elem[result, e, 2*esize]);
    integer res = element3 - element1 * element2;
    Elem[result, e, 2*esize] = res<2*esize-1:0>;

Z[da] = result;
```

Operational information

If PSTATE.DIT is 1:
  • The execution time of this instruction is independent of:
    ◦ The values of the data supplied in any of its registers.
    ◦ The values of the NZCV flags.
  • The response of this instruction to asynchronous exceptions does not vary based on:
    ◦ The values of the data supplied in any of its registers.
    ◦ The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:
  • The MOVPRFX instruction must specify the same destination register as this instruction.
  • The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:
  • An unpredicated MOVPRFX instruction.
Signed multiply-subtract long from accumulator (top).

Multiply the corresponding odd-numbered signed elements of the first and second source vectors and destructively subtract from the overlapping double-width elements of the addend vector. This instruction is unpredicated.

```
0 1 0 0 0 1 0 0 | size | 0  Zm | 0 1 0 1 | 0 1 | Zn | Zda
```

The MOVPRFX instructions that can be used with this instruction are as follows:

• An unpredicated MOVPRFX instruction.
SMLSLT (indexed)

Signed multiply-subtract long from accumulator (top, indexed).

Multiply the odd-numbered signed elements within each 128-bit segment of the first source vector by the specified signed element in the corresponding second source vector segment and destructively subtract from the overlapping double-width elements of the addend vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 2 or 3 bits depending on the size of the element.

It has encodings from 2 classes: 32-bit and 64-bit

  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:
- An unpredicate MOVPRFX instruction.
SMMLA

Signed integer matrix multiply-accumulate.

The signed integer matrix multiply-accumulate instruction multiplies the 2×8 matrix of signed 8-bit integer values held in each 128-bit segment of the first source vector by the 8×2 matrix of signed 8-bit integer values in the corresponding segment of the second source vector. The resulting 2×2 widened 32-bit integer matrix product is then destructively added to the 32-bit integer matrix accumulator held in the corresponding segment of the addend and destination vector. This is equivalent to performing an 8-way dot product per destination element.

This instruction is unpredicated.

ID_AA64ZFR0_EL1.I8MM indicates whether this instruction is implemented.

SMULLB (indexed)

Signed multiply long (bottom, indexed).

Multiply the even-numbered signed elements within each 128-bit segment of the first source vector by the specified signed element in the corresponding second source vector segment, and place the results in the overlapping double-width elements of the destination vector register.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 2 or 3 bits depending on the size of the element.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

32-bit

if !HaveSVE2() then UNDEFINED;
integer esize = 16;
integer index = UInt(i3h:i3l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
integer sel = 0;

64-bit

64-bit

  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
SPLICE

Splice two vectors under predicate control.

Copy the first active to last active elements (inclusive) from the first source vector to the lowest-numbered elements of the result. Then set any remaining elements of the result to a copy of the lowest-numbered elements from the second source vector. The result is placed destructively in the destination and first source vector, or constructively in the destination vector.

It has encodings from 2 classes: Constructive and Destructive

Constructive

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |
|-----------------------------|----------------|----------------|

x = x + 1;
Z[dst] = result;
```

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:
- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
**SQABS**

Signed saturating absolute value.

Compute the absolute value of the signed integer in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. Inactive elements in the destination vector register remain unmodified.

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 1 0 0 0 1 0 0 | size | 0 0 1 0 0 0 1 0 1 | Pg | Zn | Zd
```

**SVE2**

SQABS <Zd>.<T>, <Pg>/M, <Zn>.<T>

```sql
if !HaveSVE2() then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
```

**Assembler Symbols**

- `<Zd>` Is the name of the destination scalable vector register, encoded in the "Zd" field.
- `<T>` Is the size specifier, encoded in “size”:
  
<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>

    else
        Elem[result, e, esize] = Elem[operand1, e, esize];

Z[dn] = result;

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
• The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
SQADD (immediate)

Signed saturating add immediate (unpredicated).

Signed saturating add of an unsigned immediate to each element of the source vector, and destructively place the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. This instruction is unpredicated. The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280. The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**SQCADD**

Saturating complex integer add with rotate.

Add the real and imaginary components of the integral complex numbers from the first source vector to the complex numbers from the second source vector which have first been rotated by 90 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, equivalent to multiplying the complex numbers in the second source vector by ±j beforehand. Destructively place the results in the corresponding elements of the first source vector. Each result element is saturated to the N-bit element's signed integer range \(-2^{(N-1)}\) to \(2^{(N-1)}-1\). This instruction is unpredicated.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- **<Zm>** Is the name of the second source scalable vector register, encoded in the “Zm” field.
- **<const>** Is the const specifier, encoded in “rot”:

<table>
<thead>
<tr>
<th>rot</th>
<th>&lt;const&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>#90</td>
</tr>
<tr>
<td>1</td>
<td>#270</td>
</tr>
</tbody>
</table>
Operation

```c
CheckSVEEnabled();
integer pairs = VL DIV (2 * esize);
bits(VL) operand1 = Z[dn];
bits(VL) operand2 = Z[m];
bits(VL) result;

for p = 0 to pairs-1
    integer acc_r  = SInt(Elem[operand1, 2 * p + 0, esize]);
    integer acc_i  = SInt(Elem[operand1, 2 * p + 1, esize]);
    integer elt2_r = SInt(Elem[operand2, 2 * p + 0, esize]);
    integer elt2_i = SInt(Elem[operand2, 2 * p + 1, esize]);
    if sub_i then
        acc_r = acc_r - elt2_i;
        acc_i = acc_i + elt2_r;
    if sub_r then
        acc_r = acc_r + elt2_i;
        acc_i = acc_i - elt2_r;
    Elem[result, 2 * p + 0, esize] = SignedSat(acc_r, esize);
    Elem[result, 2 * p + 1, esize] = SignedSat(acc_i, esize);

Z[dn] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
Signed saturating decrement scalar by multiple of 8-bit predicate constraint element count.

Determines the number of active 8-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination. The result is saturated to the source general-purpose register’s signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: **32-bit** and **64-bit**

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the “imm4” field.

**Operation**

```c
CheckSVEEnabled();
integer count = DecodePredCount(pat, esize);
bits(ssize) operand1 = X[dn];
bits(ssize) result;

integer element1 = Int(operand1, unsigned);
(result, -) = SatQ(element1 - (count * imm), ssize, unsigned);
X[dn] = Extend(result, 64, unsigned);
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**SQDECH (vector)**

Signed saturating decrement vector by multiple of 16-bit predicate constraint element count.

Determines the number of active 16-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement all destination vector elements. The results are saturated to the 16-bit signed integer range.

The named predicate constraint limits the number of active elements in a single predicate to:

* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
**SQDECP (scalar)**

Signed saturating decrement scalar by count of true predicate elements.

Counts the number of true elements in the source predicate and then uses the result to decrement the scalar destination. The result is saturated to the source general-purpose register's signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

It has encodings from 2 classes: **32-bit** and **64-bit**

### 32-bit

![32-bit encoding](image)

```plaintext
SQDECP <Xdn>, <Pm>.<T>, <Wdn>
if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer m = UInt(Pm);
integer dn = UInt(Rdn);
boolean unsigned = FALSE;
integer ssize = 32;
```

### 64-bit

![64-bit encoding](image)

```plaintext
SQDECP <Xdn>, <Pm>.<T>
if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer m = UInt(Pm);
integer dn = UInt(Rdn);
boolean unsigned = FALSE;
integer ssize = 64;
```

**Assembler Symbols**

- `<Xdn>` Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
- `<Pm>` Is the name of the source scalable predicate register, encoded in the "Pm" field.
- `<T>` Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- `<Wdn>` Is the 32-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
Operation

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(ssize) operand1 = X[dn];
bits(PL) operand2 = P[m];
bits(ssize) result;
integer count = 0;

for e = 0 to elements-1
    if ElemP[operand2, e, esize] == '1' then
        count = count + 1;

integer element = Int(operand1, unsigned);
(result, -) = SatQ(element - count, ssize, unsigned);
X[dn] = Extend(result, 64, unsigned);
```

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**SQDECP (vector)**

Signed saturating decrement vector by count of true predicate elements.

Counts the number of true elements in the source predicate and then uses the result to decrement all destination vector elements. The results are saturated to the element signed integer range.

The predicate size specifier may be omitted in assembler source code, but this is deprecated and will be prohibited in a future release of the architecture.

```

SQDMLALB (vectors)

Signed saturating doubling multiply-add long to accumulator (bottom).

Multiply then double the corresponding even-numbered signed elements of the first and second source vectors. Each intermediate value is saturated to the double-width N-bit value’s signed integer range \(-2^{(N-1)}\) to \((2^{(N-1)})-1\). Then destructively add to the overlapping double-width elements of the addend and destination vector. Each destination element is saturated to the double-width N-bit element’s signed integer range \(-2^{(N-1)}\) to \((2^{(N-1)})-1\). This instruction is unpredicated.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
SQDMLALB (indexed)

Signed saturating doubling multiply-add long to accumulator (bottom, indexed).

Multiply then double the even-numbered signed elements within each 128-bit segment of the first source vector and specified signed element in the corresponding second source vector segment. Each intermediate value is saturated to the double-width N-bit value's signed integer range \(-2^{(N-1)}\) to \((2^{(N-1)})-1\). Then destructively add to the overlapping double-width elements of the addend and destination vector. Each destination element is saturated to the double-width N-bit element's signed integer range \(-2^{(N-1)}\) to \((2^{(N-1)})-1\).

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 2 or 3 bits depending on the size of the element.

It has encodings from 2 classes: **32-bit** and **64-bit**

### 32-bit

```assembly
| 31  | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  |  9  |  8  |  7  |  6  |  5  |  4  |  3  |  2  |  1  |  0 |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 0   | 1   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

Signed saturating doubling multiply-subtract long from accumulator (bottom, indexed).

Multiply then double the even-numbered signed elements within each 128-bit segment of the first source vector and the specified signed element in the corresponding second source vector segment. Each intermediate value is saturated to the double-width N-bit value’s signed integer range \(-2^{(N-1)}\) to \((2^{(N-1)})-1\). Then destructively subtract from the overlapping double-width elements of the addend and destination vector. Each destination element is saturated to the double-width N-bit element’s signed integer range \(-2^{(N-1)}\) to \((2^{(N-1)})-1\).

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 2 or 3 bits depending on the size of the element.

It has encodings from 2 classes: **32-bit** and **64-bit**

### 32-bit

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 0  | 1  | 0  | 0  | 1  | 0 | 0  | 1  | i3h | Zm | 0 | 0 | 1 | 1 | i3l | 0 | Zn | Zda |

### 32-bit

```
```

if !HaveSVE2() then UNDEFINED;
integer esize = 16;
integer index = UInt(i3h:i3l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
integer sel = 0;

### 64-bit

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

<td>S</td>
</tr>
</tbody>
</table>

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
integer elements = VL DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
    integer element1 = SInt(Elem[operand1, 2*e + 0, esize DIV 2]);
    integer element2 = SInt(Elem[operand2, 2*e + 0, esize DIV 2]);
    integer res = 2 * element1 * element2;
    Elem[result, e, esize] = SignedSat(res, esize);
Z[d] = result;
```

Operational information

If PSTATE.DIT is 1:
• The execution time of this instruction is independent of:
- The values of the data supplied in any of its registers.
- The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**SQDMULLB (indexed)**

Signed saturating doubling multiply long (bottom, indexed).

Multiply then double the even-numbered signed elements within each 128-bit segment of the first source vector and
the specified element in the corresponding second source vector segment, and place the results in overlapping double-
width elements of the destination vector register. Each result element is saturated to the double-width N-bit element's
signed integer range \(-2^{(N-1)}\) to \(2^{(N-1)}-1\).

The elements within the second source vector are specified using an immediate index which selects the same element
position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per
128-bit segment, encoded in 2 or 3 bits depending on the size of the element.

It has encodings from 2 classes: **32-bit** and **64-bit**

### 32-bit

<table>
<thead>
<tr>
<th>Zd</th>
<th>Zm</th>
<th>Zn</th>
</tr>
</thead>
<tbody>
<tr>
<td>01000101i3h</td>
<td>110000 Zm</td>
<td>00000000 Zn</td>

      ◦ The values of the data supplied in any of its registers.
      ◦ The values of the NZCV flags.
SQINCB

Signed saturating increment scalar by multiple of 8-bit predicate constraint element count.

Determines the number of active 8-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination. The result is saturated to the source general-purpose register's signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 0 0 0 0 1 0 0 0 0 1 0 | imm4 | 1 1 1 1 0 | 0 | pattern | Rdn
```

64-bit

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 0 0 0 0 1 0 0 0 0 1 1 | imm4 | 1 1 1 1 0 | 0 | pattern | Rdn
```

**SQINCD (vector)**

Signed saturating increment vector by multiple of 64-bit predicate constraint element count.

Determines the number of active 64-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment all destination vector elements. The results are saturated to the 64-bit signed integer range.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.
Operation

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
bits(VL) operand1 = Z[dn];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element1 + (count * imm), esize, unsigned);

Z[dn] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
**SQINCH (scalar)**

Signed saturating increment scalar by multiple of 16-bit predicate constraint element count.

Determines the number of active 16-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination. The result is saturated to the source general-purpose register’s signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

The named predicate constraint limits the number of active elements in a single predicate to:

* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

### 32-bit

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
SQINCW (scalar)

Signed saturating increment scalar by multiple of 32-bit predicate constraint element count.

Determines the number of active 32-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination. The result is saturated to the source general-purpose register's signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

for \( e = 0 \) to \( \text{elements-1} \)
\begin{align*}
\text{integer element1} &= \texttt{Int}([\texttt{Elem}[\text{operand1}, e, \text{esize}], \text{unsigned}]) \\
(\texttt{Elem}[\text{result}, e, \text{esize}], -) &= \texttt{SatQ}(\text{element1} + (\text{count} \times \text{imm}), \text{esize}, \text{unsigned});
\end{align*}
\texttt{Z}[dn] = \text{result};

Operational information

If \text{PSTATE.DIT} is 1:
\begin{itemize}
  \item The execution time of this instruction is independent of:
    \begin{itemize}
      \item The values of the data supplied in any of its registers.
      \item The values of the NZCV flags.
    \end{itemize}
  \item The response of this instruction to asynchronous exceptions does not vary based on:
    \begin{itemize}
      \item The values of the data supplied in any of its registers.
      \item The values of the NZCV flags.
    \end{itemize}
\end{itemize}

This instruction might be immediately preceded in program order by a \texttt{MOVPRFX} instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is \texttt{UNPREDICTABLE}:
\begin{itemize}
  \item The \texttt{MOVPRFX} instruction must specify the same destination register as this instruction.
  \item The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
\end{itemize}
The \texttt{MOVPRFX} instructions that can be used with this instruction are as follows:
\begin{itemize}
  \item An unpredicated \texttt{MOVPRFX} instruction.
\end{itemize}
**SQNEG**

Signed saturating negate.

Negate the signed integer value in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Each result element is saturated to the N-bit element's signed integer range \(-2^{(N-1)}\) to \(2^{(N-1)}-1\). Inactive elements in the destination vector register remain unmodified.

    if ElemP[mask, e, esize] \(\neq\) '1' then
        element = -element;
    Elem[result, e, esize] = \(\text{SignedSat}(\text{element}, \text{esize})\);
Z[d] = result;
```

**Operational information**

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
This instruction might be immediately preceded in program order by a `MOVPRFX` instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The `MOVPRFX` instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The `MOVPRFX` instructions that can be used with this instruction are as follows:

- An unpredicated `MOVPRFX` instruction.
- A predicated `MOVPRFX` instruction using the same governing predicate register and source element size as this instruction.
SQRDCMLAH (vectors)

Saturating rounding doubling complex integer multiply-add high with rotate.

Multiply without saturation the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of the integral numbers in the first source vector by the corresponding complex number in the second source vector rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation. Then double and add the products to the corresponding components of the complex numbers in the addend vector. Destructively place the most significant rounded half of the results in the corresponding elements of the addend vector. Each result element is saturated to the N-bit element’s signed integer range $-2^{(N-1)}$ to $(2^{(N-1)}-1$. This instruction is unpredicated.

These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees apart.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

    Elem[result, e, esize] = SignedSat(res, esize);
  else
    Elem[result, e, esize] = Elem[operand2, e, esize];
  Z[dn] = result;

Operational information

If PSTATE.DIT is 1:
  • The execution time of this instruction is independent of:
The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.

The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
SQRSHRNBN

Signed saturating rounding shift right narrow by immediate (bottom).

Shift each signed integer value in the source vector elements right by an immediate value, and place the rounded results in the even-numbered half-width destination elements, while setting the odd-numbered elements to zero. Each result element is saturated to the half-width N-bit element's signed integer range \((-2^{(N-1)})\) to \((2^{(N-1)})-1\). The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
**SQSHLU**

Signed saturating shift left unsigned by immediate.

Shift left by immediate each active signed element of the source vector, and destructively place the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element's unsigned integer range 0 to \(2^N-1\). The immediate shift amount is an unsigned value in the range 0 to number of bits per element minus 1. Inactive elements in the destination vector register remain unmodified.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
**SQSUB (immediate)**

Signed saturating subtract immediate (unpredicated).

Signed saturating subtract of an unsigned immediate from each element of the source vector, and destructively place the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element's signed integer range \(-2^{(N-1)}\) to \((2^{(N-1)}-1\). This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as ".#0, LSL #8".

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**SRSHL**

Signed rounding shift left by vector (predicated).

Shift active signed elements of the first source vector by corresponding elements of the second source vector and destructively place the rounded results in the corresponding elements of the first source vector. A positive shift amount performs a left shift, otherwise a right shift by the negated shift amount is performed. Inactive elements in the destination vector register remain unmodified.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
- The values of the NZCV flags.
  - The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
    - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a \texttt{MOVPRFX} instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is \texttt{UNPREDICTABLE}:
- The \texttt{MOVPRFX} instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The \texttt{MOVPRFX} instructions that can be used with this instruction are as follows:
  - An unpredicated \texttt{MOVPRFX} instruction.
  - A predicated \texttt{MOVPRFX} instruction using the same governing predicate register and source element size as this instruction.
Signed rounding shift left reversed vectors (predicated).

Shift active signed elements of the second source vector by corresponding elements of the first source vector and destructively place the rounded results in the corresponding elements of the first source vector. A positive shift amount performs a left shift, otherwise a right shift by the negated shift amount is performed. Inactive elements in the destination vector register remain unmodified.

$<$const$>$ Is the immediate shift amount, in the range 0 to number of bits per element minus 1, encoded in “tsz:imm3”.

Operation

CheckSVEEnabled();

integer elements = VL DIV (2 * esize);

bits(VL) operand = Z[n];

bits(VL) result;

for e = 0 to elements-1
  bits(esize) element = Elem[operand, 2*e + 1, esize];
  integer shifted_value = $<$Int (element) $<$ shift;
  Elem[result, e, 2*esize] = shifted_value$<$2*esize-1:0$>$;

Z[d] = result;
Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
SSRA

Signed shift right and accumulate (immediate).

Shift right by immediate each signed element of the source vector, preserving the sign bit, and add the truncated intermediate result destructively to the corresponding elements of the addend vector. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.

  • The execution time of this instruction is independent of:
    ◦ The values of the data supplied in any of its registers.
    ◦ The values of the NZCV flags.
  • The response of this instruction to asynchronous exceptions does not vary based on:
The values of the data supplied in any of its registers.

The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

• An unpredicated MOVPRFX instruction.
SSUBLB

Signed subtract long (bottom).

Subtract the even-numbered signed elements of the second source vector from the corresponding signed elements of
the first source vector, and place the results in the overlapping double-width elements of the destination vector. This
instruction is unpredicated.

ST1B (vector plus immediate)

Scatter store bytes from a vector (immediate index).

Scatter store of bytes from the active elements of a vector register to the memory addresses generated by a vector base plus immediate index. The index is in the range 0 to 31. Inactive elements are not written to memory.

It has encodings from 2 classes: 32-bit element and 64-bit element

32-bit element

32-bit element

ST1B { <Zt>.S }, <Pg>, [<Zn>.S{, #<imm>}]

if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
integer esize = 32;
integer msize = 8;
integer offset = UInt(imm5);

64-bit element

64-bit element

ST1B { <Zt>.D }, <Pg>, [<Zn>.D{, #<imm>}]

if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
integer esize = 64;
integer msize = 8;
integer offset = UInt(imm5);

Assembler Symbols

<Zt> Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the base scalable vector register, encoded in the "Zn" field.

<imm> Is the optional unsigned immediate byte offset, in the range 0 to 31, defaulting to 0, encoded in the "imm5" field.
Operation

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) base = Z[n];
bits(VL) src = Z[t];
bits(PL) mask = P[g];
bits(64) addr;
constant integer mbytes = msize DIV 8;
if HaveMTEExt() then SetNotTagCheckedInstruction(FALSE);
for e = 0 to elements-1
  if ElemP[mask, e, esize] == '1' then
    addr = ZeroExtend(Elem[base, e, esize], 64) + offset * mbytes;
    Mem[addr, mbytes, AccType_NORMAL] = Elem[src, e, esize]<msize-1:0>;
```

ST1B (scalar plus immediate)

Contiguous store bytes from vector (immediate index).

Contiguous store of bytes from elements of a vector register to the memory address generated by a 64-bit scalar base
and immediate index in the range -8 to 7 which is multiplied by the vector's in-memory size, irrespective of
predication, and added to the base address. Inactive elements are not written to memory.

```
| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |
|---------------------------------|----------|----------|----------|----------|----------|

```
ST1B (scalar plus scalar)

Contiguous store bytes from vector (scalar index).

Contiguous store of bytes from elements of a vector register to the memory address generated by a 64-bit scalar base and scalar index which is added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements are not written to memory.

**ST1H (scalar plus scalar)**

Contiguous store halfwords from vector (scalar index).

Contiguous store of halfwords from elements of a vector register to the memory address generated by a 64-bit scalar base and scalar index which is multiplied by 2 and added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements are not written to memory.

ST2B (scalar plus immediate)

Contiguous store two-byte structures from two vectors (immediate index).

Contiguous store two-byte structures, each from the same element number in two vector registers to the memory address generated by a 64-bit scalar base and an immediate index which is a multiple of 2 in the range -16 to 14 that is multiplied by the vector's in-memory size, irrespective of predication.

Each predicate element applies to the same element number in each of the two vector registers, or equivalently to the two consecutive bytes in memory which make up each structure. Inactive structures are not written to memory.

**STNT1B (vector plus scalar)**

Scatter store non-temporal bytes.

Scatter store non-temporal of bytes from the active elements of a vector register to the memory addresses generated by a vector base plus a 64-bit unscaled scalar register offset. Inactive elements are not written to memory. A non-temporal store is a hint to the system that this data is unlikely to be referenced again soon.

It has encodings from 2 classes: **32-bit unscaled offset** and **64-bit unscaled offset**

### 32-bit unscaled offset

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 1  | 1  | 1  | 0  | 0  | 1  | 0  | 0  | 1  | 0  | Rm | 0  | 0  | 1  | Pg | Zn | Zt |

### 32-bit unscaled offset

```
STNT1B { <Zt>.S }, <Pg>, [<Zn>.S{, <Xm>}]
```

if !HaveSVE2() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer m = UInt(Rm);
integer g = UInt(Pg);
integer esize = 32;
integer msize = 8;

### 64-bit unscaled offset

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 1  | 1  | 1  | 0  | 0  | 1  | 0  | 0  | 0  | 0  | Rm | 0  | 0  | 1  | Pg | Zn | Zt |

### 64-bit unscaled offset

```
STNT1B { <Zt>.D }, <Pg>, [<Zn>.D{, <Xm>}]
```

if !HaveSVE2() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer m = UInt(Rm);
integer g = UInt(Pg);
integer esize = 64;
integer msize = 8;

### Assembler Symbols

- **<Zt>** Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
- **<Pg>** Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- **<Zn>** Is the name of the base scalable vector register, encoded in the "Zn" field.
- **<Xm>** Is the optional 64-bit name of the general-purpose offset register, defaulting to XZR, encoded in the "Rm" field.
Operation

STNT1B (scalar plus scalar)

Contiguous store non-temporal bytes from vector (scalar index).

Contiguous store non-temporal of bytes from elements of a vector register to the memory address generated by a 64-bit scalar base and scalar index which is added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements are not written to memory.

A non-temporal store is a hint to the system that this data is unlikely to be referenced again soon.

### Assembler Symbols

**<Zt>**

Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.

**<Pg>**

Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

**<Zn>**

Is the name of the base scalable vector register, encoded in the "Zn" field.

**<Xm>**

Is the optional 64-bit name of the general-purpose offset register, defaulting to XZR, encoded in the "Rm" field.
Operation

\[
\begin{align*}
\text{CheckSVEEnabled}(); \\
\text{integer elements} &= \mathbf{VL} \div \mathbf{esize}; \\
\text{bits(}\mathbf{VL}\text{) base} &= \mathbf{Z}[n]; \\
\text{bits(64)} \text{ offset} &= \mathbf{X}[m]; \\
\text{bits(}\mathbf{VL}\text{) src} &= \mathbf{Z}[t]; \\
\text{bits(}\mathbf{PL}\text{) mask} &= \mathbf{P}[g]; \\
\text{bits(64)} \text{ addr} &= ; \\
\text{constant integer mbytes} &= \mathbf{msize} \div \mathbf{8}; \\
\text{if } \text{HaveMTEExt()} \text{ then SetNotTagCheckedInstruction(FALSE);} \\
\text{for } e = 0 \text{ to elements-1} \\
\quad \text{if } \text{ElemP[mask, e, esize]} = '1' \text{ then} \\
\qquad \text{addr} &= \text{ZeroExtend(Elem[base, e, esize], 64)} + \text{offset}; \\
\qquad \text{Mem[addr, mbytes, AccType_STREAM]} &= \text{Elem[src, e, esize]<msize-1:0>};
\end{align*}
\]
STNT1W (scalar plus immediate)

Contiguous store non-temporal words from vector (immediate index).

Contiguous store non-temporal of words from elements of a vector register to the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements are not written to memory.

A non-temporal store is a hint to the system that this data is unlikely to be referenced again soon.

A non-temporal store is a hint to the system that this data is unlikely to be referenced again soon.

---

STNT1W (scalar plus scalar)

Contiguous store non-temporal words from vector (scalar index).

Contiguous store non-temporal of words from elements of a vector register to the memory address generated by a 64-bit scalar base and scalar index which is multiplied by 4 and added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements are not written to memory. A non-temporal store is a hint to the system that this data is unlikely to be referenced again soon.

boolean aligned = AArch64.CheckAlignment(base + offset, 16, AccType_NORMAL, TRUE);
for e = 0 to elements-1
    AArch64.MemSingle[base + offset, 1, AccType_NORMAL, aligned] = Elem[src, e, 8];
    offset = offset + 1;
```
SUB (vectors, predicated)

Subtract vectors (predicated).

Subtract active elements of the second source vector from corresponding elements of the first source vector and destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

### Assembler Symbols

- `<Zdn>` Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
- `<T>` Is the size specifier, encoded in “size”:
  
<table>
<thead>
<tr>
<th>size</th>
<th><code>&lt;T&gt;</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- `<Pg>` Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<Zm>` Is the name of the second source scalable vector register, encoded in the “Zm” field.

### Operation

```plaintext
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[dn];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
    bits(esize) element2 = Elem[operand2, e, esize];
    if ElemP[mask, e, esize] == '1' then
        Elem[result, e, esize] = element1 - element2;
    else
        Elem[result, e, esize] = Elem[operand1, e, esize];

Z[dn] = result;
```

### Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
- The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
- The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

The MOVPRFX instructions that can be used with this instruction are as follows:

- An unpredicated MOVPRFX instruction.
- A predicated MOVPRFX instruction using the same governing predicate register and source element size as this instruction.
SUB (immediate)

Subtract immediate (unpredicated).

Subtract an unsigned immediate from each element of the source vector, and destructively place the results in the corresponding elements of the source vector. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<uimm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

### Assembler Symbols

- `<Zdn>` Is the name of the source and destination scalable vector register, encoded in the “Zdn” field.
- `<T>` Is the size specifier, encoded in “size”:
  
<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- `<imm>` Is an unsigned immediate in the range 0 to 255, encoded in the “imm8” field.
- `<shift>` Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:
  
<table>
<thead>
<tr>
<th>sh</th>
<th>&lt;shift&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>LSL #0</td>
</tr>
<tr>
<td>1</td>
<td>LSL #8</td>
</tr>
</tbody>
</table>

### Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(VL) result;
for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
    Elem[result, e, esize] = element1 - imm;

Z[dn] = result;
```

### Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
This instruction might be immediately preceded in program order by a MOVPRFX instruction that conforms to all of the following requirements, otherwise the behavior of either or both instructions is UNPREDICTABLE:
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
The MOVPRFX instructions that can be used with this instruction are as follows:
• An unpredicated MOVPRFX instruction.
**SUB (vectors, unpredicated)**

Subtract vectors (unpredicated).

Subtract all elements of the second source vector from corresponding elements of the first source vector and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

<td>D</td>
</tr>
</tbody>
</table>

- `<Zn>` Is the name of the first source scalable vector register, encoded in the "Zn" field.
- `<Zm>` Is the name of the second source scalable vector register, encoded in the "Zm" field.

**Operation**

```plaintext
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
    bits(esize) element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = element1 - element2;
Z[d] = result;
```

**Operational information**

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
SUBHNB

Subtract narrow high part (bottom).

Subtract each vector element of the second source vector from the corresponding vector element in the first source vector, and place the most significant half of the result in the even-numbered half-width destination elements, while setting the odd-numbered elements to zero. This instruction is unpredicated.
