    Elem[result, e, esize] = res<esize-1:0>;
  else
    Elem[result, e, esize] = Elem[operand1, e, esize];

Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**SQSUB (immediate)**

Signed saturating subtract immediate (unpredicated).

Signed saturating subtract of an unsigned immediate from each element of the source vector, and destructively place the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element's signed integer range \(-2^{(N-1)}\) to \(2^{(N-1)}-1\). This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

**Assembler Symbols**

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SRI

Shift right and insert (immediate).

Shift each source vector element right by an immediate value, and insert the result into the corresponding vector element in the destination vector register, merging the shifted bits from each source element with existing bits in each destination vector element. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.

```
0 1 0 0 1 0 1 tzh 0 tzl imm3 1 1 1 0 0 Zn  Zd

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SRSRA

Signed rounding shift right and accumulate (immediate).

Shift right by immediate each signed element of the source vector, preserving the sign bit, and add the rounded intermediate result destructively to the corresponding elements of the addend vector. The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.

  \text{Elem}[result, e, esize] = (element1 - element2)<\text{esize}-1:0>;
\text{Z}[d] = result;

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
**SSUBWT**

Signed subtract wide (top).

Subtract the even-numbered signed elements of the second source vector from the overlapping double-width elements of the first source vector and place the results in the corresponding double-width elements of the destination vector. This instruction is unpredicated.

<table>
<thead>

**ST1D (scalar plus vector)**

Scatter store doublewords from a vector (vector index).

Scatter store of doublewords from the active elements of a vector register to the memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 8. Inactive elements are not written to memory.

It has encodings from 4 classes: 32-bit unpacked scaled offset, 32-bit unpacked unscaled offset, 64-bit scaled offset and 64-bit unscaled offset.

### 32-bit unpacked scaled offset

```
0 1 1 1 0 0 0 1 1 1 0 1 Zm 1 xs 0 Pg Rn Zt
```

```
ST1D { <Zt>.D }, <Pg>, [<Xn|SP>, <Zm>.D, <mod> #3]
```

if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer m = UInt(Zm);
integer g = UInt(Pg);
integer esize = 64;
integer msize = 64;
integer offs_size = 32;
boolean offs_unsigned = xs == '0';
integer scale = 3;

### 32-bit unpacked unscaled offset

```
0 1 1 1 0 0 0 1 1 1 0 0 Zm 1 xs 0 Pg Rn Zt
```

```
ST1D { <Zt>.D }, <Pg>, [<Xn|SP>, <Zm>.D, <mod>]
```

if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Rn);
integer m = UInt(Zm);
integer g = UInt(Pg);
integer esize = 64;
integer msize = 64;
integer offs_size = 32;
boolean offs_unsigned = xs == '0';
integer scale = 0;

### 64-bit scaled offset

```
0 1 1 1 0 0 0 1 1 1 0 1 Zm 1 0 1 Pg Rn Zt
```

ST1D (scalar plus vector)

ST1W (scalar plus vector)

Scatter store words from a vector (vector index).

Scatter store of words from the active elements of a vector register to the memory addresses generated by a 64-bit scalar base plus vector index. The index values are optionally first sign or zero-extended from 32 to 64 bits and then optionally multiplied by 4. Inactive elements are not written to memory.

It has encodings from 6 classes: 32-bit scaled offset, 32-bit unpacked scaled offset, 32-bit unpacked unscaled offset, 32-bit unscaled offset, 64-bit scaled offset and 64-bit unscaled offset.

**32-bit scaled offset**

ST4W (scalar plus immediate)

Contiguous store four-word structures from four vectors (immediate index).

Contiguous store four-word structures, each from the same element number in four vector registers to the memory address generated by a 64-bit scalar base and an immediate index which is a multiple of 4 in the range -32 to 28 that is multiplied by the vector's in-memory size, irrespective of predication.

Each predicate element applies to the same element number in each of the four vector registers, or equivalently to the four consecutive words in memory which make up each structure. Inactive structures are not written to memory.

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
1 1 1 0 0 1 0 1 0 1 1 1 1 imm4 1 1 1 Pg Rn Zt

```

Contiguous store four-word structures from four vectors (scalar).

Contiguous store four-word structures, each from the same element number in four vector registers to the memory
address generated by a 64-bit scalar base and a 64-bit scalar index register scaled by the element size (LSL option)
and added to the base address. After each structure access the index value is incremented by four. The index register
is not updated by the instruction.

Each predicate element applies to the same element number in each of the four vector registers, or equivalently to the
four consecutive words in memory which make up each structure. Inactive structures are not written to memory.

integer m = UInt(Rm);
integer g = UInt(Pg);
integer esize = 64;
integer msize = 16;

**Assembler Symbols**

<Zt>  Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.

<Pg>  Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn>  Is the name of the base scalable vector register, encoded in the "Zn" field.

<Xm>  Is the optional 64-bit name of the general-purpose offset register, defaulting to XZR, encoded in the "Rm" field.
Operation

CheckSVEEnabled();
integer elements = $VL$ DIV $esize$;
bits($VL$) base = $Z\{n\}$;
bits(64) offset = $X\{m\}$;
bits($VL$) src = $Z\{t\}$;
bits($PL$) mask = $P\{g\}$;
bits(64) addr;
constant integer mbytes = $msize$ DIV 8;

if HaveMTEExt() then SetTagCheckedInstruction(TRUE);

for e = 0 to elements-1
  if $ElemP\{mask, e, esize\} == '1' then

    Mem[addr, mbytes, AccType_STREAM] = $Elem$[src, e, esize]$<msize-1:0>$;
STNT1H (scalar plus immediate)

Contiguous store non-temporal halfwords from vector (immediate index).

Contiguous store non-temporal of halfwords from elements of a vector register to the memory address generated by a 64-bit scalar base and immediate index in the range -8 to 7 which is multiplied by the vector's in-memory size, irrespective of predication, and added to the base address. Inactive elements are not written to memory.

A non-temporal store is a hint to the system that this data is unlikely to be referenced again soon.

STNT1H { <Zt>, H }, <Pg>, [ <Xn|SP>, {, #imm}, MUL VL ]

if !HaveSVE() then UNDEFINED;
integer t = UInt(Zt);

```
STNT1W (vector plus scalar)

Scatter store non-temporal words.

Scatter store non-temporal of words from the active elements of a vector register to the memory addresses generated by a vector base plus a 64-bit unscaled scalar register offset. Inactive elements are not written to memory.

A non-temporal store is a hint to the system that this data is unlikely to be referenced again soon.

It has encodings from 2 classes: **32-bit unscaled offset** and **64-bit unscaled offset**

### 32-bit unscaled offset

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 1  | 1  | 1  | 0  | 0  | 1  | 0  | 1  | 0  | Rm | 0  | 0  | 1  | Pg | Zn | Zt |
```

**msz<1>msz<0>**

STNT1W { <Zt>.S }, <Pg>, [<Zn>.S{, <Xm>}]

if !HaveSVE2() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer m = UInt(Rm);
integer g = UInt(Pg);
integer esize = 32;
integer msize = 32;

### 64-bit unscaled offset

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 1  | 1  | 1  | 0  | 0  | 1  | 0  | 1  | 0  | Rm | 0  | 0  | 1  | Pg | Zn | Zt |
```

**msz<1>msz<0>**

STNT1W { <Zt>.D }, <Pg>, [<Zn>.D{, <Xm>}]

if !HaveSVE2() then UNDEFINED;
integer t = UInt(Zt);
integer n = UInt(Zn);
integer m = UInt(Rm);
integer g = UInt(Pg);
integer esize = 64;
integer msize = 32;

**Assembler Symbols**

- `<Zt>` Is the name of the scalable vector register to be transferred, encoded in the "Zt" field.
- `<Pg>` Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- `<Zn>` Is the name of the base scalable vector register, encoded in the "Zn" field.
- `<Xm>` Is the optional 64-bit name of the general-purpose offset register, defaulting to XZR, encoded in the "Rm" field.
Operation

\begin{verbatim}
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) base = Z[n];
bits(64) offset = X[m];
bits(VL) src = Z[t];
bits(PL) mask = P[g];
bits(64) addr;
constant integer mbytes = msize DIV 8;
if HaveMTEExt() then SetTagCheckedInstruction(TRUE);
for e = 0 to elements-1
  if ElemP[mask, e, esize] == '1' then
    addr = ZeroExtend(Elem[base, e, esize], 64) + offset;
    Mem[addr, mbytes, AccType_STREAM] = Elem[src, e, esize]<msize-1:0>;
\end{verbatim}

<td>D</td>
</tr>
</tbody>
</table>

<Zm> Is the name of the second source scalable vector register, encoded in the “Zm” field.

<Zdn> Is the name of the first source and destination scalable vector register, encoded in the “Zdn” field.

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the “Pg” field.

**Operation**

```plaintext
CheckSVEEnabled();
integer esize = 8 << UInt(size);
integer g = UInt(Pg);
integer dn = UInt(Zdn);
integer m = UInt(Zm);

integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[dn];
bits(VL) operand2 = Z[m];
bits(VL) result;

for e = 0 to elements-1
    bits(esize) element1 = Elem[operand1, e, esize];
    bits(esize) element2 = Elem[operand2, e, esize];
    if ElemP[mask, e, esize] == '1' then
        Elem[result, e, esize] = element1 - element2;
    else
        Elem[result, e, esize] = Elem[operand1, e, esize];

Z[dn] = result;
```

**Operational information**

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**SUB (immediate)**

Subtract immediate (unpredicated).

Subtract an unsigned immediate from each element of the source vector, and destructively place the results in the corresponding elements of the source vector. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<imm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |
|------------------|-----------|-------|--------|------|------|------|-------|
| size 1 0 0 0 1 0 1 | imm8 0 0 0 1 1 1 | sh 0 | Zdn 0 0 0 0 0 1 1 1 1 |

**Assembler Symbols**

- `<Zdn>` Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.
- `<T>` Is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th><code>&lt;T&gt;</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- `<imm>` Is an unsigned immediate in the range 0 to 255, encoded in the "imm8" field.
- `<shift>` Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in "sh":

<table>
<thead>
<tr>
<th>sh</th>
<th><code>&lt;shift&gt;</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>LSL #0</td>
</tr>
<tr>
<td>1</td>
<td>LSL #8</td>
</tr>
</tbody>
</table>

**Operation**

```c
CheckSVEEnabled();
integer elements = VL DIV esize;

    Elem[result, e, esize] = element1 - imm;
Z[dn] = result;
```

**Operational information**

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
\textbf{SUB (vectors, unpredicated)}

Subtract vectors (unpredicated).

Subtract all elements of the second source vector from corresponding elements of the first source vector and place the results in the corresponding elements of the destination vector. This instruction is unpredicated.

\begin{verbatim}
0 0 0 0 0 0 1 0 0 1 0 0 1 0 0 0 0 0 0 1 0 0 0 0 0 0 1 0
\end{verbatim}

\texttt{SUB \langle Zd \rangle, \langle T \rangle, \langle Zn \rangle, \langle T \rangle, \langle Zm \rangle, \langle T \rangle}

\begin{verbatim}
if \text{!HaveSVE()} then UNDEFINED;
integer esize = 8 \ll \text{UInt(size)};
integer n = \text{UInt(Zn)};
integer m = \text{UInt(Zm)};
integer d = \text{UInt(Zd)};
\end{verbatim}

\textbf{Assembler Symbols}

\texttt{\langle Zd \rangle} Is the name of the destination scalable vector register, encoded in the "Zd" field.

\texttt{\langle T \rangle} Is the size specifier, encoded in "size":

\begin{center}
\begin{tabular}{|c|c|}
\hline
\texttt{size} & \texttt{\langle T \rangle} \\
\hline
00 & B \\
01 & H \\
10 & S \\
11 & D \\
\hline
\end{tabular}
\end{center}

\texttt{\langle Zn \rangle} Is the name of the first source scalable vector register, encoded in the "Zn" field.

\texttt{\langle Zm \rangle} Is the name of the second source scalable vector register, encoded in the "Zm" field.

\textbf{Operation}

\begin{verbatim}
CheckSVEEnabled();
integer elements = \text{VL} \div esize;
bits(\text{VL}) operand1 = \text{Z[n]};
bits(\text{VL}) operand2 = \text{Z[m]};
bits(\text{VL}) result;
for e = 0 to elements-1
  bits(esize) element1 = \text{Elem[operand1, e, esize]};
bits(esize) element2 = \text{Elem[operand2, e, esize]};
  \text{Elem[result, e, esize]} = element1 - element2;
\text{Z[d]} = result;
\end{verbatim}

\textbf{Operational information}

If \text{PSTATE.DIT} is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**SUBHNB**

Subtract narrow high part (bottom).

Subtract each vector element of the second source vector from the corresponding vector element in the first source vector, and place the most significant half of the result in the even-numbered half-width destination elements, while setting the odd-numbered elements to zero. This instruction is unpredicated.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |

    Elem[result, e, esize] = element2 - element1;
  else
    Elem[result, e, esize] = Elem[operand1, e, esize];
Z[dn] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate
    register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate
    register contains the same value for each execution.
  - The values of the NZCV flags.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**SUBR (immediate)**

Reversed subtract from immediate (unpredicated).

Reversed subtract from an unsigned immediate each element of the source vector, and destructively place the results in the corresponding elements of the source vector. This instruction is unpredicated.

The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a positive multiple of 256 in the range 256 to 65280.

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is "#<uimm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

SUDOT

Signed by unsigned integer indexed dot product.

The signed by unsigned integer indexed dot product instruction computes the dot product of a group of four signed 8-bit integer values held in each 32-bit element of the first source vector multiplied by a group of four unsigned 8-bit integer values in an indexed 32-bit element of the second source vector, and then destructively adds the widened dot product to the corresponding 32-bit element of the destination vector.

The groups within the second source vector are specified using an immediate index which selects the same group position within each 128-bit vector segment. The index range is from 0 to 3. This instruction is unpredicated.

ID_AA64ZFR0_EL1.I8MM indicates whether this instruction is implemented.

Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the “Zda” field.

<Zn> Is the name of the first source scalable vector register, encoded in the “Zn” field.

<Zm> Is the name of the second source scalable vector register Z0-Z7, encoded in the “Zm” field.

<imm> Is the immediate index of a quadtuplet of four 8-bit elements within each 128-bit vector segment, in the range 0 to 3, encoded in the “i2” field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;

    else
        Elem[result, e, esize] = Elem[operand1, e, esize];

Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
SXTB, SXTH, SXTW

Signed byte / halfword / word extend (predicated).

Sign-extend the least-significant sub-element of each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

It has encodings from 3 classes: Byte, Halfword and Word

**Byte**

```
0 0 0 0 0 1 0 0 | size 0 1 0 0 0 1 0 1 | Pg  Zn  Zd
```

SXTB <Zd>.<T>, <Pg>/M, <Zn>.<T>

if ![HaveSVE]() then UNDEFINED;

integer esize = 8 << UInt(size);
integer s_esize = 32;
integer g = UInt(Pg);
integer n = UInt(Zn);
integer d = UInt(Zd);
boolean unsigned = FALSE;
Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> For the byte variant: is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>RESERVED</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

For the halfword variant: is the size specifier, encoded in “size<0>”:

<table>
<thead>
<tr>
<th>size&lt;0&gt;</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>S</td>
</tr>
<tr>
<td>1</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pg> Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];

for e = 0 to elements-1
  bits(esize) element = Elem[operand, e, esize];
  if Elem[mask, e, esize] == '1' then
    Elem[result, e, esize] = Extend(element<s_esize-1:0>, esize, unsigned);
Z[d] = result;
```

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
Programmable table lookup in single vector table (merging).

Reads each element of the second source (index) vector and uses its value to select an indexed element from a table of elements in the first source vector, and places the indexed element in the destination vector element corresponding to the index vector element. If an index value is greater than or equal to the number of vector elements then the corresponding destination vector element is left unchanged.

Since the index values can select any element in a vector this operation is not naturally vector length agnostic.

If !HaveSVE2() then UNDEFINED;
integer esize = 8 << UInt(size);
integer n = UInt(Zn);
integer m = UInt(Zm);
integer d = UInt(Zd);

Assembler Symbols

TRN1, TRN2 (vectors)

Interleave even or odd elements from two vectors.

Interleave alternating even or odd-numbered elements from the first and second source vectors and place in elements of the destination vector. This instruction is unpredicated. The 128-bit element variant of this instruction requires that the current vector length is at least 256 bits, and if the current vector length is not an integer multiple of 256 bits then the trailing bits are set to zero.

ID_AA64ZFR0_EL1.F64MM indicates whether the 128-bit element variant of the instruction is implemented.

It has encodings from 4 classes: Even, Even (quadwords), Odd and Odd (quadwords)

Even

  - The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  o The values of the data supplied in any of its registers.
  o The values of the NZCV flags.
UCVTF

Unsigned integer convert to floating-point (predicated).

Convert to floating-point from the unsigned integer in each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

If the input and result types have a different size the smaller type is held unpacked in the least significant bits of elements of the larger size. When the input is the smaller type the upper bits of each source element are ignored. When the result is the smaller type the results are zero-extended to fill each destination element.

It has encodings from 7 classes: 16-bit to half-precision, 32-bit to half-precision, 32-bit to single-precision, 32-bit to double-precision, 64-bit to half-precision, 64-bit to single-precision, and 64-bit to double-precision.

| 0      | B     |
| 1      | H     |

| <Zm> | Is the name of the second source scalable vector register, encoded in the “Zm” field. |

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) operand3 = Z[da];
bits(VL) result;
for e = 0 to elements-1
  bits(esize) res = Elem[operand3, e, esize];
  for i = 0 to 3
    integer element1 = UInt(Elem[operand1, 4 * e + i, esize DIV 4]);
    integer element2 = UInt(Elem[operand2, 4 * e + i, esize DIV 4]);
    res = res + element1 * element2;
    Elem[result, e, esize] = res;
Z[da] = result;
Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
UDOT (indexed)

Unsigned integer indexed dot product.

The unsigned integer indexed dot product instruction computes the dot product of a group of four unsigned 8-bit or 16-bit integer values held in each 32-bit or 64-bit element of the first source vector multiplied by a group of four unsigned 8-bit or 16-bit integer values in an indexed 32-bit or 64-bit element of the second source vector, and then destructively adds the widened dot product to the corresponding 32-bit or 64-bit element of the destination vector. The groups within the second source vector are specified using an immediate index which selects the same group position within each 128-bit vector segment. The index range is from 0 to one less than the number of groups per 128-bit segment, encoded in 1 to 2 bits depending on the size of the group. This instruction is unpredicated.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

<table>

integer n = UInt(Zn);
integer m = UInt(Zm);
integer da = UInt(Zda);

Assembler Symbols

<Zda> Is the name of the third source and destination scalable vector register, encoded in the “Zda” field.

<Zn> Is the name of the first source scalable vector register, encoded in the “Zn” field.

<Zm> For the 32-bit variant: is the name of the second source scalable vector register Z0-Z7, encoded in the “Zm” field.

For the 64-bit variant: is the name of the second source scalable vector register Z0-Z15, encoded in the “Zm” field.

<i<imm>> For the 32-bit variant: is the immediate index of a quadtuplet of four 8-bit elements within each 128-bit vector segment, in the range 0 to 3, encoded in the “i2” field.

For the 64-bit variant: is the immediate index of a quadtuplet of four 16-bit elements within each 128-bit vector segment, in the range 0 to 1, encoded in the “i1” field.
**Operation**

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
integer eltspersegment = 128 DIV esize;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) operand3 = Z[da];
bits(VL) result;

for e = 0 to elements-1
    integer segmentbase = e - (e MOD eltspersegment);
    integer s = segmentbase + index;
    bits(esize) res = Elem[operand3, e, esize];
    for i = 0 to 3
        integer element1 = UInt(Elem[operand1, 4 * e + i, esize DIV 4]);
        integer element2 = UInt(Elem[operand2, 4 * s + i, esize DIV 4]);
        res = res + element1 * element2;
    Elem[result, e, esize] = res;
Z[da] = result;
```

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
UHADD

Unsigned halving addition.

Add active unsigned elements of the first source vector to corresponding unsigned elements of the second source vector, shift right one bit, and destructively place the results in the corresponding elements of the first source vector. Inactive elements in the destination vector register remain unmodified.

```

UMIN (immediate)

Unsigned minimum with immediate (unpredicated).

Determine the unsigned minimum of an immediate and each element of the source vector, and destructively place the results in the corresponding elements of the source vector. The immediate is an unsigned 8-bit value in the range 0 to 255, inclusive. This instruction is unpredicated.

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

0 0 1 0 0 1 0 1 0 1 0 1 1 1 0 1 1 1 0 0 0 0 1 0 1 1 1 0

imm8   Zdn

UMIN <Zdn>.<T>, <Zdn>.<T>, #<imm>

if !HaveSVE() then UNDEFINED;
integer esize = 8 << UInt(size);
integer dn = UInt(Zdn);
boolean unsigned = TRUE;
integer imm = Int(imm8, unsigned);

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in "size":

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<imm> Is the unsigned immediate operand, in the range 0 to 255, encoded in the "imm8" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(VL) result;
for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    Elem[result, e, esize] = Min(element1, imm)<esize-1:0>;
Z[dn] = result;

Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**UMINP**

Unsigned minimum pairwise.

Compute the minimum value of each pair of adjacent unsigned integer elements within each source vector, and interleave the results from corresponding lanes. The interleaved result values are destructively placed in the first source vector.

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

    integer res = Min(element1, element2);
    Elem[result, e, esize] = res<esize-1:0>;
  end if
Z[dn] = result;

**Operational information**

If PSTATE.DIT is 1:
• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  ◦ The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  ◦ The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
UMINV

Unsigned minimum reduction to scalar.

Unsigned minimum horizontally across all lanes of a vector, and place the result in the SIMD&FP scalar destination register. Inactive elements in the source vector are treated as the maximum unsigned integer for the element size.

\[
\begin{array}{cccccccccccccccccccccccccccc}
0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 & 1 & 1 & 0 & 0 & 1 & 1 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & Zn & Vd & U
\end{array}

  Elem[result, e, esize] = Elem[result, e, esize] + product;
Z[da] = result;
```

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
UMLALB (indexed)

Unsigned multiply-add long to accumulator (bottom, indexed).

Multiply the even-numbered unsigned elements within each 128-bit segment of the first source vector by the specified unsigned element in the corresponding second source vector segment and destructively add to the overlapping double-width elements of the addend vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 2 or 3 bits depending on the size of the element.

It has encodings from 2 classes: **32-bit** and **64-bit**

### 32-bit

```

UMLSLB (indexed)

Unsigned multiply-subtract long from accumulator (bottom, indexed).

Multiply the even-numbered unsigned elements within each 128-bit segment of the first source vector by the specified unsigned element in the corresponding second source vector segment and destructively subtract from the overlapping double-width elements of the addend vector.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 2 or 3 bits depending on the size of the element.

It has encodings from 2 classes: 32-bit and 64-bit

  - For the 32-bit variant: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields.
  - For the 64-bit variant: is the element index, in the range 0 to 3, encoded in the "i2h:i2l" fields.
Operation

`CheckSVEEnabled();`

integer `elements = VL DIV (2 * esize);`

integer `eltspersegment = 128 DIV (2 * esize);`

bits(VL) `operand1 = Z[n];`

bits(VL) `operand2 = Z[m];`

bits(VL) `result = Z[da];`

for `e = 0 to elements-1`

integer `s = e - (e MOD eltspersegment);`

integer `element1 = UInt(Elem[operand1, 2 * e + sel, esize]);`

integer `element2 = UInt(Elem[operand2, 2 * s + index, esize]);`

bits(2*esize) `product = (element1 * element2)<2*esize-1:0>;`

`Elem[result, e, 2*esize] = Elem[result, e, 2*esize] - product;`

endfor

`Z[da] = result;`

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**UMMLA**

Unsigned integer matrix multiply-accumulate.

The unsigned integer matrix multiply-accumulate instruction multiplies the 2×8 matrix of unsigned 8-bit integer values held in each 128-bit segment of the first source vector by the 8×2 matrix of unsigned 8-bit integer values in the corresponding segment of the second source vector. The resulting 2×2 widened 32-bit integer matrix product is then destructively added to the 32-bit integer matrix accumulator held in the corresponding segment of the addend and destination vector. This is equivalent to performing an 8-way dot product per destination element.

This instruction is unpredicated.

ID_AA64ZFR0_EL1.I8MM indicates whether this instruction is implemented.

```

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 1 0 0 1 0 1 1 1 0 Zm 1 0 0 1 1 0 Zn Zda
```

**Asmmler Symbols**

<Zda> Is the name of the third source and destination scalable vector register, encoded in the “Zda” field.

<Zn> Is the name of the first source scalable vector register, encoded in the “Zn” field.

<Zm> Is the name of the second source scalable vector register, encoded in the “Zm” field.

**Operation**

```

CheckSVEEnabled();
integer segments = VL DIV 128;
bits(VL) operand1 = Z[n];
bits(VL) operand2 = Z[m];
bits(VL) operand3 = Z[da];
bits(VL) result = Zeros();
bits(128) op1, op2;

    integer res = element1 * element2;
    Elem[result, e, esize] = res<esize-1:0>;
Z[d] = result;

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
UMULLB (indexed)

Unsigned multiply long (bottom, indexed).

Multiply the even-numbered unsigned elements within each 128-bit segment of the first source vector by the specified unsigned element in the corresponding second source vector segment, and place the results in the overlapping double-width elements of the destination vector register.

The elements within the second source vector are specified using an immediate index which selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment, encoded in 2 or 3 bits depending on the size of the element.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

  - The values of the NZCV flags.
UQADD (vectors, predicated)

Unsigned saturating addition (predicated).

Add active unsigned elements of the first source vector to corresponding unsigned elements of the second source vector and destructively place the results in the corresponding elements of the first source vector. Each result element is saturated to the N-bit element’s unsigned integer range 0 to \( (2^N) - 1 \). Inactive elements in the destination vector register remain unmodified.

</tbody>
</table>

- \(<Pg>\) Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.
- \(<Zm>\) Is the name of the second source scalable vector register, encoded in the “Zm” field.

Operation

```plaintext
CheckSVEEnabled();
it\nteger elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand1 = Z[dn];
bits(VL) operand2 = Z[m];
bits(VL) result;

for e = 0 to elements-1
    integer element1 = UInt(Elem[operand1, e, esize]);
    integer element2 = UInt(Elem[operand2, e, esize]);
    if Elem[mask, e, esize] == '1' then
        integer res = UInt(Sat(element1 + element2, esize, unsigned));
        Elem[result, e, esize] = res<esize-1:0>;
    else
        Elem[result, e, esize] = Elem[operand1, e, esize];

    Z[dn] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
UQADD (immediate)

Unsigned saturating add immediate (unpredicated).

Unsigned saturating add of an unsigned immediate to each element of the source vector, and destructively place the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element's unsigned integer range \(0\) to \((2^N)-1\). This instruction is unpredicated.

The immediate is an unsigned value in the range \(0\) to \(255\), and for element widths of 16 bits or higher it may also be a positive multiple of \(256\) in the range \(256\) to \(65280\).

The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is specified is “#<imm8>, LSL #8”. However an assembler and disassembler may also allow use of the shifted 16-bit value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as “#0, LSL #8”.

Assembler Symbols

<Zdn> Is the name of the source and destination scalable vector register, encoded in the "Zdn" field.

<T> Is the size specifier, encoded in “size”:

<table>
<thead>
<tr>
<th>size</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>B</td>
</tr>
<tr>
<td>01</td>
<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<imm> Is an unsigned immediate in the range \(0\) to \(255\), encoded in the "imm8" field.

<shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in "sh"

<table>
<thead>
<tr>
<th>sh</th>
<th>&lt;shift&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>LSL #0</td>
</tr>
<tr>
<td>1</td>
<td>LSL #8</td>
</tr>
</tbody>
</table>

Operation

```c
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(VL) result;
for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element1 + imm, esize, unsigned);
Z[dn] = result;
```

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:
• The MOVPRFX instruction must be unpredicated.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

UQDECB

Unsigned saturating decrement scalar by multiple of 8-bit predicate constraint element count.

Determines the number of active 8-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

UQDECD (scalar)

Unsigned saturating decrement scalar by multiple of 64-bit predicate constraint element count.

Determines the number of active 64-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

### 32-bit

Unsaturated decrementing vector by multiple of 16-bit predicate constraint element count.

Determines the number of active 16-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement all destination vector elements. The results are saturated to the 16-bit unsaturated integer range.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

UQDECP (vector)

Unsigned saturating decrement vector by count of true predicate elements.

Counts the number of true elements in the source predicate and then uses the result to decrement all destination vector elements. The results are saturated to the element unsigned integer range.

The predicate size specifier may be omitted in assembler source code, but this is deprecated and will be prohibited in a future release of the architecture.

</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(PL) operand2 = P[m];
bits(VL) result;
integer count = 0;
for e = 0 to elements-1
  if ElemP[operand2, e, esize] == '1' then
    count = count + 1;
for e = 0 to elements-1
  integer element = Int(Elem[operand1, e, esize], unsigned);
  (Elem[result, e, esize], -) = SatQ(element - count, esize, unsigned);
Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
UQDECW (scalar)

Unsigned saturating decrement scalar by multiple of 32-bit predicate constraint element count.

Determines the number of active 32-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to decrement the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

<imm> is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

**Operation**

```c
CheckSVEEnabled();
integer count = DecodePredCount(pat, esize);
bits(ssize) operand1 = X[dn];
bits(ssize) result;

integer element1 = Int(operand1, unsigned);
(result, -) = SatQ(element1 + (count * imm), ssize, unsigned);
X[dn] = Extend(result, 64, unsigned);
```

**UQINCD (vector)**

Unsigned saturating increment vector by multiple of 64-bit predicate constraint element count.

Determines the number of active 64-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment all destination vector elements. The results are saturated to the 64-bit unsigned integer range.

The named predicate constraint limits the number of active elements in a single predicate to:
- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

Z[dn] = result;
```

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
UQINCH (scalar)

Unsigned saturating increment scalar by multiple of 16-bit predicate constraint element count.

Determines the number of active 16-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.

The named predicate constraint limits the number of active elements in a single predicate to:

* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pm> Is the name of the source scalable predicate register, encoded in the "Pm" field.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(PL) operand2 = P[m];
bits(VL) result;
integer count = 0;
for e = 0 to elements-1
    if ElemP[operand2, e, esize] == '1' then
        count = count + 1;
for e = 0 to elements-1
    integer element = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], '-') = SatQ(element + count, esize, unsigned);

Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
UQINCW (scalar)

Unsigned saturating increment scalar by multiple of 32-bit predicate constraint element count.

Determines the number of active 32-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment the scalar destination. The result is saturated to the general-purpose register's unsigned integer range.

The named predicate constraint limits the number of active elements in a single predicate to:
- A fixed number (VL1 to VL256)
- The largest power of two (POW2)
- The largest multiple of three or four (MUL3 or MUL4)
- All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

It has encodings from 2 classes: 32-bit and 64-bit

32-bit

```assembly
UQINCW <Wdn>{, <pattern>{, MUL #<imm>}}
```

if !HaveSVE() then UNDEFINED;
integer esize = 32;
integer dn = UInt(Rdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
boolean unsigned = TRUE;
integer ssize = 32;

64-bit

```assembly
UQINCW <Xdn>{, <pattern>{, MUL #<imm>}}
```

if !HaveSVE() then UNDEFINED;
integer esize = 64;
integer dn = UInt(Rdn);
bits(5) pat = pattern;
integer imm = UInt(imm4) + 1;
boolean unsigned = TRUE;
integer ssize = 64;

Assembler Symbols

- `<Wdn>` Is the 32-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
- `<Xdn>` Is the 64-bit name of the source and destination general-purpose register, encoded in the "Rdn" field.
- `<pattern>` Is the optional pattern specifier, defaulting to ALL, encoded in "pattern";
Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the "imm4" field.

Operation

```
CheckSVEEnabled();
integer count = DecodePredCount(pat, esize);
bits(ssize) operand1 = X[dn];
bits(ssize) result;
integer element1 = Int(operand1, unsigned);
(result, -) = SatQ(element1 + (count * imm), ssize, unsigned);  
X[dn] = Extend(result, 64, unsigned);
```
UQINCW (vector)

Unsigned saturating increment vector by multiple of 32-bit predicate constraint element count.

Determines the number of active 32-bit elements implied by the named predicate constraint, multiplies that by an immediate in the range 1 to 16 inclusive, and then uses the result to increment all destination vector elements. The results are saturated to the 32-bit unsigned integer range.

The named predicate constraint limits the number of active elements in a single predicate to:
* A fixed number (VL1 to VL256)
* The largest power of two (POW2)
* The largest multiple of three or four (MUL3 or MUL4)
* All available, implicitly a multiple of two (ALL).

Unspecified or out of range constraint encodings generate an empty predicate or zero element count rather than Undefined Instruction exception.

<imm> Is the immediate multiplier, in the range 1 to 16, defaulting to 1, encoded in the “imm4” field.
Operation

CheckSVEEnabled();
integer elements = \text{VL} \text{ DIV } \text{esize};
integer count = \text{DecodePredCount}(\text{pat}, \text{esize});
bits(\text{VL}) \text{ operand1} = Z[dn];
bits(\text{VL}) \text{ result};

for \( e = 0 \) to \( \text{elements} - 1 \)
    integer \text{element1} = \text{Int(Elem}[\text{operand1}, e, \text{esize}], \text{unsigned});
    \text{(Elem}[\text{result}, e, \text{esize}], -) = \text{SatQ}(\text{element1} + (\text{count} * \text{imm}), \text{esize}, \text{unsigned});
\text{Z[dn]} = \text{result};

Operational information

This instruction might be immediately preceded in program order by a \text{MOVPRFX} instruction. The \text{MOVPRFX} instruction must conform to all of the following requirements, otherwise the behavior of the \text{MOVPRFX} and this instruction is \text{UNPREDICTABLE}:

- The \text{MOVPRFX} instruction must be unpredicated.
- The \text{MOVPRFX} instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
UQRSHL

Unsigned saturating rounding shift left by vector (predicated).

Shift active unsigned elements of the first source vector by corresponding elements of the second source vector and destructively place the rounded results in the corresponding elements of the first source vector. A positive shift amount performs a left shift, otherwise a right shift by the negated shift amount is performed. Each result element is saturated to the N-bit element’s unsigned integer range 0 to \(2^N-1\). Inactive elements in the destination vector register remain unmodified.

Unsigned saturating shift right narrow by immediate (top).

Shift each unsigned integer value in the source vector elements right by an immediate value, and place the truncated results in the odd-numbered half-width destination elements, leaving the even-numbered elements unchanged. Each result element is saturated to the half-width N-bit element's unsigned integer range 0 to \((2^N)-1\). The immediate shift amount is an unsigned value in the range 1 to number of bits per element. This instruction is unpredicated.

    integer element2 = UInt(Elem[operand2, e, esize]);
    if Elem[mask, e, esize] == '1' then
        integer res = UInt(Sat(element1 - element2, esize, unsigned));
        Elem[result, e, esize] = res<esize-1:0>;
    else
        Elem[result, e, esize] = Elem[operand1, e, esize];
Z[dn] = result;

**Operational information**

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
• The MOVPRFX instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
UQSUB (immediate)

Unsigned saturating subtract immediate (unpredicated).

Unsigned saturating subtract an unsigned immediate from each element of the source vector, and destructively place
the results in the corresponding elements of the source vector. Each result element is saturated to the N-bit element's
unsigned integer range 0 to \(2^N-1\). This instruction is unpredicated.
The immediate is an unsigned value in the range 0 to 255, and for element widths of 16 bits or higher it may also be a
positive multiple of 256 in the range 256 to 65280.
The immediate is encoded in 8 bits with an optional left shift by 8. The preferred disassembly when the shift option is
specified is ">#<uimm8>, LSL #8". However an assembler and disassembler may also allow use of the shifted 16-bit
value unless the immediate is 0 and the shift amount is 8, which must be unambiguously described as "#0, LSL #8".

```
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>LSL #0</td>
</tr>
<tr>
<td>1</td>
<td>LSL #8</td>
</tr>
</tbody>
</table>

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(VL) result;
for e = 0 to elements-1
    integer element1 = Int(Elem[operand1, e, esize], unsigned);
    (Elem[result, e, esize], -) = SatQ(element1 - imm, esize, unsigned);
Z[dn] = result;

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction
must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is
UNPREDICTABLE:
• The `MOVPRFX` instruction must be unpredicated.
• The `MOVPRFX` instruction must specify the same destination register as this instruction.
• The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
UQSUB (vectors, unpredicated)

Unsigned saturating subtract vectors (unpredicated).

Unsigned saturating subtract all elements of the second source vector from corresponding elements of the first source vector and place the results in the corresponding elements of the destination vector. Each result element is saturated to the N-bit element's unsigned integer range 0 to \((2^N)-1\). This instruction is unpredicated.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
USDOT (indexed)

Unsigned by signed integer indexed dot product.

The unsigned by signed integer indexed dot product instruction computes the dot product of a group of four unsigned 8-bit integer values held in each 32-bit element of the first source vector multiplied by a group of four signed 8-bit integer values in an indexed 32-bit element of the second source vector, and then destructively adds the widened dot product to the corresponding 32-bit element of the destination vector.

The groups within the second source vector are specified using an immediate index which selects the same group position within each 128-bit vector segment. The index range is from 0 to 3. This instruction is unpredicated.

ID_AA64ZFR0_EL1.I8MM indicates whether this instruction is implemented.

```

Z[d] = result;
Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
USMMLA

Unsigned by signed integer matrix multiply-accumulate.

The unsigned by signed integer matrix multiply-accumulate instruction multiplies the 2×8 matrix of unsigned 8-bit integer values held in each 128-bit segment of the first source vector by the 8×2 matrix of signed 8-bit integer values in the corresponding segment of the second source vector. The resulting 2×2 widened 32-bit integer matrix product is then destructively added to the 32-bit integer matrix accumulator held in the corresponding segment of the addend and destination vector. This is equivalent to performing an 8-way dot product per destination element.

This instruction is unpredicated. ID_AA64ZFR0_EL1.I8MM indicates whether this instruction is implemented.

Operational information

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
**USQADD**

Unsigned saturating addition of signed value.

Add active signed elements of the source vector to the corresponding unsigned elements of the addend vector, and destructively place the results in the corresponding elements of the addend vector. Each result element is saturated to the N-bit element’s unsigned integer range 0 to \(2^N-1\). Inactive elements in the destination vector register remain unmodified.

```
| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

Z[d] = result;

Operational information

If PSTATE.DIT is 1:

• The execution time of this instruction is independent of:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  ◦ The values of the data supplied in any of its registers.
  ◦ The values of the NZCV flags.
**UXTB, UXTH, UXTW**

Unsigned byte / halfword / word extend (predicated).

Zero-extend the least-significant sub-element of each active element of the source vector, and place the results in the corresponding elements of the destination vector. Inactive elements in the destination vector register remain unmodified.

It has encodings from 3 classes: **Byte**, **Halfword** and **Word**

**Byte**

<td>D</td>
</tr>
</tbody>
</table>

For the halfword variant: is the size specifier, encoded in “size<0>”:

<table>
<thead>
<tr>
<th>size&lt;0&gt;</th>
<th>&lt;T&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>S</td>
</tr>
<tr>
<td>1</td>
<td>D</td>
</tr>
</tbody>
</table>

<Pg>   Is the name of the governing scalable predicate register P0-P7, encoded in the "Pg" field.

<Zn>   Is the name of the source scalable vector register, encoded in the "Zn" field.

Operation

```
CheckSVEEnabled();
integer elements = VL DIV esize;
bits(PL) mask = P[g];
bits(VL) operand = Z[n];
bits(VL) result = Z[d];
for e = 0 to elements-1
    bits(esize) element = Elem[operand, e, esize];
    if Elem[mask, e, esize] == '1' then
        Elem[result, e, esize] = Extend(element<s_esize-1:0>, esize, unsigned);
Z[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its operand registers when its governing predicate register contains the same value for each execution.
  - The values of the NZCV flags.

This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated, or be predicated using the same governing predicate register and source element size as this instruction.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.

**UZP1, UZP2 (predicates)**

Concatenate even or odd elements from two predicates.

Concatenate adjacent even or odd-numbered elements from the first and second source predicates and place in elements of the destination predicate. This instruction is unpredicated.

It has encodings from 2 classes: Even and Odd

**Even**

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 |

</tr>
</tbody>
</table>

**<Pn>**  Is the name of the first source scalable predicate register, encoded in the "Pn" field.

**<Pm>**  Is the name of the second source scalable predicate register, encoded in the "Pm" field.
Operation

CheckSVEEnabled();
integer elements = \text{VL} \text{ DIV} \text{ esize};
bits(PL) operand1 = P[n];
bits(PL) operand2 = P[m];
bits(PL) result;

bits(PL+2) zipped = operand2:operand1;
for e = 0 to elements-1
    Elem[result, e, esize DIV 8] = Elem[zipped, 2*e+part, esize DIV 8];
P[d] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
UZP1, UZP2 (vectors)

Concatenate even or odd elements from two vectors.

Concatenate adjacent even or odd-numbered elements from the first and second source vectors and place in elements of the destination vector. This instruction is unpredicated. The 128-bit element variant of this instruction requires that the current vector length is at least 256 bits, and if the current vector length is not an integer multiple of 256 bits then the trailing bits are set to zero.

ID_AA64ZFR0_EL1.F64MM indicates whether the 128-bit element variant of the instruction is implemented.

It has encodings from 4 classes: Even, Even (quadwords), Odd and Odd (quadwords)

  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
WHILEGE

While decrementing signed scalar greater than or equal to scalar.

Generate a predicate that starting from the highest numbered element is true while the decrementing value of the first, signed scalar operand is greater than or equal to the second scalar operand and false thereafter down to the lowest numbered element.

If the second scalar operand is equal to the minimum signed integer value then a condition which includes an equality test can never fail and the result will be an all-true predicate.

The full width of the scalar operands is significant for the purposes of comparison, and the full width first operand is decremented by one for each destination predicate element, irrespective of the predicate result element size. The first general-purpose source register is not itself updated.

The predicate result is placed in the predicate destination register. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

```
0 0 1 0 0 1 0 1 | size | Rm | 0 0 0 | sf | 0 0 | Rn | 0 | Pd
```

WHILEGE <Pd>.<T>, <R><n>, <R><m>

```
if !HaveSVE2() then UNDEFINED;

  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
WHILEHS

While decrementing unsigned scalar higher or same as scalar.

Generate a predicate that starting from the highest numbered element is true while the decrementing value of the first, unsigned scalar operand is higher or same as the second scalar operand and false thereafter down to the lowest numbered element.

If the second scalar operand is equal to the minimum unsigned integer value then a condition which includes an equality test can never fail and the result will be an all-true predicate.

The full width of the scalar operands is significant for the purposes of comparison, and the full width first operand is decremented by one for each destination predicate element, irrespective of the predicate result element size. The first general-purpose source register is not itself updated.

The predicate result is placed in the predicate destination register. Sets the FIRST (N), NONE (Z), !LAST (C) condition flags based on the predicate result, and the V flag to zero.

WRFFR

Write the first-fault register.

Read the source predicate register and place in the first-fault register (FFR). This instruction is intended to restore a saved FFR and is not recommended for general use by applications.

This instruction requires that the source predicate contains a MONOTONIC predicate value, in which starting from bit 0 there are zero or more 1 bits, followed only by 0 bits in any remaining bit positions. If the source is not a monotonic predicate value, then the resulting value in the FFR will be UNPREDICTABLE. It is not possible to generate a non-monotonic value in FFR when using SETFFR followed by first-fault or non-fault loads.

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
0 0 1 0 0 1 0 1 0 1 0 0 0 1 0 0 1 0 0 0 0

WRFFR <Pn>.B

if !HaveSVE() then UNDEFINED;

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.
<const> Is the immediate shift amount, in the range 1 to number of bits per element, encoded in “tsz:imm3”.

Operation

CheckSVEEnabled();
integer elements = VL DIV esize;
bits(VL) operand1 = Z[dn];
bits(VL) operand2 = Z[m];
bits(VL) result;
for e = 0 to elements-1
  bits(esize) element1 = Elem[operand1, e, esize];
  bits(esize) element2 = Elem[operand2, e, esize];
  Elem[result, e, esize] = ROR(element1 EOR element2, rot);
Z[dn] = result;

Operational information

If PSTATE.DIT is 1:
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
This instruction might be immediately preceded in program order by a MOVPRFX instruction. The MOVPRFX instruction must conform to all of the following requirements, otherwise the behavior of the MOVPRFX and this instruction is UNPREDICTABLE:

- The MOVPRFX instruction must be unpredicated.
- The MOVPRFX instruction must specify the same destination register as this instruction.
- The destination register must not refer to architectural register state referenced by any other source operand register of this instruction.
ZIP1, ZIP2 (predicates)

Interleave elements from two half predicates.

Interleave alternating elements from the lowest or highest halves of the first and second source predicates and place in elements of the destination predicate. This instruction is unpredicated.

It has encodings from 2 classes: High halves and Low halves

High halves

| 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 | size | 1 0 | Pm | 0 1 0 0 0 1 0 0 | Pn | 0 | Pd |

<td>H</td>
</tr>
<tr>
<td>10</td>
<td>S</td>
</tr>
<tr>
<td>11</td>
<td>D</td>
</tr>
</tbody>
</table>

- \(<Pn>\) Is the name of the first source scalable predicate register, encoded in the "Pn" field.
- \(<Pm>\) Is the name of the second source scalable predicate register, encoded in the "Pm" field.
Operation

`CheckSVEEnabled();`
integer pairs = `VL` DIV (esize * 2);
bits(PL) operand1 = `P[n];`
bits(PL) operand2 = `P[m];`
bits(PL) result;

integer base = part * pairs;
for p = 0 to pairs-1
    
    Elem[result, 2*p+0, esize DIV 8] = Elem[operand1, base+p, esize DIV 8];
    Elem[result, 2*p+1, esize DIV 8] = Elem[operand2, base+p, esize DIV 8];

P[d] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
ZIP1, ZIP2 (vectors)

Interleave elements from two half vectors.

Interleave alternating elements from the lowest or highest halves of the first and second source vectors and place in elements of the destination vector. This instruction is unpredicated. The 128-bit element variant of this instruction requires that the current vector length is at least 256 bits, and if the current vector length is not an integer multiple of 256 bits then the trailing bits are set to zero.

ID_AA64ZFR0_EL1.F64MM indicates whether the 128-bit element variant of the instruction is implemented.

It has encodings from 4 classes: High halves, High halves (quadwords), Low halves and Low halves (quadwords)

High halves
