Preface

This preface introduces the ARM® Compiler fromelf User Guide. It contains the following:
About this book

ARM® Compiler fromelf User Guide provides information on how to use the fromelf utility.

Using this book

This book is organized into the following chapters:

Chapter 1 Overview of the fromelf Image Converter
Gives an overview of the fromelf image converter provided with ARM® Compiler.

Chapter 2 Using fromelf
Describes how to use the fromelf image converter provided with ARM Compiler.

Chapter 3 fromelf Command-line Options
Describes the command-line options of the fromelf image converter provided with ARM Compiler.

Chapter 4 Via File Syntax
Describes the syntax of via files accepted by fromelf.

Appendix A fromelf Document Revisions
Describes the technical changes that have been made to the fromelf Image Converter User Guide.

Glossary

The ARM Glossary is a list of terms used in ARM documentation, together with definitions for those terms. The ARM Glossary does not contain terms that are industry standard unless the ARM meaning differs from the generally accepted meaning.

See the ARM Glossary for more information.

Typographic conventions

italic
Introduces special terminology, denotes cross-references, and citations.

bold
Highlights interface elements, such as menu names. Denotes signal names. Also used for terms in descriptive lists, where appropriate.

monospace
Denotes text that you can enter at the keyboard, such as commands, file and program names, and source code.

monospace underline
Denotes a permitted abbreviation for a command or option. You can enter the underlined text instead of the full command or option name.

monospace italic
Denotes arguments to monospace text where the argument is to be replaced by a specific value.

monospace bold
Denotes language keywords when used outside example code.

<and>
Encloses replaceable terms for assembler syntax where they appear in code or code fragments. For example:

MRC p15, 0, <Rd>, <CRn>, <CRm>, <Opcode_2>

SMALL CAPITALS
Used in body text for a few terms that have specific technical meanings, that are defined in the ARM glossary. For example, IMPLEMENTATION DEFINED, IMPLEMENTATION SPECIFIC, UNKNOWN, and UNPREDICTABLE.

Feedback
Feedback on this product

If you have any comments or suggestions about this product, contact your supplier and give:
• The product name.
• The product revision or version.
• An explanation with as much information as you can provide. Include symptoms and diagnostic procedures if appropriate.

Feedback on content

If you have comments on content then send an e-mail to errata@arm.com. Give:
• The title ARM® Compiler fromelf User Guide.
• The number ARM DUI0477M.
• If applicable, the page number(s) to which your comments refer.
• A concise explanation of your comments.

ARM also welcomes general suggestions for additions and improvements.

Note

ARM tests the PDF only in Adobe Acrobat and Acrobat Reader, and cannot guarantee the quality of the represented document when used with any other PDF reader.

Other information

• ARM Information Center.
• ARM Technical Support Knowledge Articles.
• Support and Maintenance.
• ARM Glossary.
Chapter 1
Overview of the fromelf Image Converter

Gives an overview of the fromelf image converter provided with ARM® Compiler.

It contains the following sections:

• *1.1 About the fromelf image converter* on page 1-12.
• *1.2 fromelf execution modes* on page 1-13.
• *1.3 Getting help on the fromelf command* on page 1-14.
• *1.4 fromelf command-line syntax* on page 1-15.
1.1 About the fromelf image converter

The fromelf image conversion utility allows you to modify ELF image and object files, and to display information on those files.

fromelf allows you to:

• Process ARM ELF object and image files that the compiler, assembler, and linker generate.
• Process all ELF files in an archive that armar creates, and output the processed files into another archive if necessary.
• Convert ELF images into other formats for use by ROM tools or for direct loading into memory. The formats available are:
  — Plain binary.
  — Motorola 32-bit S-record.
  — Intel Hex-32.
  — Byte oriented (Verilog Memory Model) hexadecimal.
  — ELF. You can resave as ELF, for example, to remove debug information from an ELF image.
• Protect Intellectual Property (IP) in images and objects that are delivered to third parties.
• Display information about the input file, for example, disassembly output or symbol listings, to either stdout or a text file. Disassembly is generated in ARM assembler syntax and not GNU assembler syntax.

——— Note ————
If your image is produced without debug information, fromelf cannot:

• Translate the image into other file formats.
• Produce a meaningful disassembly listing.

——— Note ————
The command-line option descriptions and related information in the individual ARM Compiler tools documents describe all the features that ARM Compiler supports. Any features not documented are not supported and are used at your own risk. You are responsible for making sure that any generated code using unsupported features is operating correctly.

Related concepts
2.3 Options to protect code in image files with fromelf on page 2-19.
2.4 Options to protect code in object files with fromelf on page 2-20.

Related references
1.2 fromelf execution modes on page 1-13.
1.4 fromelf command-line syntax on page 1-15.
Chapter 3 fromelf Command-line Options on page 3-25.
1.2 fromelf execution modes

You can run fromelf in various execution modes.

The execution modes are:

• ELF mode (---elf), to resave a file as ELF.
• Text mode (---text, and others), to output information about an object or image file.
• Format conversion mode (---bin, ---m32, ---i32, ---vhx).

Related references

3.2 --bin on page 3-28.
3.22 --elf on page 3-50.
3.33 --i32 on page 3-64.
3.43 --m32 on page 3-75.
3.59 --text on page 3-92.
3.61 --vhx on page 3-95.
1.3 Getting help on the fromelf command

Use the --help option to display a summary of the main command-line options. This is the default if you do not specify any options or files.

To display the help information, enter:

```
fromelf --help
```

Related references
1.4 fromelf command-line syntax on page 1-15.
3.30 --help on page 3-61.
1.4 fromelf command-line syntax

You can specify an ELF file or library of ELF files on the fromelf command-line.

Syntax

fromelf options input_file

options

fromelf command-line options.

input_file

The ELF file or library file to be processed. When some options are used, multiple input files can be specified.

Related references

Chapter 3 fromelf Command-line Options on page 3-25.

3.39 input_file on page 3-70.
Chapter 2
Using fromelf

Describes how to use the fromelf image converter provided with ARM Compiler.

It contains the following sections:
• 2.1 General considerations when using fromelf on page 2-17.
• 2.2 Examples of processing ELF files in an archive on page 2-18.
• 2.3 Options to protect code in image files with fromelf on page 2-19.
• 2.4 Options to protect code in object files with fromelf on page 2-20.
• 2.5 Option to print specific details of ELF files on page 2-22.
• 2.6 Using fromelf to find where a symbol is placed in an executable ELF image on page 2-23.
2.1 General considerations when using fromelf

There are some changes that you cannot make to an image with fromelf.

When using fromelf you cannot:

- Change the image structure or addresses, other than altering the base address of Motorola S-record or Intel Hex output with the --base option.
- Change a scatter-loaded ELF image into a non scatter-loaded image in another format. Any structural or addressing information must be provided to the linker at link time.

**Related references**

3.1 --base [object_file::load_region_ID=num on page 3-27.
3.39 input_file on page 3-70.
2.2 Examples of processing ELF files in an archive

Examples of how you can process all ELF files in an archive, or a subset of those files. The processed files together with any unprocessed files are output to another archive.

Examples

Consider an archive, test.a, containing the following ELF files:

```
bmw.o
bmw1.o
call_c_code.o
newtst.o
shapes.o
strmtst.o
```

Example of processing all files in the archive

This example removes all debug, comments, notes and symbols from all the files in the archive:

```
fromelf --elf --strip=all test.a -o strip_all/
```

This creates an output archive with the name test.a in the subdirectory strip_all.

Example of processing a subset of files in the archive

To remove all debug, comments, notes and symbols from only the shapes.o and strmtst.o files in the archive, enter:

```
fromelf --elf --strip=all test.a(s*.o) -o subset/
```

This creates an output archive with the name test.a in the subdirectory subset. The archive contains the processed files together with the remaining files that are unprocessed.

To process the bmw.o, bmw1.o, and newtst.o files in the archive, enter:

```
fromelf --elf --strip=all test.a(??w*) -o subset/
```

Example of displaying a disassembled version of files in an archive

To display the disassembled version of call_c_code.o in the archive, enter:

```
fromelf --disassemble test.a(c*)
```

Related references

3.20 `--disassemble` on page 3-48.
3.22 `--elf` on page 3-50.
3.39 `input_file` on page 3-70.
3.46 `--output=destination` on page 3-78.
3.57 `--strip=option[,option,...]` on page 3-89.
2.3 Options to protect code in image files with fromelf

If you are delivering images to third parties, then you might want to protect the code they contain.

To help you to protect this code, fromelf provides the `--strip` option and the `--privacy` option. These options remove or obscure the symbol names in the image. The option that you choose depends on how much information you want to remove. The effect of these options is different for image files.

Restrictions

You must use `--elf` with these options. Because you have to use `--elf`, you must also use `--output`.

Effect of the options for protecting code in image files

For image files:

<table>
<thead>
<tr>
<th>Option</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fromelf --elf --privacy</code></td>
<td>Removes the whole symbol table.</td>
</tr>
<tr>
<td></td>
<td>Removes the <code>.comment</code> section name. This section is marked as [Anonymous Section] in the <code>fromelf --text</code> output.</td>
</tr>
<tr>
<td></td>
<td>Gives section names a default value. For example, changes code section names to <code>.text</code>.</td>
</tr>
<tr>
<td><code>fromelf --elf --strip=symbols</code></td>
<td>Removes the whole symbol table.</td>
</tr>
<tr>
<td></td>
<td>Section names remain the same.</td>
</tr>
<tr>
<td><code>fromelf --elf --strip=localsymbols</code></td>
<td>Removes local and mapping symbols.</td>
</tr>
<tr>
<td></td>
<td>Retains section names and build attributes.</td>
</tr>
</tbody>
</table>

Example

To produce a new ELF executable image with the complete symbol table removed and with the various section names changed, enter:

```
fromelf --elf --privacy --output=outfile.axf infile.axf
```

Related concepts

2.4 Options to protect code in object files with fromelf on page 2-20.

Related references

1.4 fromelf command-line syntax on page 1-15.
3.22 `--elf` on page 3-50.
3.46 `--output=destination` on page 3-78.
3.47 `--privacy` on page 3-79.
3.57 `--strip=option[,option,...]` on page 3-89.
2.4 Options to protect code in object files with fromelf

If you are delivering objects to third parties, then you might want to protect the code they contain.

To help you to protect this code, fromelf provides the `--strip` option and the `--privacy` option. These options remove or obscure the symbol names in the object. The option you choose depends on the how much information you want to remove. The effect of these options is different for object files.

**Restrictions**

You must use `--elf` with these options. Because you have to use `--elf`, you must also use `--output`.

**Effect of the options for protecting code in object files**

For object files:

<table>
<thead>
<tr>
<th>Option</th>
<th>Local symbols</th>
<th>Section names</th>
<th>Mapping symbols</th>
<th>Build attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fromelf --elf --privacy</code></td>
<td>Removes those local symbols that can be removed without loss of functionality. Symbols that cannot be removed, such as the targets for relocations, are kept. For these symbols, the names are removed. These are marked as <code>[Anonymous Symbol]</code> in the <code>fromelf --text</code> output.</td>
<td>Gives section names a default value. For example, changes code section names to <code>.text</code>.</td>
<td>Present</td>
<td>Present</td>
</tr>
<tr>
<td><code>fromelf --elf --strip=symbols</code></td>
<td>Removes those local symbols that can be removed without loss of functionality. Symbols that cannot be removed, such as the targets for relocations, are kept. For these symbols, the names are removed. These are marked as <code>[Anonymous Symbol]</code> in the <code>fromelf --text</code> output.</td>
<td>Section names remain the same</td>
<td>Present</td>
<td>Present</td>
</tr>
<tr>
<td><code>fromelf --elf --strip=localsymbols</code></td>
<td>Removes those local symbols that can be removed without loss of functionality. Symbols that cannot be removed, such as the targets for relocations, are kept. For these symbols, the names are removed. These are marked as <code>[Anonymous Symbol]</code> in the <code>fromelf --text</code> output.</td>
<td>Section names remain the same</td>
<td>Present</td>
<td>Present</td>
</tr>
</tbody>
</table>

**Example**

To produce a new ELF object with the complete symbol table removed and various section names changed, enter:

```bash
fromelf --elf --privacy --output=outfile.o infile.o
```

**Related concepts**

2.3 Options to protect code in image files with fromelf on page 2-19.

**Related references**

1.4 fromelf command-line syntax on page 1-15.
3.22 --elf on page 3-50.
3.46 --output=destination on page 3-78.
3.47 --privacy on page 3-79.
3.57 --strip=option[,option,...] on page 3-89.
2.5 Option to print specific details of ELF files

You can specify the elements of an ELF object that you want to appear in the textual output with the --emit option.

The output includes ELF header and section information. You can specify these elements as a comma separated list.

Note
You can specify some of the --emit options using the --text option.

Examples
To print the contents of the data sections of an ELF file, infile.axf, enter:

```
fromelf --emit=data infile.axf
```

To print relocation information and the dynamic section contents for the ELF file infile2.axf, enter:

```
fromelf --emit=relocation_tables,dynamic_segment infile2.axf
```

Related references
1.4 fromelf command-line syntax on page 1-15.
3.23 --emit=option[,option,...] on page 3-51.
3.59 --text on page 3-92.
2.6 Using fromelf to find where a symbol is placed in an executable ELF image

You can find where a symbol is placed in an executable ELF image.

To find where a symbol is placed in an ELF image file, use the `--text -s -v` options to view the symbol table and detailed information on each segment and section header, for example:

```
The symbol table identifies the section where the symbol is placed.
```

**Procedure**

1. Create the file `s.c` containing the following source code:
   ```c
   long long altstack[10] __attribute__((section("STACK"), zero_init));
   int main()
   {
       return sizeof(altstack);
   }
   ```
2. Compile the source:
   ```
   armcc -c s.c -o s.o
   ```
3. Link the object `s.o` and keep the `STACK` symbol:
   ```
   armlink --keep=s.o(STACK) s.o --output=s.axf
   ```
4. Run the fromelf command to display the symbol table and detailed information on each segment and section header:
   ```
   fromelf --text -s -v s.o
   ```
5. Locate the `STACK` and `altstack` symbols in the fromelf output, for example:
   ```
   ** Section #9
   Name        : .symtab
   Type        : SHT_SYMTAB (0x00000002)
   Flags       : None (0x00000000)
   Addr        : 0x00000000
   File Offset : 2792 (0xae8)
   Size        : 2896 bytes (0xb50)
   Link        : Section 10 (.strtab)
   Info        : Last local symbol no = 115
   Alignment   : 4
   Entry Size  : 16
   Symbol table .symtab (180 symbols, 115 local)
   # Symbol Name                Value      Bind  Sec  Type  Vis  Size
   ==================================================================
   ... 16  STACK                      0x00008228   Lc    2  Sect  De   0x50
   ... 179  altstack                   0x00008228   Gb    2  Data  Hi   0x50
   ...
   ```
   The `Sec` column shows the section where the stack is placed. In this example, section 2.

6. Locate the section identified for the symbol in the fromelf output, for example:
   ```
   ... ** Section #2
   Name        : ER_ZI
   Type        : SHT_NOBITS (0x00000008)
   Flags       : SHF_ALLOC + SHF_WRITE (0x00000003)
   Addr        : 0x0000081c8
   File Offset : 508 (0x1fc)
   Size        : 176 bytes (0xb0)
   Link        : SHN_UNDEF
   Info        : 0
   Alignment   : 8
   Entry Size  : 0
   ==================================================================
   ... This shows that the symbol is placed in an ZI execution region.

Chapter 3
fromelf Command-line Options

Describes the command-line options of the fromelf image converter provided with ARM Compiler.

It contains the following sections:

- 3.2 --bin on page 3-28.
- 3.3 --bincombined on page 3-29.
- 3.4 --bincombined_base=address on page 3-30.
- 3.5 --bincombined_padding=size,num on page 3-31.
- 3.6 --cad on page 3-32.
- 3.7 --cadcombined on page 3-34.
- 3.8 --compare=option[,option,...] on page 3-35.
- 3.9 --continue_on_error on page 3-36.
- 3.10 --cpu=list on page 3-37.
- 3.11 --cpu=name on page 3-38.
- 3.12 --datasymbols on page 3-40.
- 3.13 --debugonly on page 3-41.
- 3.14 --decode_build_attributes on page 3-42.
- 3.15 --diag_error=tag[,tag,...] on page 3-43.
- 3.16 --diag_remark=tag[,tag,...] on page 3-44.
- 3.17 --diag_style={arm|ide|gnu} on page 3-45.
- 3.18 --diag_suppress=tag[,tag,...] on page 3-46.
- 3.19 --diag_warning=tag[,tag,...] on page 3-47.
- 3.20 --disassemble on page 3-48.
- 3.21 --dump_build_attributes on page 3-49.
- 3.22 --elf on page 3-50.
- 3.23 --emit=option[,option,...] on page 3-51.
• 3.24 --expandarrays on page 3-53.
• 3.25 --extract_build_attributes on page 3-54.
• 3.26 --fieldoffsets on page 3-55.
• 3.27 --fpu=list on page 3-57.
• 3.28 --fpu=name on page 3-58.
• 3.29 --globalize=option[,option,...] on page 3-60.
• 3.30 --help on page 3-61.
• 3.31 --hide=option[,option,...] on page 3-62.
• 3.32 --hide_and_localize=option[,option,...] on page 3-63.
• 3.33 --i32 on page 3-64.
• 3.34 --i32combined on page 3-65.
• 3.35 --ignore_section=option[,option,...] on page 3-66.
• 3.36 --ignore_symbol=option[,option,...] on page 3-67.
• 3.37 --in_place on page 3-68.
• 3.38 --info=topic[,topic,...] on page 3-69.
• 3.39 input_file on page 3-70.
• 3.40 --interleave=option on page 3-72.
• 3.41 --linkview, --no_linkview on page 3-73.
• 3.42 --localize=option[,option,...] on page 3-74.
• 3.43 --m32 on page 3-75.
• 3.44 --m32combined on page 3-76.
• 3.45 --only=section_name on page 3-77.
• 3.46 --output=destination on page 3-78.
• 3.47 --privacy on page 3-79.
• 3.48 --qualify on page 3-80.
• 3.49 --relax_section=option[,option,...] on page 3-81.
• 3.50 --relax_symbol=option[,option,...] on page 3-82.
• 3.51 --rename=option[,option,...] on page 3-83.
• 3.52 --select=select_options on page 3-84.
• 3.53 --show=option[,option,...] on page 3-85.
• 3.54 --show_and_globalize=option[,option,...] on page 3-86.
• 3.55 --show_cmdline on page 3-87.
• 3.56 --source_directory=path on page 3-88.
• 3.57 --strip=option[,option,...] on page 3-89.
• 3.58 --symbolversions, --no_symbolversions on page 3-91.
• 3.59 --text on page 3-92.
• 3.60 --version_number on page 3-94.
• 3.61 --vhx on page 3-95.
• 3.62 --via=file on page 3-96.
• 3.63 --vsn on page 3-97.
• 3.64 -w on page 3-98.
• 3.65 --widthxbanks on page 3-99.
## 3.1 --base [[object_file::]load_region_ID=]num

Enables you to alter the base address specified for one or more load regions in Motorola S-record and Intel Hex file formats.

### Syntax

```
--base [[object_file::]load_region_ID=]num
```

Where:

- **object_file**
  - An optional ELF input file.
- **load_region_ID**
  - An optional load region. This can either be a symbolic name of an execution region belonging to a load region or a zero-based load region number, for example #0 if referring to the first region.
- **num**
  - Either a decimal or hexadecimal value.

You can:
- Use wildcard characters ? and * for symbolic names in `object_file` and `load_region_ID` arguments.
- Specify multiple values in one `option` followed by a comma-separated list of arguments.

All addresses encoded in the output file start at the base address `num`. If you do not specify a `--base` option, the base address is taken from the load region address.

### Restrictions

You must use one of the output formats `--i32`, `--i32combined`, `--m32`, or `--m32combined` with this option. Therefore, you cannot use this option with object files.

### Examples

The following table shows examples:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--base 0</code></td>
<td>decimal value</td>
</tr>
<tr>
<td><code>--base 0x8000</code></td>
<td>hexadecimal value</td>
</tr>
<tr>
<td><code>--base #0=0</code></td>
<td>base address for the first load region</td>
</tr>
<tr>
<td><code>--base foo.o::*=0</code></td>
<td>base address for all load regions in foo.o</td>
</tr>
<tr>
<td><code>--base #0=0,#1=0x8000</code></td>
<td>base address for the first and second load regions</td>
</tr>
</tbody>
</table>

### Related concepts

- 3.43 --m32 on page 3-75.
- 3.44 --m32combined on page 3-76.
3.2  --bin

Produces plain binary output, one file for each load region. You can split the output from this option into multiple files with the --widthxbanks option.

Restrictions
The following restrictions apply:
• You cannot use this option with object files.
• You must use --output with this option.

Considerations when using --bin
If you convert an ELF image containing multiple load regions to a binary format, fromelf creates an output directory named destination and generates one binary output file for each load region in the input image. fromelf places the output files in the destination directory.

Note
For multiple load regions, the name of the first non-empty execution region in the corresponding load region is used for the filename.

A file is only created when the load region describes code or data that is present in the ELF file. For example a load region containing only execution regions with ZI data in them does not result in a output file.

Example
To convert an ELF file to a plain binary file, for example outfile.bin, enter:

```bash
fromelf --bin --output=outfile.bin infile.axf
```

Related references
3.46 --output=destination on page 3-78.
3.65 --widthxbanks on page 3-99.
3.3 --bincombined

Produces plain binary output. It generates one output file for an image containing multiple load regions.

Usage
By default, the start address of the first load region in memory is used as the base address. fromelf inserts padding between load regions as required to ensure that they are at the correct relative offset from each other. Separating the load regions in this way means that the output file can be loaded into memory and correctly aligned starting at the base address.

Use this option with --bincombined_base and --bincombined_padding to change the default values for the base address and padding.

Restrictions
The following restrictions apply:

• You cannot use this option with object files.
• You must use --output with this option.

Considerations when using --bincombined
Use this option with --bincombined_base to change the default value for the base address.

The default padding value is 0xFF. Use this option with --bincombined_padding to change the default padding value.

If you use a scatter file that defines two load regions with a large address space between them, the resulting binary can be very large because it contains mostly padding. For example, if you have a load region of size 0x100 bytes at address 0x00000000 and another load region at address 0x30000000, the amount of padding is 0x2FFFFF00 bytes.

ARM recommends that you use a different method of placing widely spaced load regions, such as --bin, and make your own arrangements to load the multiple output files at the correct addresses.

Examples
To produce a binary file that can be loaded at start address 0x1000, enter:

```
fromelf --bincombined --bincombined_base=0x1000 --output=out.bin in.axf
```

To produce plain binary output and fill the space between load regions with copies of the 32-bit word 0x12345678, enter:

```
fromelf --bincombined --bincombined_padding=4,0x12345678 --output=out.bin in.axf
```

Related references
3.4 --bincombined_base=address on page 3-30.
3.5 --bincombined_padding=size,num on page 3-31.
3.46 --output=destination on page 3-78.
3.65 --widthxbanks on page 3-99.

Related information
Input sections, output sections, regions, and Program Segments.
3.4 --bincombined_base=address

Enables you to lower the base address used by the --bincombined output mode. The output file generated is suitable to be loaded into memory starting at the specified address.

Syntax

```
--bincombined_base=address
```

Where `address` is the start address where the image is to be loaded:

- If the specified address is lower than the start of the first load region, `fromelf` adds padding at the start of the output file.
- If the specified address is higher than the start of the first load region, `fromelf` gives an error.

Default

By default the start address of the first load region in memory is used as the base address.

Restrictions

You must use `--bincombined` with this option. If you omit `--bincombined`, a warning message is displayed.

Example

```
--bincombined --bincombined_base=0x1000
```

Related references

3.3 --bincombined on page 3-29.
3.5 --bincombined_padding=size,num on page 3-31.

Related information

*Input sections, output sections, regions, and Program Segments.*
### 3.5 --bincombined_padding=size,num

Enables you to specify a different padding value from the default used by the --bincombined output mode.

**Syntax**

```
--bincombined_padding=size,num
```

Where:

- **size**  
  Is 1, 2, or 4 bytes to define whether it is a byte, halfword, or word.

- **num**  
  The value to be used for padding. If you specify a value that is too large to fit in the specified size, a warning message is displayed.

**Note**

*fromelf* expects that 2-byte and 4-byte padding values are specified in the appropriate endianness for the input file. For example, if you are translating a big endian ELF file into binary, the specified padding value is treated as a big endian word or halfword.

**Default**

The default is --bincombined_padding=1,0xFF.

**Restrictions**

You must use --bincombined with this option. If you omit --bincombined, a warning message is displayed.

**Examples**

The following examples show how to use --bincombined_padding:

- **--bincombined --bincombined_padding=4,0x12345678**
  This example produces plain binary output and fills the space between load regions with copies of the 32-bit word 0x12345678.

- **--bincombined --bincombined_padding=2,0x1234**
  This example produces plain binary output and fills the space between load regions with copies of the 16-bit halfword 0x1234.

- **--bincombined --bincombined_padding=2,0x01**
  This example when specified for big endian memory, fills the space between load regions with 0x0100.

**Related references**

- 3.3 --bincombined on page 3-29.
- 3.4 --bincombined_base=address on page 3-30.
3.6  --cad

Produces a C array definition or C++ array definition containing binary output.

Usage

You can use each array definition in the source code of another application. For example, you might want to embed an image in the address space of another application, such as an embedded operating system.

If your image has a single load region, the output is directed to stdout by default. To save the output to a file, use the --output option together with a filename.

If your image has multiple load regions, then you must also use the --output option together with a directory name. Unless you specify a full path name, the path is relative to the current directory. A file is created for each load region in the specified directory. The name of each file is the name of the corresponding execution region.

Use this option with --output to generate one output file for each load region in the image.

Restrictions

You cannot use this option with object files.

Considerations when using --cad

A file is only created when the load region describes code or data that is present in the ELF file. For example a load region containing only execution regions with ZI data in them does not result in a output file.

Example

The following examples show how to use --cad:

- To produce an array definition for an image that has a single load region, enter:

  fromelf --cad myimage.axf

  unsigned char LR0[] = {
    0x00, 0x00, 0x00, 0xEB, 0x28, 0x00, 0x00, 0xEB, 0x2C, 0x00, 0x00, 0xEB, 0x28, 0x00, 0x00, 0xEB, 0x2C, 0x00, 0x00, 0xEB, 0x28, 0x00, 0x00, 0xEB, 0x2C, 0x00, 0x00, 0xEB, 0x28, 0x00, 0x00, 0xEB, 0x2C, 0x00, 0x00, 0xEB, 0x28, 0x00, 0x00, 0xEB, 0x2C, 0x00, 0x00, 0xEB, 0x28, 0x00, 0x00, 0xEB, 0x2C, 0x00, 0x00, 0xEB, 0x28, 0x00, 0x00, 0xEB, 0x2C, 0x00, 0x00, 0xEB, 0x28, 0x00, 0x00, 0xEB, 0x2C, 0x00, 0x00, 0xEB, 0x28, 0x00, 0x00, 0xEB, 0x2C, 0x00, 0x00, 0xEB, 0x28, 0x00, 0x00, 0xEB, 0x2C, 0x00, 0x00, 0xEB, 0x28, 0x00, 0x00, 0xEB, 0x2C, 0x00, 0x00, 0xEB, 0x28, 0x00, 0x00, 0xEB, 0x2C, 0x00, 0x00, 0xEB, 0x28, 0x00, 0x00, 0xEB, 0x2C, 0x00, 0x00, 0xEB, 0x28, 0x00, 0x00, 0xEB, 0x2C, 0x00, 0x00, 0xEB, 0x28, 0x00, 0x00, 0xEB, 0x2C, 0x00, 0x00, 0xEB, 0x28, 0x00, 0x00, 0xEB, 0x2C, 0x00, 0x00, 0xEB, 0x28
  };

- For an image that has multiple load regions, the following commands create a file for each load region in the directory root\myprojects\multiload\load_regions:

  cd root\myprojects\multiload

  fromelf --cad image_multiload.axf --output load_regions

If image_multiload.axf contains the execution regions EXEC_ROM and RAM, then the files EXEC_ROM and RAM are created in the load_regions subdirectory.

Related references

3.7 --cadcombined on page 3-34.
3.46 --output=destination on page 3-78.
Related information

Input sections, output sections, regions, and Program Segments.
3.7 --cadcombined

Produces a C array definition or C++ array definition containing binary output.

**Usage**

You can use each array definition in the source code of another application. For example, you might want to embed an image in the address space of another application, such as an embedded operating system.

The output is directed to stdout by default. To save the output to a file, use the --output option together with a filename.

**Restrictions**

You cannot use this option with object files.

**Example**

The following commands create the file `load_regions.c` in the directory `root\myprojects\multiload`:

```bash
    cd root\myprojects\multiload
    fromelf --cadcombined image_multiload.axf --output load_regions.c
```

**Related references**

3.6 --cad on page 3-32.
3.46 --output=destination on page 3-78.
3.8  --compare=option[,option,...]

Compares two input files and prints a textual list of the differences.

Usage

The input files must be the same type, either two ELF files or two library files. Library files are compared member by member and the differences are concatenated in the output.

All differences between the two input files are reported as errors unless specifically downgraded to warnings by using the --relax_section option.

Syntax

--compare=option[,option,...]

Where option is one of:

section_sizes
  Compares the size of all sections for each ELF file or ELF member of a library file.
  section_sizes:::object_name
    Compares the sizes of all sections in ELF objects with a name matching object_name.
  section_sizes:::section_name
    Compares the sizes of all sections with a name matching section_name.

sections
  Compares the size and contents of all sections for each ELF file or ELF member of a library file.
  sections:::object_name
    Compares the size and contents of all sections in ELF objects with a name matching object_name.
  sections:::section_name
    Compares the size and contents of all sections with a name matching section_name.

function_sizes
  Compares the size of all functions for each ELF file or ELF member of a library file.
  function_sizes:::object_name
    Compares the size of all functions in ELF objects with a name matching object_name.
  function_sizes:::function_name
    Compares the size of all functions with a name matching function_name.

global_function_sizes
  Compares the size of all global functions for each ELF file or ELF member of a library file.
  global_function_sizes:::function_name
    Compares the size of all global functions in ELF objects with a name matching function_name.

You can:
• Use wildcard characters ? and * for symbolic names in section_name, function_name, and object_name arguments.
• Specify multiple values in one option followed by a comma-separated list of arguments.

Related references

3.35 --ignore_section=option[,option,...] on page 3-66.
3.36 --ignore_symbol=option[,option,...] on page 3-67.
3.49 --relax_section=option[,option,...] on page 3-81.
3.50 --relax_symbol=option[,option,...] on page 3-82.
3.9  --continue_on_error

Reports any errors and then continues.

Usage

Use --diag_warning=error instead of this option.

Related references

3.19 --diag_warning=tag[,tag,...] on page 3-47.
3.10  --cpu=list

Lists the architecture and processor names that are supported by the --cpu=name option.

Syntax

--cpu=list

Related references

3.11 --cpu=name on page 3-38.
### 3.11 --cpu=name

Affects the way machine code is disassembled by options such as -c or -disassemble, so that it is disassembled in the same way that the specified processor or architecture interprets it.

**Syntax**

```
--cpu=name
```

Where `name` is the name of a processor or architecture:

- If `name` is the name of a processor, enter it as shown on ARM data sheets, for example, `ARM7TDMI`, `ARM1176JZ-S`, `MPCore`.
- If `name` is the name of an architecture, it must belong to the list of architectures shown in the following table.

Processor and architecture names are not case-sensitive.

Wildcard characters are not accepted.

The following table shows the supported architectures. For a complete list of the supported architecture and processor names, specify the --cpu=list option.

<table>
<thead>
<tr>
<th>Architecture</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>ARMv4 without Thumb</td>
</tr>
<tr>
<td>4T</td>
<td>ARMv4 with Thumb</td>
</tr>
<tr>
<td>5</td>
<td>ARMv5 with Thumb and interworking</td>
</tr>
<tr>
<td>5TE</td>
<td>ARMv5 with Thumb, interworking, DSP multiply, and double-word instructions</td>
</tr>
<tr>
<td>5TEJ</td>
<td>ARMv5 with Thumb, interworking, DSP multiply, double-word instructions, and Jazelle® extensions</td>
</tr>
</tbody>
</table>

**Note**

Fromelf cannot generate Java bytecodes.

<table>
<thead>
<tr>
<th>6</th>
<th>ARMv6 with Thumb, interworking, DSP multiply, double-word instructions, unaligned and mixed-endian support, Jazelle, and media extensions.</th>
</tr>
</thead>
<tbody>
<tr>
<td>6-M</td>
<td>ARMv6 microcontroller profile with Thumb only, plus processor state instructions.</td>
</tr>
<tr>
<td>6S-M</td>
<td>ARMv6 microcontroller profile with Thumb only, plus processor state instructions and OS extensions.</td>
</tr>
<tr>
<td>6K</td>
<td>ARMv6 with SMP extensions.</td>
</tr>
<tr>
<td>6T2</td>
<td>ARMv6 with Thumb (Thumb-2 technology).</td>
</tr>
<tr>
<td>6Z</td>
<td>ARMv6 with Security Extensions.</td>
</tr>
<tr>
<td>7</td>
<td>ARMv7 with Thumb (Thumb-2 technology) only, and without hardware divide.</td>
</tr>
<tr>
<td>7-A</td>
<td>ARMv7 application profile.</td>
</tr>
<tr>
<td>7-A.security</td>
<td>ARMv7-A architecture profile with the SMC instruction (formerly SMI).</td>
</tr>
<tr>
<td>7-R</td>
<td>ARMv7 real-time profile.</td>
</tr>
<tr>
<td>7-M</td>
<td>ARMv7 microcontroller profile.</td>
</tr>
<tr>
<td>7E-M</td>
<td>ARMv7-M architecture profile with DSP extension.</td>
</tr>
</tbody>
</table>
Note

- ARMv7 is not an actual ARM architecture. --cpu=7 denotes the features that are common to the ARMv7-A, ARMv7-R, and ARMv7-M architectures. By definition, any given feature used with --cpu=7 exists on the ARMv7-A, ARMv7-R, and ARMv7-M architectures.
- 7-A.security is not an actual ARM architecture, but rather refers to 7-A plus Security Extensions.
- The full list of supported architectures and processors depends on your license.

Usage

The following general points apply to processor and architecture options:

Processors

- Selecting the processor selects the appropriate architecture, Floating-Point Unit (FPU), and memory organization.
- The supported --cpu values include all current ARM product names or architecture versions.

Other ARM architecture-based processors, such as the Marvell Feroceon and the Marvell XScale, are also supported.

Architectures

- If you specify an architecture name for the --cpu option, machine code is disassembled by options such as -c or --disassemble for that architecture. If you specify --disassemble, then the disassembly can be assembled for any processor supporting that architecture.

For example, --cpu=7-A --disassemble produces disassembly that can be assembled for the Cortex-A7 processor.

FPU

- Some specifications of --cpu imply an --fpu selection.

Note

Any explicit FPU, set with --fpu on the command line, overrides an implicit FPU.

- If no --fpu option is specified and no --cpu option is specified, --fpu=softvfp is used.

Default

If you do not specify a --cpu option, then fromelf disassembles machine instructions in an architecture-independent way. This means that fromelf disassembles anything that it recognizes as an instruction by some architecture.

Restrictions

You cannot specify both a processor and an architecture on the same command-line.

Example

To specify the Cortex-M4 processor, use:

--cpu=Cortex-M4

3.20 --disassemble on page 3-48.
3.38 --info=topic[,topic,...] on page 3-69.
3.59 --text on page 3-92.
3.12 --datasymbols

Modifies the output information of data sections so that symbol definitions are interleaved.

Usage

You can use this option only with --text -d.

Related references

3.59 --text on page 3-92.
3.13 --debugonly

Removes the content of any code or data sections.

Usage

This option ensures that the output file contains only the information required for debugging, for example, debug sections, symbol table, and string table. Section headers are retained because they are required to act as targets for symbols.

Restrictions

You must use --elf with this option.

Example

To create an ELF file, debugout.axf, from the ELF file infile.axf, containing only debug information, enter:

```
fromelf --elf --debugonly --output=debugout.axf infile.axf
```

Related references

3.22 --elf on page 3-50.
3.14 **--decode_build_attributes**

Prints the contents of the build attributes section in human-readable form for standard build attributes or raw hexadecimal form for nonstandard build attributes.

--- Note ---
The standard build attributes are documented in the Application Binary Interface for the ARM Architecture.

--- Restrictions ---
You can use this option only in text mode.

--- Example ---
The following example shows the output for **--decode_build_attributes**:

```
** Section #12 `.ARM.attributes' (SHT_ARM_ATTRIBUTES)
  Size    : 69 bytes
  'aeabi' file build attributes:
  0x000000: 05 41 52 4d 37 54 44 4d 49 00 06 02 08 01 11 01  ARM7TDMI.......
  0x000010: 12 02 14 02 17 01 18 01 19 01 1a 01 1e 03 20 02 ............
  0x000020: 41 52 4d 00  ARM.
  Tag_CPU_name = "ARM7TDMI"
  Tag_CPU_arch = ARM v4T (=2)
  Tag_ARM_ISA_use = ARM instructions were permitted to be used (=1)
  Tag_ABI_PCS_GOT_use = Data are imported directly (=1)
  Tag_ABI_PCS_wchar_t = Size of wchar_t is 2 (=2)
  Tag_ABI_FP_denormal = This code was permitted to require that the sign of a flushed-to-zero number be preserved in the sign of 0 (=2)
  Tag_ABI_FP_number_model = This code was permitted to use only IEEE 754 format FP numbers (=1)
  Tag_ABI_align8_needed = Code was permitted to depend on the 8-byte alignment of 8-byte data items (=1)
  Tag_ABI_align8_preserved = Code was required to preserve 8-byte alignment of 8-byte data objects (=1)
  Tag_ABI_enum_size = Enum values occupy the smallest container big enough to hold all values (=1)
  Tag_ABI_optimization_goals = Optimized for small size, but speed and debugging illusion preserved (=3)
  Tag_compatibility = 2, "ARM"
  'ARM' file build attributes:
  0x000000: 04 01 12 01 ....
```

--- Related information ---
Application Binary Interface for the ARM Architecture.
3.15  --diag_error=tag[,tag,...]

Sets diagnostic messages that have a specific tag to Error severity.

Syntax
--diag_error=tag[,tag,...]
Where tag can be:
• A diagnostic message number to set to error severity. This is the four-digit number, nnnn, with the
tool letter prefix, but without the letter suffix indicating the severity.
• warning, to treat all warnings as errors.

Related references
3.16 --diag_remark=tag[,tag,...] on page 3-44.

3.19 --diag_warning=tag[,tag,...] on page 3-47.
3.16 --diag_remark=tag[,tag,...]

Sets diagnostic messages that have a specific tag to Remark severity.

Syntax

--diag_remark=tag[,tag,...]

Where `tag` is a comma-separated list of diagnostic message numbers. This is the four-digit number, `nnnn`, with the tool letter prefix, but without the letter suffix indicating the severity.

Related references

3.15 --diag_error=tag[,tag,...] on page 3-43.

3.19 --diag_warning=tag[,tag,...] on page 3-47.
3.17 --diag_style={arm|ide|gnu}

Specifies the display style for diagnostic messages.

Syntax
--diag_style=string

Where string is one of:

arm  Display messages using the ARM compiler style.
ide  Include the line number and character count for any line that is in error. These values are displayed in parentheses.
gnu  Display messages in the format used by gcc.

Usage
--diag_style=gnu matches the format reported by the GNU Compiler, gcc.
--diag_style=ide matches the format reported by Microsoft Visual Studio.

Default
The default is --diag_style=arm.

Related references

3.19 --diag_warning=tag[,tag,...] on page 3-47.
3.18 --diag_suppress=tag[,tag,...]

Suppresses diagnostic messages that have a specific tag.

Syntax
--diag_suppress=tag[,tag,...]
Where tag can be:
• A diagnostic message number to be suppressed. This is the four-digit number, nnnn, with the tool letter prefix, but without the letter suffix indicating the severity.
• error, to suppress all errors that can be downgraded.
• warning, to suppress all warnings.

3.20 **--disassemble**

Displays a disassembled version of the image to stdout.

**Usage**

If you use this option with **--output destination**, you can reassemble the output file with armasm.

You can use this option to disassemble either an ELF image or an ELF object file.

**Note**

The output is not the same as that from **--emit=code** and **--text -c**.

**Example**

To disassemble the ELF file *infile.axf* for the Cortex-A7 processor and create a source file *outfile.asm*, enter:

```
fromelf --cpu=Cortex-A7 --disassemble --output=outfile.asm infile.axf
```

**Related references**

3.11 **--cpu=name** on page 3-38.

3.40 **--interleave=option** on page 3-72.
3.46 **--output=destination** on page 3-78.
3.59 **--text** on page 3-92.
3.21 --dump_build_attributes

Prints the contents of the build attributes section in raw hexadecimal form.

**Restrictions**

You can use this option only in text mode.

**Example**

The following example shows the output for --dump_build_attributes:

```
** Section #12 '.ARM.attributes' (SHT_ARM_ATTRIBUTES)
  Size : 69 bytes
    0x000000:   41 33 00 00 00 61 65 61 62 69 00 01 29 00 00 00    A3...aeabi...
    0x000010:   05 41 52 4d 37 54 4d 49 00 06 02 08 01 11 01    .ARM7TDMI....
    0x000020:   12 02 14 02 17 01 18 01 01 1a 01 1e 03 20 02    ............
    0x000030:   41 52 4d 01 11 00 00 00 41 52 4d 00 01 09 00 00    ARM.....ARM....
    0x000040:   00 04 01 12 01
```

**Related references**

3.14 --decode_build_attributes on page 3-42.
3.23 --emit=option[,option,...] on page 3-51.
3.25 --extract_build_attributes on page 3-54.
3.59 --text on page 3-92.
3.22 --elf

Selects ELF output mode.

**Usage**
Use this option whenever you have to transform an ELF file into a slightly different ELF file. You also have to provide options to indicate how you want the file to be modified. The options are:

- --debugonly.
- --globalize.
- --hide.
- --hide_and_localize.
- --in_place.
- --hide.
- --linkview or --no_linkview. This option is deprecated.
- --localize.
- --rename.
- --show.
- --show_and_globalize.
- --strip.
- --show.
- --symbolversions or --no_symbolversions.

**Restrictions**
You must use --output with this option.

**Related references**
3.37 --in_place on page 3-68.
3.46 --output=destination on page 3-78.
3.57 --strip=option[,option,...] on page 3-89.
3.23  --emit=option[,option,…]

Enables you to specify the elements of an ELF object that you want to appear in the textual output. The output includes ELF header and section information.

Restrictions
You can use this option only in text mode.

Syntax
--emit=option[,option,…]
Where option is one of:

- **addresses**
  Prints global and static data addresses (including addresses for structure and union contents). It has the same effect as --text -a.
  This option can only be used on files containing debug information. If no debug information is present, a warning message is generated.
  Use the --select option to output a subset of the data addresses.
  If you want to view the data addresses of arrays, expanded both inside and outside structures, use the --expandarrays option with this text category.

- **build_attributes**
  Prints the contents of the build attributes section in human-readable form for standard build attributes or raw hexadecimal form for nonstandard build attributes. The produces the same output as the --decode_build_attributes option.

- **code**
  Disassembles code, alongside a dump of the original binary data being disassembled and the addresses of the instructions. It has the same effect as --text -c.
  **Note** Unlike --disassemble, the disassembly cannot be input to the assembler.

- **data**
  Prints contents of the data sections. It has the same effect as --text -d.

- **data_symbols**
  Modifies the output information of data sections so that symbol definitions are interleaved.

- **debug_info**
  Prints debug information. It has the same effect as --text -g.

- **dynamic_segment**
  Prints dynamic segment contents. It has the same effect as --text -y.

- **exception_tables**
  Decodes exception table information for objects. It has the same effect as --text -e.

- **frame_directives**
  Prints the contents of FRAME directives in disassembled code as specified by the debug information embedded in an object module.
  Use this option with --disassemble.

- **got**
  Prints the contents of the Global Offset Table (GOT) section.

- **heading_comments**
  Prints heading comments at the beginning of the disassembly containing tool and command-line information from .comment sections.
  Use this option with --disassemble.
raw_build_attributes
   Prints the contents of the build attributes section in raw hexadecimal form, that is, in the same
   form as data.
relocation_tables
   Prints relocation information. It has the same effect as --text -r.
string_tables
   Prints the string tables. It has the same effect as --text -t.
summary
   Prints a summary of the segments and sections in a file. It is the default output of fromelf
   --text. However, the summary is suppressed by some --info options. Use --emit summary to
   explicitly re-enable the summary, if required.
symbol_annotations
   Prints symbols in disassembled code and data annotated with comments containing the
   respective property information.
   Use this option with --disassemble.
symbol_tables
   Prints the symbol and versioning tables. It has the same effect as --text -s.
vfe
   Prints information about unused virtual functions.
whole_segments
   Prints disassembled executables or shared libraries segment by segment even if it has a link
   view.
   Use this option with --disassemble.

You can specify multiple options in one option followed by a comma-separated list of arguments.

Related references
3.20 --disassemble on page 3-48.
3.14 --decode_build_attributes on page 3-42.
3.24 --expandarrays on page 3-53.
3.59 --text on page 3-92.
3.24 --expandarrays

Prints data addresses, including arrays that are expanded both inside and outside structures.

Restrictions

You can use this option with --text -a or with --fieldoffsets.

Example

The following example shows the output for a struct containing arrays when --fieldoffsets --expandarrays is specified:

```c
< more foo.c
struct S {
  char A[8];
  char B[4];
};
struct S s;
struct S* get()
{
  return &s;
}
< armcc --debug -c foo.c
< fromelf --fieldoffsets --expandarrays foo.o

; Structure, S , Size 0xc bytes, from foo.c
S.A    EQU  0 ; array[8] of char
  S.A[0]  EQU  0 ; char
  S.A[1]  EQU  0x1 ; char
  S.A[2]  EQU  0x2 ; char
  S.A[3]  EQU  0x3 ; char
  S.A[4]  EQU  0x4 ; char
  S.A[5]  EQU  0x5 ; char
  S.A[6]  EQU  0x6 ; char
  S.A[7]  EQU  0x7 ; char
  S.B    EQU  0x8 ; array[4] of char
  S.B[0]  EQU  0x8 ; char
  S.B[1]  EQU  0x9 ; char
  S.B[2]  EQU  0xa ; char
  S.B[3]  EQU  0xb ; char
; End of Structure S
END
```

Related references

3.26 --fieldoffsets on page 3-55.
3.59 --text on page 3-92.
3.25 --extract_build_attributes

Prints only the build attributes in a form that depends on the type of attribute.

Usage
Prints the build attributes in:
• Human-readable form for standard build attributes.
• Raw hexadecimal form for nonstandard build attributes.

Restrictions
You can use this option only in text mode.

Example
The following example shows the output for --extract_build_attributes:

> armcc -c --cpu=cortex-m7 --fpu=vfpv2 hello.c -o hello.o
> fromelf --extract_build_attributes hello.o
========================================================================
** Object/Image Build Attributes
'aeabi' file build attributes:
   0x000000:   43 32 2e 30 36 00 05 43 6f 72 74 65 78 2d 4d 37    C2.06..Cortex-M7
   0x000010:   00 06 0d 07 4d 09 02 0a 02 11 01 12 02 17 01 18    ....M............

   Tag_conformance = "2.06"
   Tag_CPU_name = "Cortex-M7"
   Tag_CPU_arch = ARM v7E-M (=13)
   Tag_CPU_arch_profile = The microcontroller profile 'M' (e.g. for Cortex M3) (=77)
   Tag_THUMB_TSA_use = Thumb2 instructions were permitted (implies Thumb instructions permitted) (=2)
   Tag_VFP_arch = VFPv2 instructions were permitted (implies VFPv1 instructions were permitted) (=2)
   Tag_ABI_PCS_GOT_use = Data are imported directly (=1)
   Tag_ABI_PCS_wchar_t = Size of wchar_t is 2 (=2)
   Tag_ABI_FP_number_model = This code was permitted to use only IEEE 754 format FP numbers (=1)
   Tag_ABI_align8_needed = Code was permitted to depend on the 8-byte alignment of 8-byte data items (=1)
   Tag_ABI_align8_preserved = Code was required to preserve 8-byte alignment of 8-byte data objects (=1)
   Tag_ABI_enum_size = Enum values occupy the smallest container big enough to hold all values (=1)
   Tag_ABI_VFP_args = FP parameter/result passing conforms to the VFP variant of the AAPCS (=1)
   Tag_ABI_optimization_goals = Optimized for small size, but speed and debugging illusion preserved (=3)
   Tag_CPU_unaligned_access = The producer was permitted to generate architecture v6-style unaligned data accesses (=1)

'ARM' file build attributes:
   0x000000:   12 01 14 09

Related references
3.14 --decode_build_attributes on page 3-42.
3.21 --dump_build_attributes on page 3-49.
3.23 --emit=option[,option,...] on page 3-51.
3.59 --text on page 3-92.
3.26 --fieldoffsets

Prints a list of assembly language EQU directives that equate C++ class or C structure field names to their offsets from the base of the class or structure.

Usage
The input ELF file can be a relocatable object or an image.

Use --output to redirect the output to a file. Use the INCLUDE command from armasm to load the produced file and provide access to C++ classes and C structure members by name from assembly language.

This option outputs all structure information. To output a subset of the structures, use --select select_options.

If you do not require a file that can be input to armasm, use the --text -a options to format the display addresses in a more readable form. The -a option only outputs address information for structures and static data in images because the addresses are not known in a relocatable object.

Restrictions
This option:
• Requires that the object or image file has debug information.
• Can be used in text mode and with --expandarrays.

Examples
The following examples show how to use --fieldoffsets:
• To produce an output listing to stdout that contains all the field offsets from all structures in the file inputfile.o, enter:

```
fromelf --fieldoffsets inputfile.o
```

• To produce an output file listing to outputfile.s that contains all the field offsets from structures in the file inputfile.o that have a name starting with p, enter:

```
fromelf --fieldoffsets --select=p* --output=outputfile.s inputfile.o
```

• To produce an output listing to outputfile.s that contains all the field offsets from structures in the file inputfile.o with names of tools or moretools, enter:

```
fromelf --fieldoffsets --select=tools.*,moretools.* --output=outputfile.s inputfile.o
```

• To produce an output file listing to outputfile.s that contains all the field offsets of structure fields whose name starts with number and are within structure field top in structure tools in the file inputfile.o, enter:

```
fromelf --fieldoffsets --select=tools.top.number* --output=outputfile.s inputfile.o
```

The following is an example of the output, and includes name. and name...member that arise because of anonymous structs and unions:

```
| Structure, Table , Size 0x104 bytes, from inputfile.cpp |
| Table.TableName | EQU 0 ; int |
| Table.Data | EQU 0x4 ; array[64] of MyClassHandle |
| End of Structure Table |
| Structure, Box2 , Size 0x8 bytes, from inputfile.cpp |
| Box2.| EQU 0 ; anonymous |
| Box2...Min| EQU 0 ; Point2 |
| Box2...Min.x| EQU 0 ; short |
| Box2...Min.y| EQU 0x2 ; short |
| Box2...Max| EQU 0x4 ; Point2 |
| Box2...Max.x| EQU 0x4 ; short |
| Box2...Max.y| EQU 0x6 ; short |
| Warning: duplicate name (Box2..) present in (inputfile.cpp) and in (inputfile.cpp) |
| please use the --qualify option |
| Box2..| EQU 0 ; anonymous |
| Box2...Left| EQU 0 ; unsigned short |
| Box2...Top| EQU 0x2 ; unsigned short |
```

Related information

EQU.
GET or INCLUDE.
3.27 --fpu=list

Lists the FPU architectures that are supported by the --fpu=name option.
Deprecation options are not listed.

Related references
3.28 --fpu=name on page 3-58.
### 3.28 --fpu=name

Specifies the target FPU architecture.

To obtain a full list of FPU architectures use the --fpu=list option.

**Syntax**

```
--fpu=name
```

Where *name* is one of:

- **None**
  
  Selects no floating-point option. No floating-point code is to be used.

- **VFPv2**
  
  Selects a hardware floating-point unit conforming to architecture VFPv2.

- **VFPv3**
  
  Selects a hardware vector floating-point unit conforming to architecture VFPv3. VFPv3 is backwards compatible with VFPv2 except that VFPv3 cannot trap floating-point exceptions.

- **VFPv3_F16**
  
  Selects a hardware vector floating-point unit conforming to architecture VFPv3 that also provides the half-precision extensions.

- **VFPv3_D16**
  
  Selects a hardware vector floating-point unit conforming to VFPv3-D16 architecture.

- **VFPv3_D16_F16**
  
  Selects a hardware vector floating-point unit conforming to VFPv3-D16 architecture, that also provides the half-precision extensions.

- **VFPv4**
  
  Selects a hardware floating-point unit conforming to the VFPv4 architecture.

- **VFPv4_D16**
  
  Selects a hardware floating-point unit conforming to the VFPv4-D16 architecture.

- **FPv4-SP**
  
  Selects a hardware floating-point unit conforming to the single precision variant of the FPv4 architecture.

- **FPv5_D16**
  
  Selects a hardware floating-point unit conforming to the FPv5-D16 architecture.

- **FPv5-SP**
  
  Selects a hardware floating-point unit conforming to the single precision variant of the FPv5 architecture.

- **SoftVFP**
  
  Selects software floating-point support where floating-point operations are performed by a floating-point library, *fplib*. This is the default if you do not specify a --fpu option, or if you select a CPU that does not have an FPU.

- **SoftVFP+VFPv2**
  
  Selects a hardware floating-point unit conforming to VFPv2, with software floating-point linkage. Select this option if you are interworking Thumb code with ARM code on a system that implements a VFP unit.

- **SoftVFP+VFPv3**
  
  Selects a hardware vector floating-point unit conforming to VFPv3, with software floating-point linkage.

- **SoftVFP+VFPv3_F16**
  
  Selects a hardware vector floating-point unit conforming to VFPv3-fp16, with software floating-point linkage.

- **SoftVFP+VFPv3_D16**
  
  Selects a hardware vector floating-point unit conforming to VFPv3-D16, with software floating-point linkage.
SoftVFP+VFPv3_D16_FP16
Selects a hardware vector floating-point unit conforming to VFPv3-D16-fp16, with software floating-point linkage.

SoftVFP+VFPv4
Selects a hardware floating-point unit conforming to FPv4, with software floating-point linkage.

SoftVFP+VFPv4_D16
Selects a hardware floating-point unit conforming to VFPv4-D16, with software floating-point linkage.

SoftVFP+FPv4-SP
Selects a hardware floating-point unit conforming to FPv4-SP, with software floating-point linkage.

SoftVFP+FPv5_D16
Selects a hardware floating-point unit conforming to FPv5-D16, with software floating-point linkage.

SoftVFP+FPv5-SP
Selects a hardware floating-point unit conforming to FPv5-SP, with software floating-point linkage.

To obtain a full list of FPU architectures use the --fpu=list option.

Usage
This option selects disassembly for a specific FPU architecture. It affects how fromelf interprets the instructions it finds in the input files.

If you specify this option, it overrides any implicit FPU option that appears on the command line, for example, where you use the --cpu option.

Any FPU explicitly selected using the --fpu option always overrides any FPU implicitly selected using the --cpu option. For example, the options --disassemble --cpu=ARM1136JF-S --fpu=SoftVFP disassembles code that uses the software floating-point library fp1lib, even though the choice of CPU implies the use of architecture VFPv2.

Restrictions
NEON support is disabled for softvfp.

Default
The default target FPU architecture is derived from use of the --cpu option.

If the CPU you specify with --cpu has a VFP coprocessor, the default target FPU architecture is the VFP architecture for that CPU. For example, the option --cpu ARM1136JF-S implies the option --fpu VFPv2. If a VFP coprocessor is present, VFP instructions are generated.

3.38 --info=topic[,topic,...] on page 3-69.
3.59 --text on page 3-92.
3.29  --globalize=option[,option,...]

Converts the selected symbols to global symbols.

Syntax

--globalize=option[,option,...]

Where option is one of:

object_name::
    All symbols in ELF objects with a name matching object_name are converted to global symbols.

object_name::symbol_name
    All symbols in ELF objects with a name matching object_name and also a symbol name matching symbol_name are converted to global symbols.

symbol_name
    All symbols with a symbol name matching symbol_name are converted to global symbols.

You can:

• Use wildcard characters ? and * for symbolic names in symbol_name and object_name arguments
• Specify multiple values in one option followed by a comma-separated list of arguments.

Restrictions

You must use --elf with this option.

Related references

3.22 --elf on page 3-50.
3.31 --hide=option[,option,...] on page 3-62.
3.30 --help

Displays a summary of the main command-line options.

Default
This is the default if you specify fromelf without any options or source files.

Related references
3.55 --show_cmdline on page 3-87.
3.60 --version_number on page 3-94.

3.31 \texttt{--hide=option[,option,...]}  
Changes the symbol visibility property to mark selected symbols as hidden.

\textbf{Syntax}  
\texttt{--hide=option[,option,...]}  
Where \texttt{option} is one of:

\texttt{object\_name::}  
All symbols in ELF objects with a name matching \texttt{object\_name}.

\texttt{object\_name::symbol\_name}  
All symbols in ELF objects with a name matching \texttt{object\_name} and also a symbol name matching \texttt{symbol\_name}.

\texttt{symbol\_name}  
All symbols with a symbol name matching \texttt{symbol\_name}.

You can:
• Use wildcard characters \texttt{?} and \texttt{*} for symbolic names in \texttt{symbol\_name} and \texttt{object\_name} arguments
• Specify multiple values in one \texttt{option} followed by a comma-separated list of arguments.

\textbf{Restrictions}  
You must use \texttt{--elf} with this option.

\textbf{Related references}  
3.22 \texttt{--elf} on page 3-50.  
3.53 \texttt{--show=option[,option,...]} on page 3-85.
3.32 \texttt{--hide	extunderscore and	extunderscore localize=option[,option,...]}  

Changes the symbol visibility property to mark selected symbols as hidden, and converts the selected symbols to local symbols.

\textbf{Syntax}

\texttt{--hide	extunderscore and	extunderscore localize=option[,option,...]}

Where \texttt{option} is one of:

- \texttt{object\_name::}
  All symbols in ELF objects with a name matching \texttt{object\_name} are marked as hidden and converted to local symbols.

- \texttt{object\_name::symbol\_name}
  All symbols in ELF objects with a name matching \texttt{object\_name} and also a symbol name matching \texttt{symbol\_name} are marked as hidden and converted to local symbols.

- \texttt{symbol\_name}
  All symbols with a symbol name matching \texttt{symbol\_name} are marked as hidden and converted to local symbols.

You can:

- Use wildcard characters \texttt{?} and \texttt{*} for symbolic names in \texttt{symbol\_name} and \texttt{object\_name} arguments
- Specify multiple values in one \texttt{option} followed by a comma-separated list of arguments.

\textbf{Restrictions}

You must use \texttt{--elf} with this option.

\textbf{Related references}

3.22 \texttt{--elf} on page 3-50.
3.33 --i32

Produces Intel Hex-32 format output. It generates one output file for each load region in the image. You can specify the base address of the output with the --base option.

Restrictions
The following restrictions apply:
• You cannot use this option with object files.
• You must use --output with this option.

Considerations when using --i32
If you convert an ELF image containing multiple load regions to a binary format, fromelf creates an output directory named destination and generates one binary output file for each load region in the input image. fromelf places the output files in the destination directory.

Note
For multiple load regions, the name of the first non-empty execution region in the corresponding load region is used for the filename.

A file is only created when the load region describes code or data that is present in the ELF file. For example, a load region containing only execution regions with ZI data in them does not result in an output file.

Example
To convert the ELF file infile.axf to an Intel Hex-32 format file, for example outfile.bin, enter:

```
fromelf --i32 --output=outfile.bin infile.axf
```

Related references
3.1 --base [object_file::load_region_ID=num on page 3-27.
3.34 --i32combined on page 3-65.
3.46 --output=destination on page 3-78.
3.34 --i32combined

Produces Intel Hex-32 format output. It generates one output file for an image containing multiple load regions.

You can specify the base address of the output with the --base option.

Restrictions
The following restrictions apply:
• You cannot use this option with object files.
• You must use --output with this option.

Considerations when using --i32combined

If you convert an ELF image containing multiple load regions to a binary format, fromelf creates an output directory named destination and generates one binary output file for all load regions in the input image. fromelf places the output file in the destination directory.

ELF images contain multiple load regions if, for example, they are built with a scatter file that defines more than one load region.

Example

To create a single output file, outfile2.bin, from an image file infile2.axf, with two load regions, and with a start address of 0x1000, enter:

```
fromelf --i32combined --base=0x1000 --output=outfile2.bin infile2.axf
```

Related references

3.33 --i32 on page 3-64.
3.46 --output=destination on page 3-78.
3.35  --ignore_section=option[,option,...]

Specifies the sections to be ignored during a compare. Differences between the input files being
compared are ignored if they are in these sections.

**Syntax**

```
--ignore_section=option[,option,...]
```

Where `option` is one of:

- `object_name::`
  All sections in ELF objects with a name matching `object_name`.

- `object_name::section_name`
  All sections in ELF objects with a name matching `object_name` and also a section name
  matching `section_name`.

- `section_name`
  All sections with a name matching `section_name`.

You can:

- Use wildcard characters `?` and `*` for symbolic names in `symbol_name` and `object_name` arguments
- Specify multiple values in one `option` followed by a comma-separated list of arguments.

**Restrictions**

You must use `--compare` with this option.

**Related references**

- `3.8 --compare=option[,option,...]` on page 3-35.
- `3.36 --ignore_symbol=option[,option,...]` on page 3-67.
- `3.49 --relax_section=option[,option,...]` on page 3-81.
3.36 **--ignore_symbol=option[,option,…]**

Specifies the symbols to be ignored during a compare. Differences between the input files being compared are ignored if they are related to these symbols.

**Syntax**

```
--ignore_symbol=option[,option,...]
```

Where `option` is one of:

- `object_name::`
  - All symbols in ELF objects with a name matching `object_name`.
- `object_name::symbol_name`
  - All symbols in ELF objects with a name matching `object_name` and also a symbols name matching `symbol_name`.
- `symbol_name`
  - All symbols with a name matching `symbol_name`.

You can:
- Use wildcard characters `?` and `*` for symbolic names in `symbol_name` and `object_name` arguments
- Specify multiple values in one `option` followed by a comma-separated list of arguments.

**Restrictions**

You must use `--compare` with this option.

**Related references**

- 3.8 `--compare=option[,option,...]` on page 3-35.
- 3.35 `--ignore_section=option[,option,...]` on page 3-66.
- 3.50 `--relax_symbol=option[,option,...]` on page 3-82.
3.37 --in_place

Enables the translation of ELF members in an input file to overwrite the previous content.

Restrictions
You must use --elf with this option.

Example
To remove debug information from members of the library file test.a, enter:

```
fromelf --elf --in_place --strip=debug test.a
```

Related references
3.22 --elf on page 3-50.
3.57 --strip=option[,option,...] on page 3-89.
3.38 **--info=topic[,topic,..]**

Prints information about specific topics.

**Syntax**

```
--info=topic[,topic,..]
```

Where `topic` is a comma-separated list from the following topic keywords:

**instruction_usage**
- Categorizes and lists the ARM and Thumb instructions defined in the code sections of each input file.

**function_sizes**
- Lists the names of the global functions defined in one or more input files, together with their sizes in bytes and whether they are ARM or Thumb functions.

**function_sizes_all**
- Lists the names of the local and global functions defined in one or more input files, together with their sizes in bytes and whether they are ARM or Thumb functions.

**sizes**
- Lists the Code, RO Data, RW Data, ZI Data, and Debug sizes for each input object and library member in the image. Using this option implies `--info=sizes,totals`.

**totals**
- Lists the totals of the Code, RO Data, RW Data, ZI Data, and Debug sizes for input objects and libraries.

__________ Note __________

Code related sizes also include the size of any execute-only code.

__________

The output from `--info=sizes,totals` always includes the padding values in the totals for input objects and libraries.

__________ Note __________

Spaces are not permitted between topic keywords in the list. For example, you can enter `--info=sizes,totals` but not `--info=sizes, totals`.

__________

**Restrictions**

You can use this option only in text mode.

**Related references**

3.59 `--text` on page 3-92.
3.39 input_file

Specifies the ELF file or archive containing ELF files to be processed.

Usage

Multiple input files are supported if you:

- Output --text format.
- Use the --compare option.
- Use --elf with --in_place.
- Specify an output directory using --output.

If input_file is a scatter-loaded image that contains more than one load region and the output format is one of --bin, --cad, --m32, --i32, or --vhx, then fromelf creates a separate file for each load region.

If input_file is a scatter-loaded image that contains more than one load region and the output format is one of --cadcombined, --m32combined, or --i32combined, then fromelf creates a single file containing all load regions.

If input_file is an archive, you can process all files, or a subset of files, in that archive. To process a subset of files in the archive, specify a filter after the archive name as follows:

archive.a(filter_pattern)

where filter_pattern specifies a member file. To specify a subset of files use the following wildcard characters:

* Matches zero or more characters.
? Matched any single character.

Note

On Unix systems your shell typically requires the parentheses and these characters to be escaped with backslashes. Alternatively, enclose the archive name and filter in single quotes, for example:

'archive.a(??str*)'

Any files in the archive that are not processed are included in the output archive together with the processed files.

Example

To convert all files in the archive beginning with s, and create a new archive, my_archive.a, containing the processed and unprocessed files, enter:

fromelf archive.a(s*.o) --output=my_archive.a

Related concepts

3.59 --text on page 3-92.
3.61 --vhx on page 3-95.
3.40 --interleave=option

Inserts the original source code as comments into the disassembly if debug information is present.

Syntax

--interleave=option

Where option can be one of the following:

**line_directives**
Interleaves #line directives containing filenames and line numbers of the disassembled instructions.

**line_numbers**
Interleaves comments containing filenames and line numbers of the disassembled instructions.

**none**
Disables interleaving. This is useful if you have a generated makefile where the fromelf command has multiple options in addition to --interleave. You can then specify --interleave=none as the last option to ensure that interleaving is disabled without having to reproduce the complete fromelf command.

**source**
Interleaves comments containing source code. If the source code is no longer available then fromelf interleaves in the same way as line_numbers.

**source_only**
Interleaves comments containing source code. If the source code is no longer available then fromelf does not interleave that code.

Usage

Use this option with --emit=code, --text -c, or --disassemble.

Use this option with --source_directory if you want to specify additional paths to search for source code.

Default

The default is --interleave=none.

Related references

3.20 --disassemble on page 3-48.
3.23 --emit=option[,option,...] on page 3-51.
3.56 --source_directory=path on page 3-88.
3.59 --text on page 3-92.
3.41  --linkview, --no_linkview

Controls the section-level view from the ELF image.

Usage
--no_linkview discards the section-level view and retains only the segment-level view (load time view).

Discarding the section-level view eliminates:
• The section header table.
• The section header string table.
• The string table.
• The symbol table.
• All debug sections.

All that is left in the output is the program header table and the program segments.

According to the System V Application Binary Interface specification, these are all that a program loader can rely on being present in an ELF file.

Note
This option is deprecated.

Restrictions
The following restrictions apply:
• You must use --elf with --linkview and --no_linkview.
• Do not use the --no_linkview option with SysV images.

Example
To get ELF format output for image.axf, enter:

    fromelf --no_linkview --elf image.axf --output=image_nlk.axf

--privacy linker option.
3.42  \texttt{--localize=option[,option,...]}

Converts the selected symbols to local symbols.

\textbf{Syntax}

\texttt{--localize=option[,option,...]}

Where \texttt{option} is one of:

\texttt{object\_name::}

All symbols in ELF objects with a name matching \texttt{object\_name} are converted to local symbols.

\texttt{object\_name::symbol\_name}

All symbols in ELF objects with a name matching \texttt{object\_name} and also a symbol name matching \texttt{symbol\_name} are converted to local symbols.

\texttt{symbol\_name}

All symbols with a symbol name matching \texttt{symbol\_name} are converted to local symbols.

You can:

\begin{itemize}
  \item Use wildcard characters \texttt{?} and \texttt{*} for symbolic names in \texttt{symbol\_name} and \texttt{object\_name} arguments
  \item Specify multiple values in one \texttt{option} followed by a comma-separated list of arguments
\end{itemize}

\textbf{Restrictions}

You must use \texttt{--elf} with this option.

\textbf{Related references}

3.22 \texttt{--elf} on page 3-50.

3.31 \texttt{--hide=option[,option,...]} on page 3-62.
3.43 --m32

Produces Motorola 32-bit format (32-bit S-records) output. It generates one output file for each load region in the image.

You can specify the base address of the output with the --base option.

Restrictions
The following restrictions apply:

• You cannot use this option with object files.
• You must use --output with this option.

Considerations when using --m32
If you convert an ELF image containing multiple load regions to a binary format, fromelf creates an output directory named destination and generates one binary output file for each load region in the input image. Fromelf places the output files in the destination directory.

Note
For multiple load regions, the name of the first non-empty execution region in the corresponding load region is used for the filename.

A file is only created when the load region describes code or data that is present in the ELF file. For example a load region containing only execution regions with ZI data in them does not result in a output file.

Example
To convert the ELF file infile.axf to a Motorola 32-bit format file, for example outfile.bin, enter:

```
fromelf --m32 --output=outfile.bin infile.axf
```

Related references
3.1 --base [object_file::load_region_ID=num on page 3-27.
3.44 --m32combined on page 3-76.
3.46 --output=destination on page 3-78.
3.44 --m32combined

Produces Motorola 32-bit format (32-bit S-records) output. It generates one output file for an image containing multiple load regions.

You can specify the base address of the output with the --base option.

Restrictions
The following restrictions apply:
• You cannot use this option with object files.
• You must use --output with this option.

Considerations when using --m32combined
If you convert an ELF image containing multiple load regions to a binary format, fromelf creates an output directory named destination and generates one binary output file for all load regions in the input image. fromelf places the output file in the destination directory.

ELF images contain multiple load regions if, for example, they are built with a scatter file that defines more than one load region.

Example
To create a single Motorola 32-bit format output file, outfile2.bin, from an image file infile2.axf, with two load regions, and with a start address of 0x1000, enter:

```
fromelf --m32combined --base=0x1000 --output=outfile2.bin infile2.axf
```

Related references
3.1 --base [object_file::]load_region_ID=num on page 3-27.
3.43 --m32 on page 3-75.
3.46 --output=destination on page 3-78.
3.45 **--only=section_name**

Filters the list of sections that are displayed in the main section-by-section output from **--text**. It does not affect any additional output after the main section-by-section output.

**Syntax**

```
--only=section_name
```

Where `section_name` is the name of the section to be displayed.

You can:

- Use wildcard characters `?` and `*` for a section name.
- Use multiple **--only** options to specify additional sections to display.

**Examples**

The following examples show how to use **--only**:

- To display only the symbol table, `.symtab`, from the section-by-section output, enter:
  
  ```
  fromelf --only=.symtab --text -s test.axf
  ```

- To display all `ERn` sections, enter:
  
  ```
  fromelf --only=ER? test.axf
  ```

- To display the `HEAP` section and all symbol and string table sections, enter:
  
  ```
  fromelf --only=HEAP --only=.*tab --text -s -t test.axf
  ```

**Related references**

3.59 **--text** on page 3-92.
3.46 --output=destination

Specifies the name of the output file, or the name of the output directory if multiple output files are created.

Syntax

--output=destination
--o destination

Where destination can be either a file or a directory. For example:

--output=foo
is the name of an output file

--output=foo/
is the name of an output directory.

Usage

Usage with --bin or --elf:

• You can specify a single input file and a single output filename.
• If you specify many input files and use --elf, you can use --in_place to write the output of processing each file over the top of the input file.
• If you specify many input filenames and specify an output directory, then the output from processing each file is written into the output directory. Each output filename is derived from the corresponding input file. Therefore, specifying an output directory in this way is the only method of converting many ELF files to a binary or hexadecimal format in a single run of fromelf.
• If you specify an archive file as the input, then the output file is also an archive. For example, the following command creates an archive file called output.o:

    fromelf archive.a(s*.o) --output=output.o

• If you specify a pattern in parentheses to select a subset of objects from an archive, fromelf only converts the subset. All the other objects are passed through to the output archive unchanged.

Related references

3.2 --bin on page 3-28.
3.22 --elf on page 3-50.
3.59 --text on page 3-92.
3.47 --privacy

Modifies the output file to protect your code in images and objects that are delivered to third parties.

Usage

The effect of this option is different for images and object files.

For images, this option:

- Changes section names to a default value, for example, changes code section names to .text
- Removes the complete symbol table in the same way as --strip symbols
- Removes the .comment section name, and is marked as [Anonymous Section] in the fromelf --text output.

For object files, this option:

- Changes section names to a default value, for example, changes code section names to .text.
- Keeps mapping symbols and build attributes in the symbol table.
- Removes those local symbols that can be removed without loss of functionality.

Symbols that cannot be removed, such as the targets for relocations, are kept. For these symbols, the names are removed. These are marked as [Anonymous Symbol] in the fromelf --text output.

Related references

3.57 --strip=option[,option,...] on page 3-89.

Related information

--locals, --no_locals linker option.
--privacy linker option.
3.48 --qualify

Modifies the effect of the --fieldoffsets option so that the name of each output symbol includes an indication of the source file containing the relevant structure.

Usage

This enables the --fieldoffsets option to produce functional output even if two source files define different structures with the same name.

If the source file is in a different location from the current location, then the source file path is also included.

Examples

A structure called foo is defined in two headers for example, one.h and two.h.

Using fromelf --fieldoffsets, the linker might define the following symbols:

- foo.a, foo.b, and foo.c.
- foo.x, foo.y, and foo.z.

Using fromelf --qualify --fieldoffsets, the linker defines the following symbols:

- oneh_foo.a, oneh_foo.b and oneh_foo.c.
- twoh_foo.x, twoh_foo.y and twoh_foo.z.

Related references

3.26 --fieldoffsets on page 3-55.
---relax_section=option[,option,…]

Changes the severity of a compare report for the specified sections to warnings rather than errors.

**Restrictions**

You must use --compare with this option.

**Syntax**

--relax_section=option[,option,…]

Where *option* is one of:

- **object_name::**
  - All sections in ELF objects with a name matching *object_name*.
- **object_name::section_name**
  - All sections in ELF objects with a name matching *object_name* and also a section name matching *section_name*.
- **section_name**
  - All sections with a name matching *section_name*.

You can:
- Use wildcard characters ? and * for symbolic names in *section_name* and *object_name* arguments
- Specify multiple values in one *option* followed by a comma-separated list of arguments.

**Related references**

- 3.8 --compare=option[,option,…] on page 3-35.
- 3.35 --ignore_section=option[,option,…] on page 3-66.
- 3.50 --relax_symbol=option[,option,…] on page 3-82.
3.50 --relax_symbol=option[,option,…]

Changes the severity of a compare report for the specified symbols to warnings rather than errors.

Restrictions
You must use --compare with this option.

Syntax
--relax_symbol=option[,option,…]

Where option is one of:

object_name::
  All symbols in ELF objects with a name matching object_name.

object_name::symbol_name
  All symbols in ELF objects with a name matching object_name and also a symbol name
  matching symbol_name.

symbol_name
  All symbols with a name matching symbol_name.

You can:
  • Use wildcard characters ? and * for symbolic names in symbol_name and object_name arguments
  • Specify multiple values in one option followed by a comma-separated list of arguments.

Related references
3.8 --compare=option[,option,...] on page 3-35.
3.36 --ignore_symbol=option[,option,...] on page 3-67.
3.49 --relax_section=option[,option,...] on page 3-81.
3.51 \texttt{--rename=option[,option,…]}  

Renames the specified symbol in an output ELF object.

\textbf{Restrictions}  
You must use \texttt{--elf} and \texttt{--output} with this option.

\textbf{Syntax}  
\texttt{--rename=option[,option,…]}  

Where \texttt{option} is one of:

\begin{itemize}
  \item \texttt{object_name::old\_symbol\_name=new\_symbol\_name}
    
    This replaces all symbols in the ELF object \texttt{object\_name} that have a symbol name matching \texttt{old\_symbol\_name}.
  \item \texttt{old\_symbol\_name=new\_symbol\_name}
    
    This replaces all symbols that have a symbol name matching \texttt{old\_symbol\_name}.
\end{itemize}

You can:
\begin{itemize}
  \item Use wildcard characters \texttt{?} and \texttt{*} for symbolic names in \texttt{old\_symbol\_name}, \texttt{new\_symbol\_name}, and \texttt{object\_name} arguments.
  \item Specify multiple values in one \texttt{option} followed by a comma-separated list of arguments.
\end{itemize}

\textbf{Example}  
This example renames the \texttt{clock} symbol in the \texttt{timer.axf} image to \texttt{myclock}, and creates a new file called \texttt{mytimer.axf}:

\begin{verbatim}
fromelf --elf --rename=clock=myclock --output=mytimer.axf timer.axf
\end{verbatim}

\textbf{Related references}  
3.22 \texttt{--elf} on page 3-50.
3.46 \texttt{--output=destination} on page 3-78.
3.52 --select=select_options

When used with --fieldoffsets or --text -a options, displays only those fields that match a specified pattern list.

Syntax

--select=select_options

Where select_options is a list of patterns to match. Use special characters to select multiple fields:

- Use a comma-separated list to specify multiple fields, for example:
  a*,b*,c*

- Use the wildcard character * to match any name.
- Use the wildcard character ? to match any single letter.
- Prefix the select_options string with + to specify the fields to include. This is the default behavior.
- Prefix the select_options string with ~ to specify the fields to exclude.

If you are using a special character on Unix platforms, you must enclose the options in quotes to prevent the shell expanding the selection.

Usage

Use this option with either --fieldoffsets or --text -a.

Example

The output from the --fieldoffsets option might include the following data structure:

| structure.f1 | EQU 0 ; int16_t
| structure.f2 | EQU 0x2 ; int16_t
| structure.f3 | EQU 0x4 ; int16_t
| structure.f11| EQU 0x6 ; int16_t
| structure.f21| EQU 0x8 ; int16_t
| structure.f31| EQU 0xA ; int16_t
| structure.f111| EQU 0xC ; int16_t

To output only those fields that start with f1, enter:

`fromelf --select=structure.f1* --fieldoffsets infile.axf`

This produces the output:

| structure.f1 | EQU 0 ; int16_t
| structure.f11| EQU 0x6 ; int16_t
| structure.f111| EQU 0xC ; int16_t

Related references

3.59 --text on page 3-92.
3.53  

--show=option[,option,...]

Changes the symbol visibility property of the selected symbols, to mark them with default visibility.

**Syntax**

--show=option[,option,...]

Where `option` is one of:

- `object_name::`
  All symbols in ELF objects with a name matching `object_name` are marked as having default visibility.

- `object_name::symbol_name`
  All symbols in ELF objects with a name matching `object_name` and also a symbol name matching `symbol_name` are marked as having default visibility.

- `symbol_name`
  All symbols with a symbol name matching `symbol_name` are marked as having default visibility.

You can:
- Use wildcard characters `?` and `*` for symbolic names in `symbol_name` and `object_name` arguments
- Specify multiple values in one `option` followed by a comma-separated list of arguments.

**Restrictions**

You must use `--elf` with this option.

**Related references**

- 3.22 `--elf` on page 3-50.
- 3.31 `--hide=option[,option,...]` on page 3-62.
3.54  

--show_and_globalize=option[,option,…]

Changes the symbol visibility property of the selected symbols, to mark them with default visibility, and converts the selected symbols to global symbols.

**Syntax**

--show_and_globalize=option[,option,…]

Where `option` is one of:

- `object_name`:
  - All symbols in ELF objects with a name matching `object_name`.

- `object_name::symbol_name`:
  - All symbols in ELF objects with a name matching `object_name` and also a symbol name matching `symbol_name`.

- `symbol_name`:
  - All symbols with a symbol name matching `symbol_name`.

You can:

- Use wildcard characters `?` and `*` for symbolic names in `symbol_name` and `object_name` arguments
- Specify multiple values in one `option` followed by a comma-separated list of arguments.

**Restrictions**

You must use --elf with this option.

**Related references**

3.22 --elf on page 3-50.
### 3.55 --show_cmdline

Outputs the command line used by the ELF file converter.

**Usage**

Shows the command line after processing by the ELF file converter, and can be useful to check:

- The command line a build system is using.
- How the ELF file converter is interpreting the supplied command line, for example, the ordering of command-line options.

The commands are shown normalized, and the contents of any via files are expanded.

The output is sent to the standard error stream (`stderr`).

**Related references**

3.62 --via=file on page 3-96.
3.56  `--source_directory=path`

Explicitly specifies the directory of the source code.

**Syntax**

`--source_directory=path`

**Usage**

By default, the source code is assumed to be located in a directory relative to the ELF input file. You can use this option multiple times to specify a search path involving multiple directories.

You can use this option with `--interleave`.

**Related references**

3.40 `--interleave=option` on page 3-72.
3.57 --strip=option[,option,…]

Helps to protect your code in images and objects that are delivered to third parties. You can also use it to help reduce the size of the output image.

Syntax

--strip=option[,option,…]

Where option is one of:

all
For object modules, this option removes all debug, comments, notes and symbols from the ELF file. For executables, this option works the same as --no_linkview.

Note
Do not use the --strip=all option with SysV images.

debug
Removes all debug sections from the ELF file.

comment
Removes the .comment section from the ELF file.

file_symbols
The STT_FILE symbols are removed from the ELF file.

local_symbols
The effect of this option is different for images and object files.

For images, this option removes all local symbols, including mapping symbols, from the output symbol table.

For object files, this option:

• Keeps mapping symbols and build attributes in the symbol table.
• Removes those local symbols that can be removed without loss of functionality.

Symbols that cannot be removed, such as the targets for relocations, are kept. For these symbols, the names are removed. These are marked as [Anonymous Symbol] in the fromelf --text output.

notes
Removes the .notes section from the ELF file.

pathnames
Removes the path information from all symbols with type STT_FILE. For example, an STT_FILE symbol with the name C:\work\myobject.o is renamed to myobject.o.

Note
This option does not strip path names that are in the debug information.

symbols
The effect of this option is different for images and object files.

For images, this option removes the complete symbol table, and all static symbols. If any of these static symbols are used as a static relocation target, then these relocations are also removed. In all cases, STT_FILE symbols are removed.

For object files, this option:

• Keeps mapping symbols and build attributes in the symbol table.
• Removes those local symbols that can be removed without loss of functionality.

Symbols that cannot be removed, such as the targets for relocations, are kept. For these symbols, the names are removed. These are marked as [Anonymous Symbol] in the fromelf --text output.
Note

Stripping the symbols, path names, or file symbols might make the file harder to debug.

Restrictions

You must use --elf and --output with this option.

Example

To produce an output.axf file without debug from the ELF file infile.axf originally produced with debug, enter:

```
fromelf --strip=debug,symbols --elf --output=outfile.axf infile.axf
```

Related references

3.47 --privacy on page 3-79.

Related information

About mapping symbols.
--locals, --no_locals linker option.
--privacy linker option.
3.58  --symbolversions, --no_symbolversions

Turns off the decoding of symbol version tables.

Restrictions
If you use --elf with this option, you must also use --output.

Related information
About symbol versioning.
Base Platform ABI for the ARM Architecture.
**3.59 --text**

Prints image information in text format. You can decode an ELF image or ELF object file using this option.

**Syntax**

```
--text [options]
```

Where `options` specifies what is displayed, and can be one or more of the following:

- **-a**
  Prints the global and static data addresses (including addresses for structure and union contents).
  This option can only be used on files containing debug information. If no debug information is present, a warning is displayed.
  Use the `--select` option to output a subset of fields in a data structure.
  If you want to view the data addresses of arrays, expanded both inside and outside structures, use the `--expandarrays` option with this text category.

- **-c**
  This option disassembles code, alongside a dump of the original binary data being disassembled and the addresses of the instructions.
  
  -------- Note --------
  Unlike `--disassemble`, the disassembly cannot be input to the assembler.
  
- **-d**
  Prints contents of the data sections.

- **-e**
  Decodes exception table information for objects. Use with `-c` when disassembling images.

- **-g**
  Prints debug information.

- **-r**
  Prints relocation information.

- **-s**
  Prints the symbol and versioning tables.

- **-t**
  Prints the string tables.

- **-v**
  Prints detailed information on each segment and section header of the image.

- **-w**
  Eliminates line wrapping.

- **-y**
  Prints dynamic segment contents.

- **-z**
  Prints the code and data sizes.

These options are only recognized in text mode.

**Usage**

If you do not specify a code output format, `--text` is assumed. That is, you can specify one or more options without having to specify `--text`. For example, `fromelf -a` is the same as `fromelf --text -a`.

If you specify a code output format, such as `--bin`, then any `--text` options are ignored.
If destination is not specified with the --output option, or --output is not specified, the information is displayed on stdout.

Use the --only option to filter the list of sections.

Examples

The following examples show how to use --text:

• To produce a plain text output file that contains the disassembled version of an ELF image and the symbol table, enter:

  `fromelf --text -c -s --output=outfile.lst infile.axf`

• To list to stdout all the global and static data variables and all the structure field addresses, enter:

  `fromelf -a --select=* infile.axf`

• To produce a text file containing all of the structure addresses in infile.axf but none of the global or static data variable information, enter:

  `fromelf --text -a --select=*.dream --output=structaddress.txt infile.axf`

• To produce a text file containing addresses of the nested structures only, enter:

  `fromelf --text -a --select=*.dream.* --output=structaddress.txt infile.axf`

• To produce a text file containing all of the global or static data variable information in infile.axf but none of the structure addresses, enter:

  `fromelf --text -a --select=*,~dream.* --output=structaddress.txt infile.axf`

• To output only the .symtab section information in infile.axf, enter:

  `fromelf --only .symtab -s --output=symtab.txt infile.axf`

Related information

Linker options for getting information about images.
3.60 **--version_number**

Displays the version of fromelf you are using.

**Usage**
The ELF file converter displays the version number in the format nnnbbb, where:

- nnn is the version number.
- bbbb is the build number.

**Example**
Version 5.06 build 0019 is displayed as 5060019.

**Related references**
3.30 --help on page 3-61.
3.63 --vsn on page 3-97.
3.61 --vhx

Produces Byte oriented (Verilog Memory Model) hexadecimal format output.

**Usage**

This format is suitable for loading into the memory models of *Hardware Description Language* (HDL) simulators. You can split output from this option into multiple files with the --widthxbanks option.

**Restrictions**

The following restrictions apply:

- You cannot use this option with object files.
- You must use --output with this option.

**Considerations when using --vhx**

If you convert an ELF image containing multiple load regions to a binary format, `fromelf` creates an output directory named *destination* and generates one binary output file for each load region in the input image. `fromelf` places the output files in the *destination* directory.

Note: For multiple load regions, the name of the first non-empty execution region in the corresponding load region is used for the filename.

A file is only created when the load region describes code or data that is present in the ELF file. For example a load region containing only execution regions with ZI data in them does not result in a output file.

**Examples**

To convert the ELF file `infile.axf` to a byte oriented hexadecimal format file, for example `outfile.bin`, enter:

```
fromelf --vhx --output=outfile.bin infile.axf
```

To create multiple output files, in the `regions` directory, from an image file `multiload.axf`, with two 8-bit memory banks, enter:

```
fromelf --vhx --8x2 multiload.axf --output=regions
```

**Related references**

3.46 --output=destination on page 3-78.
3.65 --widthxbanks on page 3-99.
3.62 **--via=file**

Reads an additional list of input filenames and ELF file converter options from *filename*.

**Syntax**

```
--via=filename
```

Where *filename* is the name of a file containing options to be included on the command line.

**Usage**

You can enter multiple **--via** options on the ELF file converter command line. The **--via** options can also be included within a via file.
3.63 --vsn

Displays the version information and the license details.

Note

--vsn is intended to report the version information for manual inspection. The Component line indicates the release of ARM Compiler you are using. If you need to access the version in other tools or scripts, for example in build scripts, use the output from --version_number.

Example

```bash
> fromelf --vsn
Product: ARM Compiler N.nn
Component: ARM Compiler N.nn (toolchain_build_number)
Tool: fromelf [build_number]
license_type
Software supplied by: ARM Limited
```

Related references

- 3.30 --help on page 3-61.
- 3.60 --version_number on page 3-94.
3.64  -w

Causes some text output information that usually appears on multiple lines to be displayed on a single line.

Usage

This makes the output easier to parse with text processing utilities such as Perl.

Example

```
> fromelf --text -w -c test.axf
```

```
** ELF Header Information

** Section #1 '.text' (SHT_PROGBITS) [SHF_ALLOC + SHF_EXCEINSTR] Size : 36 bytes (alignment 4) Address: 0x00000000 $a .text

** Section #7 '.rel.text' (SHT_REL) Size : 8 bytes (alignment 4) Symbol table #6 '.symtab' 1 relocations applied to section #1 '.text'

** Section #2 '.ARM.exidx' (SHT_ARM_EXIDX) [SHF_ALLOC + SHF_LINK_ORDER] Size : 8 bytes (alignment 4) Address: 0x00000000 Link to section #1 '.text'

** Section #8 '.rel.ARM.exidx' (SHT_REL) Size : 8 bytes (alignment 4) Symbol table #6 '.symtab' 1 relocations applied to section #2 '.ARM.exidx'

** Section #3 '.arm_vfe_header' (SHT_PROGBITS) Size : 4 bytes (alignment 4) Symbol table #4 '.comment'

** Section #4 '.comment' (SHT_PROGBITS) Size : 74 bytes

** Section #5 '.debug_frame' (SHT_PROGBITS) Size : 140 bytes

** Section #9 '.rel.debug_frame' (SHT_REL) Size : 32 bytes (alignment 4) Symbol table #6 '.symtab' 4 relocations applied to section #5 '.debug_frame'

** Section #6 '.symtab' (SHT_SYMTAB) Size : 176 bytes (alignment 4) String table #11 '.strtab' Last local symbol no. 5

** Section #10 '.shstrtab' (SHT_STRTAB) Size : 110 bytes

** Section #11 '.strtab' (SHT_STRTAB) Size : 223 bytes

** Section #12 '.ARM.attributes' (SHT_ARM_ATTRIBUTES) Size : 69 bytes
```

Related references

3.59 --text on page 3-92.
---widthxbanks

Outputs multiple files for multiple memory banks.

**Syntax**

```
--widthxbanks
```

Where:

- `banks` specifies the number of memory banks in the target memory system. It determines the number of output files that are generated for each load region.
- `width` is the width of memory in the target memory system (8-bit, 16-bit, 32-bit, or 64-bit).

Valid configurations are:

<table>
<thead>
<tr>
<th>configuration</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--8x1</td>
<td>single 8-bit file per memory bank</td>
</tr>
<tr>
<td>--8x2</td>
<td>two 8-bit file per memory bank</td>
</tr>
<tr>
<td>--8x4</td>
<td>four 8-bit file per memory bank</td>
</tr>
<tr>
<td>--16x1</td>
<td>single 16-bit file per memory bank</td>
</tr>
<tr>
<td>--16x2</td>
<td>two 16-bit file per memory bank</td>
</tr>
<tr>
<td>--32x1</td>
<td>single 32-bit file per memory bank</td>
</tr>
<tr>
<td>--32x2</td>
<td>two 32-bit file per memory bank</td>
</tr>
<tr>
<td>--64x1</td>
<td>single 64-bit file per memory bank</td>
</tr>
</tbody>
</table>

**Usage**

`fromelf` uses the last specified configuration if more than one configuration is specified.

If the image has one load region, `fromelf` generates the same number of files as the number of `banks` specified. The filenames are derived from the `--output=destination` argument, using the following naming conventions:

- If there is one memory bank (`banks = 1`) the output file is named `destination`.
- If there are multiple memory banks (`banks > 1`), `fromelf` generates `banks` number of files named `destinationN` where `N` is in the range 0 to `banks - 1`. If you specify a file extension for the output filename, then the number `N` is placed before the file extension. For example:

  ```
  fromelf --vhex --8x2 test.axf --output=test.txt
  ```

  This generates two files named `test0.txt` and `test1.txt`.

If the image has multiple load regions, `fromelf` creates a directory named `destination` and generates `banks` files for each load region in that directory. The files for each load region are named `load_regionN` where `load_region` is the name of the load region, and `N` is in the range 0 to `banks - 1`. For example:

```
fromelf --vhex --8x2 multiload.axf --output=regions/
```

This might produce the following files in the `regions` directory:

```
EXEC_ROM0
EXEC_ROM1
RAM0
RAM1
```

The memory width specified by `width` controls the amount of memory that is stored in a single line of each output file. The size of each output file is the size of memory to be read divided by the number of files created. For example:

- `fromelf --vhex --8x4 test.axf --output=file` produces four files (`file0`, `file1`, `file2`, and `file3`). Each file contains lines of single bytes, for example:

  ```
  00 00 2D 00 00 2C
  ```
• fromelf --vhx --16x2 test.axf --output=file produces two files (file0 and file1). Each file contains lines of two bytes, for example:

| 0000 | 002D | 002C |

**Restrictions**

You must use **--output** with this option.

**Related references**

3.2 **--bin** on page 3-28.
3.46 **--output=destination** on page 3-78.
3.61 **--vhx** on page 3-95.
Chapter 4
Via File Syntax

Describes the syntax of via files accepted by fromelf.

It contains the following sections:

• 4.1 Overview of via files on page 4-102.
• 4.2 Via file syntax rules on page 4-103.
4.1 Overview of via files

Via files are plain text files that allow you to specify ELF file converter command-line arguments and options.

Typically, you use a via file to overcome the command-line length limitations. However, you might want to create multiple via files that:

- Group similar arguments and options together.
- Contain different sets of arguments and options to be used in different scenarios.

Note

In general, you can use a via file to specify any command-line option to a tool, including --via. This means that you can call multiple nested via files from within a via file.

Via file evaluation

When the ELF file converter is invoked it:

1. Replaces the first specified --via via_file argument with the sequence of argument words extracted from the via file, including recursively processing any nested --via commands in the via file.
2. Processes any subsequent --via via_file arguments in the same way, in the order they are presented.

That is, via files are processed in the order you specify them, and each via file is processed completely including processing nested via files before processing the next via file.

Related references

4.2 Via file syntax rules on page 4-103.
3.62 --via=file on page 3-96.
4.2 Via file syntax rules

Via files must conform to some syntax rules.

- A via file is a text file containing a sequence of words. Each word in the text file is converted into an argument string and passed to the tool.
- Words are separated by whitespace, or the end of a line, except in delimited strings, for example:
  ```
  --vhx --8x2 (two words)
  --vhx--8x2 (one word)
  ```
- The end of a line is treated as whitespace, for example:
  ```
  --vhx
  --8x2
  ```
  This is equivalent to:
  ```
  --vhx --8x2
  ```
- Strings enclosed in quotation marks ("), or apostrophes (‘) are treated as a single word. Within a quoted word, an apostrophe is treated as an ordinary character. Within an apostrophe delimited word, a quotation mark is treated as an ordinary character.
  Use quotation marks to delimit filenames or path names that contain spaces, for example:
  ```
  --output C:\My Project\output.txt (three words)
  --output "C:\My Project\output.txt" (two words)
  ```
  Use apostrophes to delimit words that contain quotes, for example:
  ```
  -DNAME="ARM Compiler" (one word)
  ```
- Characters enclosed in parentheses are treated as a single word, for example:
  ```
  --option(x, y, z) (one word)
  --option (x, y, z) (two words)
  ```
- Within quoted or apostrophe delimited strings, you can use a backslash (\) character to escape the quote, apostrophe, and backslash characters.
- A word that occurs immediately next to a delimited word is treated as a single word, for example:
  ```
  --output"C:\Project\output.txt"
  ```
  This is treated as the single word:
  ```
  --output C:\Project\output.txt
  ```
- Lines beginning with a semicolon (;) or a hash (#) character as the first nonwhitespace character are comment lines. A semicolon or hash character that appears anywhere else in a line is not treated as the start of a comment, for example:
  ```
  -o objectname.axf ;this is not a comment
  ```
  A comment ends at the end of a line, or at the end of the file. There are no multi-line comments, and there are no part-line comments.

Appendix A
fromelf Document Revisions

Describes the technical changes that have been made to the fromelf Image Converter User Guide. It contains the following sections:
A.1 Revisions for fromelf Image Converter User Guide

The following technical changes have been made to the fromelf Image Converter User Guide.

Table A-1 Differences between issue L and issue M

<table>
<thead>
<tr>
<th>Change</th>
<th>Topics affected</th>
</tr>
</thead>
<tbody>
<tr>
<td>Simplified the table to make it less confusing.</td>
<td>2.3 Options to protect code in image files with fromelf on page 2-19</td>
</tr>
<tr>
<td>Removed references to --licretry because the option no longer has an effect.</td>
<td>--licretry</td>
</tr>
<tr>
<td>Enhanced the Usage section to list the command-line options that are required with --elf.</td>
<td>3.22 --elf on page 3-50</td>
</tr>
</tbody>
</table>

Table A-2 Differences between issue K and issue L

<table>
<thead>
<tr>
<th>Change</th>
<th>Topics affected</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removed the description of --device=name.</td>
<td>Chapter 3 fromelf Command-line Options on page 3-25</td>
</tr>
</tbody>
</table>

Table A-3 Differences between issue J and issue K

<table>
<thead>
<tr>
<th>Change</th>
<th>Topics affected</th>
</tr>
</thead>
<tbody>
<tr>
<td>Added a generic note about supported features in ARM Compiler.</td>
<td>1.1 About the fromelf image converter on page 1-12</td>
</tr>
<tr>
<td>Removed the description of --device=list.</td>
<td>Chapter 3 fromelf Command-line Options on page 3-25</td>
</tr>
</tbody>
</table>
| Clarified the descriptions for --only and --select options. | • 3.45 --only=section_name on page 3-77.  
• 3.52 --select=select_options on page 3-84. |

Table A-4 Differences between issue H and issue J

<table>
<thead>
<tr>
<th>Change</th>
<th>Topics affected</th>
</tr>
</thead>
</table>
| Added a note to state that fromelf does not generate a binary output file for a load region that contains only execution regions with ZI data in them. | • 3.2 --bin on page 3-28  
• 3.6 --cad on page 3-32  
• 3.33 --i32 on page 3-64  
• 3.43 --m32 on page 3-75  
• 3.61 --vhx on page 3-95 |
| Moved the examples to the corresponding command-line options, and removed the topics. | • Converting an ELF image to Intel Hex-32 format.  
• Converting an ELF image to Motorola 32-bit format.  
• Converting an ELF image to plain binary format.  
• Converting an ELF image to Byte oriented (Verilog Memory Model) hexadecimal format.  
• Controlling debug information in output files.  
• Disassembling an ELF-formatted file. |

<tr>
<td>Added notes to the descriptions of the --project, --reinitialize_workdir, and --workdir options.</td>
<td>• --reinitialize_workdir</td>
</tr>
<tr>
<td></td>
<td>• --workdir=directory</td>
</tr>
</tbody>
</table>

### Table A-9 Differences between Issue A and Issue B

<table>
<thead>
<tr>
<th>Change</th>
<th>Topics affected</th>
</tr>
</thead>
<tbody>
<tr>
<td>Added list item stating that fromelf can now process all files in an archive.</td>
<td>1.1 About the fromelf image converter on page 1-12</td>
</tr>
<tr>
<td>Added new topic to describe how to process ELF files in an archive.</td>
<td>2.2 Examples of processing ELF files in an archive on page 2-18</td>
</tr>
<tr>
<td>Clarified the description of protecting code in images and objects with fromelf, and the use of --privacy and --strip command-line options.</td>
<td>• 2.3 Options to protect code in image files with fromelf on page 2-19</td>
</tr>
<tr>
<td></td>
<td>• 2.4 Options to protect code in object files with fromelf on page 2-20</td>
</tr>
<tr>
<td>Change</td>
<td>Topics affected</td>
</tr>
<tr>
<td>------------------------------------------------------------------------</td>
<td>------------------------------------------------------</td>
</tr>
<tr>
<td>Added an example for <strong>--decode_build_attributes</strong> command-line option</td>
<td>3.14 <strong>--decode_build_attributes</strong> on page 3-42</td>
</tr>
<tr>
<td>Added an example for <strong>--dump_build_attributes</strong> command-line option</td>
<td>3.21 <strong>--dump_build_attributes</strong> on page 3-49</td>
</tr>
<tr>
<td>Modified description of <strong>build_attributes</strong> option to the <strong>--emit</strong> command-line option</td>
<td>3.23 <strong>--emit=option[,option,...]</strong> on page 3-51</td>
</tr>
<tr>
<td>Added an example for <strong>--extract_build_attributes</strong> command-line option</td>
<td>3.25 <strong>--extract_build_attributes</strong> on page 3-54</td>
</tr>
<tr>
<td>Modified the description of <strong>input_file</strong> to describe the processing of ELF files in an archive.</td>
<td>3.39 <strong>input_file</strong> on page 3-70</td>
</tr>
<tr>
<td>Noted that the <strong>--[no_]linkview</strong> command-line option is deprecated</td>
<td>3.41 <strong>--linkview, --no_linkview</strong> on page 3-73</td>
</tr>
<tr>
<td>Added additional information about using input archive files with the <strong>--output</strong> command-line option</td>
<td>3.46 <strong>--output=destination</strong> on page 3-78</td>
</tr>
<tr>
<td>Clarified the description of the <strong>--privacy</strong> command-line option</td>
<td>3.47 <strong>--privacy</strong> on page 3-79</td>
