### Assembler Symbols

- **2**
  - Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in "Q":
    
    $Q$
    
    | 0 | 2 |
    |---|---|
    | 0 | [absent] |
    | 1 | [present] |

- **<Vd>**
  - Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

- **<Tb>**
  - Is an arrangement specifier, encoded in "size:Q":

Scalar

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = esize;
integer part = 0;
integer elements = 1;
```

Vector

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
```
<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Ta> Is an arrangement specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;Ta&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>8H</td>
</tr>
<tr>
<td>01</td>
<td>4S</td>
</tr>
<tr>
<td>10</td>

Signed Rounding Halving Add. This instruction adds corresponding signed integer values from the two source SIMD&FP registers, shifts each result right one bit, places the results into a vector, and writes the vector to the destination SIMD&FP register.

The results are rounded. For truncated results, see SHADD.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

### Three registers of the same type

SRHADD `<Vd>..<T>, <Vn>..<T>, <Vm>..<T>`

- `integer d = Uint(Rd);`
- `integer n = Uint(Rn);`
- `integer m = Uint(Rm);`

- `<Vm>` Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

### Operation

```plaintext
CheckFPAdvSIMDEnabled64();
bv31` operands = V[n];
bv31` operand1 = V[m];
bv31` result; integer element1;
integer element2;
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    Elem[result, e, esize] = (element1+element2+1)<esize:1>;
```

V[d] = result;
SRI

Shift Right and Insert (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each vector element by an immediate value, and inserts the result into the corresponding vector element in the destination SIMD&FP register such that the new zero bits created by the shift are not inserted but retain their existing value. Bits shifted out of the right of each vector element of the source register are lost.

The following figure shows an example of the operation of shift right by 3 for an 8-bit vector element.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

V[d] = result;
```

### Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**SRSHL**

Signed Rounding Shift Left (register). This instruction takes each signed integer value in the vector of the first source SIMD&FP register, shifts it by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register. If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a rounding right shift. For a truncating shift, see **SSHL**.

Depending on the settings in the **CPACR_EL1**, **CPTR_EL2**, and **CPTR_EL3** registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: **Scalar** and **Vector**

SSHL

Signed Shift Left (register). This instruction takes each signed integer value in the vector of the first source SIMD&FP register, shifts each value by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a truncating right shift. For a rounding shift, see SRSHL.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

V[d] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
SSHLL, SSHLL2

Signed Shift Left Long (immediate). This instruction reads each vector element from the source SIMD&FP register, left shifts each vector element by the specified shift amount, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are signed integer values.

The SSHLL instruction extracts vector elements from the lower half of the source register, while the SSHLL2 instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias SXTL, SXTL2.

Vector

SSHLL{2} <Vd>..<Ta>, <Vn>..<Tb>, #<shift>

integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE(asimdimm);
if immh<3> == '1' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

integer shift = UInt(immh:immb) - esize;
boolean unsigned = (U == '1');

Assembler Symbols

2

Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in "Q":

</table>

**Operation**

```cpp
CheckFPAdvSIMDEnabled64();
bhits(datasize) operand = Vpart[n, part];
bhits(datasize*2) result;
integer element;
for e = 0 to elements-1
  element = Int(Elem[operand, e, esize], unsigned) << shift;
  Elem[result, e, 2*esize] = element<2*esize-1:0>;

V[d] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
SSHR

Signed Shift Right (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, places the final result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are signed integer values. The results are truncated. For rounded results, see `SRSHR`.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

### Scalar

<td>(64-UInt(immh:immb))</td>
</tr>
<tr>
<td>1xxx</td>
<td>(128-UInt(immh:immb))</td>
</tr>
</tbody>
</table>

**Operation**

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) operand2;
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
inelement;
operand2 = if accumulate then V[d] else Zeros();
for e = 0 to elements-1
element = (Int(Elem[operand, e, esize], unsigned) + round.const) >> shift;
Elem[result, e, esize] = Elem[operand2, e, esize] + element<esize-1:0>;
V[d] = result;
```

**Operational information**

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
SSUBL, SSUBL2

Signed Subtract Long. This instruction subtracts each vector element in the lower or upper half of the second source SIMD&FP register from the corresponding vector element of the first source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are signed integer values. The destination vector elements are twice as long as the source vector elements.

The SSUBL instruction extracts each source vector from the lower half of each source register, while the SSUBL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

ST1 (multiple structures)

Store multiple single-element structures from one, two, three, or four registers. This instruction stores elements to memory from one, two, three, or four SIMD&FP registers, without interleaving. Every element of each register is stored.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: No offset and Post-index

### No offset

```
| 0 | Q | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | x | x | 1 | x | size | Rn | Rt |
```

    else
        X[n] = address + offs;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
**ST1 (single structure)**

Store a single-element structure from one lane of one register. This instruction stores the specified element of a SIMD&FP register to memory. Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: **No offset** and **Post-index**

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
ST2 (multiple structures)

Store multiple 2-element structures from two registers. This instruction stores multiple 2-element structures from two SIMD&FP registers to memory, with interleaving. Every element of each register is stored. Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: No offset and Post-index.

### No offset

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

| L  |    |    |    |    |    |    |    |    |    |    |    |    |      |    |    |    |    |      |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

### Assembler Symbols

- `<Vt>` Is the name of the first or only SIMD&FP register to be transferred, encoded in the “Rt” field.
- `<T>` Is an arrangement specifier, encoded in “size:Q”:

<table>
<thead>
<tr>
<th>size</th>
<th>Q</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>0</td>
<td>8B</td>
</tr>
<tr>
<td>00</td>
<td>1</td>
<td>16B</td>
</tr>
<tr>
<td>01</td>
<td>0</td>
<td>4H</td>
</tr>
<tr>
<td>01</td>
<td>1</td>
<td>8H</td>
</tr>
<tr>
<td>10</td>
<td>0</td>
<td>2S</td>
</tr>
<tr>
<td>10</td>
<td>1</td>
<td>4S</td>
</tr>
<tr>
<td>11</td>
<td>0</td>
<td>RESERVED</td>
</tr>
<tr>
<td>11</td>
<td>1</td>
<td>2D</td>
</tr>
</tbody>
</table>

- `<Vt2>` Is the name of the second SIMD&FP register to be transferred, encoded as “Rt” plus 1 modulo 32.
<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the post-index immediate offset, encoded in "Q":

<table>
<thead>
<tr>
<th>Q</th>
<th>&lt;imm&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>#16</td>
</tr>
<tr>
<td>1</td>
<td>#32</td>
</tr>
</tbody>
</table>

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

**Shared Decode**

ST4 (multiple structures)

Store multiple 4-element structures from four registers. This instruction stores multiple 4-element structures to memory from four SIMD&FP registers, with interleaving. Every element of each register is stored. Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: No offset and Post-index

No offset

  else
    X[n] = address + offs;

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
STNP (SIMD&FP)

Store Pair of SIMD&FP registers, with Non-temporal hint. This instruction stores a pair of SIMD&FP registers to memory, issuing a hint to the memory system that the access is non-temporal. The address used for the store is calculated from an address from a base register value and an immediate offset. For information about non-temporal pair instructions, see Load/Store SIMD and Floating-point Non-temporal pair.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

32-bit (opc == 00)

STNP <St1>, <St2>, [<Xn|SP>{, #<imm>}]  

64-bit (opc == 01)

STNP <Dt1>, <Dt2>, [<Xn|SP>{, #<imm>}]  

128-bit (opc == 10)

STNP <Qt1>, <Qt2>, [<Xn|SP>{, #<imm>}]  // Empty.

Assembler Symbols

<Dt1> Is the 64-bit name of the first SIMD&FP register to be transferred, encoded in the “Rt” field.

<St1> Is the 32-bit name of the first SIMD&FP register to be transferred, encoded in the “Rt” field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the “Rn” field.

<imm> For the 32-bit variant: is the optional signed immediate byte offset, a multiple of 4 in the range -256 to 252, defaulting to 0 and encoded in the “imm7” field as <imm>/4.

For the 64-bit variant: is the optional signed immediate byte offset, a multiple of 8 in the range -512 to 504, defaulting to 0 and encoded in the “imm7” field as <imm>/8.

For the 128-bit variant: is the optional signed immediate byte offset, a multiple of 16 in the range -1024 to 1008, defaulting to 0 and encoded in the “imm7” field as <imm>/16.

Shared Decode

```plaintext

        SP[] = address;
    else
        X[n] = address;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
STR (Immediate, SIMD&FP)

Store SIMD&FP register (immediate offset). This instruction stores a single SIMD&FP register to memory. The address that is used for the store is calculated from a base register value and an immediate offset.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 3 classes: Post-index, Pre-index and Unsigned offset

SUBHN, SUBHN2

Subtract returning High Narrow. This instruction subtracts each vector element in the second source SIMD&FP register from the corresponding vector element in the first source SIMD&FP register, places the most significant half of the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are signed integer values.

The results are truncated. For rounded results, see RSUBHN.

The SUBHN instruction writes the vector to the lower half of the destination register and clears the upper half, while the SUBHN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers, not all the same type

SUBHN(2) <Vd>.<Tb>, <Vn>.<Ta>, <Vm>.<Ta>

    integer d = UInt(Rd);
    integer n = UInt(Rn);
    integer m = UInt(Rm);

SUDOT (by element)

Dot product index form with signed and unsigned integers. This instruction performs the dot product of the four signed 8-bit integer values in each 32-bit element of the first source register with the four unsigned 8-bit integer values in an indexed 32-bit element of the second source register, accumulating the result into the corresponding 32-bit element of the destination vector.

From Armv8.2, this is an **OPTIONAL** instruction. ID_AA64ISAR0_EL1.18MM indicates whether this instruction is supported.

Vector
(Armv8.6)

```plaintext
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

</tr>
</tbody>
</table>

- `<Vn>` Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- `<Tb>` Is an arrangement specifier, encoded in “Q”:

<table>
<thead>
<tr>
<th>Q</th>
<th>&lt;Tb&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>8B</td>
</tr>
<tr>
<td>1</td>
<td>16B</td>
</tr>
</tbody>
</table>

- `<Vm>` Is the name of the second SIMD&FP source register, encoded in the "M:Rm" fields.
- `<index>` Is the immediate index of a quadtuplet of four 8-bit elements in the range 0 to 3, encoded in the "H:L" fields.
Operation

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(128) operand2 = V[m];
bits(datasize) operand3 = V[d];
bits(datasize) result;

for e = 0 to elements-1
    bits(32) res = Elem[operand3, e, 32];
    for b = 0 to 3
        integer element1 = Int(Elem[operand1, 4*e+b, 8], op1_unsigned);
        integer element2 = Int(Elem[operand2, 4*i+b, 8], op2_unsigned);
        res = res + element1 * element2;
    Elem[result, e, 32] = res;
V[d] = result;
```
SUQADD

Signed saturating Accumulate of Unsigned value. This instruction adds the unsigned integer values of the vector elements in the source SIMD&FP register to corresponding signed integer values of the vector elements in the destination SIMD&FP register, and writes the resulting signed integer values to the destination SIMD&FP register. If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

**SXTL, SXTL2**

Signed extend Long. This instruction duplicates each vector element in the lower or upper half of the source SIMD&FP register into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are signed integer values. The SXTL instruction extracts the source vector from the lower half of the source register, while the SXTL2 instruction extracts the source vector from the upper half of the source register.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This is an alias of `SSHLL`, `SSHLL2`. This means:

- The encodings in this description are named to match the encodings of `SSHLL`, `SSHLL2`.
- The description of `SSHLL`, `SSHLL2` gives the operational pseudocode for this instruction.

<table>
<thead>
<tr>
<th>Bit 31-0</th>
<th>Description</th>

**Operation**

The description of `SSHLL`, `SSHLL2` gives the operational pseudocode for this instruction.
Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
Table vector Lookup. This instruction reads each value from the vector elements in the index source SIMD&FP register, uses each result as an index to perform a lookup in a table of bytes that is described by one to four source table SIMD&FP registers, places the lookup result in a vector, and writes the vector to the destination SIMD&FP register. If an index is out of range for the table, the result for that lookup is 0. If more than one source register is used to describe the table, the first source register describes the lowest bytes of the table.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV 8;
integer regs = UInt(len) + 1;
boolean is_tbl = (op == '0');

Assembler Symbols

</tr>
</tbody>
</table>

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in "Q":

For the four register table, three register table and two register table variant: is the name of the first SIMD&FP table register, encoded in the "Rn" field.
For the single register table variant: is the name of the SIMD&FP table register, encoded in the "Rn" field.

<Vn> For the four register table, three register table and two register table variant: is the name of the first SIMD&FP table register, encoded in the "Rn" field.
For the single register table variant: is the name of the SIMD&FP table register, encoded in the "Rn" field.

<Vn+1> Is the name of the second SIMD&FP table register, encoded as "Rn" plus 1 modulo 32.

<Vn+2> Is the name of the third SIMD&FP table register, encoded as "Rn" plus 2 modulo 32.

<Vn+3> Is the name of the fourth SIMD&FP table register, encoded as "Rn" plus 3 modulo 32.

<Vm> Is the name of the SIMD&FP index register, encoded in the "Rm" field.
Operation

```
CheckFPAdvSIMDEnabled64();

bits(datasize) indices = V[m];
bits(128*regs) table = Zeros();
bits(datasize) result;
integer index;

// Create table from registers
for i = 0 to regs-1
    table<128*i+127:128*i> = V[n];
    n = (n + 1) MOD 32;

result = if is.tbl then Zeros() else V[d];
for i = 0 to elements-1
    index = UInt(Elem[indices, i, 8]);
    if index < 16 * regs then
        Elem[result, i, 8] = Elem[table, index, 8];

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
Table vector lookup extension. This instruction reads each value from the vector elements in the index source SIMD&FP register, uses each result as an index to perform a lookup in a table of bytes that is described by one to four source table SIMD&FP registers, places the lookup result in a vector, and writes the vector to the destination SIMD&FP register. If an index is out of range for the table, the existing value in the vector element of the destination register is left unchanged. If more than one source register is used to describe the table, the first source register describes the lowest bytes of the table.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

<Vn+1> Is the name of the second SIMD&FP table register, encoded as "Rn" plus 1 modulo 32.

<Vn+2> Is the name of the third SIMD&FP table register, encoded as "Rn" plus 2 modulo 32.

<Vn+3> Is the name of the fourth SIMD&FP table register, encoded as "Rn" plus 3 modulo 32.

<Vm> Is the name of the SIMD&FP index register, encoded in the "Rm" field.
Operation

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) indices = V[m];
bits(128*regs) table = Zeros();
bits(datasize) result;
integer index;

// Create table from registers
for i = 0 to regs-1
    table<128*i+127:128*i> = V[n];
    n = (n + 1) MOD 32;

result = if is_tbl then Zeros() else V[d];
for i = 0 to elements-1
    index = UInt(Elem[indices, i, 8]);
    if index < 16 * regs then
        Elem[result, i, 8] = Elem[table, index, 8];
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**TRN1**

Transpose vectors (primary). This instruction reads corresponding even-numbered vector elements from the two source SIMD&FP registers, starting at zero, places each result into consecutive elements of a vector, and writes the vector to the destination SIMD&FP register. Vector elements from the first source register are placed into even-numbered elements of the destination vector, starting at zero, while vector elements from the second source register are placed into odd-numbered elements of the destination vector.

By using this instruction with TRN2, a 2 x 2 matrix can be transposed.

The following figure shows an example of the operation of TRN1 and TRN2 halfword operations where Q = 0.

```
Vn | 3 2 1 0 |
Vd |       |
Vn |       |
TRN1.16 | TRN2.16
Vn | 3 2 1 0 |
Vd |       |
Vn |       |
```

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

### Advanced SIMD

**TRN1** `<Vd>..<T>`, `<Vn>..<T>`, `<Vm>..<T>`

integer d = `UInt(Rd)`;
integer n = `UInt(Rn)`;
integer m = `UInt(Rm)`;

if size:Q == '110' then UNDEFINED;
integer esize = 8 << `UInt(size)`;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
integer part = `UInt(op)`;
integer pairs = elements DIV 2;

### Assembler Symbols

- `<Vd>` Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- `<T>` Is an arrangement specifier, encoded in “size:Q”:

<table>
<thead>
<tr>
<th>size</th>
<th>Q</th>
<th>&lt;T&gt;</th>

<td>1</td>
<td>2D</td>
</tr>
</tbody>
</table>

- `<Vn>` Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- `<Vm>` Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;

for p = 0 to pairs-1
    Elem[result, 2*p+0, esize] = Elem[operand1, 2*p+part, esize];
    Elem[result, 2*p+1, esize] = Elem[operand2, 2*p+part, esize];

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
TRN2

Transpose vectors (secondary). This instruction reads corresponding odd-numbered vector elements from the two source SIMD&FP registers, places each result into consecutive elements of a vector, and writes the vector to the destination SIMD&FP register. Vector elements from the first source register are placed into even-numbered elements of the destination vector, starting at zero, while vector elements from the second source register are placed into odd-numbered elements of the destination vector.

By using this instruction with TRN1, a 2 x 2 matrix can be transposed.

The following figure shows an example of the operation of TRN1 and TRN2 halfword operations where Q = 0.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
UABAL, UABAL2

Unsigned Absolute difference and Accumulate Long. This instruction subtracts the vector elements in the lower or upper half of the second source SIMD&FP register from the corresponding vector elements of the first source SIMD&FP register, and accumulates the absolute values of the results into the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are unsigned integer values.

The UABAL instruction extracts each source vector from the lower half of each source register, while the UABAL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0

UADDL, UADDL2

Unsigned Add Long (vector). This instruction adds each vector element in the lower or upper half of the first source SIMD&FP register to the corresponding vector element of the second source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are unsigned integer values.

The UADDL instruction extracts each source vector from the lower half of each source register, while the UADDL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

<table>
<thead>
<tr>

</table>

Three registers, not all the same type

UADDL(2) <Vd>, <Ta>, <Vn>, <Vm>, <Tb>

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean sub_op = (o1 == '1');
boolean unsigned = (U == '1');

Assembler Symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in "Q":

<table>
<thead>
<tr>
<th>Bit</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>absent</td>
</tr>
<tr>
<td>1</td>
<td>present</td>
</tr>
</tbody>
</table>

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>8H</td>
</tr>
<tr>
<td>01</td>
<td>4S</td>
</tr>
<tr>
<td>10</td>
<td>2D</td>
</tr>
<tr>
<td>11</td>
<td>RESERVED</td>
</tr>
</tbody>
</table>

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in “size:Q”:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>0</td>
</tr>
<tr>
<td>00</td>
<td>1</td>
</tr>
<tr>
<td>01</td>
<td>0</td>
</tr>
<tr>
<td>01</td>
<td>1</td>
</tr>
<tr>
<td>10</td>
<td>0</td>
</tr>
<tr>
<td>10</td>
<td>1</td>
</tr>
<tr>
<td>11</td>
<td>x</td>
</tr>
</tbody>
</table>

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
Operation

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) result;
integer element1;
integer element2;
integer sum;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    Elem[result, e, 2*esize] = sum<2*esize-1:0>;
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
UADDLP

Unsigned Add Long Pairwise. This instruction adds pairs of adjacent unsigned integer values from the vector in the source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. Depending on the settings in the \texttt{CPACR\_EL1}, \texttt{CPTR\_EL2}, and \texttt{CPTR\_EL3} registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

\[\text{UADDLP} <Vd>,<Ta>, <Vn>,<Tb>\]

\[
\begin{align*}
\text{integer } d & = \text{UInt}(Rd); \\
\text{integer } n & = \text{UInt}(Rn); \\

UADDW, UADDW2

Unsigned Add Wide. This instruction adds the vector elements of the first source SIMD&FP register to the corresponding vector elements in the lower or upper half of the second source SIMD&FP register, places the result in a vector, and writes the vector to the SIMD&FP destination register. The vector elements of the destination register and the first source register are twice as long as the vector elements of the second source register. All the values in this instruction are unsigned integer values.

The UADDW instruction extracts vector elements from the lower half of the second source register, while the UADDW2 instruction extracts vector elements from the upper half of the second source register. Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

## UCVTF (vector, fixed-point)

Unsigned fixed-point Convert to Floating-point (vector). This instruction converts each element in a vector from fixed-point to floating-point using the rounding mode that is specified by the \textit{FPCR}, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in \textit{FPCR}, the exception results in either a flag being set in \textit{FPSR}, or a synchronous exception being generated. For more information, see \textit{Floating-point exception traps}.

Depending on the settings in the \textit{CPACR_EL1}, \textit{CPTR_EL2}, and \textit{CPTR_EL3} registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: \textbf{Scalar} and \textbf{Vector}

### Scalar

![Scalar Encoding](image)

**UCVT\textbf{F} <V><d>, <V><n>, #<fbits>**

integer \( d = \text{UInt}(Rd); \)
integer \( n = \text{UInt}(Rn); \)

if immh == '000x' || (immh == '001x' && !HaveFP16Ext()) then UNDEFINED;
integer esize = if immh == '1xxx' then 64 else if immh == '01xx' then 32 else 16;
integer datasize = esize;
integer elements = 1;

integer fracbits = (esize * 2) - \text{UInt}(immh:immb);
boolean unsigned = (U == '1');
\textit{FPRounding} rounding = \textit{FPRoundingMode}(FPCR);

### Vector

![Vector Encoding](image)

**UCVT\textbf{F} <Vd>.<T>, <Vn>.<T>, #<fbits>**

integer \( d = \text{UInt}(Rd); \)
integer \( n = \text{UInt}(Rn); \)

if immh == '0000' then \textit{SFE(asimdimm)};
if immh == '000x' || (immh == '001x' && !HaveFP16Ext()) then UNDEFINED;
if immh<3>:Q == '10' then UNDEFINED;
integer esize = if immh == '1xxx' then 64 else if immh == '01xx' then 32 else 16;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

integer fracbits = (esize * 2) - \text{UInt}(immh:immb);
boolean unsigned = (U == '1');
\textit{FPRounding} rounding = \textit{FPRoundingMode}(FPCR);

### Assembler Symbols

\textbf{<V>} Is a width specifier, encoded in “immh”:
<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in "immh:Q":

<table>
<thead>
<tr>

UCVTF (scalar, fixed-point)

Unsigned fixed-point Convert to Floating-point (scalar). This instruction converts the unsigned value in the 32-bit or 64-bit general-purpose source register to a floating-point value using the rounding mode that is specified by the FPCR, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in FPCR, the exception results in either a flag being set in FPSR, or a synchronous exception being generated. For more information, see Floating-point exception traps.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

Operation

CheckFPAdvSIMDEnabled64();

bits(fltsize) fltval;
bits(intsize) intval;

intval = X[n];
fltval = FixedToFP(intval, 0, TRUE, FPCR, rounding);
V[d] = fltval;
UDOT (by element)

Dot Product unsigned arithmetic (vector, by element). This instruction performs the dot product of the four 8-bit elements in each 32-bit element of the first source register with the four 8-bit elements of an indexed 32-bit element in the second source register, accumulating the result into the corresponding 32-bit element of the destination register. Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

In Armv8.2 and Armv8.3, this is an optional instruction. From Armv8.4 it is mandatory for all implementations to support it. ID_AA64ISAR0_EL1.DP indicates whether this instruction is supported.

Vector (Armv8.2)

    sum = element1 + element2;
    Elem[result, e, esize] = sum<esize:1>;
V[d] = result;
```
Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
UHSUB

Unsigned Halving Subtract. This instruction subtracts the vector elements in the second source SIMD&FP register from the corresponding vector elements in the first source SIMD&FP register, shifts each result right one bit, places each result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the \texttt{CPACR_EL1, CPTR_EL2,} and \texttt{CPTR_EL3} registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**UMAXP**

Unsigned Maximum Pairwise. This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements in the two source SIMD&FP registers, writes the largest of each pair of unsigned integer values into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

 UNSIGNED MINIMUM (VECTOR)

This instruction compares corresponding vector elements in the two source SIMD&FP
registers, places the smaller of each of the two unsigned integer values into a vector, and writes the vector to the
destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and
Exception level, an attempt to execute the instruction might be trapped.

UMLSL, UMLSL2 (by element)

Unsigned Multiply-Subtract Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register and subtracts the results from the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The UMLSL instruction extracts vector elements from the lower half of the first source register, while the UMLSL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

V[d] = result;
```

**Operational information**

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
UMLSL, UMLSL2 (vector)

Unsigned Multiply-Subtract Long (vector). This instruction multiplies corresponding vector elements in the lower or upper half of the two source SIMD&FP registers, and subtracts the results from the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied. All the values in this instruction are unsigned integer values.

The UMLSL instruction extracts each source vector from the lower half of each source register, while the UMLSL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

UMMLA (vector)

Unsigned 8-bit integer matrix multiply-accumulate. This instruction multiplies the 2x8 matrix of unsigned 8-bit integer values in the first source vector by the 8x2 matrix of unsigned 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator in the destination vector. This is equivalent to performing an 8-way dot product per destination element.

From Armv8.2, this is an OPTIONAL instruction. \textit{ID\_AA64ISAR0\_EL1}.I8MM indicates whether this instruction is supported.

Vector

  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
UMULL, UMULL2 (by element)

Unsigned Multiply Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The UMULL instruction extracts vector elements from the lower half of the first source register, while the UMULL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
UQADD

Unsigned saturating Add. This instruction adds the values of corresponding elements of the two source SIMD&FP registers, places the results into a vector, and writes the vector to the destination SIMD&FP register. If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set. Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

**Scalar**

Unsigned saturating Rounding Shift Left (register). This instruction takes each vector element of the first source SIMD&FP register, shifts the vector element by a value from the least significant byte of the corresponding vector element of the second source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift. The results are rounded. For truncated results, see UQSHL.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: **Scalar** and **Vector**

UQRSHRN, UQRSHRN2

Unsigned saturating Rounded Shift Right Narrow (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are rounded. For truncated results, see UQSHRN.

The UQRSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the UQRSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector.

UQSHRN, UQSHRN2

Unsigned saturating Shift Right Narrow (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, saturates each shifted result to a value that is half the original width, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are truncated. For rounded results, see UQRSHRN.

The UQSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the UQSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

URHADD

Unsigned Rounding Halving Add. This instruction adds corresponding unsigned integer values from the two source SIMD&FP registers, shifts each result right one bit, places the results into a vector, and writes the vector to the destination SIMD&FP register.

The results are rounded. For truncated results, see UHADD.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

  element2 = Int(Elem[operand2, e, esize], unsigned);
  Elem[result, e, esize] = (element1+element2+1)<esize:1>;
V[d] = result;
URSHL

Unsigned Rounding Shift Left (register). This instruction takes each element in the vector of the first source SIMD&FP register, shifts the vector element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register. If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a rounding right shift. Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

**USDOT (by element)**

Dot Product index form with unsigned and signed integers. This instruction performs the dot product of the four unsigned 8-bit integer values in each 32-bit element of the first source register with the four signed 8-bit integer values in an indexed 32-bit element of the second source register, accumulating the result into the corresponding 32-bit element of the destination register.

From Armv8.2, this is an **OPTIONAL** instruction. \textit{ID AA64ISR0 EL1}. I8MM indicates whether this instruction is supported.

**Vector**

(\textit{Armv8.6})

USDOT (vector)

Dot Product vector form with unsigned and signed integers. This instruction performs the dot product of the four unsigned 8-bit integer values in each 32-bit element of the first source register with the four signed 8-bit integer values in the corresponding 32-bit element of the second source register, accumulating the result into the corresponding 32-bit element of the destination register.

From Armv8.2, this is an **OPTIONAL** instruction. ID_AA64ISAR0_EL1.18MM indicates whether this instruction is supported.

### Vector

(Armv8.6)

#### Assembler Symbols

- `<Vd>` is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
- `<Ta>` is an arrangement specifier, encoded in "Q":
  ```
  \begin{array}{c|c}
  Q & <Ta> \\
  \hline
  0 & 25 \\
  1 & 45 \\
  \end{array}
  ```
- `<Vn>` is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- `<Tb>` is an arrangement specifier, encoded in "Q":
  ```
  \begin{array}{c|c}
  Q & <Tb> \\
  \hline
  0 & 88 \\
  1 & 16B \\
  \end{array}
  ```
- `<Vm>` is the name of the second SIMD&FP source register, encoded in the "Rm" field.

#### Operation

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) operand3 = V[d];
bits(datasize) result;
for e = 0 to elements-1
    bits(32) res = \text{Elem}[operand3, e, 32];
    for b = 0 to 3
        integer element1 = \text{UInt}(\text{Elem}[operand1, 4*e+b, 8]);
        integer element2 = \text{SInt}(\text{Elem}[operand2, 4*e+b, 8]);
        res = res + element1 * element2;
        \text{Elem}[result, e, 32] = res;
V[d] = result;
```

Internal version only: isa v31.05b, AdvSIMD v29.02, pseudocode v2019-12_rc3_1, sve v2019-12_rc3 ; Build timestamp: 2019-12-13T11:35
**USHL**

Unsigned Shift Left (register). This instruction takes each element in the vector of the first source SIMD&FP register, shifts each element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register. If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a truncating right shift. For a rounding shift, see **URSHL**.

Depending on the settings in the **CPACR_EL1**, **CPTR_EL2**, and **CPTR_EL3** registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: **Scalar** and **Vector**

    else
        Elem[result, e, esize] = element<esize-1:0>;
V[d] = result;
```

**Operational information**

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
USHLL, USHLL2

Unsigned Shift Left Long (immediate). This instruction reads each vector element in the lower or upper half of the source SIMD&FP register, shifts the unsigned integer value left by the specified number of bits, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

The USHLL instruction extracts vector elements from the lower half of the source register, while the USHLL2 instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias UXTL, UXTL2.

```

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**USHR**

Unsigned Shift Right (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, writes the final result to a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are truncated. For rounded results, see USHR.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

### Scalar

</table>

Operation

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) operand2;
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;
operand2 = if accumulate then V[d] else Zeros();
for e = 0 to elements-1
    element = (Int(Elem[operand, e, esize], unsigned) + round_const) >> shift;
    Elem[result, e, esize] = Elem[operand2, e, esize] + element<esize-1:0>;
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
USMMLA (vector)

Unsigned and signed 8-bit integer matrix multiply-accumulate. This instruction multiplies the 2x8 matrix of unsigned 8-bit integer values in the first source vector by the 8x2 matrix of signed 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator in the destination vector. This is equivalent to performing an 8-way dot product per destination element.

From Armv8.2, this is an OPTIONAL instruction. ID_AA64ISAR0_EL1.I8MM indicates whether this instruction is supported.

Vector

U B

Vector

USMMLA <Vd>.4S, <Vn>.16B, <Vm>.16B

if !HaveInt8MatMulExt() then UNDEFINED;
integer n = UInt(Rn);
integer m = UInt(Rm);
integer d = UInt(Rd);

Assembler Symbols

<Vd> is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
<Vn> is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm> is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

CheckFPAdvSIMDEnabled64();
bis(128) operand1 = V[n];
bis(128) operand2 = V[m];
bis(128) addend = V[d];
V[d] = MatMulAdd(addend, operand1, operand2, TRUE, FALSE);
USQADD

Unsigned saturating Accumulate of Signed value. This instruction adds the signed integer values of the vector elements in the source SIMD&FP register to corresponding unsigned integer values of the vector elements in the destination SIMD&FP register, and accumulates the resulting unsigned integer values with the vector elements of the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit FPSR.QC is set.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: Scalar and Vector

Scalar

**Operation**

```pseudocode
CheckFPAdvSIMDEnabled64();

bits(datasize) operand = V[n];
bits(datasize) result;

bits(datasize) operand2 = V[d];
integer op1;
integer op2;
boolean sat;

for e = 0 to elements-1
    op1 = Int[(Elem[operand, e, esize], !unsigned)];
    op2 = Int[(Elem[operand2, e, esize], unsigned)];
    (Elem[result, e, esize], sat) = SatQ(op1 + op2, esize, unsigned);
    if sat then FPSR.QC = '1';

V[d] = result;
```

Internal version only: isa v31.05b, AdvSIMD v29.02, pseudocode v2019-12_rc3_1, sve v2019-12_rc3 ; Build timestamp: 2019-12-13T11:35

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
Unsigned Shift Right and Accumulate (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, and accumulates the final results with the vector elements of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are truncated. For rounded results, see **URSRA**.

Depending on the settings in the *CPACR_EL1*, *CPTR_EL2*, and *CPTR_EL3* registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

It has encodings from 2 classes: **Scalar** and **Vector**

**Scalar**

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

<td>(128-UInt(immh:immb))</td>
</tr>
</tbody>
</table>

Operation

```c
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) operand2;
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;
operand2 = if accumulate then V[d] else Zeros();
for e = 0 to elements-1
    element = (Int(Elem[operand, e, esize], unsigned) + round_const) >> shift;
    Elem[result, e, esize] = Elem[operand2, e, esize] + element<esize-1:0>;
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
USUBL, USUBL2

Unsigned Subtract Long. This instruction subtracts each vector element in the lower or upper half of the second source SIMD&FP register from the corresponding vector element of the first source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The destination vector elements are twice as long as the source vector elements.

The USUBL instruction extracts each source vector from the lower half of each source register, while the USUBL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Three registers, not all the same type

USUBL(2) <Vd>,<Ta>, <Vn>,<Tb>, <Vm>,<Tb>

  - The values of the NZCV flags.
**UXTL, UXTL2**

Unsigned extend Long. This instruction copies each vector element from the lower or upper half of the source SIMD&FP register into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

The UXTL instruction extracts vector elements from the lower half of the source register, while the UXTL2 instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This is an alias of **USHLL, USHLL2**. This means:

* The encodings in this description are named to match the encodings of **USHLL, USHLL2**.
* The description of **USHLL, USHLL2** gives the operational pseudocode for this instruction.

![Encoding Table](image)

**Vector**

</table>

**Operation**

The description of **USHLL, USHLL2** gives the operational pseudocode for this instruction.
Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
UZP1

Unzip vectors (primary). This instruction reads corresponding even-numbered vector elements from the two source SIMD&FP registers, starting at zero, places the result from the first source register into consecutive elements in the lower half of a vector, and the result from the second source register into consecutive elements in the upper half of a vector, and writes the vector to the destination SIMD&FP register.

This instruction can be used with UZP2 to de-interleave two vectors.

The following figure shows an example of the operation of UZP1 and UZP2 with the arrangement specifier 8B.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Advanced SIMD

UZP1 <Vd>,<T>, <Vn>,<T>, <Vm>,<T>

- `<Vn>` is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- `<Vm>` is the name of the second SIMD&FP source register, encoded in the "Rm" field.
**Operation**

```plaintext
CheckFPAdvSIMDEnabled64();
bits(datasize) operandl = V[n];
bits(datasize) operandh = V[m];
bits(datasize) result;

bits(datasize*2) zipped = operandh:operandl;
for e = 0 to elements-1
    Elem[result, e, esize] = Elem[zipped, 2*e+part, esize];
V[d] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
XAR

Exclusive OR and Rotate performs a bitwise exclusive OR of the 128-bit vectors in the two source SIMD&FP registers, rotates each 64-bit element of the resulting 128-bit vector right by the value specified by a 6-bit immediate value, and writes the result to the destination SIMD&FP register.

This instruction is implemented only when **ARMv8.2-SHA** is implemented.

Advanced SIMD

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
<imm6> Is a rotation right, encoded in "imm6".

Operation

AArch64.CheckFPAdvSIMDEnabled();

bits(128) Vm = V[m];
bits(128) Vn = V[n];
bits(128) tmp;
V[d] = ROR(tmp<127:64>, UInt(imm6)):ROR(tmp<63:0>, UInt(imm6));

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
XTN, XTN2

Extract Narrow. This instruction reads each vector element from the source SIMD&FP register, narrows each value to half the original width, places the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements. The XTN instruction writes the vector to the lower half of the destination register and clears the upper half, while the XTN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

  - The values of the NZCV flags.
ZIP1

Zip vectors (primary). This instruction reads adjacent vector elements from the lower half of two source SIMD&FP registers as pairs, interleaves the pairs and places them into a vector, and writes the vector to the destination SIMD&FP register. The first pair from the first source register is placed into the two lowest vector elements, with subsequent pairs taken alternately from each source register.

This instruction can be used with ZIP2 to interleave two vectors.

The following figure shows an example of the operation of ZIP1 and ZIP2 with the arrangement specifier 8B.

```
| Vd | A7 | A6 | A5 | A4 | A3 | A2 | A1 | A0 |
| Vm | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
```

ZIP1.8, doubleword

```

A64 -- SVE Instructions (alphabetic order)

ABS: Absolute value (predicated).
ADCLB: Add with carry long (bottom).
ADCLT: Add with carry long (top).
ADD (immediate): Add immediate (unpredicated).
ADD (vectors, predicated): Add vectors (predicated).
ADD (vectors, unpredicated): Add vectors (unpredicated).
ADDHNB: Add narrow high part (bottom).
ADDHNT: Add narrow high part (top).
ADDP: Add pairwise.
ADDPL: Add multiple of predicate register size to scalar register.
ADDVL: Add multiple of vector register size to scalar register.
ADR: Compute vector address.
AESD: AES single round decryption.
AESE: AES single round encryption.
AESIMC: AES inverse mix columns.
AESMC: AES mix columns.
AND (immediate): Bitwise AND with immediate (unpredicated).
AND (vectors, predicated): Bitwise AND vectors (predicated).
AND (vectors, unpredicated): Bitwise AND vectors (unpredicated).
AND, ANDS (predicates): Bitwise AND predicates.
ANDV: Bitwise AND reduction to scalar.
ASR (immediate, predicated): Arithmetic shift right by immediate (predicated).
ASR (immediate, unpredicated): Arithmetic shift right by immediate (unpredicated).
ASR (vectors): Arithmetic shift right by vector (predicated).
ASR (wide elements, predicated): Arithmetic shift right by 64-bit wide elements (predicated).
ASR (wide elements, unpredicated): Arithmetic shift right by 64-bit wide elements (unpredicated).
ASRD: Arithmetic shift right for divide by immediate (predicated).
ASRR: Reversed arithmetic shift right by vector (predicated).
BCAX: Bitwise clear and exclusive OR.
BDEP: Scatter lower bits into positions selected by bitmask.
BEXT: Gather lower bits from positions selected by bitmask.
BFCVT: Floating-point down convert to BFloat16 format (predicated).
BFCVTNT: Floating-point down convert and narrow to BFloat16 (top, predicated).
BFDOT (indexed): BFloat16 floating-point indexed dot product.
BFDOT (vectors): BFloat16 floating-point dot product.
BFMLALB (indexed): BFloat16 floating-point multiply-add long to single-precision (bottom, indexed).
BFMLALB (vectors): BFloat16 floating-point multiply-add long to single-precision (bottom).
BFMLAIT (indexed): BFloat16 floating-point multiply-add long to single-precision (top, indexed).
BFMLAIT (vectors): BFloat16 floating-point multiply-add long to single-precision (top).
BFMMLA: BFloat16 floating-point matrix multiply-accumulate.
BGRP: Group bits to right or left as selected by bitmask.
BIC (immediate): Bitwise clear bits using immediate (unpredicated): an alias of AND (immediate).
BIC (vectors, predicated): Bitwise clear vectors (predicated).
BIC (vectors, unpredicated): Bitwise clear vectors (unpredicated).
BIC, BICS (predicates): Bitwise clear predicates.
BRKA, BRKAS: Break after first true condition.
BRKB, BRKBS: Break before first true condition.
BRKN, BRKNS: Propagate break to next partition.
BRKPA, BRKPAS: Break after first true condition, propagating from previous partition.
BRKPB, BRKPBS: Break before first true condition, propagating from previous partition.
BSL: Bitwise select.
BSL1N: Bitwise select with first input inverted.
BSL2N: Bitwise select with second input inverted.
CADD: Complex integer add with rotate.
CDOT (indexed): Complex integer dot product (indexed).
CDOT (vectors): Complex integer dot product.
CLASTA (scalar): Conditionally extract element after last to general-purpose register.
CLASTA (SIMD&FP scalar): Conditionally extract element after last to SIMD&FP scalar register.
CLASTA (vectors): Conditionally extract element after last to vector register.
CLASTB (scalar): Conditionally extract last element to general-purpose register.
CLASTB (SIMD&FP scalar): Conditionally extract last element to SIMD&FP scalar register.
CLASTB (vectors): Conditionally extract last element to vector register.
CLS: Count leading sign bits (predicated).
CLZ: Count leading zero bits (predicated).
CMLA (indexed): Complex integer multiply-add with rotate (indexed).
CMLA (vectors): Complex integer multiply-add with rotate.
CMP<cc> (immediate): Compare vector to immediate.
CMP<cc> (vectors): Compare vectors.
CMP<cc> (wide elements): Compare vector to 64-bit wide elements.
CMPLE (vectors): Compare signed less than or equal to vector, setting the condition flags: an alias of CMP<cc> (vectors).
CMPLO (vectors): Compare unsigned lower than vector, setting the condition flags: an alias of CMP<cc> (vectors).

CMPLS (vectors): Compare unsigned lower or same as vector, setting the condition flags: an alias of CMP<cc> (vectors).

CMPLT (vectors): Compare signed less than vector, setting the condition flags: an alias of CMP<cc> (vectors).

CNOT: Logically invert boolean condition in vector (predicated).

CNT: Count non-zero bits (predicated).

CNTB, CNTD, CNTH, CNTW: Set scalar to multiple of predicate constraint element count.

CNTP: Set scalar to count of true predicate elements.

COMPACT: Shuffle active elements of vector to the right and fill with zero.

CPY (immediate, merging): Copy signed integer immediate to vector elements (merging).

CPY (immediate, zeroing): Copy signed integer immediate to vector elements (zeroing).

CPY (scalar): Copy general-purpose register to vector elements (predicated).

CPY (SIMD&FP scalar): Copy SIMD&FP scalar register to vector elements (predicated).

CTERMEQ, CTERMNE: Compare and terminate loop.

DECB, DECD, DECH, DECW (scalar): Decrement scalar by multiple of predicate constraint element count.

DECD, DECH, DECW (vector): Decrement vector by multiple of predicate constraint element count.

DECP (scalar): Decrement scalar by count of true predicate elements.

DECP (vector): Decrement vector by count of true predicate elements.

DUP (immediate): Broadcast signed immediate to vector elements (unpredicated).

DUP (indexed): Broadcast indexed element to vector (unpredicated).

DUP (scalar): Broadcast general-purpose register to vector elements (unpredicated).

DUPM: Broadcast logical bitmask immediate to vector (unpredicated).

EON: Bitwise exclusive OR with inverted immediate (unpredicated): an alias of EOR (immediate).

EOR (immediate): Bitwise exclusive OR with immediate (unpredicated).

EOR (vectors, predicated): Bitwise exclusive OR vectors (predicated).

EOR (vectors, unpredicated): Bitwise exclusive OR vectors (unpredicated).

EOR, EORS (predicates): Bitwise exclusive OR predicates.

EOR3: Bitwise exclusive OR of three vectors.

EORBT: Interleaving exclusive OR (bottom, top).

EORTB: Interleaving exclusive OR (top, bottom).

EORV: Bitwise exclusive OR reduction to scalar.

EXT: Extract vector from pair of vectors.

FABD: Floating-point absolute difference (predicated).

FABS: Floating-point absolute value (predicated).

FAC<cc>: Floating-point absolute compare vectors.

FACLE: Floating-point absolute compare less than or equal: an alias of FAC<cc>.

FACTL: Floating-point absolute compare less than: an alias of FAC<cc>.
FADD (immediate): Floating-point add immediate (predicated).
FADD (vectors, predicated): Floating-point add vector (predicated).
FADD (vectors, unpredicated): Floating-point add vector (unpredicated).
FADDA: Floating-point add strictly-ordered reduction, accumulating in scalar.
FADDP: Floating-point add pairwise.
FADDV: Floating-point add recursive reduction to scalar.
FCADD: Floating-point complex add with rotate (predicated).
FCM<cc> (vectors): Floating-point compare vectors.
FCM<cc> (zero): Floating-point compare vector with zero.
FCMLA (indexed): Floating-point complex multiply-add by indexed values with rotate.
FCMLA (vectors): Floating-point complex multiply-add with rotate (predicated).
FCMLE (vectors): Floating-point compare less than or equal to vector: an alias of FCM<cc> (vectors).
FCMLT (vectors): Floating-point compare less than vector: an alias of FCM<cc> (vectors).
FCPY: Copy 8-bit floating-point immediate to vector elements (predicated).
FCVT: Floating-point convert precision (predicated).
FCVTLT: Floating-point up convert long (top, predicated).
FCVTNT: Floating-point down convert and narrow (top, predicated).
FCVTX: Floating-point down convert, rounding to odd (predicated).
FCVTXNT: Floating-point down convert, rounding to odd (top, predicated).
FCVTZS: Floating-point convert to signed integer, rounding toward zero (predicated).
FCVTZU: Floating-point convert to unsigned integer, rounding toward zero (predicated).
FDIV: Floating-point divide by vector (predicated).
FDIVR: Floating-point reversed divide by vector (predicated).
FDUP: Broadcast 8-bit floating-point immediate to vector elements (unpredicated).
FEXPA: Floating-point exponential accelerator.
FLOGB: Floating-point base 2 logarithm as integer.
FMAD: Floating-point fused multiply-add vectors (predicated), writing multiplicand \([Zdn = Za + Zdn \times Zm]\).
FMAX (immediate): Floating-point maximum with immediate (predicated).
FMAX (vectors): Floating-point maximum (predicated).
FMAXNM (immediate): Floating-point maximum number with immediate (predicated).
FMAXNM (vectors): Floating-point maximum number (predicated).
FMAXNMP: Floating-point maximum number pairwise.
FMAXNMV: Floating-point maximum number recursive reduction to scalar.
FMAXP: Floating-point maximum pairwise.
FMAXV: Floating-point maximum recursive reduction to scalar.
FMIN (immediate): Floating-point minimum with immediate (predicated).
FMIN (vectors): Floating-point minimum (predicated).
FMINNM (immediate): Floating-point minimum number with immediate (predicated).
FMINNM (vectors): Floating-point minimum number (predicated).
FMINNMP: Floating-point minimum number pairwise.
FMINNNMV: Floating-point minimum number recursive reduction to scalar.
FMINP: Floating-point minimum pairwise.
FMINV: Floating-point minimum recursive reduction to scalar.
FMLA (indexed): Floating-point fused multiply-add by indexed elements \(Zda = Zda + Zn \times Zm[\text{indexed}]\).
FMLA (vectors): Floating-point fused multiply-add vectors (predicated), writing addend \([Zda = Zda + Zn \times Zm]\).
FMLALB (indexed): Half-precision floating-point multiply-add long to single-precision (bottom, indexed).
FMLALB (vectors): Half-precision floating-point multiply-add long to single-precision (bottom).
FMLALT (indexed): Half-precision floating-point multiply-add long to single-precision (top, indexed).
FMLALT (vectors): Half-precision floating-point multiply-add long to single-precision (top).
FMLSLB (indexed): Half-precision floating-point multiply-subtract long from single-precision (bottom, indexed).
FMLSLB (vectors): Half-precision floating-point multiply-subtract long from single-precision (bottom).
FMLSLT (indexed): Half-precision floating-point multiply-subtract long from single-precision (top, indexed).
FMLSLT (vectors): Half-precision floating-point multiply-subtract long from single-precision (top).
FMMLA: Floating-point matrix multiply-accumulate.
FMOV (immediate, predicated): Move 8-bit floating-point immediate to vector elements (predicated): an alias of FCPY.
FMOV (immediate, unpredicated): Move 8-bit floating-point immediate to vector elements (unpredicated): an alias of FDUP.
FMOV (zero, predicated): Move floating-point +0.0 to vector elements (predicated): an alias of CPY (immediate, merging).
FMOV (zero, unpredicated): Move floating-point +0.0 to vector elements (unpredicated): an alias of DUP (immediate).
FMSB: Floating-point fused multiply-subtract vectors (predicated), writing multiplicand \([Zdn = Za + -Zdn \times Zm]\).
FMUL (immediate): Floating-point multiply by immediate (predicated).
FMUL (indexed): Floating-point multiply by indexed elements.
FMUL (vectors, predicated): Floating-point multiply vectors (predicated).
FMUL (vectors, unpredicated): Floating-point multiply vectors (unpredicated).
FMULX: Floating-point multiply-extended vectors (predicated).
FNEG: Floating-point negate (predicated).
FNMDAD: Floating-point negated fused multiply-add vectors (predicated), writing multiplicand \([Zdn = -Za + -Zdn \times Zm]\).
FNMLA: Floating-point negated fused multiply-add vectors (predicated), writing addend \([Zda = -Zda + -Zn \times Zm]\).
FNMLS: Floating-point negated fused multiply-subtract vectors (predicated), writing addend \([Zda = -Zda + Zn \times Zm]\).
**FNMSB:** Floating-point negated fused multiply-subtract vectors (predicated), writing multiplicand \( Z_{dn} = -Z_a + Z_{dn} \times Z_m \).

**FRECPE:** Floating-point reciprocal estimate (unpredicated).

**FRECPS:** Floating-point reciprocal step (unpredicated).

**FRECPX:** Floating-point reciprocal exponent (predicated).

**PRINT\<r\>:** Floating-point round to integral value (predicated).

**FRSORTE:** Floating-point reciprocal square root estimate (unpredicated).

**FRSORTS:** Floating-point reciprocal square root step (unpredicated).

**FSCALE:** Floating-point adjust exponent by vector (predicated).

**FSORT:** Floating-point square root (predicated).

**FSUB (immediate):** Floating-point subtract immediate (predicated).

**FSUB (vectors, predicated):** Floating-point subtract vectors (predicated).

**FSUB (vectors, unpredicated):** Floating-point subtract vectors (unpredicated).

**FSUBR (immediate):** Floating-point reversed subtract from immediate (predicated).

**FSUBR (vectors):** Floating-point reversed subtract vectors (predicated).

**FTMAD:** Floating-point trigonometric multiply-add coefficient.

**FTSMUL:** Floating-point trigonometric starting value.

**FTSSEL:** Floating-point trigonometric select coefficient.

**HISTCNT:** Count matching elements in vector.

**HISTSEG:** Count matching elements in vector segments.

**INCB, INCD, INCH, INCW (scalar):** Increment scalar by multiple of predicate constraint element count.

**INCD, INCH, INCW (vector):** Increment vector by multiple of predicate constraint element count.

**INCP (scalar):** Increment scalar by count of true predicate elements.

**INCP (vector):** Increment vector by count of true predicate elements.

**INDEX (immediate, scalar):** Create index starting from immediate and incremented by general-purpose register.

**INDEX (immediates):** Create index starting from and incremented by immediate.

**INDEX (scalar, immediate):** Create index starting from general-purpose register and incremented by immediate.

**INDEX (scalars):** Create index starting from and incremented by general-purpose register.

**INSR (scalar):** Insert general-purpose register in shifted vector.

**INSR (SIMD&FP scalar):** Insert SIMD&FP scalar register in shifted vector.

**LASTA (scalar):** Extract element after last to general-purpose register.

**LASTA (SIMD&FP scalar):** Extract element after last to SIMD&FP scalar register.

**LASTB (scalar):** Extract last element to general-purpose register.

**LASTB (SIMD&FP scalar):** Extract last element to SIMD&FP scalar register.

**LD1B (scalar plus immediate):** Contiguous load unsigned bytes to vector (immediate index).

**LD1B (scalar plus scalar):** Contiguous load unsigned bytes to vector (scalar index).

**LD1B (scalar plus vector):** Gather load unsigned bytes to vector (vector index).
LD1B (vector plus immediate): Gather load unsigned bytes to vector (immediate index).
LD1D (scalar plus immediate): Contiguous load doublewords to vector (immediate index).
LD1D (scalar plus scalar): Contiguous load doublewords to vector (scalar index).
LD1D (scalar plus vector): Gather load doublewords to vector (vector index).
LD1D (vector plus immediate): Gather load doublewords to vector (immediate index).
LD1H (scalar plus immediate): Contiguous load unsigned halfwords to vector (immediate index).
LD1H (scalar plus scalar): Contiguous load unsigned halfwords to vector (scalar index).
LD1H (scalar plus vector): Gather load unsigned halfwords to vector (vector index).
LD1H (vector plus immediate): Gather load unsigned halfwords to vector (immediate index).
LD1RB: Load and broadcast unsigned byte to vector.
LD1RD: Load and broadcast doubleword to vector.
LD1RH: Load and broadcast unsigned halfword to vector.
LD1ROB (scalar plus immediate): Contiguous load and replicate thirty-two bytes (immediate index).
LD1ROB (scalar plus scalar): Contiguous load and replicate thirty-two bytes (scalar index).
LD1ROD (scalar plus immediate): Contiguous load and replicate four doublewords (immediate index).
LD1ROD (scalar plus scalar): Contiguous load and replicate four doublewords (scalar index).
LD1ROH (scalar plus immediate): Contiguous load and replicate sixteen halfwords (immediate index).
LD1ROH (scalar plus scalar): Contiguous load and replicate sixteen halfwords (scalar index).
LD1ROW (scalar plus immediate): Contiguous load and replicate eight words (immediate index).
LD1ROW (scalar plus scalar): Contiguous load and replicate eight words (scalar index).
LD1ROB (scalar plus immediate): Contiguous load and replicate sixteen bytes (immediate index).
LD1ROB (scalar plus scalar): Contiguous load and replicate sixteen bytes (scalar index).
LD1ROD (scalar plus immediate): Contiguous load and replicate two doublewords (immediate index).
LD1ROD (scalar plus scalar): Contiguous load and replicate two doublewords (scalar index).
LD1ROH (scalar plus immediate): Contiguous load and replicate eight halfwords (immediate index).
LD1ROH (scalar plus scalar): Contiguous load and replicate eight halfwords (scalar index).
LD1ROW (scalar plus immediate): Contiguous load and replicate four words (immediate index).
LD1ROW (scalar plus scalar): Contiguous load and replicate four words (scalar index).
LD1RSB: Load and broadcast signed byte to vector.
LD1RSH: Load and broadcast signed halfword to vector.
LD1RSW: Load and broadcast signed word to vector.
LD1RW: Load and broadcast unsigned word to vector.
LD1SB (scalar plus immediate): Contiguous load signed bytes to vector (immediate index).
LD1SB (scalar plus scalar): Contiguous load signed bytes to vector (scalar index).
LD1SB (scalar plus vector): Gather load signed bytes to vector (vector index).
LD1SB (vector plus immediate): Gather load signed bytes to vector (immediate index).
LD1SH (scalar plus immediate): Contiguous load signed halfwords to vector (immediate index).
LD1SH (scalar plus scalar): Contiguous load signed halfwords to vector (scalar index).
LD1SH (scalar plus vector): Gather load signed halfwords to vector (vector index).
LD1SH (vector plus immediate): Gather load signed halfwords to vector (immediate index).
LD1SW (scalar plus immediate): Contiguous load signed words to vector (immediate index).
LD1SW (scalar plus scalar): Contiguous load signed words to vector (scalar index).
LD1SW (scalar plus vector): Gather load signed words to vector (vector index).
LD1SW (vector plus immediate): Gather load signed words to vector (immediate index).
LD1W (scalar plus immediate): Contiguous load unsigned words to vector (immediate index).
LD1W (scalar plus scalar): Contiguous load unsigned words to vector (scalar index).
LD1W (vector plus immediate): Gather load unsigned words to vector (immediate index).
LD2B (scalar plus immediate): Contiguous load two-byte structures to two vectors (immediate index).
LD2B (scalar plus scalar): Contiguous load two-byte structures to two vectors (scalar index).
LD2D (scalar plus immediate): Contiguous load two-doubleword structures to two vectors (immediate index).
LD2D (scalar plus scalar): Contiguous load two-doubleword structures to two vectors (scalar index).
LD2H (scalar plus immediate): Contiguous load two-halfword structures to two vectors (immediate index).
LD2H (scalar plus scalar): Contiguous load two-halfword structures to two vectors (scalar index).
LD2W (scalar plus immediate): Contiguous load two-word structures to two vectors (immediate index).
LD2W (scalar plus scalar): Contiguous load two-word structures to two vectors (scalar index).
LD3B (scalar plus immediate): Contiguous load three-byte structures to three vectors (immediate index).
LD3B (scalar plus scalar): Contiguous load three-byte structures to three vectors (scalar index).
LD3D (scalar plus immediate): Contiguous load three-doubleword structures to three vectors (immediate index).
LD3D (scalar plus scalar): Contiguous load three-doubleword structures to three vectors (scalar index).
LD3H (scalar plus immediate): Contiguous load three-halfword structures to three vectors (immediate index).
LD3H (scalar plus scalar): Contiguous load three-halfword structures to three vectors (scalar index).
LD3W (scalar plus immediate): Contiguous load three-word structures to three vectors (immediate index).
LD3W (scalar plus scalar): Contiguous load three-word structures to three vectors (scalar index).
LD4B (scalar plus immediate): Contiguous load four-byte structures to four vectors (immediate index).
LD4B (scalar plus scalar): Contiguous load four-byte structures to four vectors (scalar index).
LD4D (scalar plus immediate): Contiguous load four-doubleword structures to four vectors (immediate index).
LD4D (scalar plus scalar): Contiguous load four-doubleword structures to four vectors (scalar index).
LD4H (scalar plus immediate): Contiguous load four-halfword structures to four vectors (immediate index).
LD4H (scalar plus scalar): Contiguous load four-halfword structures to four vectors (scalar index).
LD4W (scalar plus immediate): Contiguous load four-word structures to four vectors (immediate index).
LD4W (scalar plus scalar): Contiguous load four-word structures to four vectors (scalar index).
LDFF1B (scalar plus scalar): Contiguous load first-fault unsigned bytes to vector (scalar index).
LDFF1B (scalar plus vector): Gather load first-fault unsigned bytes to vector (vector index).
LDFF1B (vector plus immediate): Gather load first-fault unsigned bytes to vector (immediate index).
LDFF1D (scalar plus scalar): Contiguous load first-fault doublewords to vector (scalar index).
LDFF1D (scalar plus vector): Gather load first-fault doublewords to vector (vector index).
LDFF1D (vector plus immediate): Gather load first-fault doublewords to vector (immediate index).
LDFF1H (scalar plus scalar): Contiguous load first-fault unsigned halfwords to vector (scalar index).
LDFF1H (scalar plus vector): Gather load first-fault unsigned halfwords to vector (vector index).
LDFF1H (vector plus immediate): Gather load first-fault unsigned halfwords to vector (immediate index).
LDFF1SB (scalar plus scalar): Contiguous load first-fault signed bytes to vector (scalar index).
LDFF1SB (scalar plus vector): Gather load first-fault signed bytes to vector (vector index).
LDFF1SB (vector plus immediate): Gather load first-fault signed bytes to vector (immediate index).
LDFF1SH (scalar plus scalar): Contiguous load first-fault signed halfwords to vector (scalar index).
LDFF1SH (scalar plus vector): Gather load first-fault signed halfwords to vector (vector index).
LDFF1SH (vector plus immediate): Gather load first-fault signed halfwords to vector (immediate index).
LDFF1SW (scalar plus scalar): Contiguous load first-fault signed words to vector (scalar index).
LDFF1SW (scalar plus vector): Gather load first-fault signed words to vector (vector index).
LDFF1SW (vector plus immediate): Gather load first-fault signed words to vector (immediate index).
LDFF1W (scalar plus scalar): Contiguous load first-fault unsigned words to vector (scalar index).
LDFF1W (scalar plus vector): Gather load first-fault unsigned words to vector (vector index).
LDFF1W (vector plus immediate): Gather load first-fault unsigned words to vector (immediate index).
LDNF1B: Contiguous load non-fault unsigned bytes to vector (immediate index).
LDNF1D: Contiguous load non-fault doublewords to vector (immediate index).
LDNF1H: Contiguous load non-fault unsigned halfwords to vector (immediate index).
LDNF1SB: Contiguous load non-fault signed bytes to vector (immediate index).
LDNF1SH: Contiguous load non-fault signed halfwords to vector (immediate index).
LDNF1SW: Contiguous load non-fault signed words to vector (immediate index).
LDNF1W: Contiguous load non-fault unsigned words to vector (immediate index).
LDNT1B (scalar plus immediate): Contiguous load non-temporal bytes to vector (immediate index).
LDNT1B (scalar plus scalar): Contiguous load non-temporal bytes to vector (scalar index).
LDNT1B (vector plus scalar): Gather load non-temporal unsigned bytes.
LDNT1D (scalar plus immediate): Contiguous load non-temporal doublewords to vector (immediate index).
LDNT1D (scalar plus scalar): Contiguous load non-temporal doublewords to vector (scalar index).
LDNT1D (vector plus scalar): Gather load non-temporal unsigned doublewords.
LDNT1H (scalar plus immediate): Contiguous load non-temporal halfwords to vector (immediate index).
LDNT1H (scalar plus scalar): Contiguous load non-temporal unsigned halfwords to vector (scalar index).
LDNT1H (vector plus scalar): Gather load non-temporal unsigned halfwords.
LDNT1SB: Gather load non-temporal signed bytes.
LDNT1SH: Gather load non-temporal signed halfwords.
LDNT1SW: Gather load non-temporal signed words.
LDNT1W (scalar plus immediate): Contiguous load non-temporal words to vector (immediate index).
LDNT1W (scalar plus scalar): Contiguous load non-temporal words to vector (scalar index).
LDNT1W (vector plus scalar): Gather load non-temporal unsigned words.
LDR (predicate): Load predicate register.
LDR (vector): Load vector register.
LSL (immediate, predicated): Logical shift left by immediate (predicated).
LSL (immediate, unpredicated): Logical shift left by immediate (unpredicated).
LSL (vectors): Logical shift left by vector (predicated).
LSL (wide elements, predicated): Logical shift left by 64-bit wide elements (predicated).
LSL (wide elements, unpredicated): Logical shift left by 64-bit wide elements (unpredicated).
LSLR: Reversed logical shift left by vector (predicated).
LSR (immediate, predicated): Logical shift right by immediate (predicated).
LSR (immediate, unpredicated): Logical shift right by immediate (unpredicated).
LSR (vectors): Logical shift right by vector (predicated).
LSR (wide elements, predicated): Logical shift right by 64-bit wide elements (predicated).
LSR (wide elements, unpredicated): Logical shift right by 64-bit wide elements (unpredicated).
LSRR: Reversed logical shift right by vector (predicated).
MAD: Multiply-add vectors (predicated), writing multiplicand \(Zdn = Za + Zdn \times Zm\).
MATCH: Detect any matching elements, setting the condition flags.
MLA (indexed): Multiply-add to accumulator (indexed).
MLA (vectors): Multiply-add vectors (predicated), writing addend \(Zda = Zda + Zn \times Zm\).
MLS (indexed): Multiply-subtract from accumulator (indexed).
MLS (vectors): Multiply-subtract vectors (predicated), writing addend \(Zda = Zda - Zn \times Zm\).
MOV (bitmask immediate): Move logical bitmask immediate to vector (unpredicated): an alias of DUPM.
MOV (immediate, predicated, merging): Move signed integer immediate to vector elements (merging): an alias of CPY (immediate, merging).
MOV (immediate, predicated, zeroing): Move signed integer immediate to vector elements (zeroing): an alias of CPY (immediate, zeroing).
MOV (immediate, unpredicated): Move signed immediate to vector elements (unpredicated): an alias of DUP (immediate).
MOV (scalar, predicated): Move general-purpose register to vector elements (predicated): an alias of CPY (scalar).
**MOV (scalar, unpredicated):** Move general-purpose register to vector elements (unpredicated): an alias of DUP (scalar).

**MOV (SIMD&FP scalar, predicated):** Move SIMD&FP scalar register to vector elements (predicated): an alias of CPY (SIMD&FP scalar).

**MOV (SIMD&FP scalar, unpredicated):** Move indexed element or SIMD&FP scalar to vector (unpredicated): an alias of DUP (indexed).

**MOV (vector, predicated):** Move vector elements (predicated): an alias of SEL (vectors).

**MOV (vector, unpredicated):** Move vector register (unpredicated): an alias of ORR (vectors, unpredicated).

**MOVPRFX (predicated):** Move prefix (predicated).

**MOVPRFX (unpredicated):** Move prefix (unpredicated).

**MOVS (predicated):** Move predicates (zeroing), setting the condition flags: an alias of AND, ANDS (predicates).

**MOVS (unpredicated):** Move predicate (unpredicated), setting the condition flags: an alias of ORR, ORRS (predicates).

**MSB:** Multiply-subtract vectors (predicated), writing multiplicand $[Z_{dn} = Z_a - Z_{dn} \times Z_m]$.

**MUL (immediate):** Multiply by immediate (unpredicated).

**MUL (indexed):** Multiply (indexed).

**MUL (vectors, predicated):** Multiply vectors (predicated).

**MUL (vectors, unpredicated):** Multiply vectors (unpredicated).

**NAND, NANDS:** Bitwise NAND predicates.

**NBSL:** Bitwise inverted select.

**NEG:** Negate (predicated).

**NMATCH:** Detect no matching elements, setting the condition flags.

**NOR, NORS:** Bitwise NOR predicates.

**NOT (predicate):** Bitwise invert predicate: an alias of EOR, EORS (predicates).

**NOT (vector):** Bitwise invert vector (predicated).

**NOTS:** Bitwise invert predicate, setting the condition flags: an alias of EOR, EORS (predicates).

**ORN (immediate):** Bitwise inclusive OR with inverted immediate (unpredicated): an alias of ORR (immediate).

**ORN, ORNS (predicates):** Bitwise inclusive OR inverted predicate.

**ORR (immediate):** Bitwise inclusive OR with immediate (unpredicated).

**ORR (vectors, predicated):** Bitwise inclusive OR vectors (predicated).

**ORR (vectors, unpredicated):** Bitwise inclusive OR vectors (unpredicated).

**ORR, ORRS (predicates):** Bitwise inclusive OR predicate.

**ORV:** Bitwise inclusive OR reduction to scalar.

**PFALSE:** Set all predicate elements to false.

**PFIRST:** Set the first active predicate element to true.

**PMUL:** Polynomial multiply vectors (unpredicated).

**PMULLB:** Polynomial multiply long (bottom).

**PMULLT:** Polynomial multiply long (top).

**PNEXT:** Find next active predicate.
PRFB (scalar plus immediate): Contiguous prefetch bytes (immediate index).
PRFB (scalar plus scalar): Contiguous prefetch bytes (scalar index).
PRFB (scalar plus vector): Gather prefetch bytes (scalar plus vector).
PRFB (vector plus immediate): Gather prefetch bytes (vector plus immediate).
PRFD (scalar plus immediate): Contiguous prefetch doublewords (immediate index).
PRFD (scalar plus scalar): Contiguous prefetch doublewords (scalar index).
PRFD (scalar plus vector): Gather prefetch doublewords (scalar plus vector).
PRFD (vector plus immediate): Gather prefetch doublewords (vector plus immediate).
PRFH (scalar plus immediate): Contiguous prefetch halfwords (immediate index).
PRFH (scalar plus scalar): Contiguous prefetch halfwords (scalar index).
PRFH (scalar plus vector): Gather prefetch halfwords (scalar plus vector).
PRFH (vector plus immediate): Gather prefetch halfwords (vector plus immediate).
PRFW (scalar plus immediate): Contiguous prefetch words (immediate index).
PRFW (scalar plus scalar): Contiguous prefetch words (scalar index).
PRFW (scalar plus vector): Gather prefetch words (scalar plus vector).
PRFW (vector plus immediate): Gather prefetch words (vector plus immediate).
PTEST: Set condition flags for predicate.
PTRUE, PTRUES: Initialise predicate from named constraint.
PUNPKHI, PUNPKLO: Unpack and widen half of predicate.
RADDHNB: Rounding add narrow high part (bottom).
RADDHNT: Rounding add narrow high part (top).
RAX1: Bitwise rotate left by 1 and exclusive OR.
RBIT: Reverse bits (predicated).
RDFFR (unpredicated): Read the first-fault register.
RDFFR, RDFFRS (predicated): Return predicate of sucessfully loaded elements.
RDVL: Read multiple of vector register size to scalar register.
REV (predicate): Reverse all elements in a predicate.
REV (vector): Reverse all elements in a vector (unpredicated).
REV, REVH, REVW: Reverse bytes / halfwords / words within elements (predicated).
RSHRN B: Rounding shift right narrow by immediate (bottom).
RSHRNT: Rounding shift right narrow by immediate (top).
RSUBHNB: Rounding subtract narrow high part (bottom).
RSUBHT: Rounding subtract narrow high part (top).
SABA: Signed absolute difference and accumulate.
SABALB: Signed absolute difference and accumulate long (bottom).
SABALT: Signed absolute difference and accumulate long (top).
SABD: Signed absolute difference (predicated).
SABDLB: Signed absolute difference long (bottom).
SABDLT: Signed absolute difference long (top).
SADALP: Signed add and accumulate long pairwise.
SADDLB: Signed add long (bottom).
SADDLBT: Signed add long (bottom + top).
SADDLT: Signed add long (top).
SADDY: Signed add reduction to scalar.
SADDWB: Signed add wide (bottom).
SADDWT: Signed add wide (top).
SBCLB: Subtract with carry long (bottom).
SBCLT: Subtract with carry long (top).
SCVTF: Signed integer convert to floating-point (predicated).
SDIV: Signed divide (predicated).
SDIVR: Signed reversed divide (predicated).
SDOT (indexed): Signed integer indexed dot product.
SDOT (vectors): Signed integer dot product.
SEL (predicates): Conditionally select elements from two predicates.
SEL (vectors): Conditionally select elements from two vectors.
SEFFFFR: Initialise the first-fault register to all true.
SHADD: Signed halving addition.
SHRNB: Shift right narrow by immediate (bottom).
SHRNT: Shift right narrow by immediate (top).
SHSUB: Signed halving subtract.
SHSUBR: Signed halving subtract reversed vectors.
SLI: Shift left and insert (immediate).
SM4E: SM4 encryption and decryption.
SM4EKEY: SM4 key updates.
SMAX (immediate): Signed maximum with immediate (unpredicated).
SMAX (vectors): Signed maximum vectors (predicated).
SMAXP: Signed maximum pairwise.
SMAXV: Signed maximum reduction to scalar.
SMIN (immediate): Signed minimum with immediate (unpredicated).
SMIN (vectors): Signed minimum vectors (predicated).
SMINP: Signed minimum pairwise.
SMINY: Signed minimum reduction to scalar.
SMLALB (indexed): Signed multiply-add long to accumulator (bottom, indexed).

SMLALB (vectors): Signed multiply-add long to accumulator (bottom).

SMLALT (indexed): Signed multiply-add long to accumulator (top, indexed).

SMLALT (vectors): Signed multiply-add long to accumulator (top).

SMLSLB (indexed): Signed multiply-subtract long from accumulator (bottom, indexed).

SMLSLB (vectors): Signed multiply-subtract long from accumulator (bottom).

SMLSLT (indexed): Signed multiply-subtract long from accumulator (top, indexed).

SMLSLT (vectors): Signed multiply-subtract long from accumulator (top).

SMMLA: Signed integer matrix multiply-accumulate.

SMULH (predicated): Signed multiply returning high half (predicated).

SMULH (unpredicated): Signed multiply returning high half (unpredicated).

SMULLB (indexed): Signed multiply long (bottom, indexed).

SMULLB (vectors): Signed multiply long (bottom).

SMULLT (indexed): Signed multiply long (top, indexed).

SMULLT (vectors): Signed multiply long (top).

SPLICE: Splice two vectors under predicate control.

SQABS: Signed saturating absolute value.

SQADD (immediate): Signed saturating add immediate (unpredicated).

SQADD (vectors, predicated): Signed saturating addition (predicated).

SQADD (vectors, unpredicated): Signed saturating add vectors (unpredicated).

SQCADD: Saturating complex integer add with rotate.

SQDECB: Signed saturating decrement scalar by multiple of 8-bit predicate constraint element count.

SQDECD (scalar): Signed saturating decrement scalar by multiple of 64-bit predicate constraint element count.

SQDECD (vector): Signed saturating decrement vector by multiple of 64-bit predicate constraint element count.

SQDECH (scalar): Signed saturating decrement scalar by multiple of 16-bit predicate constraint element count.

SQDECH (vector): Signed saturating decrement vector by multiple of 16-bit predicate constraint element count.

SQDECP (scalar): Signed saturating decrement scalar by count of true predicate elements.

SQDECP (vector): Signed saturating decrement vector by count of true predicate elements.

SODMLALB (indexed): Signed saturating doubling multiply-add long to accumulator (bottom, indexed).

SODMLALB (vectors): Signed saturating doubling multiply-add long to accumulator (bottom).

SODMLALBT: Signed saturating doubling multiply-add long to accumulator (bottom × top).

SODMLALT (indexed): Signed saturating doubling multiply-add long to accumulator (top, indexed).

SODMLALT (vectors): Signed saturating doubling multiply-add long to accumulator (top).

SODMLSLB (indexed): Signed saturating doubling multiply-subtract long from accumulator (bottom, indexed).
A64 -- SVE Instructions (alphabetic order)

**SQDMLSLB (vectors):** Signed saturating doubling multiply-subtract long from accumulator (bottom).

**SQDMLSLBT:** Signed saturating doubling multiply-subtract long from accumulator (bottom × top).

**SQDMLSLT (indexed):** Signed saturating doubling multiply-subtract long from accumulator (top, indexed).

**SQDMLSLT (vectors):** Signed saturating doubling multiply-subtract long from accumulator (top).

**SQDMULH (indexed):** Signed saturating doubling multiply high (indexed).

**SQDMULH (vectors):** Signed saturating doubling multiply high (unpredicated).

**SQDMULLB (indexed):** Signed saturating doubling multiply long (bottom, indexed).

**SQDMULLB (vectors):** Signed saturating doubling multiply long (bottom).

**SQDMULLT (indexed):** Signed saturating doubling multiply long (top, indexed).

**SQDMULLT (vectors):** Signed saturating doubling multiply long (top).

**SQINCB:** Signed saturating increment scalar by multiple of 8-bit predicate constraint element count.

**SQINCD (scalar):** Signed saturating increment scalar by multiple of 64-bit predicate constraint element count.

**SQINCD (vector):** Signed saturating increment vector by multiple of 64-bit predicate constraint element count.

**SQINCH (scalar):** Signed saturating increment scalar by multiple of 16-bit predicate constraint element count.

**SQINCH (vector):** Signed saturating increment vector by multiple of 16-bit predicate constraint element count.

**SQINCP (scalar):** Signed saturating increment scalar by count of true predicate elements.

**SQINCP (vector):** Signed saturating increment vector by count of true predicate elements.

**SQINCW (scalar):** Signed saturating increment scalar by multiple of 32-bit predicate constraint element count.

**SQINCW (vector):** Signed saturating increment vector by multiple of 32-bit predicate constraint element count.

**SQNEG:** Signed saturating negate.

**SQRDCMLAH (indexed):** Saturing rounding doubling complex integer multiply-add high with rotate (indexed).

**SQRDCMLAH (vectors):** Saturing rounding doubling complex integer multiply-add high with rotate.

**SQRDMLAH (indexed):** Signed saturating rounding doubling multiply-add high to accumulator (indexed).

**SQRDMLAH (vectors):** Signed saturating rounding doubling multiply-add high to accumulator (unpredicated).

**SQRDMLSH (indexed):** Signed saturating rounding doubling multiply-subtract high from accumulator (indexed).

**SQRDMLSH (vectors):** Signed saturating rounding doubling multiply-subtract high from accumulator (unpredicated).

**SQRDMULH (indexed):** Signed saturating rounding doubling multiply high (indexed).

**SQRDMULH (vectors):** Signed saturating rounding doubling multiply high (unpredicated).

**SQRSHL:** Signed saturating rounding shift left by vector (predicated).

**SQRSHLR:** Signed saturating rounding shift left reversed vectors (predicated).

**SQRSHRNP:** Signed saturating rounding shift right narrow by immediate (bottom).

**SQRSHRNT:** Signed saturating rounding shift right narrow by immediate (top).

**SQRSHRUNB:** Signed saturating rounding shift right unsigned narrow by immediate (bottom).

**SQRSHRUNT:** Signed saturating rounding shift right unsigned narrow by immediate (top).

**SQSHL (immediate):** Signed saturating shift left by immediate.

**SQSHL (vectors):** Signed saturating shift left by vector (predicated).
SOSHLR: Signed saturating shift left reversed vectors (predicated).
SOSHLU: Signed saturating shift left unsigned by immediate.
SOSHRNB: Signed saturating shift right narrow by immediate (bottom).
SOSHRNT: Signed saturating shift right narrow by immediate (top).
SOSHRUNB: Signed saturating shift right unsigned narrow by immediate (bottom).
SOSHRUNT: Signed saturating shift right unsigned narrow by immediate (top).
SOSUB (immediate): Signed saturating subtract immediate (unpredicated).
SOSUB (vectors, predicated): Signed saturating subtraction (predicated).
SOSUB (vectors, unpredicated): Signed saturating subtract vectors (unpredicated).
SOSUBR: Signed saturating subtraction reversed vectors (predicated).
SOXTNB: Signed saturating extract narrow (bottom).
SOXTNT: Signed saturating extract narrow (top).
SOXTUNB: Signed saturating unsigned extract narrow (bottom).
SOXTUNT: Signed saturating unsigned extract narrow (top).
SRHADD: Signed rounding halving addition.
SRI: Shift right and insert (immediate).
SRSHL: Signed rounding shift left by vector (predicated).
SRSHLR: Signed rounding shift left reversed vectors (predicated).
SRSHR: Signed rounding shift right by immediate.
SRSRA: Signed rounding shift right and accumulate (immediate).
SSHLLB: Signed shift left long by immediate (bottom).
SSHLLT: Signed shift left long by immediate (top).
SSRA: Signed shift right and accumulate (immediate).
SSUBLB: Signed subtract long (bottom).
SSUBLBT: Signed subtract long (bottom - top).
SSUBLT: Signed subtract long (top).
SSUBLTB: Signed subtract long (top - bottom).
SSUBWB: Signed subtract wide (bottom).
SSUBWT: Signed subtract wide (top).
ST1B (scalar plus immediate): Contiguous store bytes from vector (immediate index).
ST1B (scalar plus scalar): Contiguous store bytes from vector (scalar index).
ST1B (scalar plus vector): Scatter store bytes from a vector (vector index).
ST1B (vector plus immediate): Scatter store bytes from a vector (immediate index).
ST1D (scalar plus immediate): Contiguous store doublewords from vector (immediate index).
ST1D (scalar plus scalar): Contiguous store doublewords from vector (scalar index).
ST1D (scalar plus vector): Scatter store doublewords from a vector (vector index).
ST1D (vector plus immediate): Scatter store doublewords from a vector (immediate index).

ST1H (scalar plus immediate): Contiguous store halfwords from vector (immediate index).

ST1H (scalar plus scalar): Contiguous store halfwords from vector (scalar index).

ST1H (vector plus immediate): Scatter store halfwords from a vector (vector index).

ST1H (vector plus immediate): Scatter store halfwords from a vector (immediate index).

ST1W (scalar plus immediate): Contiguous store words from vector (immediate index).

ST1W (scalar plus scalar): Contiguous store words from vector (scalar index).

ST1W (scalar plus vector): Scatter store words from a vector (vector index).

ST1W (vector plus immediate): Scatter store words from a vector (immediate index).

ST2B (scalar plus immediate): Contiguous store two-byte structures from two vectors (immediate index).

ST2B (scalar plus scalar): Contiguous store two-byte structures from two vectors (scalar index).

ST2D (scalar plus immediate): Contiguous store two-doubleword structures from two vectors (immediate index).

ST2D (scalar plus scalar): Contiguous store two-doubleword structures from two vectors (scalar index).

ST2H (scalar plus immediate): Contiguous store two-halfword structures from two vectors (immediate index).

ST2H (scalar plus scalar): Contiguous store two-halfword structures from two vectors (scalar index).

ST2W (scalar plus immediate): Contiguous store two-word structures from two vectors (immediate index).

ST2W (scalar plus scalar): Contiguous store two-word structures from two vectors (scalar index).

ST3B (scalar plus immediate): Contiguous store three-byte structures from three vectors (immediate index).

ST3B (scalar plus scalar): Contiguous store three-byte structures from three vectors (scalar index).

ST3D (scalar plus immediate): Contiguous store three-doubleword structures from three vectors (immediate index).

ST3D (scalar plus scalar): Contiguous store three-doubleword structures from three vectors (scalar index).

ST3H (scalar plus immediate): Contiguous store three-halfword structures from three vectors (immediate index).

ST3H (scalar plus scalar): Contiguous store three-halfword structures from three vectors (scalar index).

ST3W (scalar plus immediate): Contiguous store three-word structures from three vectors (immediate index).

ST3W (scalar plus scalar): Contiguous store three-word structures from three vectors (scalar index).

ST4B (scalar plus immediate): Contiguous store four-byte structures from four vectors (immediate index).

ST4B (scalar plus scalar): Contiguous store four-byte structures from four vectors (scalar index).

ST4D (scalar plus immediate): Contiguous store four-doubleword structures from four vectors (immediate index).

ST4D (scalar plus scalar): Contiguous store four-doubleword structures from four vectors (scalar index).

ST4H (scalar plus immediate): Contiguous store four-halfword structures from four vectors (immediate index).

ST4H (scalar plus scalar): Contiguous store four-halfword structures from four vectors (scalar index).

ST4W (scalar plus immediate): Contiguous store four-word structures from four vectors (immediate index).

ST4W (scalar plus scalar): Contiguous store four-word structures from four vectors (scalar index).

STNT1B (scalar plus immediate): Contiguous store non-temporal bytes from vector (immediate index).

STNT1B (scalar plus scalar): Contiguous store non-temporal bytes from vector (scalar index).

STNT1B (vector plus scalar): Scatter store non-temporal bytes.
**STNT1D** (scalar plus immediate): Contiguous store non-temporal doublewords from vector (immediate index).

**STNT1D** (scalar plus scalar): Contiguous store non-temporal doublewords from vector (scalar index).

**STNT1D** (vector plus scalar): Scatter store non-temporal doublewords.

**STNT1H** (scalar plus immediate): Contiguous store non-temporal halfwords from vector (immediate index).

**STNT1H** (scalar plus scalar): Contiguous store non-temporal halfwords from vector (scalar index).

**STNT1H** (vector plus scalar): Scatter store non-temporal halfwords.

**STNT1W** (scalar plus immediate): Contiguous store non-temporal words from vector (immediate index).

**STNT1W** (scalar plus scalar): Contiguous store non-temporal words from vector (scalar index).

**STNT1W** (vector plus scalar): Scatter store non-temporal words.

**STR** (predicate): Store predicate register.

**STR** (vector): Store vector register.

**SUB** (immediate): Subtract immediate (unpredicated).

**SUB** (vectors, predicated): Subtract vectors (predicated).

**SUB** (vectors, unpredicated): Subtract vectors (unpredicated).

**SUBHNB**: Subtract narrow high part (bottom).

**SUBHNT**: Subtract narrow high part (top).

**SUBR** (immediate): Reversed subtract from immediate (unpredicated).

**SUBR** (vectors): Reversed subtract vectors (predicated).

**SUDOT**: Signed by unsigned integer indexed dot product.

**SUNPKHI, SUNPKLO**: Signed unpack and extend half of vector.

**SUQADD**: Signed saturating addition of unsigned value.

**SXTB, SXTH, SXTW**: Signed byte / halfword / word extend (predicated).

**TBL**: Programmable table lookup in one or two vector table (zeroing).

**TBX**: Programmable table lookup in single vector table (merging).

**TRN1, TRN2** (predicates): Interleave even or odd elements from two predicates.

**TRN1, TRN2** (vectors): Interleave even or odd elements from two vectors.

**UABA**: Unsigned absolute difference and accumulate.

**UABALB**: Unsigned absolute difference and accumulate long (bottom).

**UABALT**: Unsigned absolute difference and accumulate long (top).

**UABD**: Unsigned absolute difference (predicated).

**UABDLB**: Unsigned absolute difference long (bottom).

**UABDLT**: Unsigned absolute difference long (top).

**UADALP**: Unsigned add and accumulate long pairwise.

**UADDLB**: Unsigned add long (bottom).

**UADDLT**: Unsigned add long (top).

**UADDV**: Unsigned add reduction to scalar.
UADDWP: Unsigned add wide (bottom).
UADDWT: Unsigned add wide (top).
UCVTF: Unsigned integer convert to floating-point (predicated).
UDIV: Unsigned divide (predicated).
UDIVR: Unsigned reversed divide (predicated).
UDOT (indexed): Unsigned integer indexed dot product.
UDOT (vectors): Unsigned integer dot product.
UHADD: Unsigned halving addition.
UHSUB: Unsigned halving subtract.
UHSUBR: Unsigned halving subtract reversed vectors.
UMAX (immediate): Unsigned maximum with immediate (unpredicated).
UMAX (vectors): Unsigned maximum vectors (predicated).
UMAXP: Unsigned maximum pairwise.
UMAXV: Unsigned maximum reduction to scalar.
UMIN (immediate): Unsigned minimum with immediate (unpredicated).
UMIN (vectors): Unsigned minimum vectors (predicated).
UMINP: Unsigned minimum pairwise.
UMINY: Unsigned minimum reduction to scalar.
UMLALB (indexed): Unsigned multiply-add long to accumulator (bottom, indexed).
UMLALB (vectors): Unsigned multiply-add long to accumulator (bottom).
UMLALT (indexed): Unsigned multiply-add long to accumulator (top, indexed).
UMLALT (vectors): Unsigned multiply-add long to accumulator (top).
UMLSLB (indexed): Unsigned multiply-subtract long from accumulator (bottom, indexed).
UMLSLB (vectors): Unsigned multiply-subtract long from accumulator (bottom).
UMLSLT (indexed): Unsigned multiply-subtract long from accumulator (top, indexed).
UMLSLT (vectors): Unsigned multiply-subtract long from accumulator (top).
UMMLA: Unsigned integer matrix multiply-accumulate.
UMULH (predicated): Unsigned multiply returning high half (predicated).
UMULH (unpredicated): Unsigned multiply returning high half (unpredicated).
UMULLB (indexed): Unsigned multiply long (bottom, indexed).
UMULLB (vectors): Unsigned multiply long (bottom).
UMULLT (indexed): Unsigned multiply long (top, indexed).
UMULLT (vectors): Unsigned multiply long (top).
UQADD (immediate): Unsigned saturating add immediate (unpredicated).
UQADD (vectors, predicated): Unsigned saturating addition (predicated).
UQADD (vectors, unpredicated): Unsigned saturating add vectors (unpredicated).
UQDECB: Unsigned saturating decrement scalar by multiple of 8-bit predicate constraint element count.
UQDECD (scalar): Unsigned saturating decrement scalar by multiple of 64-bit predicate constraint element count.
UQDECD (vector): Unsigned saturating decrement vector by multiple of 64-bit predicate constraint element count.
UQDECH (scalar): Unsigned saturating decrement scalar by multiple of 16-bit predicate constraint element count.
UQDECH (vector): Unsigned saturating decrement vector by multiple of 16-bit predicate constraint element count.
UQDECP (scalar): Unsigned saturating decrement scalar by count of true predicate elements.
UQDECP (vector): Unsigned saturating decrement vector by count of true predicate elements.
UQDECW (scalar): Unsigned saturating decrement scalar by multiple of 32-bit predicate constraint element count.
UQDECW (vector): Unsigned saturating decrement vector by multiple of 32-bit predicate constraint element count.
UQINCB: Unsigned saturating increment scalar by multiple of 8-bit predicate constraint element count.
UQINCD (scalar): Unsigned saturating increment scalar by multiple of 64-bit predicate constraint element count.
UQINCD (vector): Unsigned saturating increment vector by multiple of 64-bit predicate constraint element count.
UQINCH (scalar): Unsigned saturating increment scalar by multiple of 16-bit predicate constraint element count.
UQINCH (vector): Unsigned saturating increment vector by multiple of 16-bit predicate constraint element count.
UQINCP (scalar): Unsigned saturating increment scalar by count of true predicate elements.
UQINCP (vector): Unsigned saturating increment vector by count of true predicate elements.
UQINCW (scalar): Unsigned saturating increment scalar by multiple of 32-bit predicate constraint element count.
UQINCW (vector): Unsigned saturating increment vector by multiple of 32-bit predicate constraint element count.
UQRSHL: Unsigned saturating rounding shift left by vector (predicated).
UQRSHLR: Unsigned saturating rounding shift left reversed vectors (predicated).
UQSHLNB: Unsigned saturating shift right narrow by immediate (bottom).
UQSHRNT: Unsigned saturating shift right narrow by immediate (top).
UQSHL (immediate): Unsigned saturating shift left by immediate.
UQSHL (vectors): Unsigned saturating shift left by vector (predicated).
UQSHLR: Unsigned saturating shift left reversed vectors (predicated).
UQSHRN: Unsigned saturating shift right narrow by immediate (bottom).
UQSHRT: Unsigned saturating shift right narrow by immediate (top).
UQSUIMM: Unsigned saturating subtract immediate (unpredicated).
UQSUB (vectors, predicated): Unsigned saturating subtraction (predicated).
UQSUB (vectors, unpredicated): Unsigned saturating subtract vectors (unpredicated).
UQSUBB: Unsigned saturating subtraction reversed vectors (predicated).
UQXTNB: Unsigned saturating extract narrow (bottom).
UQXTNT: Unsigned saturating extract narrow (top).
URECPE: Unsigned reciprocal estimate (predicated).
URHADD: Unsigned rounding halving addition.
URSHL: Unsigned rounding shift left by vector (predicated).
URSHLR: Unsigned rounding shift left reversed vectors (predicated).
URSHR: Unsigned rounding shift right by immediate.
URSORTE: Unsigned reciprocal square root estimate (predicated).
URSRA: Unsigned rounding shift right and accumulate (immediate).
USDOT (indexed): Unsigned by signed integer indexed dot product.
USDOT (vectors): Unsigned by signed integer dot product.
USHLLB: Unsigned shift left long by immediate (bottom).
USHLLT: Unsigned shift left long by immediate (top).
USMMLA: Unsigned by signed integer matrix multiply-accumulate.
USQADD: Unsigned saturating addition of signed value.
USRA: Unsigned shift right and accumulate (immediate).
USUBLB: Unsigned subtract long (bottom).
USUBLT: Unsigned subtract long (top).
USUBWB: Unsigned subtract wide (bottom).
USUBWT: Unsigned subtract wide (top).
UUNPKHI, UUNPKLO: Unsigned unpack and extend half of vector.
UXTB, UXTH, UXTW: Unsigned byte / halfword / word extend (predicated).
UZP1, UZP2 (predicates): Concatenate even or odd elements from two predicates.
UZP1, UZP2 (vectors): Concatenate even or odd elements from two vectors.
WHILEGE: While decrementing signed scalar greater than or equal to scalar.
WHILEGT: While decrementing signed scalar greater than scalar.
WHILEHI: While decrementing unsigned scalar higher than scalar.
WHILEHS: While decrementing unsigned scalar higher or same as scalar.
WHILELE: While incrementing signed scalar less than or equal to scalar.
WHILELO: While incrementing unsigned scalar lower than scalar.
WHILELS: While incrementing unsigned scalar lower or same as scalar.
WHILELT: While incrementing signed scalar less than scalar.
WHILERW: While free of read-after-write conflicts.
WHILEWR: While free of write-after-read/write conflicts.
WRFFR: Write the first-fault register.
XAR: Bitwise exclusive OR and rotate right by immediate.
ZIP1, ZIP2 (predicates): Interleave elements from two half predicates.
ZIP1, ZIP2 (vectors): Interleave elements from two half vectors.
ABS

Absolute value (predicated).

Compute the absolute value of the signed integer in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

SVE

ABS <Zd>.<T>, <Pg>/M, <Zn>.<T>

if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.
<T> Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];
for e = 0 to elements-1
    integer element = SInt(Elem[operand, e, esize]);
    if ElemP[mask, e, esize] == '1' then
        element = Abs(element);
        Elem[result, e, esize] = element<esize-1:0>;
Z[d] = result;

Operational information

If PSTATE.DIT is 1:
  • The execution time of this instruction is independent of:
    ◦ The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
    ◦ The values of the NZCV flags.
  • The response of this instruction to asynchronous exceptions does not vary based on:
    ◦ The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
    ◦ The values of the NZCV flags.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
ADCLB

Add with carry long (bottom).

Add the even-numbered elements of the first source vector and the 1-bit carry from the least-significant bit of the odd-numbered elements of the second source vector to the even-numbered elements of the destination and accumulator vector. The 1-bit carry output is placed in the corresponding odd-numbered element of the destination vector.

ADD (immediate)

Add immediate (unpredicated).

Add an unsigned immediate to each element of the source vector, and destructively place the results in the corresponding elements of the source vector. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

```
0 0 1 0 0 1 0 1 | size 1 0 0 0 0 0 0 | imm8
0 0 1 0 0 1 0 1 | sh 1 1
```

SVE

```
ADD <Zdn>,<T>, #<imm>{, <shift>}
```

if !HaveSVE() then UNDEFINED;
if size:sh == '001' then UNDEFINED;
integer esize = 8 << UInt(size);
integer dn = UInt(Zdn);
integer imm = UInt(imm8);
if sh == '1' then imm = imm << 8;

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

```
size  | <T>
00    | B
01    | H
10    | S
11    | D
```

<imm> Is an unsigned immediate in the range 0 to 255, encoded in the “imm8” field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

```
sh  | <shift>
0   | LSL #0
1   | LSL #8
```

Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(VL) result;
for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
    Elem[result, e, esize] = element1 + imm;
Z[dn] = result;
```

  - The values of the NZCV flags.
ADDHNB

Add narrow high part (bottom).

Add each vector element of the first source vector to the corresponding vector element of the second source vector, and place the most significant half of the result in the even-numbered half-width destination elements, while setting the odd-numbered elements to zero. This instruction is unpredicated.

**Operational information**

If PSTATE.DIT is 1:

ADDP
• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  ◦ The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  ◦ The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**ADDPL**

Add multiple of predicate register size to scalar register.

Add the current predicate register size in bytes multiplied by an immediate in the range -32 to 31 to the 64-bit source general-purpose register or current stack pointer and place the result in the 64-bit destination general-purpose register or current stack pointer.

```
| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |
|-----------------|-----------------|-----------------|-----------------|

  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
ADR

Compute vector address.

Optionally sign or zero-extend the least significant 32-bits of each element from a vector of offsets or indices in the second source vector, scale each index by 2, 4 or 8, add to a vector of base addresses from the first source vector, and place the resulting addresses in the destination vector. This instruction is unpredicated.

It has encodings from 3 classes: Packed offsets, Unpacked 32-bit signed offsets and Unpacked 32-bit unsigned offsets

Packed offsets

```
 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 0 0 0 0 1 0 0 1 | sz | 1 Zm | 1 0 1 0 | msz | Zn | Zd
```

Packed offsets

```java
ADR <Zd>.<T>, [<Zn>.<T>, <Zm>.<T>{, <mod> <amount>}}
```

if !HaveSVE() then UNDEFINED;
integer esize = 32 << UInt(sz);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
integer osize = esize;
boolean unsigned = TRUE;
integer mbytes = 1 << UInt(msz);

Unpacked 32-bit signed offsets

```
 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 0 0 0 0 1 0 0 0 | 1 | Zm | 1 0 1 0 | msz | Zn | Zd
```

Unpacked 32-bit signed offsets

```java
ADR <Zd>.D, [<Zn>.D, <Zm>.D, SXTW{ <amount>}}
```

if !HaveSVE() then UNDEFINED;
integer esize = 64;
integer n = UInt(Zn);
integer m = UInt(Zm);

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
AESMC

AES mix columns.

The AESMC instruction reads a 16-byte state array from each 128-bit segment of the source register, and performs a single round of the \texttt{MIXCOLUMNS} transformation on each state array in accordance with the AES standard. Each updated state array is destructively placed in the corresponding segment of the first source vector. This instruction is unpredicated.

ID\_AA64ZFR0\_EL1\_AES indicates whether this instruction is implemented.

AND, ANDS (predicates)

Bitwise AND predicates.

Bitwise AND active elements of the second source predicate with corresponding elements of the first source predicate and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Optionally sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

This instruction is used by the aliases MOVS (predicated), and MOV (predicate, predicated, zeroing).

It has encodings from 2 classes: Not setting the condition flags and Setting the condition flags

Not setting the condition flags

```
AND <Pd>B, <Pg>/Z, <Pn>B, <Pm>B
```

if !HaveSVE() then UNDEFINED;
integer esize = 8;
integer g = UInt(Pg);
integer n = UInt(Pn);
integer m = UInt(Pm);
integer d = UInt(Pd);
boolean setflags = FALSE;

Setting the condition flags

```
AND <Pd>B, <Pg>/Z, <Pn>B, <Pm>B
```

if !HaveSVE() then UNDEFINED;
integer esize = 8;
integer g = UInt(Pg);
integer n = UInt(Pn);
integer m = UInt(Pm);
integer d = UInt(Pd);
boolean setflags = TRUE;

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn> Is the name of the first source scalable predicate register, encoded in the "Pn" field.
<Pm> Is the name of the second source scalable predicate register, encoded in the "Pm" field.

Alias Conditions

<table>
<thead>
<tr>
<th>Alias</th>
<th>Is preferred when</th>
</tr>
</thead>
<tbody>
<tr>
<td>MOVS (predicated)</td>
<td>$S == '1' &amp;&amp; Pn == Pm</td>
</tr>
</tbody>
</table>
**Alias**

MOV (predicate, predicated, zeroing)  
Is preferred when  
\( S == '0' \) \&\& \( Pn == Pm \)

**Operation**

```plaintext
CheckSVEEnabled();  
integer elements = VL DIV esize;  
bits(PL) mask = P[g];  
bits(PL) operand1 = P[n];  
bits(PL) operand2 = P[m];  
bits(PL) result;  
for e = 0 to elements - 1  
    bit element1 = ElemP[operand1, e, esize];  
    bit element2 = ElemP[operand2, e, esize];  
    if ElemP[mask, e, esize] == '1' then  
        ElemP[result, e, esize] = element1 AND element2;  
    else  
        ElemP[result, e, esize] = '0';  
if setflags then  
PSTATE.<N,Z,C,V> = PredTest(mask, result, esize);  
P[d] = result;
```

**Operational information**

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
**AND (vectors, predicated)**

Bitwise AND vectors (predicated).

Bitwise AND active elements of the second source vector with corresponding elements of the first source vector and destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

<table>
<thead>
<tr>

Z[dn] = result;

**Operational information**

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.

The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
AND (immediate)

Bitwise AND with immediate (unpredicated).

Bitwise AND an immediate with each 64-bit element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits. This instruction is unpredicated.

This instruction is used by the pseudo-instruction BIC (immediate).

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**ASR (vectors)**

Arithmetic shift right by vector (predicated).

Shift right, preserving the sign bit, active elements of the first source vector by corresponding elements of the second source vector and destructively place the results in the corresponding elements of the first source vector. The shift amount operand is a vector of unsigned elements in which all bits are significant, and not used modulo the element size. Inactive elements in the destination vector register remain unmodified.

### SVE

ASR <Zdn>..<T>, <Pg>/M, <Zdn>..<T>, <Zm>..<T>

if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt[size];
integer g = UInt[Pg];
integer dn = UInt[Zdn];
integer m = UInt[Zm];

### Assembler Symbols

**<Zdn>** Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.

**<T>** Is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

**<Pg>** Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

**<Zm>** Is the name of the second source scalable vector register, encoded in the "Zm" field.

### Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[dn];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
  bits(esize) element1 = Elem[operand1, e, esize];
  bits(esize) element2 = Elem[operand2, e, esize];
  integer shift = Min(UInt(element2), esize);
  if ElemP[mask, e, esize] == '1' then
    Elem[result, e, esize] = ASR(element1, shift);
  else
    Elem[result, e, esize] = Elem[operand1, e, esize];
Z[dn] = result;

### Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  ◦ The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
BFCVT

Floating-point down convert to BFloat16 format (predicated).

Convert to BFloat16 from single-precision in each active floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

Since the result type is smaller than the input type, the results are zero-extended to fill each destination element. Unlike the BFloat16 matrix multiplication and dot product instructions, this instruction honors all of the FPCR bits that apply to single-precision arithmetic. It can also generate a floating-point exception that causes cumulative exception bits in the FPSR to be set, or a synchronous exception to be taken, depending on the enable bits in the FPCR.

ID_AA64ZFR0_EL1.BF16 indicates whether this instruction is implemented.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
BFCVTNT

Floating-point down convert and narrow to BFloat16 (top, predicated).

Convert active 32-bit single-precision elements from the source vector to BFloat16 format, and place the results in the odd-numbered 16-bit elements of the destination vector, leaving the even-numbered elements unchanged. Inactive elements in the destination vector register remain unmodified.

Unlike the BFloat16 matrix multiplication and dot product instructions, this instruction honors all of the FPCR bits that apply to single-precision arithmetic. It can also generate a floating-point exception that causes cumulative exception bits in the FPSR to be set, or a synchronous exception to be taken, depending on the enable bits in the FPCR.

ID_AA64ZFR0_EL1.BF16 indicates whether this instruction is implemented.

SVE

BFCVTNT <Zd>.H, <Pg>/M, <Zn>.S

if !HaveSVE() || !HaveBF16Ext() then UNDEFINED;
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV 32;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];

for e = 0 to elements-1
    bits(32) element = Elem[operand, e, 32];
    if ElemP[mask, e, 32] == '1' then
        Elem[result, 2*e+1, 16] = FPConvertBF(element, FPCR);
Z[d] = result;
BFDOT (vectors)

BFloat16 floating-point dot product.

The BFloat16 floating-point (BF16) dot product instruction computes the dot product of a pair of BF16 values held in each 32-bit element of the first source vector multiplied by a pair of BF16 values in the corresponding 32-bit element of the second source vector, and then destructively adds the single-precision dot product to the corresponding single-precision element of the destination vector.

This instruction is unpredicated.

All floating-point calculations performed by this instruction are performed with the following behaviors, irrespective of the value in FPCR:

* Uses the non-IEEE 754 Round-to-Odd mode, which forces bit 0 of an inexact result to 1, and rounds an overflow to an appropriately signed Infinity.
* The cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC and IOC) are not modified.
* Trapped floating-point exceptions are disabled, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE and IOE) are all zero.
* Denormalized inputs and results are flushed to zero, as if FPCR.FZ == 1.
* Only the Default NaN is generated, as if FPCR.DN == 1.

ID_AA64ZFR0_EL1.BF16 indicates whether this instruction is implemented.

```
if !HaveSVE() || !HaveBF16Ext() then UNDEFINED;
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
```

**Assembler Symbols**

<Zda> Is the name of the third source and destination scalable vector register, encoded in the “Zda” field.

<Zn> Is the name of the first source scalable vector register, encoded in the “Zn” field.

<Zm> Is the name of the second source scalable vector register, encoded in the “Zm” field.

**Operation**

```
CheckSVEEnabled();
integer elements = VL DIV 32;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) operand3 = Z[da];
bits(VL) result;
for e = 0 to elements-1
    bits(16) elt1_a = Elem[operand1, 2 * e + 0, 16];
    bits(16) elt1_b = Elem[operand1, 2 * e + 1, 16];
    bits(16) elt2_a = Elem[operand2, 2 * e + 0, 16];
    bits(16) elt2_b = Elem[operand2, 2 * e + 1, 16];
    bits(32) sum = BFAdd(BFMul(elt1_a, elt2_a), BFMul(elt1_b, elt2_b));
    Elem[result, e, 32] = BFAdd(Elem[operand3, e, 32], sum);
Z[da] = result;
```
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
BFDOT (indexed)

BFloat16 floating-point indexed dot product.

The BFloat16 floating-point (BF16) indexed dot product instruction computes the dot product of a pair of BF16 values held in each 32-bit element of the first source vector multiplied by a pair of BF16 values in an indexed 32-bit element of the second source vector, and then destructively adds the single-precision dot product to the corresponding single-precision element of the destination vector.

The BF16 pairs within the second source vector are specified using an immediate index which selects the same BF16 pair position within each 128-bit vector segment. The index range is from 0 to 3. This instruction is unpredicated. All floating-point calculations performed by this instruction are performed with the following behaviors, irrespective of the value in FPCR:

* Uses the non-IEEE 754 Round-to-Odd mode, which forces bit 0 of an inexact result to 1, and rounds an overflow to an appropriately signed Infinity.
* The cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC and IOC) are not modified.
* Trapped floating-point exceptions are disabled, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE and IOE) are all zero.
* Denormalized inputs and results are flushed to zero, as if FPCR.FZ == 1.
* Only the Default NaN is generated, as if FPCR.DN == 1.

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
BFMMLA

BFloat16 floating-point matrix multiply-accumulate.

This BFloat16 floating-point (BF16) matrix multiply-accumulate instruction multiplies the 2×4 matrix of BF16 values held in each 128-bit segment of the first source vector by the 4×2 BF16 matrix in the corresponding segment of the second source vector. The resulting 2×2 single-precision (FP32) matrix product is then destructively added to the FP32 matrix accumulator held in the corresponding segment of the addend and destination vector. This is equivalent to performing a 4-way dot product per destination element.

This instruction is unpredicated and vector length agnostic.

All floating-point calculations performed by this instruction are performed with the following behaviors, irrespective of the value in FPCR:

* Uses the non-IEEE 754 Round-to-Odd mode, which forces bit 0 of an inexact result to 1, and rounds an overflow to an appropriately signed Infinity.
* The cumulative FPSR exception bits (IDC, IXC, UFC, OFC, DZC and IOC) are not modified.
* Trapped floating-point exceptions are disabled, as if the FPCR trap enable bits (IDE, IXE, UFE, OFE, DZE and IOE) are all zero.
* Only the Default NaN is generated, as if FPCR.DN == 1.

ID_AA64ZFR0_EL1.BF16 indicates whether this instruction is implemented.

Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
BIC (immediate)

Bitwise clear bits using immediate (unpredicated).

Bitwise clear bits using immediate with each 64-bit element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits. This instruction is unpredicated.

This is a pseudo-instruction of **AND (immediate)**. This means:

- The encodings in this description are named to match the encodings of **AND (immediate)**.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of **AND (immediate)** gives the operational pseudocode for this instruction.

<td>RESERVED</td>
</tr>
<tr>
<td>1</td>
<td>xxxxxxx</td>
<td>D</td>
</tr>
</tbody>
</table>

- **<const>** is a 64, 32, 16 or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32 or 64 bit fields, each field containing a rotated run of non-zero bits, encoded in the "imm13" field.

**Operation**

The description of **AND (immediate)** gives the operational pseudocode for this instruction.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
BIC, BICS (predicates)

Bitwise clear predicates.

Bitwise AND inverted active elements of the second source predicate with corresponding elements of the first source predicate and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Optionally sets the FIRST (N), NONE (Z), LAST (C) condition flags based on the predicate result, and the V flag to zero.

It has encodings from 2 classes: Not setting the condition flags and Setting the condition flags.

Not setting the condition flags

CADD

Complex integer add with rotate.

Add the real and imaginary components of the integral complex numbers from the first source vector to the complex numbers from the second source vector which have first been rotated by 90 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, equivalent to multiplying the complex numbers in the second source vector by ±j beforehand. Destructively place the results in the corresponding elements of the first source vector. This instruction is unpredicated.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

CDOT (vectors)

Complex integer dot product.

The complex integer dot product instructions delimit the source vectors into pairs of 8-bit or 16-bit signed integer complex numbers. Within each pair, the complex numbers in the first source vector are multiplied by the corresponding complex numbers in the second source vector and the resulting wide real or wide imaginary part of the product is accumulated into a 32-bit or 64-bit destination vector element which overlaps all four of the elements that comprise a pair of complex number values in the first source vector.

As a result each instruction implicitly deinterleaves the real and imaginary components of their complex number inputs, so that the destination vector accumulates 4×wide real sums or 4×wide imaginary sums. The complex numbers in the second source vector are rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, by performing the following transformations prior to the dot product operations:

* If the rotation is #0, the imaginary parts of the complex numbers in the second source vector are negated. The destination vector therefore accumulates the real parts of a complex dot product.
* If the rotation is #90, the real and imaginary parts of the complex numbers the second source vector are swapped. The destination vector therefore accumulates the imaginary parts of a complex dot product.
* If the rotation is #180, there is no transformation. The destination vector therefore accumulates the real parts of a complex conjugate dot product.
* If the rotation is #270, the real parts of the complex numbers in the second source vector are negated and then swapped with the imaginary parts. The destination vector therefore accumulates the imaginary parts of a complex conjugate dot product.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

CDOT (indexed)

Complex integer dot product (indexed).

The complex integer dot product instructions delimit the source vectors into pairs of 8-bit or 16-bit signed integer complex numbers. Within each pair, the complex numbers in the first source vector are multiplied by the corresponding complex numbers in the second source vector and the resulting wide real or wide imaginary part of the product is accumulated into a 32-bit or 64-bit destination vector element which overlaps all four of the elements that comprise a pair of complex number values in the first source vector.

As a result each instruction implicitly deinterleaves the real and imaginary components of their complex number inputs, so that the destination vector accumulates 4×wide real sums or 4×wide imaginary sums.

The complex numbers in the second source vector are rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, by performing the following transformations prior to the dot product operations:

* If the rotation is #0, the imaginary parts of the complex numbers in the second source vector are negated. The destination vector therefore accumulates the real parts of a complex dot product.
* If the rotation is #90, the real and imaginary parts of the complex numbers the second source vector are swapped. The destination vector therefore accumulates the imaginary parts of a complex dot product.
* If the rotation is #180, there is no transformation. The destination vector therefore accumulates the real parts of a complex conjugate dot product.
* If the rotation is #270, the real parts of the complex numbers in the second source vector are negated and then swapped with the imaginary parts. The destination vector therefore accumulates the imaginary parts of a complex conjugate dot product.

The indexed form of these instructions select a single pair of complex numbers within each 128-bit segment of the second source vector as the multiplier for all pairs of complex numbers within the corresponding 128-bit segment of the first source vector. The complex number pairs within the second source vector are specified using an immediate index which selects the same complex number pair position within each 128-bit vector segment. The index range is from 0 to one less than the number of complex number pairs per 128-bit segment, encoded in 1 or 2 bits depending on the size of the complex number pair.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
CLASTA (scalar)

Conditionally extract element after last to general-purpose register.

From the source vector register extract the element after the last active element, or if the last active element is the final element extract element zero, and then zero-extend that element to destructively place in the destination and first source general-purpose register. If there are no active elements then destructively zero-extend the least significant element-size bits of the destination and first source general-purpose register.

Z[d] = result;

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
• The `MOVPRFX` instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
• The `MOVPRFX` instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
CMLA (vectors)

Complex integer multiply-add with rotate.

Multiply the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of the integral numbers in the first source vector by the corresponding complex number in the second source vector rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation.

Then add the products to the corresponding components of the complex numbers in the addend vector. Destructively place the results in the corresponding elements of the addend vector. This instruction is unpredicated.

These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees apart.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

Operational information

If PSTATE.DIT is 1:
• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

Internal version only: isa v31.05b, AdvSIMD v29.02, pseudocode v2019-12_rc3_1, sve v2019-12_rc3 ; Build timestamp: 2019-12-13T11:35

CMLA (indexed)

Complex integer multiply-add with rotate (indexed).

Multiply the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of the integral numbers in each 128-bit segment of the first source vector by the specified complex number in the corresponding the second source vector segment rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation.

Then add the products to the corresponding components of the complex numbers in the addend vector. Destructively place the results in the corresponding elements of the addend vector. This instruction is unpredicated.

These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees apart.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

It has encodings from 2 classes: 16-bit and 32-bit

Operational information

If PSTATE.DIT is 1:
• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**CMP<cc> (immediate)**

Compare active integer elements in the source vector with an immediate, and place the boolean results of the specified comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Sets the \texttt{FIRST} (N), \texttt{NONE} (Z), \texttt{!LAST} (C) condition flags based on the predicate result, and the V flag to zero.

The \texttt{<cc>} symbol specifies one of the standard ARM condition codes: EQ, GE, GT, HI, HS, LE, LO, LS, LT or NE.

It has encodings from 10 classes: Equal, Greater than, Greater than or equal, Higher, Higher or same, Less than, Less than or equal, Lower, Lower or same and Not equal.

P[d] = result;

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
The values of the NZCV flags.
CMPLE (vectors)

Compare signed less than or equal to vector, setting the condition flags.

Compare active signed integer elements in the first source vector being less than or equal to corresponding signed elements in the second source vector, and place the boolean results of the comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

This is a pseudo-instruction of CMP<cc> (vectors). This means:

- The encodings in this description are named to match the encodings of CMP<cc> (vectors).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of CMP<cc> (vectors) gives the operational pseudocode for this instruction.

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**CNTB, CNTD, CNTH, CNTW**

Set scalar to multiple of predicate constraint element count.

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then places the result in the scalar destination.

The named predicate constraint limits the number of active elements in a single predicate to:

* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 4 classes: **Byte**, **Doubleword**, **Halfword** and **Word**

### Byte

![Byte Opcode](image)

**CNTB <Xd>{, <pattern>{, MUL #<imm>}}**

```assembly
if !HaveSVE() then UNDEFINED;
integer esize = 8;
integer d = UInt(Rd);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
```

### Doubleword

![Doubleword Opcode](image)

**CNTD <Xd>{, <pattern>{, MUL #<imm>}}**

```assembly
if !HaveSVE() then UNDEFINED;
integer esize = 64;
integer d = UInt(Rd);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
```

### Halfword

![Halfword Opcode](image)

**CNTH <Xd>{, <pattern>{, MUL #<imm>}}**

```assembly
if !HaveSVE() then UNDEFINED;
integer esize = 16;
integer d = UInt(Rd);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
```
Word

  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
CNTP

Set scalar to count of true predicate elements.

Counts the number of active and true elements in the source predicate and places the scalar result in the destination general-purpose register. Inactive predicate elements are not counted.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

Shuffle active elements of vector to the right and fill with zero.

Read the active elements from the source vector and pack them into the lowest-numbered elements of the destination vector. Then set any remaining elements of the destination vector to zero.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**SVE**

COMPACT <Zd>, <T>, <Pg>, <Zn>, <T>

if !HaveSVE() then UNDEFINED;
if size == '0x' then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);

**Assembler Symbols**

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in "size<0>":

<table>
<thead>
<tr>
<th>size&lt;0&gt;</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>S</td>
</tr>
<tr>
<td>1</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

**Operation**

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[n];
bits(VL) result;
integer x = 0;
for e = 0 to elements-1

        bits(esize) element = Elem[operand1, e, esize];
        Elem[result, x, esize] = element;
        x = x + 1;
Z[d] = result;
**CPY (immediate, zeroing)**

Copy signed integer immediate to vector elements (zeroing).

Copy a signed integer immediate to each active element in the destination vector. Inactive elements in the destination vector register are set to zero.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<simm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This instruction is used by the alias **MOV (immediate, predicated, zeroing)**.

**Assembler Symbols**

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in "size":

- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
CTERMEQ, CTERMNE

Compare and terminate loop.

Detect termination conditions in serialized vector loops. Tests whether the comparison between the scalar source operands holds true and if not tests the state of the !LAST condition flag (C) which indicates whether the previous flag-setting predicate instruction selected the last element of the vector partition.

The Z and C condition flags are preserved by this instruction. The N and V condition flags are set as a pair to generate one of the following conditions for a subsequent conditional instruction:
* GE (N=0 & V=0): continue loop (compare failed and last element not selected);
* LT (N=0 & V=1): terminate loop (last element selected);
* LT (N=1 & V=0): terminate loop (compare succeeded);

The scalar source operands are 32-bit or 64-bit general-purpose registers of the same size.

It has encodings from 2 classes: Equal and Not equal

### Equal

```

    ◦ The values of the data supplied in any of its registers.
    ◦ The values of the NZCV flags.
**DECB, DECD, DECH, DECW (scalar)**

Decrement scalar by multiple of predicate constraint element count.

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination.

The named predicate constraint limits the number of active elements in a single predicate to:

* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 4 classes: **Byte, Doubleword, Halfword** and **Word**

### Byte

</table>

<imm>  Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

CheckSVEEnabled();
integer count = DecodePredCount(pat, esize);
bits(64) operand1 = X[dn];
X[dn] = operand1 - (count * imm);

Operational information

If PSTATE.DIT is 1:
  • The execution time of this instruction is independent of:
    o The values of the data supplied in any of its registers.
    o The values of the NZCV flags.
  • The response of this instruction to asynchronous exceptions does not vary based on:
    o The values of the data supplied in any of its registers.
    o The values of the NZCV flags.
DECD, DECH, DECW (vector)

Decrement vector by multiple of predicate constraint element count.

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement all destination vector elements.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 3 classes: Doubleword, Halfword and Word

Doubleword

DECD <Zdn>.D{, <pattern>{, MUL #<imm>}}

if !HaveSVE() then UNDEFINED;
integer esize = 64;
integer dn = UInt(Zdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;

Halfword

DECH <Zdn>.H{, <pattern>{, MUL #<imm>}}

if !HaveSVE() then UNDEFINED;
integer esize = 16;
integer dn = UInt(Zdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;

Word

DECW <Zdn>.S{, <pattern>{, MUL #<imm>}}

if !HaveSVE() then UNDEFINED;
integer esize = 32;
integer dn = UInt(Zdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

</tr>
</tbody>
</table>

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
b bits(VL) operand1 = Z[dn];
b bits(VL) result;
for e = 0 to elements-1
    Elem[result, e, esize] = Elem[operand1, e, esize] - (count * imm);
Z[dn] = result;

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

DECP (scalar)

Decrement scalar by count of true predicate elements.

Counts the number of true elements in the source predicate and then uses the result to decrement the scalar destination.

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(64) operand1 = X[dn];
bits(PL) operand2 = P[m];
integer count = 0;
for e = 0 to elements-1
  if ElemP(operand2, e, esize) == '1' then
    count = count + 1;
X[dn] = operand1 - count;
DECP (vector)

Decrement vector by count of true predicate elements.

Counts the number of true elements in the source predicate and then uses the result to decrement all destination vector elements.

The predicate size specifier may be omitted in assembler source code, but this is deprecated and will be prohibited in a future release of the architecture.

      count = count + 1;
for e = 0 to elements-1
   Elem[result, e, esize] = Elem[operand1, e, esize] - count;
Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
DUP (immediate)

Broadcast signed immediate to vector elements (unpredicated).

Unconditionally broadcast the signed integer immediate into each element of the destination vector. This instruction is unpredicated.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This instruction is used by the aliases FMOV (zero, unpredicated), and MOV (immediate, unpredicated).

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

</tbody>
</table>

<imm> Is a signed immediate in the range -128 to 127, encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in "sh":

<table>
<thead>
<tr>
<th>sh &lt;shift&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 LSL #0</td>
</tr>
<tr>
<td>1 LSL #8</td>
</tr>
</tbody>
</table>

Operation

CheckSVEEnabled();
bits(VL) result = Replicate(imm<esize-1:0>);
Z[d] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
DUP (scalar)

Broadcast general-purpose register to vector elements (unpredicated).

Unconditionally broadcast the general-purpose scalar source register into each element of the destination vector. This instruction is unpredicated.

This instruction is used by the alias MOV (scalar, unpredicated).

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0</th>

DUPM

Broadcast logical bitmask immediate to vector (unpredicated).

Unconditionally broadcast the logical bitmask immediate into each element of the destination vector. This instruction
is unpredicated. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16,
32 or 64 bits.

This instruction is used by the alias MOV (bitmask immediate).

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 0 0 0 0 1 0 1 1 1 0 0 0 0 imm13 Zd
```

SVE

DUPM <Zd>.<T>, #<const>

if !HaveSVE() then UNDEFINED;
integer esize = 64;
integer d = UInt(Zd);
bits(esize) imm;
(imm, -) = DecodeBitMasks(imm13<12>, imm13<5:0>, imm13<11:6>, TRUE);

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the “Zd” field.
<T> Is the size specifier, encoded in “imm13<12>:imm13<5:0>”:

<table>
<thead>
<tr>
<th>imm13&lt;12&gt;</th>
<th>imm13&lt;5:0&gt;</th>

Operation

CheckSVEEnabled();
bits(VL) result = Replicate(imm);
Z[d] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
EON

Bitwise exclusive OR with inverted immediate (unpredicated).

Bitwise exclusive OR an inverted immediate with each 64-bit element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits. This instruction is unpredicated.

This is a pseudo-instruction of EOR (immediate). This means:

• The encodings in this description are named to match the encodings of EOR (immediate).
• The assembler syntax is used only for assembly, and is not used on disassembly.
• The description of EOR (immediate) gives the operational pseudocode for this instruction.

</tbody>
</table>

<const> Is a 64, 32, 16 or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32 or 64 bit fields, each field containing a rotated run of non-zero bits, encoded in the "imm13" field.

Operation

The description of EOR (immediate) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  • The values of the data supplied in any of its registers.
  • The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  • The values of the data supplied in any of its registers.
  • The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
EOR3

Bitwise exclusive OR of three vectors.

Bitwise exclusive OR the corresponding elements of all three source vectors, and destructively place the results in the corresponding elements of the destination and first source vector. This instruction is unpredicated.

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

SVE2

if !HaveSVE2() then UNDEFINED;
integer m = UInt(Zm);
integer k = UInt(Zk);
integer dn = UInt(Zdn);

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.
<Zk> Is the name of the third source scalable vector register, encoded in the "Zk" field.

Operation

CheckSVEEnabled();
bits(VL) operand1 = Z[dn];
bits(VL) operand2 = Z[m];
bits(VL) operand3 = Z[k];
Z[dn] = operand1 EOR operand2 EOR operand3;

Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
EOR, EORS (predicates)

Bitwise exclusive OR predicates.

Bitwise exclusive OR active elements of the second source predicate with corresponding elements of the first source predicate and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Optionally sets the FIRST (N), NONE (Z), LAST (C) condition flags based on the predicate result, and the V flag to zero.

This instruction is used by the aliases NOTS, and NOT (predicate).

It has encodings from 2 classes: Not setting the condition flags and Setting the condition flags

Not setting the condition flags

if !HaveSVE() then UNDEFINED;
integer esize = 8;
integer g = UInt(Pg);
integer n = UInt(Pn);
integer m = UInt(Pm);
integer d = UInt(Pd);
boolean setflags = FALSE;

Setting the condition flags

if !HaveSVE() then UNDEFINED;
integer esize = 8;
integer g = UInt(Pg);
integer n = UInt(Pn);
integer m = UInt(Pm);
integer d = UInt(Pd);
boolean setflags = TRUE;

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn> Is the name of the first source scalable predicate register, encoded in the "Pn" field.
<Pm> Is the name of the second source scalable predicate register, encoded in the "Pm" field.

The values of the NZCV flags.
Extract vector from pair of vectors.

Copy the indexed byte up to the last byte of the first source vector to the bottom of the result vector, then fill the remainder of the result starting from the first byte of the second source vector. The result is placed destructively in the destination and first source vector, or constructively in the destination vector. This instruction is unpredicated.

An index that is greater than or equal to the vector length in bytes is treated as zero, resulting in the first source vector being copied to the result unchanged.

It has encodings from 2 classes: **Constructive** and **Destructive**

**Constructive**

<table>
<thead>
<tr>

<th>imm8l 0 0</th>
<th>Zm</th>
<th>Zdn</th>
</tr>
</thead>
</table>

**Assembler Symbols**

- `<Zd>` is the name of the destination scalable vector register, encoded in the "Zd" field.
- `<Zn1>` is the name of the first scalable vector register of a multi-vector sequence, encoded in the "Zn" field.
- `<Zn2>` is the name of the second scalable vector register of a multi-vector sequence, encoded in the "Zn" field.
- `<Zdn>` is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
- `<Zm>` is the name of the second source scalable vector register, encoded in the "Zm" field.
- `<imm>` is the unsigned immediate operand, in the range 0 to 255, encoded in the "imm8h:imm8l" fields.
Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[s1];
bits(VL) operand2 = Z[s2];
bits(VL) result;

if position >= elements then
    position = 0;
position = position << 3;
bits(VL*2) concat = operand2 : operand1;
result = concat<position+VL-1:position>;
Z[dst] = result;

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
Floating-point absolute difference (predicated).

Compute the absolute difference of active floating-point elements of the second source vector and corresponding floating-point elements of the first source vector and destructively place the result in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 1 1 0 0 1 0 1 size 0 0 1 0 0 0 1 0 0 0 1 0 0 0 1 0 0 0 1 0 0 0 1 0 0
```

FABD

if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
inertn dn = UInt(Zdn);
inertn m = UInt(Zm);

Assembler Symbols

- `<Zdn>` is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
- `<T>` is the size specifier, encoded in “size”:

```
size <T>
00 RESERVED
01 H
10 S
11 D
```

- `<Pg>` is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<Zm>` is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

CheckSVEEnabled();
inertn elements = VL DIV esize;
inertn mask = P[g];
inertn operand1 = Z[dn];
inertn operand2 = Z[m];
inertn result;
for e = 0 to elements-1
  inertn element1 = Elem[operand1, e, esize];
inertn element2 = Elem[operand2, e, esize];
if Elem[mask, e, esize] == '1' then
  Elem[result, e, esize] = FPAbs(FPSUB(element1, element2, FPCR));
else
  Elem[result, e, esize] = element1;
Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**FABS**

Floating-point absolute value (predicated).

Take the absolute value of each active floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. This clears the sign bit and cannot signal a floating-point exception. Inactive elements in the destination vector register remain unmodified.

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

FABS  Page 1665
**FAC<cc>**

Floating-point absolute compare vectors.

Compare active absolute values of floating-point elements in the first source vector with corresponding absolute values of elements in the second source vector, and place the boolean results of the specified comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Does not set the condition flags.

The `<cc>` symbol specifies one of the standard ARM condition codes: GE, GT, LE, or LT.

This instruction is used by the pseudo-instructions FACLE and FACLT.

It has encodings from 2 classes: Greater than and Greater than or equal

### Greater than

|   |   | 1 | 1 | 0 | 1 | 0 | 0 | 0 | 1 | 1 | 1 | Zm | Pg | Zn | 1 | Pd |

Z[d] = result;
```
FADDA

Floating-point add strictly-ordered reduction, accumulating in scalar.

Floating-point add a SIMD&FP scalar source and all active lanes of the vector source and place the result destructively in the SIMD&FP scalar source register. Vector elements are processed strictly in order from low to high, with the scalar source providing the initial value. Inactive elements in the source vector are ignored.

Assembler Symbols

$<V>$ is a width specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>$&lt;V&gt;$</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>RESERVED</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

$<dn>$ is the number [0-31] of the source and destination SIMD&FP register, encoded in the "Vdn" field.

$<Pg>$ is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

$<Zm>$ is the name of the source scalable vector register, encoded in the "Zm" field.

$<T>$ is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>$&lt;T&gt;$</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>RESERVED</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(esize) operand1 = V[dn];
bits(VL) operand2 = Z[m];
bits(esize) result = operand1;

for e = 0 to elements-1
  if ElemP[mask, e, esize] == '1' then
    bits(esize) element = Elem[operand2, e, esize];
    result = FPAdd(result, element, FPCR);
V[dn] = result;
FADDP

Floating-point add pairwise.

Add pairs of adjacent floating-point elements within each source vector, and interleave the results from corresponding lanes. The interleaved result values are destructively placed in the first source vector.

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0</th>

Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FADDV
Floating-point add recursive reduction to scalar.

Floating-point add horizontally over all lanes of a vector using a recursive pairwise reduction, and place the result in the SIMD&FP scalar destination register. Inactive elements in the source vector are treated as +0.0.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

Operation

CheckSVEEnabled();
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(esize) identity = FPZero('0');
V[d] = ReducePredicated(ReduceOp_FADD, operand, mask, identity);
**FCADD**

Floating-point complex add with rotate (predicated).

Add the real and imaginary components of the active floating-point complex numbers from the first source vector to the complex numbers from the second source vector which have first been rotated by 90 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, equivalent to multiplying the complex numbers in the second source vector by ±j beforehand. Destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FCM<cc> (zero)

Floating-point compare vector with zero.

Compare active floating-point elements in the source vector with zero, and place the boolean results of the specified comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Does not set the condition flags.
The <cc> symbol specifies one of the standard ARM condition codes: EQ, GE, GT, LE, LT, or NE.

It has encodings from 6 classes: Equal, Greater than, Greater than or equal, Less than, Less than or equal and Not equal.

Equal

FCM<cc> (vectors)

Floating-point compare vectors.

Compare active floating-point elements in the first source vector with corresponding elements in the second source vector, and place the boolean results of the specified comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Does not set the condition flags. The <cc> symbol specifies one of the standard ARM condition codes: EQ, GE, GT, or NE, with the addition of UO for an unordered comparison.

This instruction is used by the pseudo-instructions FCMLE (vectors), and FCMLT (vectors).

It has encodings from 5 classes: **Equal**, Greater than, Greater than or equal, Not equal and Unordered.

FCMLA (vectors)

Floating-point complex multiply-add with rotate (predicated).

Multiply the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of the floating-point complex numbers in the first source vector by the corresponding complex number in the second source vector rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation.

Then destructively add the products to the corresponding components of the complex numbers in the addend and destination vector, without intermediate rounding.

These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees apart.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element. Inactive elements in the destination vector register remain unmodified.

    Elem[result, 2 * p + 1, esize] = addend_i;
Z[da] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

Internal version only: isa v31.05b, AdvSIMD v29.02, pseudocode v2019-12_rc3_1, sve v2019-12_rc3 ; Build timestamp: 2019-12-13T11:35

FCMLA (indexed)

Floating-point complex multiply-add by indexed values with rotate.

Multiply the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of the floating-point complex numbers in each 128-bit segment of the first source vector by the specified complex number in the corresponding the second source vector segment rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation.

Then destructively add the products to the corresponding components of the complex numbers in the addend and destination vector, without intermediate rounding.

These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees apart.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

The complex numbers within the second source vector are specified using an immediate index which selects the same complex number position within each 128-bit vector segment. The index range is from 0 to one less than the number of complex numbers per 128-bit segment, encoded in 1 to 2 bits depending on the size of the complex number. This instruction is unpredicated.

It has encodings from 2 classes: Half-precision and Single-precision

**Half-precision**

```
0 1 1 0 0 1 0 0 1 0 1 i2 Zm 0 0 0 1 rot Zn Zda
```

**Half-precision**

```

integer da = UInt(Zda);
integer sel_a = UInt(rot<0>);
integer sel_b = UInt(NOT(rot<0>));
boolean neg_i = (rot<1> == '1');
boolean neg_r = (rot<0> != rot<1>);
```
Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the “Zda” field.

<Zn> Is the name of the first source scalable vector register, encoded in the “Zn” field.

<Zm> For the half-precision variant: is the name of the second source scalable vector register Z0-Z7, encoded in the “Zm” field.

For the single-precision variant: is the name of the second source scalable vector register Z0-Z15, encoded in the “Zm” field.

<imm> For the half-precision variant: is the index of a Real and Imaginary pair, in the range 0 to 3, encoded in the “i2” field.

For the single-precision variant: is the index of a Real and Imaginary pair, in the range 0 to 1, encoded in the “i1” field.

<const> Is the const specifier, encoded in “rot”:

<table>
<thead>
<tr>
<th>rot</th>
<th>&lt;const&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>#0</td>
</tr>
<tr>
<td>01</td>

<tr>
<td>11</td>
<td>#270</td>
</tr>
</tbody>
</table>

Operation

CheckSVEEnabled();
integer pairs = VL DIV (2 * esize);
integer pairspersegment = 128 DIV (2 * esize);
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) operand3 = Z[da];
bits(VL) result;

for p = 0 to pairs-1
  segmentbase = p - p MOD pairspersegment;
  s = segmentbase + index;
  addend_r = Elem[operand3, 2 * p + 0, esize];
  addend_i = Elem[operand3, 2 * p + 1, esize];
  elt1_a = Elem[operand1, 2 * p + sel_a, esize];
  elt2_a = Elem[operand2, 2 * s + sel_a, esize];
  elt2_b = Elem[operand2, 2 * s + sel_b, esize];
  if neg_r then elt2_a = FPNeg(elt2_a);
  if neg_i then elt2_b = FPNeg(elt2_b);
  addend_r = FPMulAdd(addend_r, elt1_a, elt2_a, FPCR);
  addend_i = FPMulAdd(addend_i, elt1_a, elt2_b, FPCR);
  Elem[result, 2 * p + 0, esize] = addend_r;
  Elem[result, 2 * p + 1, esize] = addend_i;
Z[da] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FCMLE (vectors)

Floating-point compare less than or equal to vector.

Compare active floating-point elements in the first source vector being less than or equal to corresponding elements in the second source vector, and place the boolean results of the comparison in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Does not set the condition flags.

This is a pseudo-instruction of FCM<cc> (vectors). This means:

- The encodings in this description are named to match the encodings of FCM<cc> (vectors).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of FCM<cc> (vectors) gives the operational pseudocode for this instruction.

<td>D</td>
</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<const> Is a floating-point immediate value expressable as ±n×16×2^r, where n and r are integers such that 16 ≤ n ≤ 31 and -3 ≤ r ≤ 4, i.e. a normalized binary floating-point encoding with 1 sign bit, 3-bit exponent, and 4-bit fractional part, encoded in the "imm8" field.

Operation

CheckSVEEnabled();

integer elements = VL DIV esize;
bv(PL) mask = P[g];
bv(VL) result = Z[d];

for e = 0 to elements-1
  if Elem[mask, e, esize] == '1' then
    Elem[result, e, esize] = imm;

Z[d] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FCVT

Floating-point convert precision (predicated).

Convert the size and precision of each active floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

Since the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are zero-extended to fill each destination element.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];
for e = 0 to elements-1
  if Elem[mask, e, esize] == '1' then
    bits(esize DIV 2) element = Elem[operand, 2*e + 1, esize DIV 2];
    Elem[result, e, esize] = FPConvertSVE(element, FPCR);
Z[d] = result;
FCVTNT

Floating-point down convert and narrow (top, predicated).

Convert active floating-point elements from the source vector to the next lower precision, and place the results in the odd-numbered half-width elements of the destination vector, leaving the even-numbered elements unchanged. Inactive elements in the destination vector register remain unmodified.

It has encodings from 2 classes: Single-precision to half-precision and Double-precision to single-precision.

Single-precision to half-precision

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

if !HaveSVE2() then UNDEFINED;
integer esize = 64;
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];
for e = 0 to elements-1
    if Elem[mask, e, esize] == '1' then
        bits(esize) element = Elem[operand, e, esize];
        Elem[result, 2*e + 1, esize DIV 2] = FPConvertSVE(element, FPCR);
Z[d] = result;
FCVTX

Floating-point down convert, rounding to odd (predicated).

Convert active double-precision floating-point elements from the source vector to single-precision, rounding to Odd, and place the results in the even-numbered 32-bit elements of the destination vector, while setting the odd-numbered elements to zero. Inactive elements in the destination vector register remain unmodified.

Rounding to Odd (aka Von Neumann rounding) permits a two-step conversion from double-precision to half-precision without incurring intermediate rounding errors.

        bits(esize) element = Elem[operand, e, esize];
        Elem[result, 2*e + 1, esize DIV 2] = FPConvertSVE(element, FPCR, FPRounding_ODD);
    Z[d] = result;
FCVTZS

Floating-point convert to signed integer, rounding toward zero (predicated).

Convert to the signed integer nearer to zero from each active floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

If the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are sign-extended to fill each destination element.

It has encodings from 7 classes: Half-precision to 16-bit, Half-precision to 32-bit, Half-precision to 64-bit, Single-precision to 32-bit, Single-precision to 64-bit, Double-precision to 32-bit and Double-precision to 64-bit

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FDIV

Floating-point divide by vector (predicated).

Divide active floating-point elements of the first source vector by corresponding floating-point elements of the second source vector and destructively place the quotient in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE

FDIV <Zdn>.<T>, <Pg>/M, <Zdn>.<T>, <Zm>.<T>

if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer dn = UInt(Zdn);
integer m = UInt(Zm);

Assembler Symbols

<Zdn>  Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
<T>    Is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>

- The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FDUP

Broadcast 8-bit floating-point immediate to vector elements (unpredicated).

Unconditionally broadcast the floating-point immediate into each element of the destination vector. This instruction is unpredicated.

This instruction is used by the alias FMOV (immediate, unpredicated).

```
0 0 1 0 0 1 0 1 size 1 1 1 0 0 1 1 1 imm8 Zd
```

SVE

FDUP <Zd>,<T>, #=><const>

if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer d = UInt(Zd);
bits(esize) imm = VFPExpandImm(imm8);

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the “Zd” field.

**FEXPA**

Floating-point exponential accelerator.

The FEXPA instruction accelerates the polynomial series calculation of the \( \text{EXP}(x) \) function.

The double-precision variant copies the low 52 bits of an entry from a hard-wired table of 64-bit coefficients, indexed by the low 6 bits of each element of the source vector, and prepends to that the next 11 bits of the source element (src<16:6>), setting the sign bit to zero.

The single-precision variant copies the low 23 bits of an entry from hard-wired table of 32-bit coefficients, indexed by the low 6 bits of each element of the source vector, and prepends to that the next 8 bits of the source element (src<13:6>), setting the sign bit to zero.

The half-precision variant copies the low 10 bits of an entry from hard-wired table of 16-bit coefficients, indexed by the low 5 bits of each element of the source vector, and prepends to that the next 5 bits of the source element (src<9:5>), setting the sign bit to zero.

A coefficient table entry with index \( m \) holds the floating-point value \( 2^{(m/64)} \), or for the half-precision variant \( 2^{(m/32)} \).

This instruction is unpredicated.

### SVE

FEXPA <Zd>.<T>, <Zn>.<T>

if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer d = UInt(Zd);

#### Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

#### Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand = Z[n];
bits(VL) result;
for e = 0 to elements-1
  bits(esize) element = Elem[operand, e, esize];
  Elem[result, e, esize] = FPExpA(element);
Z[d] = result;
FLOGB

Floating-point base 2 logarithm as integer.

This instruction returns the signed integer base 2 logarithm of each floating-point input element $|X|$ after normalization.

This is the unbiased exponent of $X$ used in the representation of the floating-point value, such that, for positive $X$, $X = \text{significand} \times 2^{\text{exponent}}$.

The integer results are placed in elements of the destination vector which have the same width ($ESIZE$) as the floating-point input elements:

* If $X$ is normal, the result is the base 2 logarithm of $X$.
* If $X$ is subnormal, the result corresponds to the normalized representation.
* If $X$ is infinite, the result is $2^{(esize-1)}-1$.
* If $X$ is ±0.0 or NaN, the result is $-2^{(esize-1)}$.

Inactive elements in the destination vector register remain unmodified.

SVE2

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FMAD

Floating-point fused multiply-add vectors (predicated), writing multiplicand \( Z_{dn} = Z_a + Z_{dn} \times Z_m \).

Multiply the corresponding active floating-point elements of the first and second source vectors and add to elements of the third (addend) vector without intermediate rounding. Destructively place the results in the destination and first source (multiplicand) vector. Inactive elements in the destination vector register remain unmodified.

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

FMAXNMP

Floating-point maximum number pairwise.

Compute the maximum value of each pair of adjacent floating-point elements within each source vector, and interleave the results from corresponding lanes. The interleaved result values are destructively placed in the first source vector. NaNs are handled according to the IEEE 754-2008 standard. If one vector element is numeric and the other is a quiet NaN, the result is the numerical value.

```

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**FMINNMP**

Floating-point minimum number pairwise.

Compute the minimum value of each pair of adjacent floating-point elements within each source vector, and interleave the results from corresponding lanes. The interleaved result values are destructively placed in the first source vector. NaNs are handled according to the IEEE 754-2008 standard. If one vector element is numeric and the other is a quiet NaN, the result is the numerical value.

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FMLA (indexed)

Floating-point fused multiply-add by indexed elements (Zda = Zda + Zn * Zm[indexed]).

Multiply all floating-point elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively added without intermediate rounding to the corresponding elements of the addend and destination vector. The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element. This instruction is unpredicated.

It has encodings from 3 classes: Half-precision, Single-precision and Double-precision

**Half-precision**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 0  | 1  | 1  | 0  | 0  | 1  | 0  | 0  | 0  | 1  | 3h | 1  | Zm | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | Zn | Zda |

**Single-precision**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 0  | 1  | 1  | 0  | 0  | 1  | 0  | 0  | 1  | 0  | 1  | Zm | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | Zn | Zda |

**Double-precision**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 0  | 1  | 1  | 0  | 0  | 1  | 0  | 0  | 1  | 1  | 1  | Zm | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | Zn | Zda |
Double-precision

Z[da] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FMLALT (vectors)

Half-precision floating-point multiply-add long to single-precision (top).

This half-precision floating-point multiply-add long instruction widens the odd-numbered 16-bit half-precision elements in the first source vector and the corresponding elements in the second source vector to single-precision format and then destructively multiplies and adds these values without intermediate rounding to the overlapping 32-bit single-precision elements of the addend and destination vector. This instruction is unpredicated.

• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FMLS (vectors)

Floating-point fused multiply-subtract vectors (predicated), writing addend \[Zda = Zda + Zn * Zm\].

Multiply the corresponding active floating-point elements of the first and second source vectors and subtract from elements of the third source (addend) vector without intermediate rounding. Destructively place the results in the destination and third source (addend) vector. Inactive elements in the destination vector register remain unmodified.

### SVE

\[\text{FMLS (<Zda>,<T>, <Pg>/M, <Zn>,<T>, <Zm>,<T>)}\]

\[\text{if !HaveSVE() then UNDEFINED; if size == '00' then UNDEFINED; integer esize = 8 << \text{UInt}(size); integer g = \text{UInt}(Pg); integer n = \text{UInt}(Zn); integer m = \text{UInt}(Zm); integer da = \text{UInt}(Zda); boolean op1_neg = TRUE; boolean op3_neg = FALSE;}\]

**Assembler Symbols**

\qquad \text{Elem[result, e, esize] = element3;} \\
\end{align*}
\]

\[Z[da] = \text{result;}\]
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FMLS (indexed)

Floating-point fused multiply-subtract by indexed elements \((Zda = Zda + -Zn \times Zm[\text{indexed}])\).

Multiply all floating-point elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively subtracted without intermediate rounding from the corresponding elements of the addend and destination vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element. This instruction is unpredicated.

It has encodings from 3 classes: Half-precision, Single-precision and Double-precision.

### Half-precision

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | 0 1 1 0 0 1 0 0 0 1 3 1 | | Zm | 0 0 0 0 0 1 | Zn | Zda |

### Single-precision

\[\text{FMLS} <Zda>.S, <Zn>.S, <Zm>.S[<imm>]\]

if !HaveSVE() then UNDEFINED;
integer esize = 32;
integer index = Uint(i2);

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FMMLA

Floating-point matrix multiply-accumulate.

The floating-point matrix multiply-accumulate instruction supports single-precision and double-precision data types in a 2×2 matrix contained in segments of 128 or 256 bits, respectively. It multiplies the 2×2 matrix in each segment of the first source vector by the 2×2 matrix in the corresponding segment of the second source vector. The resulting 2×2 matrix product is then destructively added to the matrix accumulator held in the corresponding segment of the addend and destination vector. This is equivalent to performing a 2-way dot product per destination element. This instruction is unpredicated. The single-precision variant is vector length agnostic. The double-precision variant requires that the current vector length is at least 256 bits, and if the current vector length is not an integer multiple of 256 bits then the trailing bits are set to zero.

ID_AA64ZFR0_EL1.F32MM indicates whether the single-precision variant is implemented. ID_AA64ZFR0_EL1.F64MM indicates whether the double-precision variant is implemented.

It has encodings from 2 classes: 32-bit element and 64-bit element

- `<Pg>` Is the name of the governing scalable predicate register, encoded in the "Pg" field.

Operation

The description of CPY (immediate, merging) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**FMOV (zero, unpredicated)**

Move floating-point +0.0 to vector elements (unpredicated).

Unconditionally broadcast the floating-point constant +0.0 into each element of the destination vector. This instruction is unpredicated.

This is a pseudo-instruction of **DUP (immediate)**. This means:

- The encodings in this description are named to match the encodings of **DUP (immediate)**.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of **DUP (immediate)** gives the operational pseudocode for this instruction.

```

FMUL (indexed)

Floating-point multiply by indexed elements.

Multiply all floating-point elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The results are placed in the corresponding elements of the destination vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element. This instruction is unpredicated.

It has encodings from 3 classes: **Half-precision**, **Single-precision** and **Double-precision**

**Half-precision**

```
0 1 1 1 0 0 1 0 0 0 | i3h | i3l | Zm | 0 0 1 0 0 0 | Zn | Zd
```

**Single-precision**

```
0 1 1 1 0 0 1 0 0 1 | i2 | Zm | 0 0 1 0 0 0 | Zn | Zd
```

**Double-precision**

```
0 1 1 1 0 0 1 0 1 1 | i1 | Zm | 0 0 1 0 0 0 | Zn | Zd
```

```java
if (!HaveSVE()) then UNDEFINED;
integer esize = 16;
integer index = UInt(i3h:i3l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
```
Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the “Zd” field.

<Zn> Is the name of the first source scalable vector register, encoded in the “Zn” field.

<Zm> For the half-precision and single-precision variant: is the name of the second source scalable vector register Z0-Z7, encoded in the “Zm” field.

For the double-precision variant: is the name of the second source scalable vector register Z0-Z15, encoded in the “Zm” field.

<imm> For the half-precision variant: is the immediate index, in the range 0 to 7, encoded in the “i3h:i3l” fields.

For the single-precision variant: is the immediate index, in the range 0 to 3, encoded in the “i2” field.

For the double-precision variant: is the immediate index, in the range 0 to 1, encoded in the “i1” field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
integer eltspersegment = 128 DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
    integer segmentbase = e - e MOD eltspersegment;
    integer s = segmentbase + index;
    bits(esize) element1 = Elem[operand1, e, esize];
    bits(esize) element2 = Elem[operand2, s, esize];
    Elem[result, e, esize] = FPMul(element1, element2, FPCR);
Z[d] = result;
**FMULX**

Floating-point multiply-extended vectors (predicated).

Multiply active floating-point elements of the first source vector by corresponding floating-point elements of the second source vector except that $\infty \times 0.0$ gives 2.0 instead of NaN, and destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

The instruction can be used with FRECPX to safely convert arbitrary elements in mathematical vector space to UNIT VECTORS or DIRECTION VECTORS with length 1.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.

The MOVPRFX instruction must specify the same destination register as this instruction.

The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FNEG

Floating-point negate (predicated).

Negate each active floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. This inverts the sign bit and cannot signal a floating-point exception. Inactive elements in the destination vector register remain unmodified.

SVE

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FRINT<\text{r}>

Floating-point round to integral value (predicated).

Round to an integral floating-point value with the specified rounding option from each active floating-point element of
the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in
the destination vector register remain unmodified.

The \text{<r>} symbol specifies one of the following rounding options: N (to nearest, with ties to even), A (to nearest, with
ties away from zero), M (toward minus Infinity), P (toward plus Infinity), Z (toward zero), I (current FPCR rounding
mode), or X (current FPCR rounding mode, signalling inexact).

It has encodings from 7 classes: Current mode, Current mode signalling inexact, Nearest
with ties to away, Nearest
with ties to even, Toward zero, Toward minus infinity and Toward plus infinity

\textbf{Current mode}

\begin{verbatim}
if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
boolean exact = FALSE;
FPRounding rounding = FPRoundingMode(FPCR);
\end{verbatim}

\textbf{Current mode signalling inexact}

\begin{verbatim}
if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
boolean exact = TRUE;
FPRounding rounding = FPRoundingMode(FPCR);
\end{verbatim}

\textbf{Nearest with ties to away}

\begin{verbatim}
if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
boolean exact = FALSE;
FPRounding rounding = FPRoundingMode(FPCR);
\end{verbatim}
Nearest with ties to away

```
FRINTA <Zd>.<T>, <Pg>/M, <Zn>.<T>

if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
boolean exact = FALSE;
FPRounding rounding = FPRounding_TIEAWAY;
```
Toward minus infinity

```c
if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
boolean exact = FALSE;
FPRounding rounding = FPRounding_NEGINF;
```

Toward plus infinity

```c
if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
boolean exact = FALSE;
FPRounding rounding = FPRounding_POSINF;
```

Operation

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];

for e = 0 to elements-1
  bits(esize) element = Elem[operand, e, esize];
  if ElemP[mask, e, esize] == '1' then
    Elem[result, e, esize] = FPRoundInt(element, FPCR, rounding, exact);

Z[d] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
• The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
FRSQRTE

Floating-point reciprocal square root estimate (unpredicated).

Find the approximate reciprocal square root of each active floating-point element of the source vector, and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

FRSQRTS

Floating-point reciprocal square root step (unpredicated).

Multiply corresponding floating-point elements of the first and second source vectors, subtract the products from 3.0 and divide the results by 2.0 without any intermediate rounding and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

This instruction can be used to perform a single Newton-Raphson iteration for calculating the reciprocal square root of a vector of floating-point values.

```
| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

</tr>
</tbody>
</table>

- `<Zn>` Is the name of the first source scalable vector register, encoded in the "Zn" field.
- `<Zm>` Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```vex
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
bits(esize) element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = FPRsqrtStepFused(element1, element2);
Z[d] = result;
```
FScale

Floating-point adjust exponent by vector (predicated).

Multiply the active floating-point elements of the first source vector by 2.0 to the power of the signed integer values in the corresponding elements of the second source vector and destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

SVE

  if ElemP[mask, e, esize] == '1' then
    Elem[result, e, esize] = FPSub(element2, element1, FPCR);
  else
    Elem[result, e, esize] = element1;
Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
Floating-point trigonometric multiply-add coefficient.

The FTMAD instruction calculates the series terms for either \(\sin(x)\) or \(\cos(x)\), where the argument \(x\) has been adjusted to be in the range \(-\pi/4 < x \leq \pi/4\).

To calculate the series terms of \(\sin(x)\) and \(\cos(x)\) the initial source operands of FTMAD should be zero in the first source vector and \(x^2\) in the second source vector. The FTMAD instruction is then executed eight times to calculate the sum of eight series terms, which gives a result of sufficient precision.

The FTMAD instruction multiplies each element of the first source vector by the absolute value of the corresponding element of the second source vector and performs a fused addition of each product with a value obtained from a table of hard-wired coefficients, and places the results destructively in the first source vector.

The coefficients are different for \(\sin(x)\) and \(\cos(x)\), and are selected by a combination of the sign bit in the second source element and an immediate index in the range 0 to 7.

This instruction is unpredicated.

### SVE

FTMAD \(<Zdn>..<T>, <Zdn>..<T>, <Zm>..<T>, #<imm>

```c
if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer dn = UInt(Zdn);
integer m = UInt(Zm);
integer imm = UInt(imm3);
```

**Assembler Symbols**

- \(<Zdn>\) Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
- \(<T>\) Is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>(&lt;T&gt;)</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>RESERVED</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- \(<Zm>\) Is the name of the second source scalable vector register, encoded in the "Zm" field.
- \(<imm>\) Is the unsigned immediate operand, in the range 0 to 7, encoded in the "imm3" field.

**Operation**

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
  bits(esize) element1 = Elem[operand1, e, esize];
bits(esize) element2 = Elem[operand2, e, esize];
  Elem[result, e, esize] = FPTrigMAdd(imm, element1, element2, FPCR);
Z[dn] = result;
```
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
### FTSMUL

Floating-point trigonometric starting value.

The FTSMUL instruction calculates the initial value for the FTMAD instruction. The instruction squares each element in the first source vector and then sets the sign bit to a copy of bit 0 of the corresponding element in the second source register, and places the results in the destination vector. This instruction is unpredicated.

To compute \( \sin(x) \) or \( \cos(x) \) the instruction is executed with elements of the first source vector set to \( x \), adjusted to be in the range \(-n/4 < x \leq n/4\).

The elements of the second source vector hold the corresponding value of the quadrant \( q \) number as an integer not a floating-point value. The value \( q \) satisfies the relationship \((2q-1) \times \pi/4 < x \leq (2q+1) \times \pi/4\).

#### SVE

**FTSMUL <Zd>,<T>, <Zn>,<T>, <Zm>,<T>**

if !HaveSVE() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);

**Assembler Symbols**

- \(<Zd>\) is the name of the destination scalable vector register, encoded in the "Zd" field.
- \(<T>\) is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>(&lt;T&gt;)</th>

<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>
- \(<Zn>\) is the name of the first source scalable vector register, encoded in the "Zn" field.
- \(<Zm>\) is the name of the second source scalable vector register, encoded in the "Zm" field.

**Operation**

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result;

for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
    bits(esize) element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = FPTrigSMul(element1, element2, FPCR);
Z[d] = result;
FTSSEL

Floating-point trigonometric select coefficient.

The FTSSEL instruction selects the coefficient for the final multiplication in the polynomial series approximation. The instruction places the value 1.0 or a copy of the first source vector element in the destination element, depending on bit 0 of the quadrant number Q held in the corresponding element of the second source vector. The sign bit of the destination element is copied from bit 1 of the corresponding value of Q. This instruction is unpredicated.

To compute sin(x) or cos(x) the instruction is executed with elements of the first source vector set to x, adjusted to be in the range -π/4 < x ≤ π/4.

The elements of the second source vector hold the corresponding value of the quadrant Q number as an integer not a floating-point value. The value Q satisfies the relationship (2q-1) × π/4 < x ≤ (2q+1) × π/4.

```
0 0 0 0 0 1 0 0 1 0 1 1 0 0 | size 1 | Zm 1 0 1 1 0 0 | Zn 3 2 1 0
```

    Elem[result, e, esize] = count<esize-1:0>;
Z[d] = result;
INCB, INCD, INCH, INCW (scalar)

Increment scalar by multiple of predicate constraint element count.

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 4 classes: Byte, Doubleword, Halfword and Word

Byte

\[
\begin{array}{cccccccccccccccccccccccccccc}

</tbody>
</table>

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

CheckSVEEnabled();
iconteger count = DecodePredCount(pat, esize);
bits(64) operand1 = X[dn];

X[dn] = operand1 + (count * imm);

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
INCD, INCH, INCW (vector)

Increment vector by multiple of predicate constraint element count.

Determines the number of active elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment all destination vector elements.

The named predicate constraint limits the number of active elements in a single predicate to:
- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 3 classes: Doubleword, Halfword and Word

**Doubleword**

</tr>
</tbody>
</table>

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(PL) operand2 = P[m];
bits(VL) result;
integer count = 0;
for e = 0 to elements-1
    if ElemP[operand2, e, esize] == '1' then
        count = count + 1;
for e = 0 to elements-1
    Elem[result, e, esize] = Elem[operand1, e, esize] + count;
Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
INDEX (immediates)

Create index starting from and incremented by immediate.

Populates the destination vector by setting the first element to the first signed immediate integer operand and monotonically incrementing the value by the second signed immediate integer operand for each subsequent element. This instruction is unpredicated.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

### SVE

LASTB <R><d>, <Pg>, <Zn>.

if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer rsize = if esize < 64 then 32 else 64;
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Rd);
boolean isBefore = TRUE;

### Assembler Symbols

- **<R>** Is a width specifier, encoded in “size”:
  ```
  size  <R>
  01  W
  x0  W
  11  X
  ```

- **<d>** Is the number [0-30] of the destination general-purpose register or the name ZR (31), encoded in the "Rd" field.

- **<Pg>** Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

- **<Zn>** Is the name of the source scalable vector register, encoded in the "Zn" field.

- **<T>** Is the size specifier, encoded in “size”:
  ```
  size  <T>
  00  B
  01  H
  10  S
  11  D
  ```

### Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(rsize) result;
integer last = LastActiveElement(mask, esize);
if isBefore then
  if last < 0 then last = elements - 1;
else
  last = last + 1;
if last >= elements then last = 0;
result = ZeroExtend(Elem(operand, last, esize));
X[d] = result;
LASTB (SIMD&FP scalar)

Extract last element to SIMD&FP scalar register.

If there is an active element then extract the last active element from the final source vector register. If there are no active elements, extract the highest-numbered element. Then place the extracted element in the destination SIMD&FP register.

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

**LD1D (vector plus immediate)**

Gather load doublewords to vector (immediate index).

Gather load of doublewords to active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is a multiple of 8 in the range 0 to 248. Inactive elements will not read Device memory or signal faults, and are set to zero in the destination vector.

LD1H (scalar plus vector)

Gather load unsigned halfwords to vector (vector index).

Gather load of unsigned halfwords to active elements of a vector register from memory addresses generated by a
64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and
then optionally multiplied by 2. Inactive elements will not read Device memory or signal faults, and are set to zero in
the destination vector.

It has encodings from 6 classes: 32-bit scaled offset, 32-bit unpacked scaled offset, 32-bit unpacked unscaled offset,
32-bit offset, 64-bit scaled offset and 64-bit unscaled offset

LD1ROB (scalar plus immediate)

Contiguous load and replicate thirty-two bytes (immediate index).

Load thirty-two contiguous bytes to elements of a 256-bit (octaword) vector from the memory address generated by a 64-bit scalar base address and immediate index that is a multiple of 32 in the range -256 to +224 added to the base address.

Inactive elements will not read Device memory or signal a fault, and are set to zero.

The resulting 256-bit vector is then replicated to fill the destination vector. The instruction requires that the current vector length is at least 256 bits, and if the current vector length is not an integer multiple of 256 bits then the trailing bits in the destination vector are set to zero.

Only the first thirty-two predicate elements are used and higher numbered predicate elements are ignored.

ID_AA64ZFR0_EL1.F64MM indicates whether this instruction is implemented.

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

LD1ROD (scalar plus scalar)

Contiguous load and replicate four doublewords (scalar index).

Load four contiguous doublewords to elements of a 256-bit (octaword) vector from the memory address generated by a 64-bit scalar base address and scalar index which is multiplied by 8 and added to the base address. Inactive elements will not read Device memory or signal a fault, and are set to zero. The resulting 256-bit vector is then replicated to fill the destination vector. The instruction requires that the current vector length is at least 256 bits, and if the current vector length is not an integer multiple of 256 bits then the trailing bits in the destination vector are set to zero.

Only the first four predicate elements are used and higher numbered predicate elements are ignored.

ID_AA64ZFR0_EL1.F64MM indicates whether this instruction is implemented.

LD1RQH (scalar plus immediate)

Contiguous load and replicate eight halfwords (immediate index).

Load eight contiguous halfwords to elements of a short, 128-bit (quadword) vector from the memory address generated by a 64-bit scalar base address and immediate index that is a multiple of 16 in the range -128 to +112 added to the base address.

Inactive elements will not read Device memory or signal a fault, and are set to zero. The resulting short vector is then replicated to fill the long destination vector. Only the first eight predicate elements are used and higher numbered predicate elements are ignored.

LD1SB (vector plus immediate)

Gather load signed bytes to vector (immediate index).

Gather load of signed bytes to active elements of a vector register from memory addresses generated by a vector base plus immediate index. The index is in the range 0 to 31. Inactive elements will not read Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 2 classes: 32-bit element and 64-bit element

32-bit element

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 1  | 0  | 0  | 0  | 1  | 0  | 0  | 0  | 1  | imm5| 1  | 0  | 0  | Pg | Zn | Zt |

32-bit element

LD1SB { <Zt>.S }, <Pg>/Z, [<Zn>.S{, #imm>}

if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
integer esize = 32;
integer msize = 8;
boolean unsigned = FALSE;
integer offset = UInt(imm5);

64-bit element

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 1  | 1  | 0  | 0  | 0  | 1  | 0  | 0  | 0  | 1  | imm5| 1  | 0  | 0  | Pg | Zn | Zt |

64-bit element

LD1SB { <Zt>.D }, <Pg>/Z, [<Zn>.D{, #imm>}

if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer g = UInt(Pg);
integer esize = 64;
integer msize = 8;
boolean unsigned = FALSE;
integer offset = UInt(imm5);

Assembler Symbols

<Zt> Is the name of the scalable vector register to be transferred, encoded in the “Zt” field.
<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn> Is the name of the base scalable vector register, encoded in the “Zn” field.
<imm> Is the optional unsigned immediate byte offset, in the range 0 to 31, defaulting to 0, encoded in the "imm5" field.
Operation

CheckSVEEnabled();
integer elements = VL DIV esize;

LD1SH (scalar plus vector)

Gather load signed halfwords to vector (vector index).

Gather load of signed halfwords to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 2. Inactive elements will not read Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 6 classes: 32-bit scaled offset, 32-bit unpacked scaled offset, 32-bit unpacked unscaled offset, 32-bit unscaled offset, 64-bit scaled offset and 64-bit unscaled offset

LD1W (scalar plus vector)

Gather load unsigned words to vector (vector index).

Gather load of unsigned words to active elements of a vector register from memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 4. Inactive elements will not read Device memory or signal faults, and are set to zero in the destination vector.

It has encodings from 6 classes: 32-bit scaled offset, 32-bit unpacked scaled offset, 32-bit unpacked unscaled offset, 32-bit unscaled offset, 64-bit scaled offset and 64-bit unscaled offset.

32-bit scaled offset

```

LD3W (scalar plus scalar)

Contiguous load three-word structures to three vectors (scalar index).

Contiguous load three-word structures, each to the same element number in three vector registers from the memory address generated by a 64-bit scalar base and a 64-bit scalar index register scaled by the element size (LSL option) and added to the base address. After each structure access the index value is incremented by three. The index register is not updated by the instruction.

Each predicate element applies to the same element number in each of the three vector registers, or equivalently to the three consecutive words in memory which make up each structure. Inactive elements will not read Device memory or signal a fault, and the corresponding element is set to zero in each of the three destination vector registers.

```

Contiguous load four-word structures to four vectors (scalar index).

Contiguous load four-word structures, each to the same element number in four vector registers from the memory address generated by a 64-bit scalar base and a 64-bit scalar index register scaled by the element size (LSL option) and added to the base address. After each structure access the index value is incremented by four. The index register is not updated by the instruction. Each predicate element applies to the same element number in each of the four vector registers, or equivalently to the four consecutive words in memory which make up each structure. Inactive elements will not read Device memory or signal a fault, and the corresponding element is set to zero in each of the four destination vector registers.

**LDFF1D (scalar plus scalar)**

Contiguous load first-fault doublewords to vector (scalar index).

Contiguous load with first-faulting behavior of doublewords to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index which is multiplied by 8 and added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements will not read Device memory or signal a fault, and are set to zero in the destination vector.

**LDFF1SB (scalar plus scalar)**

Contiguous load first-fault signed bytes to vector (scalar index).

Contiguous load with first-faulting behavior of signed bytes to elements of a vector register from the memory address generated by a 64-bit scalar base and scalar index which is added to the base address. After each element access the index value is incremented, but the index register is not updated. Inactive elements will not read Device memory or signal a fault, and are set to zero in the destination vector.

It has encodings from 3 classes: 16-bit element, 32-bit element and 64-bit element

LDR (predicate)

Load predicate register.

Load a predicate register from a memory address generated by a 64-bit scalar base, plus an immediate offset in the range -256 to 255 which is multiplied by the current predicate register size in bytes. This instruction is unpredicated. The load is performed as a stream of bytes containing 8 consecutive predicate bits in ascending element order, without any endian conversion.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
MATCH

Detect any matching elements, setting the condition flags.

This instruction compares each active 8-bit or 16-bit character in the first source vector with all of the characters in the corresponding 128-bit segment of the second source vector. Where the first source element detects any matching characters in the second segment it places true in the corresponding element of the destination predicate, otherwise false. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
MLA (indexed)

Multiply-add to accumulator (indexed).

Multiply all integer elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The products are then destructively added to the corresponding elements of the addend and destination vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element. This instruction is unpredicated.

It has encodings from 3 classes: **16-bit**, **32-bit** and **64-bit**

### 16-bit

    bits(esize) product = (element1 * element2)<esize-1:0>;
    Elem[result, e, esize] = Elem[result, e, esize] - product;

Z[da] = result;

Operational information

If PSTATE.DIT is 1:
• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
MOV (predicate, predicated, zeroing)

Move predicates (zeroing).

Read active elements from the source predicate and place in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Does not set the condition flags.

This is an alias of AND, ANDS (predicates). This means:

- The encodings in this description are named to match the encodings of AND, ANDS (predicates).
- The description of AND, ANDS (predicates) gives the operational pseudocode for this instruction.

Not setting the condition flags

MOV <Pd>.B, <Pg>/Z, <Pn>.B

is equivalent to

and is the preferred disassembly when S == '0' && Pn == Pm.

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

<Pn> Is the name of the first source scalable predicate register, encoded in the "Pn" field.

Operation

The description of AND, ANDS (predicates) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
MOV (immediate, predicated, zeroing)

Move signed integer immediate to vector elements (zeroing).

Move a signed integer immediate to each active element in the destination vector. Inactive elements in the destination vector register are set to zero.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is “#<imm8>, LSL #8”. However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as “#0, LSL #8”.

This is an alias of CPY (immediate, zeroing). This means:

- The encodings in this description are named to match the encodings of CPY (immediate, zeroing).
- The description of CPY (immediate, zeroing) gives the operational pseudocode for this instruction.

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
  0 0 0 0 0 0 1 1 | size 0 1 | Pg 0 0 | sh | imm8 | Zd

SVE

MOV <Zd>, <T>, #<imm>{, <shift>}

is equivalent to

CPY <Zd>, <T>, #<imm>{, <shift>}

and is always the preferred disassembly.

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.

<imm> Is a signed immediate in the range -128 to 127, encoded in the “imm8” field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in “sh”:

<table>
<thead>
<tr>
<th>sh</th>
<th>&lt;shift&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>LSL #0</td>
</tr>
<tr>
<td>1</td>
<td>LSL #8</td>
</tr>
</tbody>
</table>

Operation

The description of CPY (immediate, zeroing) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
The values of the NZCV flags.

**MOV (immediate, predicated, merging)**

Move signed integer immediate to vector elements (merging).

Move a signed integer immediate to each active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This is an alias of **CPY (immediate, merging)**. This means:

- The encodings in this description are named to match the encodings of **CPY (immediate, merging)**.
- The description of **CPY (immediate, merging)** gives the operational pseudocode for this instruction.

<table>

</tr>
</thead>
<tbody>
<tr>
<td>0 0 0 0 0 0 0 0 0 0 1 0 1</td>
</tr>
</tbody>
</table>

**SVE**

MOV <Zd>.<T>, <Pg>/M, #<imm>{, <shift>}

is equivalent to

CPY <Zd>.<T>, <Pg>/M, #<imm>{, <shift>}

and is always the preferred disassembly.

**Assembler Symbols**

- **<Zd>**
  - Is the name of the destination scalable vector register, encoded in the "Zd" field.

- **<T>**
  - Is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- **<Pg>**
  - Is the name of the governing scalable predicate register, encoded in the "Pg" field.

- **<imm>**
  - Is a signed immediate in the range -128 to 127, encoded in the "imm8" field.

- **<shift>**
  - Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in "sh":

<table>
<thead>
<tr>
<th>sh</th>
<th>&lt;shift&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>LSL #0</td>
</tr>
<tr>
<td>1</td>
<td>LSL #8</td>
</tr>
</tbody>
</table>

**Operation**

The description of **CPY (immediate, merging)** gives the operational pseudocode for this instruction.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
MOV (scalar, predicated)

Move general-purpose register to vector elements (predicated).

Move the general-purpose scalar source register to each active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

This is an alias of CPY (scalar). This means:

- The encodings in this description are named to match the encodings of CPY (scalar).
- The description of CPY (scalar) gives the operational pseudocode for this instruction.

</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<R> Is a width specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;R&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>W</td>
</tr>
<tr>
<td>x0</td>
<td>W</td>
</tr>
<tr>
<td>11</td>
<td>X</td>
</tr>
</tbody>
</table>

<n|SP> Is the number [0-30] of the general-purpose source register or the name SP (31), encoded in the "Rn" field.

Operation

The description of CPY (scalar) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
MOV (SIMD&FP scalar, predicated)

Move SIMD&FP scalar register to vector elements (predicated).

Move the SIMD & floating-point scalar source register to each active element in the destination vector. Inactive elements in the destination vector register remain unmodified.

This is an alias of CPY (SIMD&FP scalar). This means:

- The encodings in this description are named to match the encodings of CPY (SIMD&FP scalar).
- The description of CPY (SIMD&FP scalar) gives the operational pseudocode for this instruction.

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- **<n>** is the number [0-31] of the source SIMD&FP register, encoded in the "Vn" field.

Operation

The description of CPY (SIMD&FP scalar) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
MOV (immediate, unpredicated)

Move signed immediate to vector elements (unpredicated).

Unconditionally broadcast the signed integer immediate into each element of the destination vector. This instruction is unpredicated.

The immediate operand is a signed value in the range -128 to +127, and for element widths of 16 bits or higher it may also be a signed multiple of 256 in the range -32768 to +32512 (excluding 0).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

This is an alias of DUP (immediate). This means:

• The encodings in this description are named to match the encodings of DUP (immediate).
• The description of DUP (immediate) gives the operational pseudocode for this instruction.

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 0 1 0 0 1 0 1 size 1 1 1 0 0 0 1 1 sh imm8 Zd

SVE

MOV <Zd>.<T>, #<imm>{, <shift>}

is equivalent to

DUP <Zd>.<T>, #<imm>{, <shift>}

and is always the preferred disassembly.

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>

<tr>
<td>x0</td>
<td>W</td>
</tr>
<tr>
<td>11</td>
<td>X</td>
</tr>
</tbody>
</table>

- `<n|SP>` Is the number [0-30] of the general-purpose source register or the name SP (31), encoded in the "Rn" field.

**Operation**

The description of **DUP (scalar)** gives the operational pseudocode for this instruction.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
MOV (SIMD&FP scalar, unpredicated)

Move indexed element or SIMD&FP scalar to vector (unpredicated).

Unconditionally broadcast the SIMD&FP scalar into each element of the destination vector. This instruction is unpredicated.

This is an alias of DUP (indexed). This means:

- The encodings in this description are named to match the encodings of DUP (indexed).
- The description of DUP (indexed) gives the operational pseudocode for this instruction.

The description of DUP (indexed) gives the operational pseudocode for this instruction.

Assembler Symbols

<Zd>  Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T>   Is the size specifier, encoded in "tsz":

<table>
<thead>
<tr>
<th>tsz</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00000</td>
<td>RESERVED</td>
</tr>
<tr>
<td>xxxx1</td>

</tr>
<tr>
<td>xxx10</td>
<td>H</td>
</tr>
<tr>
<td>xx100</td>
<td>S</td>
</tr>
<tr>
<td>x1000</td>
<td>D</td>
</tr>
<tr>
<td>10000</td>
<td>0</td>
</tr>
</tbody>
</table>

<Zn>  Is the name of the source scalable vector register, encoded in the "Zn" field.

<imm> Is the immediate index, in the range 0 to one less than the number of elements in 512 bits, encoded in "imm2:tsz".

<V>   Is a width specifier, encoded in "tsz":

<table>
<thead>
<tr>
<th>tsz</th>
<th>&lt;V&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00000</td>
<td>RESERVED</td>
</tr>
<tr>
<td>xxxx1</td>
<td>B</td>
</tr>
<tr>
<td>xxx10</td>
<td>H</td>
</tr>
<tr>
<td>xx100</td>
<td>S</td>
</tr>
<tr>
<td>x1000</td>
<td>D</td>
</tr>
<tr>
<td>10000</td>
<td>0</td>
</tr>
</tbody>
</table>

<n>   Is the number [0-31] of the source SIMD&FP register, encoded in the "Zn" field.

Operation

The description of DUP (indexed) gives the operational pseudocode for this instruction.
Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
MOV (bitmask immediate)

Move logical bitmask immediate to vector (unpredicated).

Unconditionally broadcast the logical bitmask immediate into each element of the destination vector. This instruction is unpredicated. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits.

This is an alias of DUPM. This means:

- The encodings in this description are named to match the encodings of DUPM.
- The description of DUPM gives the operational pseudocode for this instruction.

This is an alias of DUPM. This means:

- The encodings in this description are named to match the encodings of DUPM.
- The description of DUPM gives the operational pseudocode for this instruction.

<table>
<thead>
<tr>

<tr>
<td>0       111110  RESERVED</td>
</tr>
<tr>
<td>0       111111  RESERVED</td>
</tr>
<tr>
<td>1       xxxxxxx  D</td>
</tr>
</tbody>
</table>

<const> Is a 64, 32, 16 or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32 or 64 bit fields, each field containing a rotated run of non-zero bits, encoded in the "imm13" field.

Operation

The description of DUPM gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
MOV (predicate, unpredicated)

Move predicate (unpredicated).

Read all elements from the source predicate and place in the destination predicate. This instruction is unpredicated. Does not set the condition flags.

This is an alias of ORR, ORRS (predicates). This means:

- The encodings in this description are named to match the encodings of ORR, ORRS (predicates).
- The description of ORR, ORRS (predicates) gives the operational pseudocode for this instruction.

Not setting the condition flags

MOV <Pd>.B, <Pn>.B

is equivalent to

and is the preferred disassembly when S == '0' & Pn == Pm & Pm == Pg.

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.

<Pn> Is the name of the first source scalable predicate register, encoded in the "Pn" field.

Operation

The description of ORR, ORRS (predicates) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
MOV (vector, unpredicated)

Move vector register (unpredicated).
Move vector register. This instruction is unpredicated.
This is an alias of ORR (vectors, unpredicated). This means:
  • The encodings in this description are named to match the encodings of ORR (vectors, unpredicated).
  • The description of ORR (vectors, unpredicated) gives the operational pseudocode for this instruction.

SVE

MOV <Zd>.D, <Zn>.D

is equivalent to

ORR <Zd>.D, <Zn>.D, <Zn>.D

and is the preferred disassembly when Zn == Zm.

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

Operation

The description of ORR (vectors, unpredicated) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:
  • The execution time of this instruction is independent of:
    ◦ The values of the data supplied in any of its registers.
    ◦ The values of the NZCV flags.
  • The response of this instruction to asynchronous exceptions does not vary based on:
    ◦ The values of the data supplied in any of its registers.
    ◦ The values of the NZCV flags.
MOV (predicate, predicated, merging)

Move predicates (merging).

Read active elements from the source predicate and place in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register remain unmodified. Does not set the condition flags.

This is an alias of SEL (predicates). This means:

- The encodings in this description are named to match the encodings of SEL (predicates).
- The description of SEL (predicates) gives the operational pseudocode for this instruction.

SVE

MOV <Pd>.B, <Pg>/M, <Pn>.B

is equivalent to

and is the preferred disassembly when Pd == Pm.

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn> Is the name of the first source scalable predicate register, encoded in the "Pn" field.

Operation

The description of SEL (predicates) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

**MOV (vector, predicated)**

Move vector elements (predicated).

Move elements from the source vector to the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

This is an alias of `SEL (vectors)`. This means:

- The encodings in this description are named to match the encodings of `SEL (vectors)`.
- The description of `SEL (vectors)` gives the operational pseudocode for this instruction.

- \(<Pg>\) Is the name of the governing scalable predicate register, encoded in the "Pg" field.
- \(<Zn>\) Is the name of the first source scalable vector register, encoded in the "Zn" field.

**Operation**

The description of `SEL (vectors)` gives the operational pseudocode for this instruction.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
MOVPRFX (predicated)

Move prefix (predicated).

The predicated MOVPRFX instruction is a hint to hardware that the instruction may be combined with the destructive instruction which follows it in program order to create a single constructive operation. Since it is a hint it is also permitted to be implemented as a discrete vector copy, and the result of executing the pair of instructions with or without combining is identical. The choice of combined versus discrete operation may vary dynamically. Unless the combination of a constructive operation with merging predication is specifically required, it is strongly recommended that for performance reasons software should prefer to use the zeroing form of predicated MOVPRFX or the unpredicated MOVPRFX instruction.

Although the operation of the instruction is defined as a simple predicated vector copy, it is required that the prefixed instruction at PC+4 must be an SVE destructive binary or ternary instruction encoding, or a unary operation with merging predication, but excluding other MOVPRFX instructions. The prefixed instruction must specify the same predicate register, and have the same maximum element size (ignoring a fixed 64-bit “wide vector” operand), and the same destination vector as the MOVPRFX instruction. The prefixed instruction must not use the destination register in any other operand position, even if they have different names but refer to the same architectural register state. Any other use is UNPREDICTABLE.

### SVE

MOVPRFX `<Zd>`.<`T`>, `<Pg>`/<`ZM`>, `<Zn>`.<`T`

if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
boolean merging = (M == '1');

### Assembler Symbols

- `<Zd>` Is the name of the destination scalable vector register, encoded in the “Zd” field.
- `<T>` Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th><code>&lt;T&gt;</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- `<Pg>` Is the name of the governing scalable predicate register P0-P7, encoded in the “Pg” field.
- `<ZM>` Is the predication qualifier, encoded in “M”:

<table>
<thead>
<tr>
<th>M</th>
<th><code>&lt;ZM&gt;</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Z</td>
</tr>
<tr>
<td>1</td>
<td>M</td>
</tr>
</tbody>
</table>

- `<Zn>` Is the name of the source scalable vector register, encoded in the “Zn” field.
**Operation**

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[n];
bits(VL) dest = Z[d];
bits(VL) result;

for e = 0 to elements-1
  bits(esize) element = Elem[operand1, e, esize];
  if ElemP[mask, e, esize] == '1' then
    Elem[result, e, esize] = element;
  elsif merging then
    Elem[result, e, esize] = Elem[dest, e, esize];
  else
    Elem[result, e, esize] = Zeros();

Z[d] = result;

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
MOVPRFX (unpredicated)

Move prefix (unpredicated).

The unpredicated MOVPRFX instruction is a hint to hardware that the instruction may be combined with the destructive instruction which follows it in program order to create a single constructive operation. Since it is a hint it is also permitted to be implemented as a discrete vector copy, and the result of executing the pair of instructions with or without combining is identical. The choice of combined versus discrete operation may vary dynamically. Although the operation of the instruction is defined as a simple unpredicated vector copy, it is required that the prefixed instruction at PC+4 must be an SVE destructive binary or ternary instruction encoding, or a unary operation with merging predication, but excluding other MOVPRFX instructions. The prefixed instruction must specify the same destination vector as the MOVPRFX instruction. The prefixed instruction must not use the destination register in any other operand position, even if they have different names but refer to the same architectural register state. Any other use is UNPREDICTABLE.

![Register Encoding](image)

SVE

MOVPRFX <Zd>, <Zn>

if !HaveSVE() then UNDEFINED;
integer n = UInt(Zn);
integer d = UInt(Zd);

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

CheckSVEEnabled();
bits(VL) result = Z[n];
Z[d] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
MOVS (predicated)

Move predicates (zeroing), setting the condition flags.

Read active elements from the source predicate and place in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

This is an alias of **AND, ANDS (predicates)**. This means:

- The encodings in this description are named to match the encodings of **AND, ANDS (predicates)**.
- The description of **AND, ANDS (predicates)** gives the operational pseudocode for this instruction.

**Setting the condition flags**

MOVS <Pd>.B, <Pg>/Z, <Pn>.B

is equivalent to

and is the preferred disassembly when S == '1' && Pn == Pm.

**Assembler Symbols**

- <Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.
- <Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.
- <Pn> Is the name of the first source scalable predicate register, encoded in the "Pn" field.

**Operation**

The description of **AND, ANDS (predicates)** gives the operational pseudocode for this instruction.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
**MOVS (unpredicated)**

Move predicate (unpredicated), setting the condition flags.

Read all elements from the source predicate and place in the destination predicate. This instruction is unpredicated. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

This is an alias of **ORR, ORRS (predicates)**. This means:

- The encodings in this description are named to match the encodings of **ORR, ORRS (predicates)**.
- The description of **ORR, ORRS (predicates)** gives the operational pseudocode for this instruction.

### Setting the condition flags

\[
\text{MOVS } \langle Pd \rangle.B, \langle Pn \rangle.B
\]

is equivalent to

\[
\text{ORRS } \langle Pd \rangle.B, \langle Pn \rangle/Z, \langle Pn \rangle.B, \langle Pn \rangle.B
\]

and is the preferred disassembly when \( S == '1' \&\& Pn == Pm \&\& Pm == Pg \).

**Assembler Symbols**

\(<Pd>\)  
Is the name of the destination scalable predicate register, encoded in the "Pd" field.

\(<Pn>\)  
Is the name of the first source scalable predicate register, encoded in the "Pn" field.

**Operation**

The description of **ORR, ORRS (predicates)** gives the operational pseudocode for this instruction.

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
Multiply-subtract vectors (predicated), writing multiplicand \([Zdn = Za - Zdn \cdot Zm]\).

Multiply the corresponding active elements of the first and second source vectors and subtract from elements of the third (addend) vector. Destructively place the results in the destination and first source (multiplicand) vector. Inactive elements in the destination vector register remain unmodified.

\[
\begin{array}{cccccccccccccccccc}
0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & \text{size} & 0 & \text{Zm} & 1 & 1 & 1 & \text{Pg} & \text{Za} & \text{Zdn} & \text{Zdn} \end{array}
\]

**SVE**

if !HaveSVE() then UNDEFINED;

    integer element2 = UInt(Elem[operand2, e, esize]);
    integer product = element1 * element2;
    Elem[result, e, esize] = product<esize-1:0>;
Z[d] = result;

**Operational information**

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
MUL (indexed)

Multiply (indexed).

Multiply all integer elements within each 128-bit segment of the first source vector by the specified element in the corresponding second source vector segment. The results are placed in the corresponding elements of the destination vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element. This instruction is unpredicated.

It has encodings from 3 classes: 16-bit, 32-bit and 64-bit

16-bit

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
  0 1 0 0 0 1 0 0 |i3h i3l| Zm | 1 1 1 1 1 0 | Zn | Zd
```

16-bit

```
```

```java
if !HaveSVE2() then UNDEFINED;
integer esize = 16;
integer index = UInt(i3h:i3l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
```

32-bit

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
  0 1 0 0 0 1 0 0 |i2| Zm | 1 1 1 1 1 0 | Zn | Zd
```

32-bit

```
MUL <Zd>.S, <Zn>.S, <Zm>.S[iimm]
```

```java
if !HaveSVE2() then UNDEFINED;
integer esize = 32;
integer index = UInt(i2);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
```

64-bit

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
  0 1 0 0 0 1 0 0 |i1| Zm | 1 1 1 1 1 0 | Zn | Zd
```

64-bit

```
MUL <Zd>.D, <Zn>.D, <Zm>.D[iimm]
```

```java
if !HaveSVE2() then UNDEFINED;
integer esize = 64;
integer index = UInt(i1);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
```
Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the “Zd” field.

<Zn> Is the name of the first source scalable vector register, encoded in the “Zn” field.

<Zm> For the 16-bit and 32-bit variant: is the name of the second source scalable vector register Z0-Z7, encoded in the “Zm” field.

For the 64-bit variant: is the name of the second source scalable vector register Z0-Z15, encoded in the “Zm” field.

<imm> For the 16-bit variant: is the element index, in the range 0 to 7, encoded in the “i3h:i3l” fields.

For the 32-bit variant: is the element index, in the range 0 to 3, encoded in the “i2” field.

For the 64-bit variant: is the element index, in the range 0 to 1, encoded in the “i1” field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
integer eltspersegment = 128 DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
  integer segmentbase = e - e MOD eltspersegment;
  integer s = segmentbase + index;
  integer element1 = UInt(Elem[operand1, e, esize]);
  integer element2 = UInt(Elem[operand2, s, esize]);
  integer res = element1 * element2;
  Elem[result, e, esize] = res<esize-1:0>;
Z[d] = result;

Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
**NAND, NANDS**

Bitwise NAND predicates.

Bitwise NAND active elements of the second source predicate with corresponding elements of the first source predicate and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Optionally sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

It has encodings from 2 classes: [Not setting the condition flags](#) and [Setting the condition flags](#).

### Not setting the condition flags

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

| 0  | 0  | 1  | 0  | 1  | 0  | 1  | 1  | 0  | 0  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

**<Pd>**.B, **<Pg>/Z**, **<Pn>.B**, **<Pm>.B**

```c
if !HaveSVE() then UNDEFINED;
integer esize = 8;
integer g = UInt(Pg);
integer n = UInt(Pn);
integer m = UInt(Pm);
integer d = UInt(Pd);
boolean setflags = FALSE;
```

### Setting the condition flags

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 0  | 0  | 1  | 0  | 1  | 0  | 1  | 1  | 0  | 0  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

**<Pd>**.B, **<Pg>/Z**, **<Pn>.B**, **<Pm>.B**

```c
if !HaveSVE() then UNDEFINED;
integer esize = 8;
integer g = UInt(Pg);
integer n = UInt(Pn);
integer m = UInt(Pm);
integer d = UInt(Pd);
boolean setflags = TRUE;
```

### Assembler Symbols

- **<Pd>** Is the name of the destination scalable predicate register, encoded in the "Pd" field.
- **<Pg>** Is the name of the governing scalable predicate register, encoded in the "Pg" field.
- **<Pn>** Is the name of the first source scalable predicate register, encoded in the "Pn" field.
- **<Pm>** Is the name of the second source scalable predicate register, encoded in the "Pm" field.
Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(PL) operand1 = P[n];
bits(PL) operand2 = P[m];
bits(PL) result;

for e = 0 to elements-1
    bit element1 = ElemP[operand1, e, esize];
    bit element2 = ElemP[operand2, e, esize];
    if ElemP[mask, e, esize] == '1' then
        ElemP[result, e, esize] = NOT(element1 AND element2);
    else
        ElemP[result, e, esize] = '0';

if setflags then
    PSTATE.<N,Z,C,V> = PredTest(mask, result, esize);
P[d] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate
    register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate
    register contains the same value for each execution.
  - The values of the NZCV flags.
NBSL

Bitwise inverted select.

Selects bits from the first source vector where the corresponding bit in the third source vector is '1', and from the second source vector where the corresponding bit in the third source vector is '0'. The inverted result is placed destructively in the destination and first source vector. This instruction is unpredicated.

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 0 0 0 1 0 0 1 1 1 | Zm | 0 0 1 1 1 1 | Zk | Zdn
```

SVE2

if !HaveSVE2() then UNDEFINED;
integer m = UInt(Zm);
integer k = UInt(Zk);
integer dn = UInt(Zdn);

Assembler Symbols

- `<Zdn>` Is the name of the first source and destination scalable vector register, encoded in the "Zdn" field.
- `<Zm>` Is the name of the second source scalable vector register, encoded in the "Zm" field.
- `<Zk>` Is the name of the third source scalable vector register, encoded in the "Zk" field.

Operation

CheckSVEEnabled();
bits(VL) operand1 = Z[dn];
bits(VL) operand2 = Z[m];
bits(VL) operand3 = Z[k];

Z[dn] = NOT((operand1 AND operand3) OR (operand2 AND NOT(operand3)));

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
NEG

Negate (predicated).

Negate the signed integer value in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 0 0 0 0 1 0 0 | size | 0 1 0 1 1 1 0 1 | Pg | Zn | Zd

SVE

NEG <Zd>.<T>, <Pg>/M, <Zn>.<T>

if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.
<T> Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];
for e = 0 to elements-1
    integer element = SInt(Elem[operand, e, esize]);
    if ElemP[mask, e, esize] == '1' then
        element = -element;
    Elem[result, e, esize] = element<esize-1:0>;
Z[d] = result;

Operational information

If PSTATE.DIT is 1:
• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  ◦ The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  ◦ The values of the NZCV flags.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
NMATCH

Detect no matching elements, setting the condition flags.

This instruction compares each active 8-bit or 16-bit character in the first source vector with all of the characters in the corresponding 128-bit segment of the second source vector. Where the first source element detects no matching characters in the second segment it places true in the corresponding element of the destination predicate, otherwise false. Inactive elements in the destination predicate register are set to zero. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

### SVE2

```
NMATCH <Pd>.<T>, <Pg>/Z, <Zn>.<T>, <Zm>.<T>
```

```plaintext
if !HaveSVE2() then UNDEFINED;
if size == '1x' then UNDEFINED;
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer d = UInt(Pd);
integer n = UInt(Zn);
integer m = UInt(Zm);
```

#### Assembler Symbols

- `<Pd>`: Is the name of the destination scalable predicate register, encoded in the "Pd" field.
- `<T>`: Is the size specifier, encoded in “size<0>”:
  ```plaintext
  size<0>  <T>
  0     B
  1     H
  ```
- `<Pg>`: Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<Zn>`: Is the name of the first source scalable vector register, encoded in the "Zn" field.
- `<Zm>`: Is the name of the second source scalable vector register, encoded in the "Zm" field.

#### Operation

```plaintext
CheckSVEEnabled();
integer elements = VL DIV esize;
integer eltspersegment = 128 DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(PL) result;
for e = 0 to elements-1
  if ElemP[mask, e, esize] == '1' then
    integer segmentbase = e - e MOD eltspersegment;
    ElemP[result, e, esize] = '1';
    bits(esize) element1 = Elem[operand1, e, esize];
    for i = segmentbase to segmentbase + eltspersegment - 1
      bits(esize) element2 = Elem[operand2, i, esize];
      if element1 == element2 then
        ElemP[result, e, esize] = '0';

NOTS

Bitwise invert predicate, setting the condition flags.

Bitwise invert each active element of the source predicate, and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Sets the \texttt{FIRST (N)}, \texttt{NONE (Z)}, \texttt{!LAST (C)} condition flags based on the predicate result, and the V flag to zero.

This is an alias of \texttt{FOR, EORS (predicates)}. This means:

- The encodings in this description are named to match the encodings of \texttt{FOR, EORS (predicates)}.
- The description of \texttt{FOR, EORS (predicates)} gives the operational pseudocode for this instruction.

\begin{itemize}
  \item \texttt{NOTS <Pd>.B, <Pg>/Z, <Pn>.B} is equivalent to \texttt{EORS <Pd>.B, <Pg>/Z, <Pn>.B, <Pg>.B} and is the preferred disassembly when \texttt{Pm == Pg}.
\end{itemize}

\textbf{Assembler Symbols}

\begin{itemize}
  \item \texttt{<Pd>} is the name of the destination scalable predicate register, encoded in the "Pd" field.
  \item \texttt{<Pg>} is the name of the governing scalable predicate register, encoded in the "Pg" field.
  \item \texttt{<Pn>} is the name of the first source scalable predicate register, encoded in the "Pn" field.
\end{itemize}

\textbf{Operation}

The description of \texttt{FOR, EORS (predicates)} gives the operational pseudocode for this instruction.

\textbf{Operational information}

If \texttt{PSTATE.DIT} is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
ORN (immediate)

Bitwise inclusive OR with inverted immediate (unpredicated).

Bitwise inclusive OR an inverted immediate with each 64-bit element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is a 64-bit value consisting of a single run of ones or zeros repeating every 2, 4, 8, 16, 32 or 64 bits. This instruction is unpredicated.

This is a pseudo-instruction of ORR (immediate). This means:

- The encodings in this description are named to match the encodings of ORR (immediate).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of ORR (immediate) gives the operational pseudocode for this instruction.

</tr>
</tbody>
</table>

<const> Is a 64, 32, 16 or 8-bit bitmask consisting of replicated 2, 4, 8, 16, 32 or 64 bit fields, each field containing a rotated run of non-zero bits, encoded in the "imm13" field.

Operation

The description of ORR (immediate) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
ORN, ORNS (predicates)

Bitwise inclusive OR inverted predicate.

Bitwise inclusive OR inverted active elements of the second source predicate with corresponding elements of the first source predicate and place the results in the corresponding elements of the destination predicate. Inactive elements in the destination predicate register are set to zero. Optionally sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

It has encodings from 2 classes: Not setting the condition flags and Setting the condition flags

PFALSE <Pd>.B

if !HaveSVE() then UNDEFINED;
integer d = UInt(Pd);

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.

Operation

CheckSVEEnabled();
P[d] = Zeros(PL);

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**PFIRST**

Set the first active predicate element to true.

Sets the first active element in the destination predicate to true, otherwise elements from the source predicate are passed through unchanged. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
PNEXT

Find next active predicate.

An instruction used to construct a loop which iterates over all active elements in a predicate. If all source predicate elements are false it sets the first active predicate element in the destination predicate to true. Otherwise it determines the next active predicate element following the last true source predicate element, and if one is found sets the corresponding destination predicate element to true. All other destination predicate elements are set to false. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

```
0 0 1 0 0 1 0 1
0 1 1 0 0 1 1 0
0 0 0 1 0
Pg 0
```

PRFB (vector plus immediate)

Gather prefetch bytes (vector plus immediate).

Gather prefetch of bytes from the active memory addresses generated by a vector base plus immediate index. The index is in the range 0 to 31. Inactive addresses are not prefetched from memory.

The `<prfop>` symbol specifies the prefetch hint as a combination of three options: access type PLD for load or PST for store; target cache level L1, L2 or L3; temporality (KEEP for temporal or STRM for non-temporal).

It has encodings from 2 classes: **32-bit element** and **64-bit element**

**32-bit element**

PRFB (scalar plus immediate)

Contiguous prefetch bytes (immediate index).

Contiguous prefetch of byte elements from the memory address generated by a 64-bit scalar base and immediate index in the range -32 to 31 which is multiplied by the vector’s in-memory size, irrespective of predication, and added to the base address.

The predicate may be used to suppress prefetches from unwanted addresses.

- `<Pg>` Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

- `<Xn|SP>` Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

- `<Xm>` Is the 64-bit name of the general-purpose offset register, encoded in the "Rm" field.
Operation

CheckSVEEnabled();
integer elements = VL DIV esize;

bits(PL) mask = P[g];
bits(64) base;
bits(64) offset = X[m];
bits(64) addr;

if n == 31 then
    base = SP[];
else
    base = X[n];

for e = 0 to elements-1
    if ElemP[mask, e, esize] == '1' then
        addr = base + (UInt(offset) << scale);
        Hint_Prefetch(addr, pref_hint, level, stream);
        offset = offset + 1;
PRFB (scalar plus vector)

Gather prefetch bytes (scalar plus vector).

Gather prefetch of bytes from the active memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally sign or zero-extended from 32 to 64 bits. Inactive addresses are not prefetched from memory.

The <prfop> symbol specifies the prefetch hint as a combination of three options: access type PLD for load or PST for store; target cache level L1, L2 or L3; temporality (KEEP for temporal or STRM for non-temporal).

It has encodings from 3 classes: 32-bit scaled offset , 32-bit unpacked scaled offset and 64-bit scaled offset

32-bit scaled offset

```plaintext
0

1 0 0 0 1 0 0 0 |xs| Zm 0 0 0 Pg Rn 0 prfop
```

32-bit scaled offset

```plaintext
PRFB <prfop>, <Pg>, [<Xn|SP>, <Zm>.S, <mod>]
```

```
if !HaveSVE() then UNDEFINED;
integer esize = 32;
integer g = UInt(Pg);

PRFH (scalar plus immediate)

Contiguous prefetch halfwords (immediate index).

Contiguous prefetch of halfword elements from the memory address generated by a 64-bit scalar base and immediate index in the range -32 to 31 which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address.

The predicate may be used to suppress prefetches from unwanted addresses.

    addr = base + (off << scale);
    Hint_Prefetch(addr, pref_hint, level, stream);
PTEST

Set condition flags for predicate.

Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate source register, and the V flag to zero.

```
0 0 1 0 0 1 0 1 0 1 0 0 0 0 1 1  Pg 0  Pn 0 0 0 0 0
```

SVE

PTEST <Pg>, <Pn>.B

if !HaveSVE() then UNDEFINED;
integer esize = 8;
integer g = UInt(Pg);
integer n = UInt(Pn);

Assembler Symbols

<Pg> Is the name of the governing scalable predicate register, encoded in the "Pg" field.
<Pn> Is the name of the source scalable predicate register, encoded in the "Pn" field.

Operation

CheckSVEEnabled();
bits(PL) mask = P[g];
bits(PL) result = P[n];
PSTATE.<N,Z,C,V> = PredTest(mask, result, esize);

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
**PTRUE, PTRUES**

Initialise predicate from named constraint.

Set elements of the destination predicate to true if the element number satisfies the named predicate constraint, or to false otherwise. If the constraint specifies more elements than are available at the current vector length then all elements of the destination predicate are set to false.

The named predicate constraint limits the number of active elements in a single predicate to:

* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception. Optionally sets the **FIRST** (N), **NONE** (Z), **!LAST** (C) condition flags based on the predicate result, and the V flag to zero.

It has encodings from 2 classes: [Not setting the condition flags](#) and [Setting the condition flags](#).

### Not setting the condition flags

![Binary Encoding](image)

**Not setting the condition flags**

**PTRUE** <Pd>.<T>{, <pattern>}

```plaintext
if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer d = UInt(Pd);
boolean setflags = FALSE;
bits(5) pat = pattern;
```

### Setting the condition flags

![Binary Encoding](image)

**Setting the condition flags**

**PTRUES** <Pd>.<T>{, <pattern>}

```plaintext
if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer d = UInt(Pd);
boolean setflags = TRUE;
bits(5) pat = pattern;
```

### Assembler Symbols

- `<Pd>` Is the name of the destination scalable predicate register, encoded in the "Pd" field.
- `<T>` Is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>&lt;T&gt;</th>

<td>MUL4</td>
</tr>
<tr>
<td>11110</td>
<td>MUL3</td>
</tr>
<tr>
<td>11111</td>
<td>ALL</td>
</tr>
</tbody>
</table>

**Operation**

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
bits(PL) result;

for e = 0 to elements-1
    ElemP[result, e, esize] = if e < count then '1' else '0';

if setflags then
    PSTATE.<N,Z,C,V> = PredTest(result, result, esize);
P[d] = result;
```

**Operational information**

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
PUNPKHI, PUNPKLO

Unpack and widen half of predicate.

Unpack elements from the lowest or highest half of the source predicate and place in elements of twice their size within the destination predicate. This instruction is unpredicated.

It has encodings from 2 classes: High half and Low half.

High half

High half

PUNPKHI <Pd>.H, <Pn>.B

if !HaveSVE() then UNDEFINED;
integer esize = 16;
integer n = UInt(Pn);
integer d = UInt(Pd);
boolean hi = TRUE;

Low half

Low half

PUNPKLO <Pd>.H, <Pn>.B

if !HaveSVE() then UNDEFINED;
integer esize = 16;
integer n = UInt(Pn);
integer d = UInt(Pd);
boolean hi = FALSE;

Assembler Symbols

<Pd> Is the name of the destination scalable predicate register, encoded in the "Pd" field.
<Pn> Is the name of the source scalable predicate register, encoded in the "Pn" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) operand = P[n];
bits(PL) result;
for e = 0 to elements-1
    ElemP[result, e, esize] = ElemP[operand, if hi then e + elements else e, esize DIV 2];
P[d] = result;

Operational information

If PSTATE.DIT is 1:
• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.
- The values of the NZCV flags.

The response of this instruction to asynchronous exceptions does not vary based on:
- The values of the data supplied in any of its registers.
- The values of the NZCV flags.
RADDHNB

Rounding add narrow high part (bottom).

Add each vector element of the first source vector to the corresponding vector element of the second source vector, and place the most significant rounded half of the result in the even-numbered half-width destination elements, while setting the odd-numbered elements to zero. This instruction is unpredicated.

### SVE2

RADDHNB $<Zd>$. $<T>$, $<Zn>$. $<Tb>$, $<Zm>$. $<Tb>$

if !HaveSVE2() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 $<UInt$ (size);
integer n = $UInt$(Zn);
integer m = $UInt$(Zm);
integer d = $UInt$(Zd);

#### Assembler Symbols

- **$<Zd>$** Is the name of the destination scalable vector register, encoded in the “Zd” field.
- **$<T>$** Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>$&lt;T&gt;$</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>RESERVED</td>
</tr>
<tr>
<td>01</td>
<td>B</td>
</tr>
<tr>
<td>10</td>
<td>H</td>
</tr>
<tr>
<td>11</td>
<td>S</td>
</tr>
</tbody>
</table>

- **$<Zn>$** Is the name of the first source scalable vector register, encoded in the “Zn” field.
- **$<Tb>$** Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>$&lt;Tb&gt;$</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>RESERVED</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- **$<Zm>$** Is the name of the second source scalable vector register, encoded in the “Zm” field.

#### Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result;
integer halfesize = esize DIV 2;
integer round_const = 1 << (halfesize - 1);

for e = 0 to elements-1
    integer element1 = $UInt$(Elem[operand1, e, esize]);
    integer element2 = $UInt$(Elem[operand2, e, esize]);
    integer res = ((element1 + element2) + round_const) >> halfesize;
    Elem[result, 2*e + 0, halfesize] = res<halfesize-1:0>;
    Elem[result, 2*e + 1, halfesize] = Zeros();
Z[d] = result;
Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
RADDHNT

Rounding add narrow high part (top).

Add each vector element of the first source vector to the corresponding vector element of the second source vector, and place the most significant rounded half of the result in the odd-numbered half-width destination elements, leaving the even-numbered elements unchanged. This instruction is unpredicated.

SVE2

RADDHNT <Zd>.<T>, <Zn>.<Tb>, <Zm>.<Tb>

if !HaveSVE2() then UNDEFINED;
if size == '00' then UNDEFINED;
integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>

<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result = Z[d];
integer halfesize = esize DIV 2;
integer round_const = 1 << (halfesize - 1);
for e = 0 to elements-1
    integer element1 = UInt(Elem[operand1, e, esize]);
    integer element2 = UInt(Elem[operand2, e, esize]);
    integer res = ((element1 + element2) + round_const) >> halfesize;
    Elem[result, 2*e + 1, halfesize] = res<halfesize-1:0>;
Z[d] = result;
Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
RAX1

Bitwise rotate left by 1 and exclusive OR.

Rotate each 64-bit element of the second source vector left by 1 and exclusive OR with the corresponding elements of the first source vector. The results are placed in the corresponding elements of the destination vector. This instruction is unpredicated.

ID_AA64ZFR0_EL1.SHA3 indicates whether this instruction is implemented.

SVE2

RAX1 <Zd>.D, <Zn>.D, <Zm>.D

if !HaveSVE2SHA3() then UNDEFINED;
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the “Zd” field.
<Zn> Is the name of the first source scalable vector register, encoded in the “Zn” field.
<Zm> Is the name of the second source scalable vector register, encoded in the “Zm” field.

Operation

CheckSVEEnabled();
integer elements = VL DIV 64;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
    bits(64) element1 = Elem[operand1, e, 64];
    bits(64) element2 = Elem[operand2, e, 64];
    Elem[result, e, 64] = element1 EOR ROL(element2, 1);
Z[d] = result;

Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.

<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

CheckSVEEnabled();
exteger elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];

for e = 0 to elements-1

    bits(esize) element = Elem[operand, e, esize];
    if ElemP[mask, e, esize] == '1' then
        Elem[result, e, esize] = BitReverse(element);

Z[d] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
• The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

SVE

RDVL <Xd>, #<imm>

if !HaveSVE() then UNDEFINED;
integer d = UInt(Rd);
integer imm = SInt(imm6);

Assembler Symbols

<Xd> Is the 64-bit name of the destination general-purpose register, encoded in the "Rd" field.
<imm> Is the signed immediate operand, in the range -32 to 31, encoded in the "imm6" field.

Operation

CheckSVEEnabled();
integer len = imm * (VL DIV 8);
X[d] = len<63:0>;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**REV (predicate)**

Reverse all elements in a predicate.

Reverse the order of all elements in the source predicate and place in the destination predicate. This instruction is unpredicated.

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the “Zd" field.

<T> For the byte variant: is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>RESERVED</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

For the halfword variant: is the size specifier, encoded in “size<0>”:

<table>
<thead>
<tr>
<th>size&lt;0&gt;</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>S</td>
</tr>
<tr>
<td>1</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the “Zn” field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];

for e = 0 to elements-1
  if ElemP[mask, e, esize] == '1' then
    bits(esize) element = Elem[operand, e, esize];
    Elem[result, e, esize] = Reverse(element, swsize);

Z[d] = result;

Operational information

If PSTATE.DIT is 1:
  • The execution time of this instruction is independent of:
    ◦ The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
    ◦ The values of the NZCV flags.
  • The response of this instruction to asynchronous exceptions does not vary based on:
    ◦ The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
    ◦ The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

  • The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
  • The MOVPRFX instruction must specify the same destination register as this instruction.
  • The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
RSHRNB

Rounding shift right narrow by immediate (bottom).

Shift each unsigned integer value in the source vector elements right by an immediate value, and place the rounded results in the even-numbered half-width destination elements, while setting the odd-numbered elements to zero. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**SCVTF**

Signed integer convert to floating-point (predicated).

Convert to floating-point from the signed integer in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

If the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are zero-extended to fill each destination element.

It has encodings from 7 classes: 16-bit to half-precision, 32-bit to half-precision, 32-bit to single-precision, 32-bit to double-precision, 64-bit to half-precision, 64-bit to single-precision and 64-bit to double-precision.

### 16-bit to half-precision

- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**SDOT (vectors)**

Signed integer dot product.

The signed integer dot product instruction computes the dot product of a group of four signed 8-bit or 16-bit integer values held in each 32-bit or 64-bit element of the first source vector multiplied by a group of four signed 8-bit or 16-bit integer values in the corresponding 32-bit or 64-bit element of the second source vector, and then destructively adds the widened dot product to the corresponding 32-bit or 64-bit element of the destination vector.

This instruction is unpredicated.

---

**Assembler Symbols**

<td>B</td>
</tr>
<tr>
<td>1</td>
<td>H</td>
</tr>
</tbody>
</table>

- `<Zm>` Is the name of the second source scalable vector register, encoded in the "Zm" field.

**Operation**

CheckSVEEnabled();

integer elements = VL DIV esize;

bits(VL) operand1 = Z[n];

bits(VL) operand2 = Z[m];

bits(VL) operand3 = Z[da];

bits(VL) result;

for e = 0 to elements-1
  bits(esize) res = Elem[operand3, e, esize];
  for i = 0 to 3
    integer element1 = SInt(Elem[operand1, 4 * e + i, esize DIV 4]);
    integer element2 = SInt(Elem[operand2, 4 * e + i, esize DIV 4]);
    res = res + element1 * element2;
    Elem[result, e, esize] = res;

Z[da] = result;
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SDOT (indexed)

Signed integer indexed dot product.

The signed integer indexed dot product instruction computes the dot product of a group of four signed 8-bit or 16-bit integer values held in each 32-bit or 64-bit element of the first source vector multiplied by a group of four signed 8-bit or 16-bit integer values in an indexed 32-bit or 64-bit element of the second source vector, and then destructively adds the widened dot product to the corresponding 32-bit or 64-bit element of the destination vector.

The groups within the second source vector are specified using an immediate index which selects the same group position within each 128-bit vector segment. The index range is from 0 to one less than the number of groups per 128-bit segment, encoded in 1 to 2 bits depending on the size of the group. This instruction is unpredicated.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

32-bit

if !HaveSVE() then UNDEFINED;
integer esize = 32;
integer index = UInt(i2);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);

64-bit

64-bit

SDOT <Zda>.D, <Zn>.H, <Zm>.H[i1]

if !HaveSVE() then UNDEFINED;
integer esize = 64;
integer index = UInt(i1);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);

Assembler Symbols

<Xda> Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.

<Xn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Xm> For the 32-bit variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field.
For the 64-bit variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.

<imm> For the 32-bit variant: is the immediate index of a quadtuplet of four 8-bit elements within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field.
For the 64-bit variant: is the immediate index of a quadtuplet of four 16-bit elements within each 128-bit vector segment, in the range 0 to 1, encoded in the "i1" field.
Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
integer eltspersegment = 128 DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) operand3 = Z[da];

SHRNT

Shift right narrow by immediate (top).

Shift each unsigned integer value in the source vector elements right by an immediate value, and place the truncated results in the odd-numbered half-width destination elements, leaving the even-numbered elements unchanged. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.

• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
SM4E

SM4 encryption and decryption.

The SM4E instruction reads 16 bytes of input data from each 128-bit segment of the first source vector, together with four iterations of 32-bit round keys from the corresponding 128-bit segments of the second source vector. Each block of data is encrypted by four rounds in accordance with the SM4 standard, and destructively placed in the corresponding segments of the first source vector. This instruction is unpredicated.

ID_AA64ZFR0_EL1.SM4 indicates whether this instruction is implemented.

Assembler Symbols

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the “Zdn” field.

  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
SM4EKEY

SM4 key updates.

The SM4EKEY instruction reads four rounds of 32-bit input key values from each 128-bit segment of the first source vector, along with four rounds of 32-bit constants from the corresponding 128-bit segment of the second source vector. The four rounds of output key values are derived in accordance with the SM4 standard, and placed in the corresponding segments of the destination vector. This instruction is unpredicated.

ID_AA64ZFR0_EL1.SM4 indicates whether this instruction is implemented.

SMAXV

Signed maximum reduction to scalar.

Signed maximum horizontally across all lanes of a vector, and place the result in the SIMD&FP scalar destination register. Inactive elements in the source vector are treated as the minimum signed integer for the element size.

```
0 0 0 0 0 0 1 0 0 | size 0 0 1 0 0 0 0 1 | Pg  Zn  Vd
```

SVE

SMAXV <V><d>, <Pg>, <Zn>.<T>

if !HaveSVE() then UNDEFINED;

- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SMLALB (indexed)

Signed multiply-add long to accumulator (bottom, indexed).

Multiply the even-numbered signed elements within each 128-bit segment of the first source vector by the specified signed element in the corresponding second source vector segment and destructively add to the overlapping double-width elements of the addend vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 2 or 3 bits depending on the size of the element.

It has encodings from 2 classes: **32-bit** and **64-bit**

### 32-bit

```plaintext
0 1 0 0 0 1 0 0 1 0 1 i3h Zm 1 0 0 0 i3l Zn Zda
```

#### 32-bit

```plaintext
```

  • The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SMLALT (indexed)

Signed multiply-add long to accumulator (top, indexed).

Multiply the odd-numbered signed elements within each 128-bit segment of the first source vector by the specified signed element in the corresponding second source vector segment and destructively add to the overlapping double-width elements of the addend vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 2 or 3 bits depending on the size of the element.

It has encodings from 2 classes: 32-bit and 64-bit.

32-bit

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 1 0 0 0 1 0 0 1 0 1 0 i3h Zm 1 0 0 0 i3l 1 Zn Zda
```

if !HaveSVE2() then UNDEFINED;
integer esize = 16;
integer index = UInt(i3h:i3l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
integer sel = 1;

64-bit

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 1 0 0 0 1 0 0 1 1 1 i2h Zm 1 0 0 0 i2l 1 Zn Zda
```

SMLALT <Zda>.D, <Zn>.S, <Zm>.S[<imm>]

if !HaveSVE2() then UNDEFINED;
integer esize = 32;
integer index = UInt(i2h:i2l);
integer n = UInt(Zn);
integer m = UInt(Zm);

integer sel = 1;

Assembler Symbols

- `<Zda>` is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
- `<Zn>` is the name of the first source scalable vector register, encoded in the "Zn" field.
- `<Zm>` For the 32-bit variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field.
  - For the 64-bit variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
- `<imm>` For the 32-bit variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields.
  - For the 64-bit variant: is the element index, in the range 0 to 3, encoded in the "i2h:i2l" fields.
Operation

CheckSVEEnabled();
integer elements = VL DIV (2 * esize);
integer eltspersegment = 128 DIV (2 * esize);
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result = Z[da];

for e = 0 to elements-1
    integer s = e - e MOD eltspersegment;
    integer element1 = SInt(Elem[operand1, 2 * e + sel, esize]);
    integer element2 = SInt(Elem[operand2, 2 * s + index, esize]);
    bits(2*esize) product = (element1 * element2)<2*esize-1:0>;
    Elem[result, e, 2*esize] = Elem[result, e, 2*esize] + product;
Z[da] = result;

Operational information

If PSTATE.DIT is 1:
• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SMLSLB (vectors)

Signed multiply-subtract long from accumulator (bottom).

Multiply the corresponding even-numbered signed elements of the first and second source vectors and destructively subtract from the overlapping double-width elements of the addend vector. This instruction is unpredicated.

If PSTATE.DIT is 1:
• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.

SMMLA

Signed integer matrix multiply-accumulate.

The signed integer matrix multiply-accumulate instruction multiplies the 2×8 matrix of signed 8-bit integer values held in each 128-bit segment of the first source vector by the 8×2 matrix of signed 8-bit integer values in the corresponding segment of the second source vector. The resulting 2×2 widened 32-bit integer matrix product is then destructively added to the 32-bit integer matrix accumulator held in the corresponding segment of the addend and destination vector. This is equivalent to performing an 8-way dot product per destination element.

This instruction is unpredicated.

ID_AA64ZFR0_EL1.I8MM indicates whether this instruction is implemented.

Z[dn] = result;

Operational information

If PSTATE.DIT is 1:
  • The execution time of this instruction is independent of:
    ◦ The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
    ◦ The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  ◦ The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SMULH (unpredicated)

Signed multiply returning high half (unpredicated).

Widening multiply signed integer values of all elements of the first source vector by corresponding elements of the second source vector and place the high half of the result in the corresponding elements of the destination vector. This instruction is unpredicated.

![SVE2 Symbol Table]

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

  ◦ The values of the data supplied in any of its registers.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
SMULLB (indexed)

Signed multiply long (bottom, indexed).

Multiply the even-numbered signed elements within each 128-bit segment of the first source vector by the specified
signed element in the corresponding second source vector segment, and place the results in the overlapping double-
width elements of the destination vector register.

The elements within the second source vector are specified using an immediate index which selects the same element
position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per
128-bit segment, encoded in 2 or 3 bits depending on the size of the element.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

SQADD (immediate)

Signed saturating add immediate (unpredicated).

Signed saturating add of an unsigned immediate to each element of the source vector, and destructively place the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<uimm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

- if sh == '1' then imm = imm << 8;
- boolean unsigned = FALSE;

Assembler Symbols

- `<Zdn>` Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.
- `<T>` Is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- `<imm>` Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.
- `<shift>` Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in "sh":

<table>
<thead>
<tr>
<th>sh</th>
<th>&lt;shift&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>LSL #0</td>
</tr>
<tr>
<td>1</td>
<td>LSL #8</td>
</tr>
</tbody>
</table>

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(VL) result;
for e = 0 to elements-1
  integer element1 = Int(Elem[operand1, e, esize], unsigned);
  (Elem[result, e, esize], -) = SatQ(element1 + imm, esize, unsigned);
Z[dn] = result;
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SQADD (vectors, unpredicated)

Signed saturating add vectors (unpredicated).

Signed saturating add all elements of the second source vector to corresponding elements of the first source vector and place the results in the corresponding elements of the destination vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. This instruction is unpredicated.

```
<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0</th>

</tr>
</tbody>
</table>
```

SVE

```
SQADD <Zd>.<T>, <Zn>.<T>, <Zm>.<T>

if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);
boolean unsigned = FALSE;
```

Assembler Symbols

```
<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.
<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.
```

Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    integer element2 = Int(Elem[operand2, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element1 + element2, esize, unsigned);
Z[d] = result;
```
SQCADD

Saturating complex integer add with rotate.

Add the real and imaginary components of the integral complex numbers from the first source vector to the complex numbers from the second source vector which have first been rotated by 90 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation, equivalent to multiplying the complex numbers in the second source vector by ±j beforehand. Destructively place the results in the corresponding elements of the first source vector. Each result element is saturated to the N-bit element's signed integer range \(-2^{(N-1)}\) to \(2^{(N-1)}\)-1. This instruction is unpredicated.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**SQDECB**

Signed saturating decrement scalar by multiple of 8-bit predicate constraint element count.

Determines the number of active 8-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination. The result is saturated to the source general-purpose register's signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

The named predicate constraint limits the number of active elements in a single predicate to:
- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: **32-bit** and **64-bit**

### 32-bit

```assembly
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 0 0 0 0 1 0 0 0 1 0 imm4 1 1 1 1 1 0 pattern Rdn
```

**SQDECB** `<Xdn>, <Wdn>{, <pattern>{, MUL #<imm>}}`

if !HaveSVE() then UNDEFINED;
integer esize = 8;
integer dn = UInt(Rdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
boolean unsigned = FALSE;
integer ssize = 32;

### 64-bit

```assembly
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 0 0 0 0 1 0 0 0 1 1 imm4 1 1 1 1 1 0 pattern Rdn
```

**SQDECB** `<Xdn>{, <pattern>{, MUL #<imm>}}`

if !HaveSVE() then UNDEFINED;
integer esize = 8;
integer dn = UInt(Rdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
boolean unsigned = FALSE;
integer ssize = 64;

### Assembler Symbols

X[dn] = Extend(result, 64, unsigned);
SQDECH (vector)

Signed saturating decrement vector by multiple of 16-bit predicate constraint element count.

Determines the number of active 16-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement all destination vector elements. The results are saturated to the 16-bit signed integer range.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

**SQDECP (scalar)**

Signed saturating decrement scalar by count of true predicate elements.

Counts the number of true elements in the source predicate and then uses the result to decrement the scalar destination. The result is saturated to the source general-purpose register’s signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

It has encodings from 2 classes: **32-bit** and **64-bit**

### 32-bit

```
0 0 1 0 0 1 0 1 | size | 1 0 1 0 | 1 0 1 0 0 1 | 0 0 | Pm | Rdn
```

### 64-bit

```
0 0 1 0 0 1 0 1 | size | 1 0 1 0 | 1 0 1 0 0 1 | 1 0 | Pm | Rdn
```

**Assembler Symbols**

- `<Xdn>` Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
- `<Pm>` Is the name of the source scalable predicate register, encoded in the "Pm" field.

    integer product = SInt(SignedSat(2 * element1 * element2, esize));
    Elem[result, e, esize] = SignedSat(element3 + product, esize);
Z[da] = result;
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand or register of this instruction.
**SQDMLALB (indexed)**

Signed saturating doubling multiply-add long to accumulator (bottom, indexed).

Multiply then double the even-numbered signed elements within each 128-bit segment of the first source vector and specified signed element in the corresponding second source vector segment. Each intermediate value is saturated to the double-width N-bit value's signed integer range \(-2^{(N-1)}\) to \((2^{(N-1)})-1\). Then destructively add to the overlapping double-width elements of the addend and destination vector. Each destination element is saturated to the double-width N-bit element's signed integer range \(-2^{(N-1)}\) to \((2^{(N-1)})-1\).

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 2 or 3 bits depending on the size of the element.

It has encodings from 2 classes: **32-bit** and **64-bit**

### 32-bit

    integer element3 = SInt(Elem[result, e, esize]);
    integer product = SInt(SignedSat(2 * element1 * element2, esize));
    Elem[result, e, esize] = SignedSat(element3 + product, esize);

Z[da] = result;
```
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SQDMLALT (indexed)

Signed saturating doubling multiply-add long to accumulator (top, indexed).

Multiply then double the odd-numbered signed elements within each 128-bit segment of the first source vector and the specified signed element in the corresponding second source vector segment. Each intermediate value is saturated to the double-width N-bit value’s signed integer range \(-2^{(N-1)}\) to \((2^{(N-1)})-1\). Then destructively add to the overlapping double-width elements of the addend and destination vector. Each destination element is saturated to the double-width N-bit element’s signed integer range \(-2^{(N-1)}\) to \((2^{(N-1)})-1\).

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 2 or 3 bits depending on the size of the element.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 1 0 0 0 1 0 0 1 0 1 |i3h| Zm 0 0 1 0 |i3l| 1 Zn Zda
```

32-bit

\[
\text{SQDMLALT } \langle Zda \rangle.S, \langle Zn \rangle.H, \langle Zm \rangle.H[<imm>]
\]

if !HaveSVE2() then UNDEFINED;
integer esize = 16;
integer index = UInt(i3h:i3l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
integer sel = 1;

64-bit

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 1 0 0 0 1 0 0 1 1 |i2h| Zm 0 0 1 0 |i2l| 1 Zn Zda
```

64-bit

\[
\text{SQDMLALT } \langle Zda \rangle.D, \langle Zn \rangle.S, \langle Zm \rangle.S[<imm>]
\]

if !HaveSVE2() then UNDEFINED;
integer esize = 32;
integer index = UInt(i2h:i2l);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
integer sel = 1;

Assembler Symbols

- **<Zda>** Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
- **<Zn>** Is the name of the first source scalable vector register, encoded in the "Zn" field.
- **<Zm>** For the 32-bit variant: is the name of the second source scalable vector register Z0-Z7, encoded in the "Zm" field.
  For the 64-bit variant: is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
- **<imm>** For the 32-bit variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields.
  For the 64-bit variant: is the element index, in the range 0 to 3, encoded in the "i2h:i2l" fields.
Operation

CheckSVEEnabled();
integer elements = VL DIV (2 * esize);
integer eltspersegment = 128 DIV (2 * esize);
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];

-|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SQDMLSLT (vectors)

Signed saturating doubling multiply-subtract long from accumulator (top).

Multiply then double the corresponding odd-numbered signed elements of the first and second source vectors. Each intermediate value is saturated to the double-width N-bit value's signed integer range \(-2^{(N-1)}\) to \((2^{(N-1)})-1\). Then destructively subtract from the overlapping double-width elements of the addend and destination vector. Each destination element is saturated to the double-width N-bit element's signed integer range \(-2^{(N-1)}\) to \((2^{(N-1)})-1\). This instruction is unpredicated.

integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);
integer sel1 = 1;
integer sel2 = 1;

Assembler Symbols

\(<Zda>\) Is the name of the third source and destination scalable vector register, encoded in the "Zda" field.
\(<T>\) Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>RESERVED</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

\(<Zn>\) Is the name of the first source scalable vector register, encoded in the "Zn" field.
\(<Tb>\) Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;Tb&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>RESERVED</td>
</tr>
<tr>
<td>01</td>
<td>B</td>
</tr>
<tr>
<td>10</td>
<td>H</td>
</tr>
<tr>
<td>11</td>
<td>S</td>
</tr>
</tbody>
</table>

\(<Zm>\) Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) result = Z[da];

for e = 0 to elements-1
    integer element1 = SInt(Elem[operand1, 2 * e + sel1, esize DIV 2]);
    integer element2 = SInt(Elem[operand2, 2 * e + sel2, esize DIV 2]);
    integer element3 = SInt(Elem[result, e, esize]);
    integer product = SInt(SignedSat(2 * element1 * element2, esize));
    Elem[result, e, esize] = SignedSat(element3 - product, esize);

Z[da] = result;
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SQDMLSLT (indexed)

Signed saturating doubling multiply-subtract long from accumulator (top, indexed).

Multiply then double the odd-numbered signed elements within each 128-bit segment of the first source vector and the specified signed element in the corresponding second source vector segment. Each intermediate value is saturated to the double-width N-bit value's signed integer range \(-2^{(N-1)}\) to \((2^{(N-1)})-1\). Then destructively subtract from the overlapping double-width elements of the addend and destination vector. Each destination element is saturated to the double-width N-bit element's signed integer range \(-2^{(N-1)}\) to \((2^{(N-1)})-1\).

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 2 or 3 bits depending on the size of the element.

It has encodings from 2 classes: **32-bit** and **64-bit**

SQDMULH (indexed)

Signed saturating doubling multiply high (indexed).

Multiply all signed elements within each 128-bit segment of the first source vector by the specified signed element in the corresponding second source vector segment, double and place the most significant half of the result in the corresponding elements of the destination vector register. Each result element is saturated to the N-bit element’s signed integer range $-2^{(N-1)}$ to $2^{(N-1)}-1$. The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element.

It has encodings from 3 classes: 16-bit, 32-bit and 64-bit

### 16-bit

    Elem[result, e, esize] = SignedSat(res, esize);
Z[d] = result;
**SQDMULLB (indexed)**

Signed saturating doubling multiply long (bottom, indexed).

Multiply then double the even-numbered signed elements within each 128-bit segment of the first source vector and the specified element in the corresponding second source vector segment, and place the results in overlapping double-width elements of the destination vector register. Each result element is saturated to the double-width N-bit element's signed integer range \(-2^{(N-1)}\) to \(2^{(N-1)}-1\). The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 2 or 3 bits depending on the size of the element.

It has encodings from 2 classes: 32-bit and 64-bit

### 32-bit

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Z[d] = result;
**SQINCB**

Signed saturating increment scalar by multiple of 8-bit predicate constraint element count.

Determines the number of active 8-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination. The result is saturated to the source general-purpose register’s signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

The named predicate constraint limits the number of active elements in a single predicate to:

* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: [32-bit](#) and [64-bit](#).

SQINCD (vector)

Signed saturating increment vector by multiple of 64-bit predicate constraint element count.

Determines the number of active 64-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment all destination vector elements. The results are saturated to the 64-bit signed integer range.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

### Assembler Symbols

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.
Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
bits(VL) operand1 = Z[dn];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element1 + (count * imm), esize, unsigned);
Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

<imm> is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

### Operation

CheckSVEEnabled();
integer count = DecodePredCount(pat, esize);
bits(ssize) operand1 = X[dn];
bits(ssize) result;

integer element1 = Int(operand1, unsigned);
(result, -) = SatQ(element1 + (count * imm), ssize, unsigned);
X[dn] = Extend(result, 64, unsigned);
SQINCH (vector)

Signed saturating increment vector by multiple of 16-bit predicate constraint element count.

Determines the number of active 16-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment all destination vector elements. The results are saturated to the 16-bit signed integer range.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

</tbody>
</table>

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.
**Operation**

CheckSVEEnabled();
integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
bits(VL) operand1 = Z[dn];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element1 + (count * imm), esize, unsigned);

Z[dn] = result;

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SQINCP (scalar)

Signed saturating increment scalar by count of true predicate elements.

Counts the number of true elements in the source predicate and then uses the result to increment the scalar destination. The result is saturated to the source general-purpose register's signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

It has encodings from 2 classes: **32-bit** and **64-bit**

**32-bit**

```
0 0 1 0 0 1 0 1 | size 1 0 1 0 | Pm | Rdn
```

**64-bit**

```
0 0 1 0 0 1 0 1 | size 1 0 1 0 | Pm | Rdn
```

**Assembler Symbols**

- `<Xdn>`: Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
- `<Pm>`: Is the name of the source scalable predicate register, encoded in the "Pm" field.
- `<T>`: Is the size specifier, encoded in “size”:

```
size | <T>
------|------
00    | B    
01    | H    
10    | S    
11    | D    
```

- `<Wdn>`: Is the 32-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(ssize) operand1 = X[dn];
bits(PL) operand2 = P[m];
bits(ssize) result;
integer count = 0;

for e = 0 to elements-1
  if ElemP[operand2, e, esize] == '1' then
    count = count + 1;

integer element = Int(operand1, unsigned);
(result, -) = SatQ(element + count, ssize, unsigned);
X[dn] = Extend(result, 64, unsigned);
**SQINCP (vector)**

Signed saturating increment vector by count of true predicate elements.

Counts the number of true elements in the source predicate and then uses the result to increment all destination vector elements. The results are saturated to the element signed integer range.

The predicate size specifier may be omitted in assembler source code, but this is deprecated and will be prohibited in a future release of the architecture.

</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

**Operation**

CheckSVEEnabled();
ninteger elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(PL) operand2 = P[m];
bits(VL) result;
ninteger count = 0;

for e = 0 to elements-1
    if ElemP[operand2, e, esize] == '1' then
        count = count + 1;
for e = 0 to elements-1
    integer element = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element + count, esize, unsigned);

Z[dn] = result;

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SQINCW (scalar)

Signed saturating increment scalar by multiple of 32-bit predicate constraint element count.

Determines the number of active 32-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination. The result is saturated to the source general-purpose register's signed integer range. A 32-bit saturated result is then sign-extended to 64 bits.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
  * The largest power of two (POW2)
  * The largest multiple of three or four (MUL3 or MUL4)
  * All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: **32-bit** and **64-bit**

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.
Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
integer count = DecodePredCount(pat, esize);
bits(VL) operand1 = Z[dn];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element1 + (count * imm), esize, unsigned);
Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**SQNEG**

Signed saturating negate.

Negate the signed integer value in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Each result element is saturated to the N-bit element’s signed integer range \(-2^{(N-1)}\) to \((2^{(N-1)})-1\). Inactive elements in the destination vector register remain unmodified.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the “Zn” field.

**Operation**

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];
for e = 0 to elements-1
    integer element = SInt(Elem[operand, e, esize]);
    if ElemP[mask, e, esize] == '1' then
        element = -element;
        Elem[result, e, esize] = SignedSat(element, esize);
Z[d] = result;

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SQRDCMLAH (vectors)

Saturating rounding doubling complex integer multiply-add high with rotate.

Multiply without saturation the duplicated real components for rotations 0 and 180, or imaginary components for rotations 90 and 270, of the integral numbers in the first source vector by the corresponding complex number in the second source vector rotated by 0, 90, 180 or 270 degrees in the direction from the positive real axis towards the positive imaginary axis, when considered in polar representation. Then double and add the products to the corresponding components of the complex numbers in the addend vector. Destructively place the most significant rounded half of the results in the corresponding elements of the addend vector. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. This instruction is unpredicated.

These transformations permit the creation of a variety of multiply-add and multiply-subtract operations on complex numbers by combining two of these instructions with the same vector operands but with rotations that are 90 degrees apart.

Each complex number is represented in a vector register as an even/odd pair of elements with the real part in the even-numbered element and the imaginary part in the odd-numbered element.

```
Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the “Zda” field.

<Zn> Is the name of the first source scalable vector register, encoded in the “Zn” field.

<Zm> For the 16-bit and 32-bit variant: is the name of the second source scalable vector register Z0-Z7, encoded in the “Zm” field.

For the 64-bit variant: is the name of the second source scalable vector register Z0-Z15, encoded in the “Zm” field.

<imm> For the 16-bit variant: is the element index, in the range 0 to 7, encoded in the “i3h:i3l” fields.

For the 32-bit variant: is the element index, in the range 0 to 3, encoded in the “i2” field.

For the 64-bit variant: is the element index, in the range 0 to 1, encoded in the “i1” field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
integer eltspersegment = 128 DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) operand3 = Z[da];
bits(VL) result;
integer round_const = 1 << (esize - 1);
for e = 0 to elements-1
    integer segmentbase = e - e MOD eltspersegment;
    integer s = segmentbase + index;
    integer element1 = SInt(Elem[operand1, e, esize]);
    integer element2 = SInt(Elem[operand2, s, esize]);
    integer element3 = SInt(Elem[operand3, e, esize]);
    integer res = (element3 << esize) - (2 * element1 * element2);
    Elem[result, e, esize] = SignedSat((res + round_const) >> esize, esize);
Z[da] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SQRDMULH (vectors)

Signed saturating rounding doubling multiply high (unpredicated).

Multiply then double the corresponding signed elements of the first and second source vectors, and place the most significant saturated half of the result in the corresponding elements of the destination vector. Each result element is saturated to the N-bit element's signed integer range \(-2^{(N-1)}\) to \(2^{(N-1)}-1\). This instruction is unpredicated.

```

SQRDMULH (indexed)

Signed saturating rounding doubling multiply high (indexed).

Multiply all signed elements within each 128-bit segment of the first source vector by the specified signed element in the corresponding second source vector segment, double and place the most significant rounded half of the result in the corresponding elements of the destination vector register. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $2^{(N-1)}$-1.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 1 to 3 bits depending on the size of the element.

It has encodings from 3 classes: 16-bit, 32-bit and 64-bit

16-bit

```

```
**SQSHL (immediate)**

Signed saturating shift left by immediate.

Shift left by immediate each active signed element of the source vector, and destructively place the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element’s signed integer range \(-2^{(N-1)}\) to \((2^{(N-1)})-1\). The immediate shift amount is an unsigned value in the range 0 to number of bits per element minus 1. Inactive elements in the destination vector register remain unmodified.

```
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SQSHL (vectors)

Signed saturating shift left by vector (predicated).

Shift active signed elements of the first source vector by corresponding elements of the second source vector and destructively place the results in the corresponding elements of the first source vector. A positive shift amount performs a left shift, otherwise a right shift by the negated shift amount is performed. Each result element is saturated to the N-bit element's signed integer range $-2^{(N-1)}$ to $(2^{(N-1)})-1$. Inactive elements in the destination vector register remain unmodified.

  Elem[result, 2*e + 1, esize] = Zeros();
Z[d] = result;
```

SQSHRUNB
SQSHRUNT

Signed saturating shift right unsigned narrow by immediate (top).

Shift each signed integer value in the source vector elements right by an immediate value, and place the truncated results in the odd-numbered half-width destination elements, leaving the even-numbered elements unchanged. Each result element is saturated to the half-width N-bit element's unsigned integer range 0 to \((2^N)-1\). The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.

Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
• The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

Internal version only: isa v31.05b, AdvSIMD v29.02, pseudocode v2019-12_rc3_1, sve v2019-12_rc3 ; Build timestamp: 2019-12-13T11:35

SQSUB (immediate)

Signed saturating subtract immediate (unpredicated).

Signed saturating subtract of an unsigned immediate from each element of the source vector, and destructively place
the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element's
signed integer range \(-2^{(N-1)}\) to \(2^{(N-1)}-1\). This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a
positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is
specified is "#<imm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit
value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

Z[d] = result;
SRHADD

Signed rounding halving addition.

Add active signed elements of the first source vector to corresponding signed elements of the second source vector, shift right one bit, and destructively place the rounded results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

    else
        Elem[result, e, esize] = Elem[operand1, e, esize];
Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SRI

Shift right and insert (immediate).

Shift each source vector element right by an immediate value, and insert the result into the corresponding vector element in the destination vector register, merging the shifted bits from each source element with existing bits in each destination vector element. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.

Z[d] = result;

Operational information

If PSTATE.DIT is 1:
  • The execution time of this instruction is independent of:
- The values of the data supplied in any of its registers.
- The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
SRSHL

Signed rounding shift left by vector (predicated).

Shift active signed elements of the first source vector by corresponding elements of the second source vector and destructively place the rounded results in the corresponding elements of the first source vector. A positive shift amount performs a left shift, otherwise a right shift by the negated shift amount is performed. Inactive elements in the destination vector register remain unmodified.
