# Preface

This preface introduces the *ARM® Compiler Errors and Warnings Reference Guide*.

It contains the following:

- *About this book on page 7.*
- *Feedback on page 9.*

## About this book

ARM Compiler Errors and Warnings Reference Guide. This manual lists the errors and warnings that each of the compilation tools can generate. Available as a PDF.

## Using this book

This book is organized into the following chapters:

### **Chapter 1 C and C++ Compiler Errors and Warnings**

Describes the error and warning messages for the C and C++ compiler, **armcc**.

### **Chapter 2 Assembler Errors and Warnings**

Describes the error and warning messages for the assembler, **armasm**.

### **Chapter 3 Linker Errors and Warnings**

Describes the error and warning messages for the linker, **armlink**.

### **Chapter 4 ELF Image Converter Errors and Warnings**

Describes the error and warning messages for the ELF image converter, **fromelf**.

### **Chapter 5 Librarian Errors and Warnings**

Describes the error and warning messages for the ARM librarian, **armar**.

### **Chapter 6 Other Errors and Warnings**

Describes error and warning messages that might be displayed by any of the tools.

### **Appendix A Errors and Warnings Reference Guide Document Revisions**

Describes the technical changes that have been made to the Errors and Warnings Reference Guide.

## Typographic conventions

*italic*

Introduces special terminology, denotes cross-references, and citations.

**bold**

Highlights interface elements, such as menu names. Denotes signal names. Also used for terms in descriptive lists, where appropriate.

`monospace`

Denotes text that you can enter at the keyboard, such as commands, file and program names, and source code.

`monospace`

Denotes a permitted abbreviation for a command or option. You can enter the underlined text instead of the full command or option name.

*`monospace italic`*

Denotes arguments to monospace text where the argument is to be replaced by a specific value.

**`monospace bold`**

Denotes language keywords when used outside example code.

<and>

Encloses replaceable terms for assembler syntax where they appear in code or code fragments. For example:

```
MRC p15, 0 <Rd>, <CRn>, <CRm>, <Opcode_2>
```

SMALL CAPITALS

Used in body text for a few terms that have specific technical meanings, that are defined in the *ARM glossary*. For example, IMPLEMENTATION DEFINED, IMPLEMENTATION SPECIFIC, UNKNOWN, and UNPREDICTABLE.

## Feedback

### Feedback on this product

If you have any comments or suggestions about this product, contact your supplier and give:

- The product name.
- The product revision or version.
- An explanation with as much information as you can provide. Include symptoms and diagnostic procedures if appropriate.

### Feedback on content

If you have comments on content then send an e-mail to [errata@arm.com](mailto:errata@arm.com). Give:

- The title.
- The number ARM DUI0496J.
- The page number(s) to which your comments refer.
- A concise explanation of your comments.

ARM also welcomes general suggestions for additions and improvements.

# Chapter 1

## C and C++ Compiler Errors and Warnings

Describes the error and warning messages for the C and C++ compiler, **armcc**.

It contains the following:

- *1.1 Suppressing armcc error and warning messages on page 1-11.*
- *1.2 List of the armcc error and warning messages on page 1-12.*
- *1.3 List of the old-style armcc error and warning messages on page 1-80.*

## 1.1 Suppressing armcc error and warning messages

You can use command-line options to control the severity of the diagnostic messages that the compiler produces.

The compiler normally warns of potential portability problems and other hazards.

When porting legacy code (for example, in old-style C) to the ARM Compiler, many warnings might be reported. It might be tempting to disable all such warnings with `-w`. ARM recommends however that for portability reasons, you change the code to make it ANSI compatible rather than suppressing the warnings.

Some warnings are suppressed by default. To override this, use the `--strict_warnings` switch to enable all suppressed warnings.

By default, optimization messages, for example most of the messages between 1593 and 2159, are not warnings. To treat optimization messages as warnings, use the `--diag_warning=optimizations` option.

### Related information

*--diag\_warning=tag[,tag,...] compiler option.*

*--strict\_warnings compiler option.*

*-W compiler option.*

## 1.2 List of the armcc error and warning messages

A list of the error and warning messages that **armcc** produces.

0: unknown error

1: last line of file ends without a new line

2: last line of file ends with a backslash

3: #include file <entity> includes itself

4: out of memory

5: cannot open <entity> input file <filename>: <reason>

For example:

```
#include <file.h>
```

results in the message:

```
Error: #5: cannot open source input file "file.h": No such file or directory
```

because `file.h` does not exist in the system include directory.

6: comment unclosed at end of file

Comment started with `/*` but no matching `*/` to close the comment.

7: unrecognized token

8: missing closing quote

For example:

```
char foo[] = {"\"};
```

In this example, the backslash causes the following quote `"` to be treated as a literal character rather than closing the string. To fix this, use:

```
char foo[] = {"\\"};
```

9: nested comment is not allowed

For example:

```
/*nested  
/*comment*/
```

10: `"#"` not expected here

11: unrecognized preprocessing directive

For example:

```
#foo
```

12: parsing restarts here after previous syntax error

13: expected a file name

For example:

```
#include <>
```

14: extra text after expected end of preprocessing directive

For example:

```
#if EMBEDDED foo
```

or:

```
#include <stdio.h> foo
```

or:

```
#ifdef SOMETHING  
:  
#endif SOMETHING
```

The `#endif` does not expect or require any argument. Enclosing the trailing part of the line in a comment fixes the problem:

```
#endif /* SOMETHING */
```

16: `<entity>` is not a valid source file name

17: expected a "]"

18: expected a ")"

19: extra text after expected end of number

For example:

```
int a = 37r;
```

20: identifier `<entity>` is undefined

For example, when compiled for C++, the code:

```
void foo( arg ) { }
```

results in the message:

```
Error: #20: identifier <arg> is undefined
```

Another example of code that can cause this error is:

```
int foo(void)  
{  
    int a = 4;  
    a = i;  
}
```

which results in the message:

```
Error: #20: identifier "i" is undefined
```

because `i` has not been declared.

21: type qualifiers are meaningless in this declaration

22: invalid hexadecimal number

23: integer constant is too large

24: invalid octal digit

For example:

```
int a = 0378;
```

25: quoted string should contain at least one character

For example:

```
char a ='';
```

26: too many characters in character constant

For example, the following code produces this warning because the multibyte character consists of more bytes than can fit into an int:

```
int a ='abcde';
```

27: character value is out of range

This error can occur when a character value described by a hex constant is too large to be represented in a char variable, for example:

```
char x = '\x100';
```

28: expression must have a constant value

29: expected an expression

30: floating constant is out of range

31: expression must have integral type

32: expression must have arithmetic type

33: expected a line number

34: invalid line number

35: #error directive: <entity>

36: the #if for this directive is missing

37: the #endif for this directive is missing

An open #if was still active, but was not closed with #endif before the end of file.

38: directive is not allowed -- an #else has already appeared

39: division by zero

40: expected an identifier

This error is raised if preprocessor statements are incorrectly formatted, for example if an identifier which must immediately follow a #define preprocessor command is missing.

This error can also occur when code uses a keyword as an identifier, for example:

```
int if =0;
```

41: expression must have arithmetic or pointer type

42: operand types are incompatible (<type> and <type>)

44: expression must have pointer type

45: #undef may not be used on this predefined name

46: <entity> is predefined; attempted redefinition ignored

47: incompatible redefinition of macro <entity>

A macro has been defined twice, with different replacement strings.

For example:

```
#define TEST 0  
#define TEST 1
```

causes the compiler to produce:

```
Warning: #47-D: incompatible redefinition of macro "TEST" (declared at line 1)
```

If it is necessary to do this, undefine the macro using `#undef` before the second definition.

If you want to define a macro, unless it already has a definition, you can use conditional preprocessing, for example:

```
#ifndef TEST  
#define TEST 0  
#endif
```

Compiling this with `armcc -c foo.c` defines TEST to be 0 (the default).

Compiling this with `armcc -c -DTEST=1 foo.c` defines TEST to be 1.

49: duplicate macro parameter name

50: "##" may not be first in a macro definition

51: "##" may not be last in a macro definition

52: expected a macro parameter name

53: expected a ":"

54: too few arguments in macro invocation

55: too many arguments in macro invocation

56: operand of sizeof may not be a function

57: this operator is not allowed in a constant expression

58: this operator is not allowed in a preprocessing expression

59: function call is not allowed in a constant expression

60: this operator is not allowed in an integral constant expression

61: integer operation result is out of range

62: shift count is negative

63: shift count is too large

64: declaration does not declare anything

For example:

```
int;
```

65: expected a ";"

66: enumeration value is out of "int" range

This diagnostic message is generated by the compiler when an enum constant is outside the range of a signed int.

For example, the compiler generates this warning when the following code is compiled in C mode:

```
typedef enum
{
    Bit31 = 0x80000000
} Bits;
```

———— **Note** —————

This description applies to RVCT 2.2 and later.

C mode:

- the warning is produced but the compiler promotes the constants to unsigned
- the switch `--strict` always produces this message as an error.

C++ mode:

- by default the out-of-range constants are promoted to unsigned without a warning and also when `--strict` is used

As a work around for cases where the message is an error use the following code example:

```
typedef enum
{
    Bit31 = (int)0x80000000
} Bits;
```

An overflow no longer occurs, and so no error is reported.

———— **Note** —————

The value of `Bit31` is now negative because it is a signed int.

See the following in the compiler document:

[\*Structures, unions, enumerations, and bitfields.\*](#)

67: expected a "}"

68: integer conversion resulted in a change of sign

The constant is too large to be represented in a signed long, and therefore has been given unsigned type.

Example:

```
long l = 2147483648;
```

69: integer conversion resulted in truncation

70: incomplete type is not allowed

Example:

```
typedef struct {  
    unsigned char size;  
    char string[];  
} F00;
```

By not declaring a size for the array in the structure, the compiler is not able to allocate a size of the structure. Incomplete types are permitted in `--gnu` and `--c99` modes.

71: operand of sizeof may not be a bit field

76: argument to macro is empty

77: this declaration has no storage class or type specifier

78: a parameter declaration may not have an initializer

79: expected a type specifier

The ellipses to denote variadic functions, such as `printf()`, must follow at least one parameter. For example, change:

```
int foo( ... );
```

to:

```
int foo( int bar, ... );
```

80: a storage class may not be specified here

81: more than one storage class may not be specified

82: storage class is not first

83: type qualifier specified more than once

84: invalid combination of type specifiers

The type name or type qualifier cannot be used in the same declaration as the second type name or type qualifier. For example:

```
typedef int int;
```

85: invalid storage class for a parameter

86: invalid storage class for a function

87: a type specifier may not be used here

88: array of functions is not allowed

89: array of void is not allowed

90: function returning function is not allowed

91: function returning array is not allowed

92: identifier-list parameters may only be used in a function definition

93: function type may not come from a typedef

94: the size of an array must be greater than zero

Zero-sized arrays are permitted only when in `--gnu` mode, for example:

```
char name[0];
```

See the following in the compiler document:

- [`--gnu`](#)
- [GNU extensions to the C and C++ languages](#).

95: array is too large

There is a limit of 4GB on the maximum size of arrays or structures.

96: a translation unit must contain at least one declaration

97: a function may not return a value of this type

98: an array may not have elements of this type

99: a declaration here must declare a parameter

100: duplicate parameter name

101: <entity> has already been declared in the current scope

102: forward declaration of enum type is nonstandard

103: class is too large

104: struct or union is too large

There is a limit of 4GB on the maximum size of arrays or structures.

105: invalid size for bit field

Bit fields must not be larger than the size of the type.

For example, with `--strict`:

```
struct X{  
    int y:5000;  
};
```

106: invalid type for a bit field

Bit fields must have integral type.

Example:

```
struct X{  
    float x:5;  
    float y:2;  
};
```

107: zero-length bit field must be unnamed

108: signed bit field of length 1

109: expression must have (pointer-to-) function type

110: expected either a definition or a tag name

111: statement is unreachable

112: expected "while"

114: <entity> was referenced but not defined

115: a continue statement may only be used within a loop

116: a break statement may only be used within a loop or switch

Example:

```
void foo(void){  
    int a=0;  
    continue;  
}
```

or:

```
void bar(void){  
    int a=0;  
    break;  
}
```

117: non-void <entity> should return a value

118: a void function may not return a value

119: cast to type <type> is not allowed

120: return value type does not match the function type

121: a case label may only be used within a switch

122: a default label may only be used within a switch

123: case label value has already appeared in this switch

124: default label has already appeared in this switch

125: expected a "("

126: expression must be an lvalue

127: expected a statement

128: loop is not reachable from preceding code

129: a block-scope function may only have extern storage class

130: expected a "{"

131: expression must have pointer-to-class type

132: expression must have pointer-to-struct-or-union type

133: expected a member name

134: expected a field name

135: <entity> has no member <entity>

136: <entity> has no field <entity>

137: expression must be a modifiable lvalue

138: taking the address of a register variable is not allowed

139: taking the address of a bit field is not allowed

140: too many arguments in function call

Function declaration does not match the number of parameters in an earlier function prototype.

Example:

```
extern void foo(int x);  
void bar(void)  
{  
    foo(1,2);  
}
```

141: unnamed prototyped parameters not allowed when body is present

142: expression must have pointer-to-object type

143: program too large or complicated to compile

144: a value of type <type> cannot be used to initialize an entity of type <type>

The initializing string for a fixed size character array is exactly as long as the array size, leaving no room for a terminating `\0`, for example:

```
char name[5] = "Hello";
```

The name array can hold up to 5 characters. "Hello" does not fit because C strings are always null-terminated (for example, "Hello\0"). The compiler reports:

```
Error: #144: a value of type "const char [6]" cannot be used to initialize an  
entity of type "char [5]"
```

A similar error is also raised if there is an implicit cast of non-zero int to pointer.

For example:

```
void foo_func( void )  
{  
    char *foo=1;  
}
```

results in the message:

```
#144: a value of type "int" cannot be used to initialize an entity of type  
"char *"
```

For the cast, this error can be suppressed with the use of the `--loose_implicit_cast` switch.

145: <entity> may not be initialized

146: too many initializer values

147: declaration is incompatible with <entity>

The following incorrect C code causes an error in all modes. This can be downgraded from an error to a warning by using `--diag_warning 147`, or suppressed completely by using `--diag_suppress 147`.

```
typedef enum { e } E;  
typedef enum { f } F;  
E g(void);  
F g(void);
```

- 148: <entity> has already been initialized
- 149: a global-scope declaration may not have this storage class
- 150: a type name may not be redeclared as a parameter
- 151: a typedef name may not be redeclared as a parameter
- 152: conversion of nonzero integer to pointer
- 153: expression must have class type
- 154: expression must have struct or union type
- 155: old-fashioned assignment operator
- 156: old-fashioned initializer
- 157: expression must be an integral constant expression
- 158: expression must be an lvalue or a function designator
- 159: declaration is incompatible with previous <entity>
- 160: external name conflicts with external name of <entity>
- 161: unrecognized #pragma
- 163: could not open temporary file <entity>
- 164: name of directory for temporary files is too long (<entity>)
- 165: too few arguments in function call  
Function prototype is defined with a number of parameters that does not match the number of parameters passed in the function call.

For example:

```
extern void foo(int x);  
void bar(void)  
{  
    foo();  
}
```

- 166: invalid floating constant
  - 167: argument of type <type> is incompatible with parameter of type <type>
  - 168: a function type is not allowed here
  - 169: expected a declaration  
This can occur when attempting to compile some C++ header files with the C compiler instead of the C++ compiler.
  - 170: pointer points outside of underlying object
  - 171: invalid type conversion
  - 172: external/internal linkage conflict with previous declaration  
The compiler suppresses errors about linkage disagreements, where functions are implicitly declared as `extern` and later re-declared as `static`, unless the `--strict` option is used. For example:
- ```
extern void foo(void);  
static void foo(void){}
```
- 173: floating-point value does not fit in required integral type
  - 174: expression has no effect

175: subscript out of range

177: <entity> was declared but never referenced

By default, unused declaration warnings are given for:

- Local (within a function) declarations of variables, typedefs, and functions.
- Labels (always within a function).
- Top-level static functions and static variables.

The `--diag_suppress 177` option suppresses these warnings.

178: "&" applied to an array has no effect

179: right operand of "%" is zero

180: argument is incompatible with formal parameter

181: argument is incompatible with corresponding format string conversion

For example when compiling with `--strict`, the following code:

```
unsigned long foo = 0x1234;  
printf("%08X", foo);
```

results in the warning:

```
Warning: #181-D: argument is incompatible with corresponding format string  
conversion
```

To avoid the warning, the code could be rewritten as follows:

```
unsigned long foo = 0x1234;  
printf("%01X", foo);
```

or alternatively:

```
unsigned int foo = 0x1234;  
printf("%0X", foo);
```

`%0X` can be used for `char`, `short` or `int`. Use `1X` for a long integer, even though both `ints` and `longs` are 32-bits wide on an ARM processor.

182: could not open source file <entity> (no directories in search list)

183: type of cast must be integral

184: type of cast must be arithmetic or pointer

185: dynamic initialization in unreachable code

186: pointless comparison of unsigned integer with zero

For example:

```
unsigned short foo;  
if (foo<0) printf("This never happens");
```

gives a warning that the comparison between an unsigned (for example, `char` or `int`) value and zero always evaluates to false.

187: use of "=" where "==" may have been intended

For example:

```
int main(void)
{
    int a;
    const int b =1;
    if (a=b);
}
```

If the assignment in the `if` statement is intentional, then you can avoid the warning by adding an explicit comparison. For example, change the `if` statement in the example to:

```
if ((a=b)!=0);
```

188: enumerated type mixed with another type

189: error while writing <entity> file

190: invalid intermediate language file

191: type qualifier is meaningless on cast type

The C specification states that a cast does not yield an lvalue, so a cast to a qualified type has the same effect as a cast to the unqualified version of the type. This warning is to inform you that the type qualifier has no effect, although the code is still legal. The warning is suppressible with `--diag_suppress 191`.

For example:

```
val2 = (const float)val1;
```

is equivalent to:

```
val2 = (float)val1;
```

192: unrecognized character escape sequence

This error is commonly associated with the attempted use of non-ASCII character sets, such as 16-bit Unicode characters. The compiler supports multibyte character sets, such as Unicode. Source files are compiled according to the selected locale of that machine. It is possible to use *Escape processing* (as recommended by Kernighan and Ritchie, section A2.5.2) to encode specific values instead.

For example:

```
char *p = "\x12\x34\x56\x78"; // 12 34 56 78
```

In character and string escapes, if the character following the `\` has no special meaning, the value of the escape is the character itself, for example, `\s` is the same as `s` and the warning is given.

193: zero used for undefined preprocessing identifier <entity>

194: expected an asm string

195: an asm function must be prototyped

196: an asm function may not have an ellipsis

219: error while deleting file <entity>

220: integral value does not fit in required floating-point type

221: floating-point value does not fit in required floating-point type

222: floating-point operation result is out of range

223: function <entity> declared implicitly

This is a common warning that occurs where there is no prototype for a function.

For example:

```
void foo(void)
{
    printf("foo");
}
```

To fix this, add `#include <stdio.h>` to include the prototype for `printf()`.

For ANSI C, you can suppress this warning with `--diag_suppress 223`. This is useful when compiling old-style C in ANSI C mode.

224: the format string requires additional arguments

225: the format string ends before this argument

226: invalid format string conversion

227: macro recursion

228: trailing comma is nonstandard

229: bit field cannot contain all values of the enumerated type

230: nonstandard type for a bit field

In strict ANSI C, the only types permitted for a bit field are `int`, `signed int`, and `unsigned int`.

For example:

```
struct X {
    char y:2;
};
```

231: declaration is not visible outside of function

232: old-fashioned typedef of "void" ignored

233: left operand is not a struct or union containing this field

234: pointer does not point to struct or union containing this field

235: variable <entity> was declared with a never-completed type

236: controlling expression is constant

237: selector expression is constant

238: invalid specifier on a parameter

239: invalid specifier outside a class declaration

240: duplicate specifier in declaration

241: a union is not allowed to have a base class

242: multiple access control specifiers are not allowed

243: class or struct definition is missing

244: qualified name is not a member of class <type> or its base classes

245: a nonstatic member reference must be relative to a specific object

246: a nonstatic data member may not be defined outside its class

247: <entity> has already been defined

A typical example of this is where a variable name has been used more than once.

This can sometimes occur when compiling legacy code that relies on tentative declarations. Tentative declarations permit a variable to be declared and initialized as separate statements such as:

```
int a;  
int a = 1;
```

Tentative declarations are permitted by default for C code, but produce an error with C++ code.

248: pointer to reference is not allowed

249: reference to reference is not allowed

250: reference to void is not allowed

251: array of reference is not allowed

252: reference <entity> requires an initializer

253: expected a ",",

254: type name is not allowed

This occurs when a typedef name is being used directly in an expression, for example:

```
typedef int footype;  
int x = footype; // reports Error: #254: type name is not allowed
```

To fix this, first create an instance of that type, for example, a variable of the new type:

```
typedef int footype;  
footype bar = 1;  
int x = bar;
```

255: type definition is not allowed

256: invalid redeclaration of type name <entity>

257: const <entity> requires an initializer

258: "this" may only be used inside a nonstatic member function

259: constant value is not known

260: explicit type is missing ("int" assumed)

261: access control not specified (<entity> by default)

262: not a class or struct name

263: duplicate base class name

264: invalid base class

265: <entity> is inaccessible

For C++ only, the `--diag_warning 265` option downgrades access control errors to warnings.

For example:

```
class A { void f() {} }; // private member
A a;
void g() { a.f(); } // erroneous access
```

results in the message:

```
Error: #265-D: function "A::f" is inaccessible
```

266: <entity> is ambiguous

267: old-style parameter list (anachronism)

268: declaration may not appear after executable statement in block

269: conversion to inaccessible base class <type> is not allowed

274: improperly terminated macro invocation

276: name followed by "::<" must be a class or namespace name

277: invalid friend declaration

278: a constructor or destructor may not return a value

279: invalid destructor declaration

280: declaration of a member with the same name as its class

281: global-scope qualifier (leading "::<") is not allowed

282: the global scope has no <entity>

283: qualified name is not allowed

284: NULL reference is not allowed

285: initialization with "<...>" is not allowed for object of type <type>

286: base class <type> is ambiguous

287: derived class <type> contains more than one instance of class <type>

288: cannot convert pointer to base class <type> to pointer to derived class <type> -- base class is virtual

289: no instance of constructor <entity> matches the argument list

290: copy constructor for class <type> is ambiguous

291: no default constructor exists for class <type>

292: <entity> is not a nonstatic data member or base class of class <type>

293: indirect nonvirtual base class is not allowed

294: invalid union member -- class <type> has a disallowed member function

296: invalid use of non-lvalue array

297: expected an operator

- 298: inherited member is not allowed
- 299: cannot determine which instance of <entity> is intended
- 300: a pointer to a bound function may only be used to call the function
- 301: typedef name has already been declared (with same type)
- 302: <entity> has already been defined
- 304: no instance of <entity> matches the argument list
- 305: type definition is not allowed in function return type declaration
- 306: default argument not at end of parameter list
- 307: redefinition of default argument
- 308: more than one instance of <entity> matches the argument list:
- 309: more than one instance of constructor <entity> matches the argument list:
- 310: default argument of type <type> is incompatible with parameter of type <type>
- 311: cannot overload functions distinguished by return type alone
- 312: no suitable user-defined conversion from <type> to <type> exists
- 313: type qualifier is not allowed on this function
- 314: only nonstatic member functions may be virtual
- 315: the object has cv-qualifiers that are not compatible with the member function
- 316: program too large to compile (too many virtual functions)
- 317: return type is not identical to nor covariant with return type <type> of overridden virtual function <entity>
- 318: override of virtual <entity> is ambiguous
- 319: pure specifier ("= 0") allowed only on virtual functions
- 320: badly-formed pure specifier (only "= 0" is allowed)
- 321: data member initializer is not allowed
- 322: object of abstract class type <type> is not allowed:
- 323: function returning abstract class <type> is not allowed:
- 324: duplicate friend declaration
- 325: inline specifier allowed on function declarations only
- 326: "inline" is not allowed
- 327: invalid storage class for an inline function
- 328: invalid storage class for a class member
- 329: local class member <entity> requires a definition
- 330: <entity> is inaccessible
- 332: class <type> has no copy constructor to copy a const object
- 333: defining an implicitly declared member function is not allowed
- 334: class <type> has no suitable copy constructor
- 335: linkage specification is not allowed

336: unknown external linkage specification

337: linkage specification is incompatible with previous <entity>

If the linkage for a function is redeclared with an incompatible specification to a previous declaration this error is produced.

For example:

```
int foo(void);
int bar(void)
{
    int x;
    x = foo();
    return x;
}
extern "C" int foo(void)
{
    return 0;
}
```

results in the message:

```
Error: #337: linkage specification is incompatible with previous "foo"
(declared at line 1)
```

338: more than one instance of overloaded function <entity> has "C" linkage

339: class <type> has more than one default constructor

340: value copied to temporary, reference to temporary used

341: "operator<entity>" must be a member function

342: operator may not be a static member function

343: no arguments allowed on user-defined conversion

344: too many parameters for this operator function

345: too few parameters for this operator function

346: nonmember operator requires a parameter with class type

347: default argument is not allowed

348: more than one user-defined conversion from <type> to <type> applies:

349: no operator <entity> matches these operands

350: more than one operator <entity> matches these operands:

351: first parameter of allocation function must be of type "size\_t"

352: allocation function requires "void \*" return type

353: deallocation function requires "void" return type

354: first parameter of deallocation function must be of type "void \*"

356: type must be an object type

357: base class <type> has already been initialized

358: base class name required -- <type> assumed (anachronism)

359: <entity> has already been initialized

360: name of member or base class is missing

361: assignment to "this" (anachronism)

- 362: "overload" keyword used (anachronism)
- 363: invalid anonymous union -- nonpublic member is not allowed
- 364: invalid anonymous union -- member function is not allowed
- 365: anonymous union at global or namespace scope must be declared static
- 366: <entity> provides no initializer for:
- 367: implicitly generated constructor for class <type> cannot initialize:
- 368: <entity> defines no constructor to initialize the following:  
This indicates that you have a `const` structure or a structure containing a `const`. It is issued as a friendly warning to assist with error 369. This can safely be ignored providing that the `const` members of structures are appropriately initialized.
- 369: <entity> has an uninitialized `const` or reference member  
This indicates that you have an instance of a `const` structure or a structure containing a `const` that has not been correctly initialized. You must either initialize it correctly for every instance or provide a constructor to initialize it.
- 370: <entity> has an uninitialized `const` field
- 371: class <type> has no assignment operator to copy a `const` object
- 372: class <type> has no suitable assignment operator
- 373: ambiguous assignment operator for class <type>
- 375: declaration requires a typedef name
- 377: "virtual" is not allowed
- 378: "static" is not allowed
- 379: cast of bound function to normal function pointer (anachronism)
- 380: expression must have pointer-to-member type
- 381: extra ";" ignored  
In C, this can be caused by an unexpected semicolon at the end of a declaration line, for example:
- ```
int x;;
```
- This might occur inadvertently when using macros.
- Similarly, in C++, this might be caused by constructions like:
- ```
class X { ... } ; ;
```
- This probably resulted from some macro usage, for example:
- ```
#define M(c) class c { ... } ;  
M(X);
```
- The extra semicolon is illegal because empty declarations are illegal.
- 382: nonstandard member constant declaration (standard form is a `static const integral member`)
- 384: no instance of overloaded <entity> matches the argument list
- 386: no instance of <entity> matches the required type

- 387: delete array size expression used (anachronism)
- 389: a cast to abstract class <type> is not allowed:
- 390: function "main" may not be called or have its address taken
- 391: a new-initializer may not be specified for an array
- 392: member function <entity> may not be redeclared outside its class
- 393: pointer to incomplete class type is not allowed
- 394: reference to local variable of enclosing function is not allowed
- 395: single-argument function used for postfix <entity> (anachronism)
- 398: cast to array type is nonstandard (treated as cast to <type>)
- 399: <entity> has an operator new<entity>() but no default operator delete<entity>()
- 400: <entity> has a default operator delete<entity>() but no operator new<entity>()
- 401: destructor for base class <entity> is not virtual
- 403: invalid redeclaration of member <entity>
- 404: function "main" may not be declared inline
- 405: member function with the same name as its class must be a constructor
- 406: using nested <entity> (anachronism)
- 407: a destructor may not have parameters
- 408: copy constructor for class <type> may not have a parameter of type <type>
- 409: <entity> returns incomplete type <type>
- 410: protected <entity> is not accessible through a <type> pointer or object
- 411: a parameter is not allowed
- 412: an "asm" declaration is not allowed here
- 413: no suitable conversion function from <type> to <type> exists
- 414: delete of pointer to incomplete class
- 415: no suitable constructor exists to convert from <type> to <type>
- 416: more than one constructor applies to convert from <type> to <type>:
- 417: more than one conversion function from <type> to <type> applies:
- 418: more than one conversion function from <type> to a built-in type applies:
- 424: a constructor or destructor may not have its address taken
- 427: qualified name is not allowed in member declaration
- 428: enumerated type mixed with another type (anachronism)
- 429: the size of an array in "new" must be non-negative
- 430: returning reference to local temporary

433: qualifiers dropped in binding reference of type <type> to initializer of type <type>

434: a reference of type <type> (not const-qualified) cannot be initialized with a value of type <type>

435: a pointer to function may not be deleted

436: conversion function must be a nonstatic member function

437: template declaration is not allowed here

438: expected a "<"

439: expected a ">"

440: template parameter declaration is missing

441: argument list for <entity> is missing

442: too few arguments for <entity>

443: too many arguments for <entity>

450: the type "long long" is nonstandard

451: omission of <entity> is nonstandard

452: return type may not be specified on a conversion function

456: excessive recursion at instantiation of <entity>

457: <entity> is not a function or static data member

458: argument of type <type> is incompatible with template parameter of type <type>

459: initialization requiring a temporary or conversion is not allowed

460: declaration of <entity> hides function parameter

461: initial value of reference to non-const must be an lvalue

463: "template" is not allowed

464: <type> is not a class template

467: invalid reference to <entity> (union/nonunion mismatch)

468: a template argument may not reference a local type

469: tag kind of <entity> is incompatible with declaration of <entity>

470: the global scope has no tag named <entity>

471: <entity> has no tag member named <entity>

473: <entity> may be used only in pointer-to-member declaration

476: name followed by "::~" must be a class name or a type name

477: destructor name does not match name of class <type>

478: type used as destructor name does not match type <type>

479: <entity> redeclared "inline" after being called

485: <entity> is not an entity that can be instantiated

486: compiler generated <entity> cannot be explicitly instantiated

487: inline <entity> cannot be explicitly instantiated

490: <entity> cannot be instantiated -- it has been explicitly specialized

- 494: declaring a void parameter list with a typedef is nonstandard  
When the compiler is not in C99 mode, this error is produced by a function declaration `f(V)` where `V` is a void type.  
Using a parameter that is a typedef to void to mean that the function has no parameters is only permitted in C99 mode.
- 496: template parameter `<entity>` may not be redeclared in this scope
- 497: declaration of `<entity>` hides template parameter
- 498: template argument list must match the parameter list
- 501: an operator name must be declared as a function
- 502: operator name is not allowed
- 503: `<entity>` cannot be specialized in the current scope
- 504: nonstandard form for taking the address of a member function  
The C++ standard requires that a pointer to a member be named using a qualifier and an ampersand character, for example `&A::f`.
- 505: too few template parameters -- does not match previous declaration
- 506: too many template parameters -- does not match previous declaration
- 507: function template for operator `delete(void *)` is not allowed
- 508: class template and template parameter may not have the same name
- 511: enumerated type is not allowed
- 512: type qualifier on a reference type is not allowed
- 513: a value of type `<type>` cannot be assigned to an entity of type `<type>`
- 514: pointless comparison of unsigned integer with a negative constant
- 515: cannot convert to incomplete class `<type>`
- 516: const object requires an initializer
- 517: object has an uninitialized const or reference member
- 518: nonstandard preprocessing directive
- 519: `<entity>` may not have a template argument list
- 520: initialization with "`<...>`" expected for aggregate object
- 521: pointer-to-member selection class types are incompatible (`<type>` and `<type>`)
- 522: pointless friend declaration
- 524: non-const function called for const object (anachronism)
- 525: a dependent statement may not be a declaration
- 526: a parameter may not have void type  
For example:
- ```
void foo(void a) { }
```
- 529: this operator is not allowed in a template argument expression
- 530: try block requires at least one handler
- 531: handler requires an exception declaration

- 532: handler is masked by default handler
- 533: handler is potentially masked by previous handler for type <type>
- 534: use of a local type to specify an exception
- 535: redundant type in exception specification
- 536: exception specification is incompatible with that of previous <entity>
- 540: support for exception handling is disabled
- 541: omission of exception specification is incompatible with previous <entity>
- 542: could not create instantiation request file <entity>
- 543: non-arithmetic operation not allowed in nontype template argument
- 544: use of a local type to declare a nonlocal variable
- 545: use of a local type to declare a function
- 546: transfer of control bypasses initialization of:

Example:

```
int main(void){
    int choice = 1;
    int z =1;
    switch(choice)
    {
        case 1:
            int y = 1;
            z = y + z;
            break;
        case 2:
            break;
    }
    return 0;
}
```

In this example, `y` is an initialized variable that is in scope, but unused, in the other cases. A transfer from the condition of the switch statement to a case label, bypassing the initialization of `y`, conflicts with the C++ Standard.

The usual way to fix this is to enclose the case that declares `y` in braces. The following code limits the scope of `y` to case 1, so an attempt to use it elsewhere causes an error:

```
case 1: {
    int y = 1;
    z = y + z;
}
break;
```

Because `y` is a POD (Plain Old Data) type, an alternative is to not use initialization:

```
case 1:
    int y;
    y = 1;
    z = y + z;
    break;
```

This approach has the disadvantage that if code outside of case 1 uses `y`, and accidentally expects it to have the value assigned in case 1, no warning is given.

- 548: transfer of control into an exception handler
- 549: <entity> is used before its value is set

550: <entity> was set but never used  
551: <entity> cannot be defined in the current scope  
552: exception specification is not allowed  
553: external/internal linkage conflict for <entity>  
554: <entity> will not be called for implicit or explicit conversions  
555: tag kind of <entity> is incompatible with template parameter of type <type>  
556: function template for operator new(size\_t) is not allowed  
558: pointer to member of type <type> is not allowed  
559: ellipsis is not allowed in operator function parameter list  
560: <entity> is reserved for future use as a keyword  
561: invalid macro definition:  
562: invalid macro undefinition:  
563: invalid <entity> output file <filename>  
564: cannot open <entity> output file <filename>: <reason>  
570: error in debug option argument  
571: invalid option:  
574: invalid number:  
576: invalid instantiation mode:  
578: invalid error limit:  
585: virtual function tables can only be suppressed when compiling C++  
586: anachronism option can be used only when compiling C++  
587: instantiation mode option can be used only when compiling C++  
588: automatic instantiation mode can be used only when compiling C++  
589: implicit template inclusion mode can be used only when compiling C++  
590: exception handling option can be used only when compiling C++  
593: missing source file name  
594: output files may not be specified when compiling several input files  
595: too many arguments on command line  
596: an output file was specified, but none is needed  
598: a template parameter may not have void type  
600: strict mode is incompatible with allowing anachronisms  
601: a throw expression may not have void type  
602: local instantiation mode is incompatible with automatic instantiation  
603: parameter of abstract class type <type> is not allowed:  
604: array of abstract class <type> is not allowed:  
605: floating-point template parameter is nonstandard

- 606: this pragma must immediately precede a declaration
- 607: this pragma must immediately precede a statement
- 608: this pragma must immediately precede a declaration or statement
- 609: this kind of pragma may not be used here
- 611: overloaded virtual function <entity> is only partially overridden in <entity>
- 612: specific definition of inline template function must precede its first use
- 613: invalid error tag in diagnostic control option:
- 614: invalid error number in diagnostic control option:
- 615: parameter type involves pointer to array of unknown bound
- 616: parameter type involves reference to array of unknown bound
- 617: pointer-to-member-function cast to pointer to function
- 618: struct or union declares no named members
- 619: nonstandard unnamed field
- 620: nonstandard unnamed member
- 624: <entity> is not a type name
- 625: cannot open precompiled header input file <entity>: <reason>
- 626: precompiled header file <entity> is either invalid or not generated by this version of the compiler
- 627: precompiled header file <entity> was not generated in this directory
- 628: header files used to generate precompiled header file <entity> have changed
- 629: the command line options do not match those used when precompiled header file <entity> was created
- 630: the initial sequence of preprocessing directives is not compatible with those of precompiled header file <entity>
- 631: unable to obtain mapped memory for <entity>: <reason>  
This can occur if you are trying to use a large Precompiled Header (PCH), and you have a size limitation on the TMP directory that the ARM Compiler toolchain uses. A possible workaround is to remove the TMP environment variable. This forces the tools to create temporary files in the current working directory.  
See the following in the *Getting Started Guide*:  
*[TMP and TMPDIR environment variables for temporary file directories.](#)*
- 632: "<entity>": using precompiled header file "<entity>"
- 633: "<entity>": creating precompiled header file "<entity>"
- 634: memory usage conflict with precompiled header file <entity>  
This can occur if a PCH file cannot be mapped back into the build because the required parts of the address space of the compiler are not available.  
See also error 631.
- 635: invalid PCH memory size
- 636: PCH options must appear first in the command line

- 637: insufficient memory for PCH memory allocation
- 638: precompiled header files may not be used when compiling several input files
- 639: insufficient preallocated memory for generation of precompiled header file (<entity> bytes required)
- 640: very large entity in program prevents generation of precompiled header file
- 641: <entity> is not a valid directory
- 642: cannot build temporary file name
- 643: "restrict" is not allowed
- 644: a pointer or reference to function type may not be qualified by "restrict"
- 645: <entity> is an unrecognized \_\_declspec attribute
- 646: a calling convention modifier may not be specified here
- 647: conflicting calling convention modifiers
- 650: calling convention specified here is ignored
- 651: a calling convention may not be followed by a nested declarator
- 652: calling convention is ignored for this type
- 654: declaration modifiers are incompatible with previous declaration
- 655: the modifier <entity> is not allowed on this declaration
- 656: transfer of control into a try block
- 657: inline specification is incompatible with previous <entity>
- 658: closing brace of template definition not found
- 659: wchar\_t keyword option can be used only when compiling C++
- 660: invalid packing alignment value
- 661: expected an integer constant
- 662: call of pure virtual function

A pure virtual function is being called, for example:

```
struct T { T(); virtual void pvfn() = 0; };  
           // a pure virtual function  
T::T() { pvfn(); } // warning given here
```

By default, calling a pure virtual function results in:

1. a call to the library function \_\_cxa\_pure\_virtual()
2. the \_\_cxa\_pure\_virtual() function raising the signal SIGPVFN
3. the signal being trapped by the default\_signal\_handler
4. the handler displaying Pure virtual fn called on the console using semihosting.

See the following in the compiler document:

[Calling a pure virtual function.](#)

- 663: invalid source file identifier string
- 664: a class template cannot be defined in a friend declaration

665: "asm" is not allowed  
666: "asm" must be used with a function definition  
667: "asm" function is nonstandard  
668: ellipsis with no explicit parameters is nonstandard  
669: "&..." is nonstandard  
670: invalid use of "&..."  
672: temporary used for initial value of reference to const volatile (anachronism)  
673: a reference of type <type> cannot be initialized with a value of type <type>  
674: initial value of reference to const volatile must be an lvalue  
676: using out-of-scope declaration of <entity>  
678: call of <entity> cannot be inlined  
679: <entity> cannot be inlined  
680: invalid PCH directory:  
688: <entity> not found on pack alignment stack  
689: empty pack alignment stack  
690: RTTI option can be used only when compiling C++  
691: <entity>, required for copy that was eliminated, is inaccessible  
692: <entity>, required for copy that was eliminated, is not callable because reference parameter cannot be bound to rvalue  
693: <typeinfo> must be included before typeid is used  
694: <entity> cannot cast away const or other type qualifiers  
695: the type in a dynamic\_cast must be a pointer or reference to a complete class type, or void \*  
696: the operand of a pointer dynamic\_cast must be a pointer to a complete class type  
697: the operand of a reference dynamic\_cast must be an lvalue of a complete class type  
698: the operand of a runtime dynamic\_cast must have a polymorphic class type  
699: bool option can be used only when compiling C++  
702: expected an "="  
703: expected a declarator in condition declaration  
704: <entity>, declared in condition, may not be redeclared in this scope  
705: default template arguments are not allowed for function templates  
706: expected a ",", or ">"  
707: expected a template parameter list  
708: incrementing a bool value is deprecated  
709: bool type is not allowed

710: offset of base class <entity> within class <entity> is too large  
711: expression must have bool type (or be convertible to bool)  
712: array new and delete option can be used only when compiling C++  
713: <entity> is not a variable name  
717: the type in a const\_cast must be a pointer, reference, or pointer to member to an object type  
718: a const\_cast can only adjust type qualifiers; it cannot change the underlying type  
719: mutable is not allowed  
720: redeclaration of <entity> is not allowed to alter its access  
722: use of alternative token "<:" appears to be unintended  
723: use of alternative token "%:" appears to be unintended  
724: namespace definition is not allowed  
725: name must be a namespace name  
726: namespace alias definition is not allowed  
727: namespace-qualified name is required  
728: a namespace name is not allowed  
730: <entity> is not a class template  
731: array with incomplete element type is nonstandard  
732: allocation operator may not be declared in a namespace  
733: deallocation operator may not be declared in a namespace  
734: <entity> conflicts with using-declaration of <entity>  
735: using-declaration of <entity> conflicts with <entity>  
736: namespaces option can be used only when compiling C++  
737: using-declaration ignored -- it refers to the current namespace  
738: a class-qualified name is required  
744: incompatible memory attributes specified  
745: memory attribute ignored  
746: memory attribute may not be followed by a nested declarator  
747: memory attribute specified more than once  
748: calling convention specified more than once  
749: a type qualifier is not allowed  
750: <entity> was used before its template was declared  
751: static and nonstatic member functions with same parameter types cannot be overloaded  
752: no prior declaration of <entity>  
753: a template-id is not allowed  
754: a class-qualified name is not allowed  
755: <entity> may not be redeclared in the current scope  
756: qualified name is not allowed in namespace member declaration

757: <entity> is not a type name  
758: explicit instantiation is not allowed in the current scope  
759: <entity> cannot be explicitly instantiated in the current scope  
760: <entity> explicitly instantiated more than once  
761: typename may only be used within a template  
763: typename option can be used only when compiling C++  
764: implicit typename option can be used only when compiling C++  
765: nonstandard character at start of object-like macro definition  
766: exception specification for virtual <entity> is incompatible with that of overridden <entity>  
767: conversion from pointer to smaller integer  
768: exception specification for implicitly declared virtual <entity> is incompatible with that of overridden <entity>  
769: <entity>, implicitly called from <entity>, is ambiguous  
770: option "explicit" can be used only when compiling C++  
771: "explicit" is not allowed  
772: declaration conflicts with <entity> (reserved class name)  
773: only "()" is allowed as initializer for array <entity>  
774: "virtual" is not allowed in a function template declaration  
775: invalid anonymous union -- class member template is not allowed  
776: template nesting depth does not match the previous declaration of <entity>  
777: this declaration cannot have multiple "template <...>" clauses  
778: option to control the for-init scope can be used only when compiling C++  
779: <entity>, declared in for-loop initialization, may not be redeclared in this scope  
780: reference is to <entity> -- under old for-init scoping rules it would have been <entity>  
781: option to control warnings on for-init differences can be used only when compiling C++  
782: definition of virtual <entity> is required here  
783: empty comment interpreted as token-pasting operator "###"  
784: a storage class is not allowed in a friend declaration  
785: template parameter list for <entity> is not allowed in this declaration  
786: <entity> is not a valid member class or function template  
787: not a valid member class or function template declaration  
788: a template declaration containing a template parameter list may not be followed by an explicit specialization declaration  
789: explicit specialization of <entity> must precede the first use of <entity>

- 790: explicit specialization is not allowed in the current scope
- 791: partial specialization of <entity> is not allowed
- 792: <entity> is not an entity that can be explicitly specialized
- 793: explicit specialization of <entity> must precede its first use
- 794: template parameter <entity> may not be used in an elaborated type specifier
- 795: specializing <entity> requires "template<>" syntax
- 798: option `old_specializations` can be used only when compiling C++
- 799: specializing <entity> without "template<>" syntax is nonstandard
- 800: this declaration may not have extern "C" linkage
- 801: <entity> is not a class or function template name in the current scope
- 802: specifying a default argument when redeclaring an unreferenced function template is nonstandard
- 803: specifying a default argument when redeclaring an already referenced function template is not allowed
- 804: cannot convert pointer to member of base class <type> to pointer to member of derived class <type> -- base class is virtual
- 805: exception specification is incompatible with that of <entity><entity>
- 806: omission of exception specification is incompatible with <entity>
- 807: unexpected end of default argument expression
- 808: default-initialization of reference is not allowed
- 809: uninitialized <entity> has a const member
- 810: uninitialized base class <type> has a const member
- 811: const <entity> requires an initializer -- class <type> has no explicitly declared default constructor
- 812: const object requires an initializer -- class <type> has no explicitly declared default constructor
- 814: strict mode is incompatible with long preserving rules
- 815: type qualifier on return type is meaningless

For example:

```
__packed void foo( void ) { }
```

The `__packed` qualifier is ignored because the return type cannot be `__packed`.

- 816: in a function definition a type qualifier on a "void" return type is not allowed
- 817: static data member declaration is not allowed in this class
- 818: template instantiation resulted in an invalid function declaration
- 819: "... " is not allowed
- 821: extern inline <entity> was referenced but not defined
- 822: invalid destructor name for type <type>

- 824: destructor reference is ambiguous -- both <entity> and <entity> could be used
- 825: <entity> could be used
- 826: <entity> was never referenced
- 827: only one member of a union may be specified in a constructor initializer list
- 828: support for "new[]" and "delete[]" is disabled
- 829: "double" used for "long double" in generated C code
- 830: <entity> has no corresponding operator delete<entity> (to be called if an exception is thrown during initialization of an allocated object)
- 831: support for placement delete is disabled
- 832: no appropriate operator delete is visible
- 833: pointer or reference to incomplete type is not allowed
- 834: invalid partial specialization -- <entity> is already fully specialized
- 835: incompatible exception specifications
- 836: returning reference to local variable
- 837: omission of explicit type is nonstandard ("int" assumed)  
A function has been declared or defined with no return type.

Example, with the code:

```
foo(void){  
    int a;  
}
```

an int result is assumed.

If you want it to return no result, use `void` as the return type. This is widespread in old-style C.

The `--diag_suppress 837` option suppresses this warning.

See also message number 938, that is a special case of this message for `main()`.

- 838: more than one partial specialization matches the template argument list of <entity>
- 840: a template argument list is not allowed in a declaration of a primary template
- 841: partial specializations may not have default template arguments
- 842: <entity> is not used in template argument list of <entity>
- 844: the template argument list of the partial specialization includes a nontype argument whose type depends on a template parameter
- 845: this partial specialization would have been used to instantiate <entity>
- 846: this partial specialization would have been made the instantiation of <entity> ambiguous
- 847: expression must have integral or enum type

- 848: expression must have arithmetic or enum type
- 849: expression must have arithmetic, enum, or pointer type
- 850: type of cast must be integral or enum
- 851: type of cast must be arithmetic, enum, or pointer
- 852: expression must be a pointer to a complete object type
- 854: a partial specialization nontype argument must be the name of a nontype parameter or a constant
- 855: return type is not identical to return type <type> of overridden virtual function <entity>
- 856: option "guiding\_decls" can be used only when compiling C++
- 857: a partial specialization of a class template must be declared in the namespace of which it is a member
- 858: <entity> is a pure virtual function
- 859: pure virtual <entity> has no overrider
- 860: \_\_declspec attributes ignored
- 861: invalid character in input line
- 862: function returns incomplete type <type>
- 863: effect of this "#pragma pack" directive is local to <entity>
- 864: <entity> is not a template
- 865: a friend declaration may not declare a partial specialization
- 866: exception specification ignored
- 867: declaration of "size\_t" does not match the expected type <type>
- 868: space required between adjacent ">" delimiters of nested template argument lists (">>" is the right shift operator)
- 869: could not set locale <entity> to allow processing of multibyte characters
- 870: invalid multibyte character sequence
- 871: template instantiation resulted in unexpected function type of <type> (the meaning of a name may have changed since the template declaration -- the type of the template is <type>)
- 872: ambiguous guiding declaration -- more than one function template <entity> matches type <type>
- 873: non-integral operation not allowed in nontype template argument
- 884: pointer-to-member representation <entity> has already been set for <entity>
- 885: <type> cannot be used to designate constructor for <type>
- 886: invalid suffix on integral constant
- 890: variable length array with unspecified bound is not allowed
- 891: an explicit template argument list is not allowed on this declaration
- 892: an entity with linkage cannot have a type involving a variable length array

- 893: a variable length array cannot have static storage duration
- 894: <entity> is not a template
- 895: variable length array dimension (declared <entity>)
- 896: expected a template argument
- 902: type qualifier ignored
- 912: ambiguous class member reference -- <entity> used in preference to <entity>
- 915: a segment name has already been specified
- 916: cannot convert pointer to member of derived class <type> to pointer to member of base class <type> -- base class is virtual
- 917: invalid directory for instantiation files:
- 921: an instantiation information file name may not be specified when compiling several input files
- 923: more than one command line option matches the abbreviation "--<entity>":
- 925: type qualifiers on function types are ignored
- 926: cannot open definition list file: <entity>
- 928: incorrect use of va\_start
- 929: incorrect use of va\_arg
- 930: incorrect use of va\_end
- 931: pending instantiations option can be used only when compiling C++
- 932: invalid directory for #import files:
- 934: a member with reference type is not allowed in a union
- 935: "typedef" may not be specified here
- 936: redeclaration of <entity> alters its access
- 937: a class or namespace qualified name is required
- 938: return type "int" omitted in declaration of function "main"  
main() has been declared or defined with no return type.

For example:

```
main(void){  
    int a;  
}
```

is reported as an error by the compiler if compiled with `--strict`.

If you want it to return no result, use `void` as the return type. This is widespread in old-style C.

For ANSI C, the `--diag_suppress 938` option suppresses this warning.

For C++, this always results in an error.

See also message number 837 for more general cases.

- 939: pointer-to-member representation <entity> is too restrictive for <entity>

940: missing return statement at end of non-void <entity>  
A return type has been defined for a function, but no value is returned.

Example:

```
int foo(int a)
{
    printf("Hello %d", a);
}
```

941: duplicate using-declaration of <entity> ignored

942: enum bit-fields are always unsigned, but enum <type> includes negative enumerator

943: option "class\_name\_injection" can be used only when compiling C++

944: option "arg\_dep\_lookup" can be used only when compiling C++

945: option "friend\_injection" can be used only when compiling C++

946: name following "template" must be a template

949: specifying a default argument on this declaration is nonstandard

951: return type of function "main" must be "int"

952: a nontype template parameter may not have class type

953: a default template argument cannot be specified on the declaration of a member of a class template outside of its class

954: a return statement is not allowed in a handler of a function try block of a constructor

955: ordinary and extended designators cannot be combined in an initializer designation

956: the second subscript must not be smaller than the first

959: declared size for bit field is larger than the size of the bit field type; truncated to <entity> bits

960: type used as constructor name does not match type <type>

961: use of a type with no linkage to declare a variable with linkage

962: use of a type with no linkage to declare a function

963: return type may not be specified on a constructor

964: return type may not be specified on a destructor

965: incorrectly formed universal character name

966: universal character name specifies an invalid character

967: a universal character name cannot designate a character in the basic character set

968: this universal character is not allowed in an identifier

969: the identifier `__VA_ARGS__` can only appear in the replacement lists of variadic macros

970: the qualifier on this friend declaration is ignored

971: array range designators cannot be applied to dynamic initializers

972: property name cannot appear here

975: a variable-length array type is not allowed

- 976: a compound literal is not allowed in an integral constant expression
- 977: a compound literal of type <type> is not allowed
- 978: a template friend declaration cannot be declared in a local class
- 979: ambiguous "?" operation: second operand of type <type> can be converted to third operand type <type>, and vice versa
- 980: call of an object of a class type without appropriate operator() or conversion functions to pointer-to-function type
- 982: there is more than one way an object of type <type> can be called for the argument list:
- 983: typedef name has already been declared (with similar type)
- 984: operator new and operator delete cannot be given internal linkage
- 985: storage class "mutable" is not allowed for anonymous unions
- 986: invalid precompiled header file
- 987: abstract class type <type> is not allowed as catch type:
- 988: a qualified function type cannot be used to declare a nonmember function or a static member function
- 989: a qualified function type cannot be used to declare a parameter
- 990: cannot create a pointer or reference to qualified function type
- 991: extra braces are nonstandard
- 992: invalid macro definition:  
    Incorrect use of -D on the compile line, for example, "-D###"
- 993: subtraction of pointer types <type> and <type> is nonstandard
- 994: an empty template parameter list is not allowed in a template template parameter declaration
- 995: expected "class"
- 996: the "class" keyword must be used when declaring a template template parameter
- 997: <entity> is hidden by <entity> -- virtual function override intended?
- 998: a qualified name is not allowed for a friend declaration that is a function definition
- 999: <entity> is not compatible with <entity>
- 1000: a storage class may not be specified here
- 1001: class member designated by a using-declaration must be visible in a direct base class
- 1006: a template template parameter cannot have the same name as one of its template parameters
- 1007: recursive instantiation of default argument
- 1009: <entity> is not an entity that can be defined
- 1010: destructor name must be qualified
- 1011: friend class name may not be introduced with "typename"
- 1012: a using-declaration may not name a constructor or destructor

1013: a qualified friend template declaration must refer to a specific previously declared template

1014: invalid specifier in class template declaration

1015: argument is incompatible with formal parameter

1016: prefix form of ARM function qualifier not permitted in this position

1017: Duplicate ARM function qualifiers not permitted

1018: ARM function qualifiers not permitted on this declaration/definition

Examples of ARM function qualifiers are `__svc`, `__pure`, and `__irq`.

See the following in the compiler document:

*Keywords and operators.*

1019: function qualifier `<entity>` not permitted on a non-static member function

1020: `__irq` functions must take no arguments

1021: `__irq` functions must return no result

1022: cannot have pointer nor reference to `<entity>` function

1023: `__global_reg` not allowed on this declaration

1024: invalid global register number; 1 to 8 allowed

An invalid register is being used in `__global_reg`.

Example:

```
__global_reg(786) int x;
```

1025 : `__svc` parameter `<entity>` is not within permitted range (0 to 0xffffffff) for ARM SVC instruction

SVC numbers are limited to the range 0 to 0xffffffff for the ARM compilers, and 0 to 0xFF for the Thumb compilers.

For standard semihosting SVCs, 0x123456 is used for ARM, 0xAB is used for Thumb.

1026: taking the address of a global register variable is not allowed

1027: `__svc_indirect` function must have arguments

1028: conflicting global register declaration with `<entity>`

1029: `__packed` ignored for non-pointer parameter

1030: `<entity>` `<type>` previously declared without `__packed`

1031: Definition of <type> in packed <type> must be `__packed`  
The compiler faults a non-packed child structure contained in a packed parent structure.  
This includes the case where the substructure is an array.

For example:

```
typedef struct ChildStruct {  
    int a;  
} ChildStruct;  
typedef __packed struct ParentStruct {  
    ChildStruct child[1];  
} ParentStruct;
```

results in the message:

```
Error: #1031: Definition of "ChildStruct" in packed "ParentStruct" must be  
__packed
```

See the following in the compiler document:

[\\_\\_packed.](#)

1032: Definition of nested anonymous <entity> in packed <type> must be `__packed`

1033: <entity> incompatible with function definition

1034: `__irq` functions must not be the target of a function call

1038: invalid alignment specified; only integer powers of 2 allowed

1039: conflicting alignment declaration with <entity>

1040: under-alignment not allowed

1041: alignment for an auto object may not be larger than 8

For example:

```
int main(void){  
    __align(16) int foo = 10;  
}
```

`__align` is not permitted for a local variable `foo`, so the error is given.

See the following in the compiler document:

[\\_\\_align.](#)

1042: <entity> cannot be dynamically initialized when compiled position independent

1043: <entity> cannot be const because it contains a mutable member  
For example:

```
struct foo { int a; mutable int b; };  
extern const struct foo bar;
```

When the compiler is in ROPI or RWPI mode, it disallows **const** objects from containing **mutable** members.

The reason for this restriction is that in these modes, the compiler addresses read-only data differently from read-write data. It therefore must know whether an object is in the RO or RW data section. In the following example, this restriction means that **bar** cannot contain any **mutable** members and is therefore in the RO data section:

```
struct foo;  
extern const struct foo bar;  
const struct foo *get_foo() { return &bar; }
```

See the following in the compiler document:

*--apcs=qualifier...qualifier.*

- 1044: option "dep\_name" can be used only when compiling C++
- 1045: loop in sequence of "operator->" functions starting at class <type>
- 1046: <entity> has no member class <entity>
- 1047: the global scope has no class named <entity>
- 1048: recursive instantiation of template default argument
- 1049: access declarations and using-declarations cannot appear in unions
- 1050: <entity> is not a class member
- 1051: nonstandard member constant declaration is not allowed
- 1053: option "parse\_templates" can be used only when compiling C++
- 1054: option "dep\_name" cannot be used with "no\_parse\_templates"
- 1055: language modes specified are incompatible
- 1056: invalid redeclaration of nested class
- 1057: type containing an unknown-size array is not allowed
- 1058: a variable with static storage duration cannot be defined within an inline function
- 1059: an entity with internal linkage cannot be referenced within an inline function with external linkage
- 1060: argument type <type> does not match this type-generic function macro
- 1062: friend declaration cannot add default arguments to previous declaration
- 1063: <entity> cannot be declared in this scope
- 1064: the reserved identifier <entity> may only be used inside a function
- 1065: this universal character cannot begin an identifier

- 1066: expected a string literal
  - 1070: incorrect use of va\_copy
  - 1071: <entity> can only be used with floating-point types
  - 1072: complex type is not allowed
  - 1073: invalid designator kind
  - 1074: floating-point value cannot be represented exactly
  - 1075: complex floating-point operation result is out of range
  - 1077: an initializer cannot be specified for a flexible array member
  - 1079: standard requires that <entity> be given a type by a subsequent declaration ("int" assumed)
  - 1080: a definition is required for inline <entity>
  - 1081: conversion from integer to smaller pointer
  - 1082: a floating-point type must be included in the type specifier for a `_Complex` or `_Imaginary` type
  - 1083: Inline assembler syntax error
    - In ARM Compiler 4.lp2 and earlier, this error can be generated when inline assembly code contains instructions that are not supported by the inline assembler (for example, the WFI instruction). In 4.lp3 and later, including all ARM Compiler 5 versions, the following error is raised instead:
- 1084: This instruction not permitted in inline assembler
- 1084: This instruction not permitted in inline assembler
  - 1085: Missing operand
  - 1086: Operand is wrong type
  - 1087: Operand should be constant
  - 1088: Wrong number of operands
  - 1089: Invalid PSR operand
  - 1090: Expected PSR operand
  - 1091: Invalid shift specified
  - 1092: Should be `acc0`
  - 1093: Must be a modifiable lvalue
  - 1094: Expected a register expression
  - 1095: Expected a label or function name
  - 1096: Instruction cannot be conditional
  - 1097: Expected a [ or ]
  - 1098: Expected a shift operation
  - 1099: Unexpected ]
  - 1100: Register specified shift not allowed
  - 1101: Pre-Indexed addressing not allowed
  - 1102: Post-Indexed addressing not allowed
  - 1103: Writeback not allowed in the addressing mode

- 1104: Expected {
- 1105: Expected }
- 1106: Too many registers in register list
- 1107: Only ^ valid here
- 1108: Cannot mix virtual register and C/C++ expressions in register list
- 1109: Only virtual registers can be specified in a register range
- 1110: User mode register selection/CPSR update not supported in inline assembler. Use embedded assembler or out-of-line assembler
- 1111: Expected a coprocessor name
- 1112: Expected a coprocessor register name

These errors are given by the inline assembler if either of the following occurs:

- the coprocessor number is accidentally omitted from an MCR or MRC instruction
- an invalid coprocessor number or coprocessor register number has been given.

This is an example of correct use:

```
void foo()
{
    int reg0;
    __asm
    {
        MRC p15, 0, reg0, c1, c0, 0
    }
}
```

- 1114: this feature not supported on target architecture/processor  
Example when compiled with **armcc --cpu 4T**:

```
int main(void) {
    int a,b,c;
    __asm {
        QADD a,b,c
    }
    return(a);
}
```

results in an error message because the saturated add instruction is only supported in ARMv5TE and later.

- 1115: Cannot assign to const operand
- 1116: Register list cannot be empty
- 1117: Unqualified virtual function not allowed
- 1118: Expected a newline
- 1119: Reference to static variable not allowed in \_\_asm function
- 1120: Reference to static function not allowed in \_\_asm function
- 1121: Pointer to data member not allowed in \_\_asm function
- 1122: \_\_asm function cannot have static qualifier
- 1123: base class <type> is a virtual base class of <type>
- 1124: base class <type> is not virtual base class of <type>
- 1125: <entity> has no member function <entity>

- 1126: "\_\_asm" is not allowed in this declaration
- 1127: Member initializer list not permitted for \_\_asm constructors
- 1128: try block not permitted for \_\_asm constructors
- 1129: Order of operands not compatible with previous compiler versions
- 1130: \_\_align not permitted in typedef
- 1131: Non portable instruction (LDM with writeback and base in reg. list, final value of base unpredictable)
- 1132: Non portable instruction (STM with writeback and base not first in reg. list, stored value of base unpredictable)
- 1133: Expression operands not permitted with virtual base register
- 1134: literal treated as "long long"  
The constant is too large to be represented in a signed long, and therefore has been treated as a (signed) long long.

For example:

```
int foo(unsigned int bar)
{   return (bar == 2147483648);
}
```

gives a warning because 2147483648 is one greater than the maximum value permitted for a signed long. To eliminate the warning, if the constant should be treated as a (64-bit) long long type rather than a signed long, explicitly add an LL or LL suffix, or, if it should be treated as an unsigned integer, add a U suffix.

For example:

```
int foo(unsigned int bar)
{   return (bar == 2147483648U);
}
```

See the following in the compiler document:

*long long.*

- 1135: literal treated as "unsigned long long"  
The constant is too large to be represented in a signed long long, and therefore has been given type unsigned long long. See error number 1134.
- 1137: Expected a comma
- 1138: Unexpected comma after this expression
- 1139: MRRRC operation opcode must lie in range 0-15

- 1165: types cannot be declared in anonymous unions
- 1166: returning pointer to local variable
- 1167: returning pointer to local temporary
- 1168: option "export" can be used only when compiling C++
- 1169: option "export" cannot be used with "no\_dep\_name"
- 1170: option "export" cannot be used with "implicit\_include"
- 1171: declaration of <entity> is incompatible with a declaration in another translation unit
- 1172: the other declaration is <entity>
- 1175: a field declaration cannot have a type involving a variable length array
- 1176: declaration of <entity> had a different meaning during compilation of <entity>
- 1177: expected "template"
- 1178: "export" cannot be used on an explicit instantiation
- 1179: "export" cannot be used on this declaration
- 1180: a member of an unnamed namespace cannot be declared "export"
- 1181: a template cannot be declared "export" after it has been defined
- 1182: a declaration cannot have a label

- 1183: support for exported templates is disabled
- 1184: cannot open exported template file: <entity>
- 1185: <entity> already defined during compilation of <entity>
- 1186: <entity> already defined in another translation unit
- 1188: the option to list makefile dependencies may not be specified when compiling more than one translation unit
- 1190: the option to generate preprocessed output may not be specified when compiling more than one translation unit
- 1191: a field with the same name as its class cannot be declared in a class with a user-declared constructor
- 1192: "implicit\_include" cannot be used when compiling more than one translation unit
- 1193: exported template file <entity> is corrupted
- 1194: <entity> cannot be instantiated -- it has been explicitly specialized in the translation unit containing the exported definition
- 1196: the object has cv-qualifiers that are not compatible with the member <entity>
- 1197: no instance of <entity> matches the argument list and object (the object has cv-qualifiers that prevent a match)
- 1198: an attribute specifies a mode incompatible with <type>
- 1199: there is no type with the width specified
- 1200: invalid alignment value specified by attribute
- 1201: invalid attribute for <type>
- 1202: invalid attribute for <entity>
- 1203: invalid attribute for parameter
- 1204: attribute <entity> does not take arguments
- 1207: attribute <entity> ignored
- 1208: attributes may not appear here
- 1209: invalid argument to attribute <entity>
- 1210: the "packed" attribute is ignored in a typedef
- 1211: in "goto \*expr" expr must have type "void \*"
- 1212: "goto \*expr" is nonstandard
- 1213: taking the address of a label is nonstandard
- 1214: file name specified more than once:
- 1215: #warning directive: <entity>
- 1216: attribute <entity> is only allowed in a function definition
- 1217: the "transparent\_union" attribute only applies to unions, and <type> is not a union
- 1218: the "transparent\_union" attribute is ignored on incomplete types
- 1219: <type> cannot be transparent because <entity> does not have the same size as the union

- 1220: <type> cannot be transparent because it has a field of type <type> which is not the same size as the union
- 1221: only parameters can be transparent
- 1222: the <entity> attribute does not apply to local variables
- 1224: attributes are not permitted in a function definition
- 1225: declarations of local labels should only appear at the start of statement expressions
- 1226: the second constant in a case range must be larger than the first
- 1227: an asm name is not permitted in a function definition
- 1228: an asm name is ignored in a typedef
- 1229: unknown register name "<entity>"
- 1230: modifier letter '<entity>' ignored in asm operand
- 1231: unknown asm constraint modifier '<entity>'
- 1232: unknown asm constraint letter '<entity>'
- 1233: asm operand has no constraint letter
- 1234: an asm output operand must have one of the '=' or '+' modifiers
- 1235: an asm input operand may not have the '=' or '+' modifiers
- 1236: too many operands to asm statement (maximum is 30; '+' modifier adds an implicit operand)
- 1237: too many colons in asm statement
- 1238: register "<entity>" used more than once
- 1239: register "<entity>" is both used and clobbered
- 1240: register "<entity>" clobbered more than once
- 1241: register "<entity>" has a fixed purpose and may not be used in an asm statement
- 1242: register "<entity>" has a fixed purpose and may not be clobbered in an asm statement
- 1243: an empty clobbers list must be omitted entirely
- 1244: expected an asm operand
- 1245: expected a register to clobber
- 1246: "format" attribute applied to <entity> which does not have variable arguments
- 1247: first substitution argument is not the first variable argument
- 1248: format argument index is greater than number of parameters
- 1249: format argument does not have string type
- 1250: the "template" keyword used for syntactic disambiguation may only be used within a template
- 1253: attribute does not apply to non-function type <type>
- 1254: arithmetic on pointer to void or function type
- 1255: storage class must be auto or register

- 1256: <type> would have been promoted to <type> when passed through the ellipsis parameter; use the latter type instead
- 1257: <entity> is not a base class member
- 1262: mangled name is too long
- 1263: Offset must be half-word aligned
- 1264: Offset must be double-word aligned
- 1265: converting to and from floating-point type is not permitted with --fpu=none
- 1266: Operand should be a constant expression
- 1267: Implicit physical register <entity> should be defined as a variable
- 1268: declaration aliased to unknown entity <entity>
- 1269: declaration does not match its alias <entity>
- 1270: entity declared as alias cannot have definition
- 1271: variable-length array field type will be treated as zero-length array field type
- 1272: nonstandard cast on lvalue not supported
- 1273: unrecognized flag name
- 1274: void return type cannot be qualified
- 1275: the auto specifier is ignored here (invalid in standard C/C++)
- 1276: a reduction in alignment without the "packed" attribute is ignored
- 1277: a member template corresponding to <entity> is declared as a template of a different kind in another translation unit
- 1278: excess initializers are ignored
- 1279: va\_start should only appear in a function with an ellipsis parameter
- 1282: variable <entity> cannot be used in a register range
- 1283: A physical register name is required here
- 1284: A register range cannot be specified here
- 1285: Implicit physical register <entity> has not been defined
- 1286: LDRD/STRD instruction will be expanded  
When LDRD and STRD instructions are used in inline assembler the compiler expands these into two LDR or STR instructions before being passed through the compiler optimization stage.  
  
The optimization stage normally combines the two LDR or STR instruction back into a single LDRD or STRD instruction, however it is possible in some cases that a LDRD or STRD is not used.

**1287: LDM/STM instruction may be expanded**

The compiler expands LDM and STM instructions in inline assembly code into a number of LDR or STR instructions, before passing through the compiler optimization stage.

The optimization stage normally changes the LDR or STR instructions back into LDM or STM instructions, although it is possible that in some cases a single LDM or STM instruction is not used.

**1288: Implicit ARM register <entity> was not defined due to name clash**

**1289: statement expressions are only allowed in block scope**

**1291: an asm name is ignored on a non-register automatic variable**

**1292: inline function also declared as an alias; definition ignored**

**1293: assignment in condition**

In a context where a boolean value is required, for example in the controlling expression for an `if`, `while`, or `for` statement, or the first operand of a conditional expression, the expression contains one of the following instead:

- A bitwise not operator (`~`). It is likely that a logical not operator (`!`) was intended.
- An assignment operator (`=`). This could be a mis-typed equality operator (`==`). For example:

```
int main(void)
{
    int a,b;
    if (a=b);
}
```

In either case, if the operator was used intentionally, it might be possible to suppress the warning by adding an explicit comparison against zero.

For example, change the `if` statement in the example to:

```
if ((a=b)!=0);
```

This warning can also be suppressed by using the `--diag_suppress 1293` option.

See also message number 187, which applies when you compare against a constant.

**1294: Old-style function <entity>**

The compiler accepts both old-style and new-style function declarations. The difference between them is shown in the following example.

```
// new style
int add2(int a, int b)
{
    return a+b;
}
// old style
int oldadd2(a,b)
int a;
int b;
{
    return a+b;
}
```

When compiling old style functions in C mode, the compiler reports:

```
Warning: #1294-D: Old-style function oldadd2
```

**1295: Deprecated declaration <entity> - give arg types**

This warning is normally given when a declaration without argument types is encountered in ANSI C mode. In ANSI C, declarations like this are deprecated. However, it is sometimes useful to suppress this warning with the `--diag_suppress 1295` option when porting old code.

In C++:

```
void foo();
```

means:

```
void foo(void);
```

and no warning is generated.

### 1296: extended constant initialiser used

The expression used as a constant initializer might not be portable.

This warns that there is a constant initializer that does not follow the strict rules of ANSI C.

The solution is to rewrite your code to be ANSI compliant.

The following examples show code that generates this warning, and suggest potential alternatives for achieving the same goal with ANSI C compliant code.

Compiling with `--diag_suppress 1296` suppresses the warning.

Example 1:

This code generates warning 1296 when `x` and `y` are static objects, that is, global variables or static local variables, because the C standard does not permit a cast of a pointer to an integer in a constant expression:

```
int x;  
int y = (int) &x;
```

ANSI C requires the initializer for a static object to be a constant expression. `(int) &x` is not considered to be a constant expression.

Be aware that addresses are not arithmetic types, so this example C code is disallowed for ANSI C. Unfortunately, this is a common ANSI non-compliance amongst other compilers, and can result in problems when porting legacy code to ARM. This is why the ARM compiler issues a warning rather than an error.

An ANSI C compliant alternative method would be to rewrite the code so that `y` is a pointer to `x`:

```
int x;  
int* y = &x;
```

Example 2:

This code, compiled with the `--c90` switch, generates warning 1296:

```
const int foo_table[] = { (int)"foo", 0, 1, 2};
```

An ANSI C compliant alternative method would be to rewrite the code as follows:

```
const char* foo_table[] = { "foo", 0, (char*)1, (char*)2};
```

Example 3:

This code generates warning 1296 because the C standard does not permit a cast of a pointer to a long integer in a constant expression:

```
char value;  
long array[] = {  
    (long)&value,  
    (long)"string"  
};
```

An ANSI C compliant alternative method would be to rewrite the code to use pointers:

```
char value;
```

```
char *array[] = {  
    (char*)&value,  
    (char*)"string"  
};
```

This solution works because pointer-to-pointer casts are allowed in C.

**1297: Header file not guarded against multiple inclusion**

This warning is given when an unguarded header file is #included.

An unguarded header file is a header file not wrapped in a declaration such as:

```
#ifndef foo_h  
#define foo_h  
/* body of include file */  
#endif
```

This warning is off by default. It can be enabled with:

```
--diag_warning 1297
```

**1298: Header file is guarded by '<entity>', but does not #define it**

Example:

```
#ifndef MYHEADER_H  
//#define MYHEADER_H  
#endif
```

To correct the code, remove the comment slashes (//). This warning is off by default. It can be enabled with:

```
--diag_warning 1298
```

**1299: members and base-classes will be initialized in declaration order, not in member initialisation list order**

**1300: <entity> inherits implicit virtual**

This warning is issued when a non-virtual member function of a derived class hides a virtual member of a parent class. For example:

```
struct Base { virtual void f(); };  
struct Derived : Base { void f(); };
```

results in the message:

```
Warning: #1300-D: f inherits implicit virtual  
struct Derived : Base { void f(); };  
                ^
```

Adding the `virtual` keyword in the derived class prevents the warning. For C++, specifying the `--diag_suppress 1300` option suppresses the implicit virtual warning.

1301: padding inserted in struct <entity>

For the members of the structure to be correctly aligned, some padding has been inserted between members. This warning is off by default and can be enabled with `--diag_warning 1301` or `--remarks`.

For example:

```
struct X {  
    char x;  
    int y;  
}
```

results in the message:

```
Warning: #1301-D: padding inserted in struct X
```

The compiler can also warn of padding added at the end of a `struct` or between `structs`, see 2530.

1302: type too large to be returned in registers - `__value_in_regs` ignored

1303: using `--force_new_nothrow`: added "throw()"

1304: operator new missing exception specification

1305: using `--force_new_nothrow`: added "(::std::nothrow)"

1307: floating point argument not permitted with `-fpu=none`

1308: Base class <type> of `__packed` class <type> must be `__packed`

1310: shared block size does not match one previously specified

1311: bracketed expression is assumed to be a block size specification rather than an array dimension

1312: the block size of a shared array must be greater than zero

1313: multiple block sizes not allowed

1314: strict or relaxed requires shared

1316: block size specified exceeds the maximum value of <entity>

1317: function returning shared is not allowed

1320: shared type inside a struct or union is not allowed

1321: parameters may not have shared types

1323: shared variables must be static or extern

1327: affinity expression must have a shared type or point to a shared type

1328: affinity has shared type (not pointer to shared)

1329: shared `void*` types can only be compared for equality

1331: null (zero) character in input line ignored

1332: null (zero) character in string or character constant

1333: null (zero) character in header name

1334: declaration in for-initializer hides a declaration in the surrounding scope

1335: the hidden declaration is <entity>

- 1336: the prototype declaration of <entity> is ignored after this unprototyped redeclaration
- 1338: <entity> must have external C linkage
- 1339: variable declaration hides declaration in for-initializer
- 1340: typedef <entity> may not be used in an elaborated type specifier
- 1341: call of zero constant ignored
- 1342: parameter <entity> may not be redeclared in a catch clause of function try block
- 1343: the initial explicit specialization of <entity> must be declared in the namespace containing the template
- 1345: "template" must be followed by an identifier
- 1347: layout qualifier cannot qualify pointer to shared
- 1348: layout qualifier cannot qualify an incomplete array
- 1349: declaration of <entity> hides handler parameter
- 1350: nonstandard cast to array type ignored
- 1351: this pragma cannot be used in a \_Pragma operator (a #pragma directive must be used)
- 1352: field uses tail padding of a base class
- 1353: GNU C++ compilers may use bit field padding
- 1354: memory mapping conflict with precompiled header file <entity>
- 1355: abstract class <type> has a non-virtual destructor, calling delete on a pointer to this class is undefined behaviour
- 1356: an asm name is not allowed on a nonstatic member declaration
- 1357: static initialisation of <entity> using address of <entity> may cause link failure <option>  
See error number 1359.
- 1358: static initialisation of extern const <entity> using address of <entity> cannot be lowered for ROPI

1359: static initialisation of <entity> using address of <entity> may cause link failure <option>

Warnings 1357 and 1359 highlight code constructs that are not *position independent* (PI) and that might cause a subsequent link step to fail.

#### Example 1

The following code, when compiled with `--apcs /ropi`:

```
char *str = "test"; /* global pointer */
```

results in the message:

```
Warning: #1357-D: static initialisation of variable "str" using address of string literal may cause link failure --ropi
```

because the global pointer `str` must be initialized to the address of the char string `test` in the `.constdata` section, but absolute addresses cannot be used in a PI system.

#### Example 2

The following code, when compiled with `--apcs /rwpi`:

```
int bar;  
int *foo = &bar; /* global pointer */
```

results in the message:

```
Warning: #1359-D: static initialisation of variable "foo" using address of bar may cause link failure --rwpi
```

because the global pointer `foo` must be initialized to the address of `bar` in the `.data` section, but absolute addresses cannot be used in a PI system.

The following workarounds are possible:

- Change your code to avoid use of a global pointer. You can, for example, use a global array or local pointer instead.
- Do the initialization at run-time, for example:

```
int bar;  
int *foo;
```

Then write code inside a function that sets `foo = &bar;`. This is because when generating code as opposed to statically initializing data, the compiler has scope to work around the ROPI/RWPI constraints.

See the linker error L6248E.

1360: static initialisation of extern const <entity> using address of <entity> cannot be lowered for RWPI

For example, when compiled with `--apcs /rwp`:

```
extern int y;  
int* const x = &y;  
int* foo()  
{  
    return(x);  
}
```

produces a warning because prefixing `y` by `extern` prevents the compiler defining a direct address offset between the variables `x` and `y`.

1361: <entity> was declared "deprecated"

1362: unrecognized format function type <entity> ignored

1363: base class <entity> uses tail padding of base class <entity>

1366: this anonymous union/struct field is hidden by <entity>

1367: invalid error number

1368: invalid error tag

1369: expected an error number or error tag

1370: size of class is affected by tail padding

1371: labels can be referenced only in function definitions

1372: transfer of control into a statement expression is not allowed

1374: transfer of control out of a statement expression is not allowed

1375: a non-POD class definition is not allowed inside of a statement expression

1376: destructible entities are not allowed inside of a statement expression

1377: a dynamically-initialized local static variable is not allowed inside of a statement expression

1378: a variable-length array is not allowed inside of a statement expression

1379: a statement expression is not allowed inside of a default argument

1382: nonstandard conversion between pointer to function and pointer to data

1383: interface types cannot have virtual base classes

1384: interface types cannot specify "private" or "protected"

1385: interface types can only derive from other interface types

1386: <type> is an interface type

1387: interface types cannot have typedef members

1388: interface types cannot have user-declared constructors or destructors

1389: interface types cannot have user-declared member operators

1390: interface types cannot be declared in functions

1391: cannot declare interface templates

- 1392: interface types cannot have data members
- 1393: interface types cannot contain friend declarations
- 1394: interface types cannot have nested classes
- 1395: interface types cannot be nested class types
- 1396: interface types cannot have member templates
- 1397: interface types cannot have static member functions
- 1398: this pragma cannot be used in a `__pragma` operator (a `#pragma` directive must be used)
- 1399: qualifier must be base class of `<type>`
- 1400: declaration must correspond to a pure virtual member function in the indicated base class
- 1401: integer overflow in internal computation due to size or complexity of `<type>`
- 1402: integer overflow in internal computation
- 1404: potentially narrowing conversion when compiled in an environment where `int`, `long`, or pointer types are 64 bits wide
- 1405: current value of `pragma pack` is `<entity>`
- 1406: arguments for `pragma pack(show)` are ignored
- 1407: invalid alignment specifier value
- 1408: expected an integer literal
- 1409: earlier `__declspec(align(...))` ignored
- 1410: expected an argument value for the `<entity>` attribute parameter
- 1411: invalid argument value for the `<entity>` attribute parameter
- 1412: expected a boolean value for the `<entity>` attribute parameter
- 1413: a positional argument cannot follow a named argument in an attribute
- 1414: attribute `<filename>` has no parameter named `<filename>`
- 1415: expected an argument list for the `<entity>` attribute
- 1416: expected a `"`, `,` or `]"`
- 1417: attribute argument `<entity>` has already been given a value
- 1418: a value cannot be assigned to the `<entity>` attribute
- 1419: a throw expression may not have pointer-to-incomplete type
- 1420: alignment-of operator applied to incomplete type
- 1421: `<entity>` may only be used as a standalone attribute
- 1422: `<entity>` attribute cannot be used here
- 1423: unrecognized attribute `<entity>`
- 1424: attributes are not allowed here
- 1425: invalid argument value for the `<entity>` attribute parameter
- 1426: too many attribute arguments
- 1427: conversion from inaccessible base class `<type>` is not allowed
- 1428: option "export" requires distinct template signatures

- 1429: string literals with different character kinds cannot be concatenated
- 1430: GNU layout bug not emulated because it places virtual base <entity> outside <entity> object boundaries
- 1431: virtual base <entity> placed outside <entity> object boundaries
- 1432: nonstandard qualified name in namespace member declaration
- 1433: reduction in alignment ignored
- 1434: const qualifier ignored
- 1436: \_\_breakpoint argument must be an integral compile-time constant
- 1437: \_\_breakpoint argument must be within 0-65535 when compiling for ARM
- 1438: \_\_breakpoint argument must be within 0-255 when compiling for Thumb
- 1439: BKPT instruction is not supported on target architecture/processor
- 1440: oversize bitfield layout will change -- consider preceding with "<entity>;0;"
- 1441: nonstandard cast on lvalue  
The C specification states "An assignment operator shall have a modifiable lvalue as its left operand" and "a cast does not yield an lvalue".
- 1442: polymorphic base classes need to be exported if they are to be used for exported derivation
- 1443: polymorphic base classes inherited via virtual derivation need to be exported
- 1444: polymorphic base classes inherited via virtual derivation need all virtual functions to be exported
- 1446: non-POD class type passed through ellipsis
- 1447: a non-POD class type cannot be fetched by va\_arg  
The ISO C++ standard defines that the non-required arguments of a variadic function must be of type POD (plain-old-data), such as an int or a char, but not structs or classes.  
  
To avoid the error or warning, the address of a class or struct could be given instead.
- 1448: the 'u' or 'U' suffix must appear before the 'l' or 'L' suffix in a fixed-point literal
- 1450: integer operand may cause fixed-point overflow
- 1451: fixed-point constant is out of range
- 1452: fixed-point value cannot be represented exactly
- 1453: constant is too large for long long; given unsigned long long type (nonstandard)
- 1454: layout qualifier cannot qualify pointer to shared void
- 1456: a strong using-directive may only appear in a namespace scope
- 1457: <entity> declares a non-template function -- add <> to refer to a template instance
- 1458: operation may cause fixed-point overflow

- 1459: expression must have integral, enum, or fixed-point type
- 1460: expression must have integral or fixed-point type
- 1461: function declared with "noreturn" does return
- 1462: asm name ignored because it conflicts with a previous declaration
- 1463: class member typedef may not be redeclared
- 1464: taking the address of a temporary
- 1465: attributes are ignored on a class declaration that is not also a definition
- 1466: fixed-point value implicitly converted to floating-point type
- 1467: fixed-point types have no classification
- 1468: a template parameter may not have fixed-point type
- 1469: hexadecimal floating-point constants are not allowed
- 1471: floating-point value does not fit in required fixed-point type
- 1472: value cannot be converted to fixed-point value exactly
- 1473: fixed-point conversion resulted in a change of sign
- 1474: integer value does not fit in required fixed-point type
- 1475: fixed-point operation result is out of range
- 1481: fixed-point value does not fit in required floating-point type
- 1482: fixed-point value does not fit in required integer type
- 1483: value does not fit in required fixed-point type
- 1485: a named-register storage class is not allowed here
- 1486: <entity> redeclared with incompatible named-register storage class
- 1487: named-register storage class cannot be specified for aliased variable
- 1488: named-register storage specifier is already in use
- 1492: invalid predefined macro entry at line <entity>: <reason>
- 1493: invalid macro mode name <entity>
- 1494: incompatible redefinition of predefined macro <entity>
- 1495: redeclaration of <entity> is missing a named-register storage class
- 1496: named register is too small for the type of the variable
- 1497: arrays cannot be declared with named-register storage class
- 1498: const\_cast to enum type is nonstandard
- 1500: \_\_svc parameter <entity> is not within permitted range (0 to 0xff) for Thumb SVC instruction
- 1501: too many arguments for \_\_svc or \_\_svc\_indirect function
- 1502: arguments for \_\_svc or \_\_svc\_indirect function must have integral type
- 1503: \_\_svc\_indirect function must have arguments

- 1504: first argument for `__svc_indirect` function must have integral type
- 1505: result of `__svc` or `__svc_indirect` function must be returned in integer registers
- 1506: source file `<entity>` has bad format
- 1507: error while writing `<entity>` file: `<reason>`
- 1508: cannot overload functions distinguished by function qualifier alone
- 1509: function qualifier `<entity>` not permitted on a virtual member function
- 1510: function `"__attribute__((__<entity>__))"` present on overridden virtual function `<entity>` must be present on overriding function
- 1511: function qualifier `<entity>` is not identical on overridden virtual function `<entity>`
- 1512: function qualifier `<entity>` present on overridden virtual function `<entity>` must be present on overriding function
- 1514: an empty initializer is invalid for an array with unspecified bound
- 1515: function returns incomplete class type `<type>`
- 1516: `<entity>` has already been initialized; the out-of-class initializer will be ignored
- 1517: declaration hides `<entity>`
- 1519: invalid suffix on fixed-point or floating-point constant
- 1522: `<entity>` has no corresponding member operator `delete<entity>` (to be called if an exception is thrown during initialization of an allocated object)
- 1523: a thread-local variable cannot be declared with `"dllimport"` or `"dllexport"`
- 1525: an initializer cannot be specified for a flexible array member whose elements have a nontrivial destructor
- 1526: an initializer cannot be specified for an indirect flexible array member
- 1528: variable attributes appearing after a parenthesized initializer are ignored
- 1529: the result of this cast cannot be used as an lvalue
- 1530: negation of an unsigned fixed-point value
- 1531: this operator is not allowed at this point; use parentheses
- 1532: flexible array member initializer must be constant
- 1533: register names can only be used for register variables
- 1534: named-register variables cannot have void type
- 1535: `__declspec` modifiers not valid for this declaration
- 1536: parameters cannot have link scope specifiers
- 1537: multiple link scope specifiers

- 1538: link scope specifiers can only appear on functions and variables with external linkage
- 1539: a redeclaration cannot weaken a link scope
- 1540: link scope specifier not allowed on this declaration
- 1541: nonstandard qualified name in global scope declaration
- 1542: implicit conversion of a 64-bit integral type to a smaller integral type (potential portability problem)
- 1543: explicit conversion of a 64-bit integral type to a smaller integral type (potential portability problem)
- 1544: conversion from pointer to same-sized integral type (potential portability problem)
- 1547: only static and extern variables can use thread-local storage
- 1548: multiple thread-local storage specifiers
- 1549: virtual <entity> was not defined (and cannot be defined elsewhere because it is a member of an unnamed namespace)
- 1550: carriage return character in source line outside of comment or character/string literal
- 1551: expression must have fixed-point type
- 1552: invalid use of access specifier is ignored
- 1553: pointer converted to bool
- 1554: pointer-to-member converted to bool
- 1555: storage specifier ignored
- 1556: dlllexport and dllimport are ignored on class templates
- 1557: base class dlllexport/dllimport specification differs from that of the derived class
- 1558: redeclaration cannot add dlllexport/dllimport to <entity>  
If this message is suppressed, the behavior is as though the dlllexport or dllimport had been omitted. For example:

```
void f(void);  
__declspec(dllimport) void f(void) { } /* suppress treats as  
void f(void) { } */
```

1559: `dllexport/dllimport conflict with <entity>; dllexport assumed`  
 This indicates that an entity is marked as both `dllimport` and `dllexport`. In this case, the compiler assumes that the entity is `dllexport`.

In the following example, the function definition `foo()` conflicts with the declaration `__declspec(dllimport) void foo()`. In this situation, the compiler assumes `dllexport`.

```

---test.cpp---
__declspec(dllimport) void foo();
void foo()
{
}
-----
armcc -c test.cpp
"test.cpp", line 3: Warning: #1559-D: dllexport/dllimport conflict with "foo"
(declared at line 1); dllexport assumed
fromelf -s test.o
...
# Symbol Name      Value          Bind Sec Type Vis Size
-----
6 _Z3foov          0x00000000    Gb  1  Code Pr  0x4
...

```

The warning message and the symbol visibility indicate that the function `foo()` is `dllexport` assumed.

- 1560: cannot define `dllimport` entity
- 1561: `dllexport/dllimport` requires external linkage
- 1562: a member of a class declared with `dllexport/dllimport` cannot itself be declared with such a specifier
- 1563: field of class type without a DLL interface used in a class with a DLL interface
- 1564: parenthesized member declaration is nonstandard
- 1565: white space between backslash and newline in line splice ignored
- 1566: `dllexport/dllimport conflict with <entity>; dllimport/dllexport dropped`
- 1567: invalid member for anonymous member class -- class <type> has a disallowed member function
- 1568: nonstandard `reinterpret_cast`
- 1569: positional format specifier cannot be zero
- 1570: a local class cannot reference a variable-length array type from an enclosing function
- 1571: member <entity> already has an explicit `dllexport/dllimport` specifier
- 1572: a variable-length array is not allowed in a function return type
- 1573: variable-length array type is not allowed in pointer to member of type <type>
- 1574: the result of a statement expression cannot have a type involving a variable-length array
- 1575: Load/Store with translation not supported in inline assembler. Use embedded assembler or out-of-line assembler

1576: Flag-setting multiply instructions not supported in inline assembler. Use embedded assembler or out-of-line assembler

1577: Flag-setting MOV/MVN instructions with constant operand not supported in inline assembler. Use embedded assembler or out-of-line assembler

1578: an asm name is ignored on an automatic variable

1593: Could not optimize: Use of unsigned index prevents optimization

1594: Could not optimize: Loop parameters must be integer for full optimization

1604: Could not optimize: Reference to this function inhibits optimization

1613: Could not optimize: Multiple store conflict

1617: Could not optimize: Loop too complex

1621: Optimization: Dead code eliminated

1624: Could not optimize: Too many overlapping conditions for efficient translation

1629: Could not optimize: Iteration count too short for array optimization

1636: Could not optimize: Complicated use of variable

1637: Unknown pragma - ignored

1638: Unable to determine last value of scalar temporary

1639: Use nolstval directive if possible

1641: Could not optimize: Too many data dependency problems

1656: Problem in pragma syntax

1661: Could not optimize: Backward transfers cannot be optimized

1662: Could not optimize: Last value of promoted scalar required

1663: Could not optimize: Branches out of the loop prevent translation

1670: Optimization: If loop converted to for loop

1676: Could not optimize: This statement prevents loop optimization

1679: Optimization: Loop vectorized

1687: Could not optimize: Reduction function suppressed - needs associative transformation

1690: Could not optimize: Unsupported data type for explicit vector operations

1691: Optimization: Loop fused with previous loop

1714: Could not optimize: Outer loop conditionally executes inner loop

1730: No indexing done along this loop

1742: Could not optimize: Feedback of array elements (equivalenced arrays)

1750: Optimization: Loop re-rolled

1759: Could not optimize: Non-unit stride interferes with vector optimization

1771: Could not optimize: Volatile items prevent analysis

1801: Optimization: Function expanded

1824: Could not optimize: Not enough vector operations to justify translation

1885: Could not optimize: Loop bounds exceed array dimensions

1861: Could not optimize: This store into array prevents optimization of outer loop

1866: Could not optimize: Non-integer subscript

1894: Optimization: Iterations peeled from loop in order to avoid dependence

1896: Optimization: Logical clause simplified

1947: Could not optimize: Cannot transform this combination of data types and operations

1978: Could not optimize: Unable to optimize user-selected loop

1979: Could not optimize: This operation inhibits loop transformation

1987: Optimization: Loop switched

1988: Optimization: Alternate code generated

1997: Optimization: Constant-length loop unrolled

2091: Optimization: Loop unrolled

2168: Optimization: Outer loop moved inside inner loop(s)

2170: Optimization: Invariant expression moved outside of outer loop

2189: Optimization: Loop unrolled and rotated

2190: Optimization: Loop unrolled and optimized

2191: Optimization: Some loads lifted to top of loop

2218: Idiom detected and optimized

2300: Might not be able to optimize: Feedback of scalar value from one loop pass to another. Conflict on line <entity>. Loop index is <entity> (<filename>,<entity>)"

2301: Might not be able to optimize: Feedback of scalar value from one loop pass to another. Conflict on line <entity>. Loop index is <entity> (<filename>)

2302: Might not be able to optimize: Feedback of scalar value from one loop pass to another. Conflict on line <entity>. (<entity>,<filename>)

2303: Might not be able to optimize: Feedback of scalar value from one loop pass to another. Conflict on line <entity>. (<entity>)

2304: Might not be able to optimize: Potential multiple store conflict between loop iterations. Conflict on line <entity>. Loop index is <entity> (<filename>,<entity>)

2305: Might not be able to optimize: Potential multiple store conflict between loop iterations. Conflict on line <entity>. Loop index is <entity> (<filename>)

2306: Might not be able to optimize: Potential multiple store conflict between loop iterations. Conflict on line <entity>. (<entity>,<filename>)

2307: Might not be able to optimize: Potential multiple store conflict between loop iterations. Conflict on line <entity>. (<entity>)

2308: Might not be able to optimize: Potential feedback between loop iterations. Conflict on line <entity>. Loop index is <entity> (<filename>,<entity>)

2309: Might not be able to optimize: Potential feedback between loop iterations. Conflict on line <entity>. Loop index is <entity> (<filename>)

2310: Might not be able to optimize: Potential feedback between loop iterations. Conflict on line <entity>. (<entity>,<filename>)

2311: Might not be able to optimize: Potential feedback between loop iterations. Conflict on line <entity>. (<entity>)

2312: Could not optimize: Potential pointer aliasing - use restrict qualifier if ok. Conflict on line <entity>. Loop index is <entity> (<filename>,<entity>)

2313: Could not optimize: Potential pointer aliasing - use restrict qualifier if ok. Conflict on line <entity>. Loop index is <entity> (<filename>)

2314: Could not optimize: Potential pointer aliasing - use restrict qualifier if ok. Conflict on line <entity>. (<entity>,<filename>)

2315: Could not optimize: Potential pointer aliasing - use restrict qualifier if ok. Conflict on line <entity>. (<entity>)

2351: Loop nest fused with following nest(s)

2438: Could not inline: Void function used in expression

2439: Could not inline: Identifier declaration

2442: Could not inline: Cannot remove function from expression

2516: High Level Optimization halted: assembly code in routine

2519: Unable to determine constant iteration count for this loop

2524: #pragma pop with no matching #pragma push  
#pragma push and #pragma pop save and restore the current pragma state.

Each pop must be paired with a push, so an error is raised for the following code:

```
#pragma push  
;  
#pragma pop  
;  
#pragma pop
```

2525: #pragma push with no matching #pragma pop  
#pragma push and #pragma pop save and restore the current pragma state.

Each pop must be paired with a push.

2529: expression must be an integral constant in range <entity> to <entity>

2530: padding added to end of struct <entity>

The compiler can warn of padding added at the end of a struct or between structs. This warning is off by default. You can enable it with `--diag_warning 2530` or `--remarks`.

For example:

```
typedef struct {  
    int x;  
    char y;  
} A;  
typedef struct {  
    int p;  
    int q;  
} B;
```

results in the message:

```
Warning: #2530-D: padding added to end of struct 'anonymous'
```

The compiler can also warn of padding inserted within a struct, see 1301.

2531: `dllimport/dllexport` applied to a member of an unnamed namespace

2533: the <entity> attribute can only appear on functions and variables with external linkage

2534: strict mode is incompatible with treating namespace `std` as an alias for the global namespace

2535: in expansion of macro "<entity>" <entity>,</p></div>

2537: in expansion of macro "<entity>" <entity><entity>

2540: invalid symbolic operand name <entity>

2541: a symbolic match constraint must refer to one of the first ten operands

2544: thread-local variable cannot be dynamically initialized

2546: some enumerator values cannot be represented by the integral type underlying the enum type

2547: default argument is not allowed on a friend class template declaration

2548: multicharacter character literal (potential portability problem)

2549: expected a class, struct, or union type

2550: second operand of `offsetof` must be a field

2551: second operand of `offsetof` may not be a bit field

2552: cannot apply `offsetof` to a member of a virtual base

2553: `offsetof` applied to non-POD types is nonstandard

2554: default arguments are not allowed on a friend declaration of a member function

2555: default arguments are not allowed on friend declarations that are not definitions

2556: redeclaration of <entity> previously declared as a friend with default arguments is not allowed

2557: invalid qualifier for <type> (a derived class is not allowed here)

2558: invalid qualifier for definition of class <type>

2560: wide string literal not allowed

2565: template argument list of <entity> must match the parameter list

2566: an incomplete class type is not allowed

2567: complex integral types are not supported

2570: <entity> was declared "deprecated (<entity>)"

2571: invalid redefinition of <entity>

2574: explicit specialization of <entity> must precede its first use (<entity>)

2575: a sealed class type cannot be used as a base class

2576: duplicate class modifier

2577: a member function cannot have both the "abstract" and "sealed" modifiers

2578: a sealed member cannot be pure virtual

2579: nonvirtual function cannot be declared with "abstract" or "sealed" modifier

2580: member function declared with "override" modifier does not override a base class member

2581: cannot override sealed <entity>

2582: <entity> was declared with the class modifier "abstract"

2662: unrecognized calling convention <entity>, must be one of:

2665: attribute <entity> not allowed on parameter declarations

2666: underlying type of enum type must be an integral type other than bool

2667: some enumerator constants cannot be represented by <type>

2668: <entity> not allowed in current mode

2676: no #pragma start\_map\_region is currently active: pragma ignored

2677: <entity> cannot be used to name a destructor (a type name is required)

2678: nonstandard empty wide character literal treated as L'\\0'

2679: "typename" may not be specified here

2680: a non-placement operator delete must be visible in a class with a virtual destructor

2681: name linkage conflicts with previous declaration of <entity>

2682: alias creates cycle of aliased entities

2683: subscript must be constant

2684: a variable with static storage duration allocated in a specific register cannot be declared with an initializer

2685: a variable allocated in a specific register must have POD type

2686: predefined meaning of <entity> discarded

2687: declaration hides built-in <entity>

2688: declaration overloads built-in <entity>

2689: static member function not permitted here

2690: the <entity> attribute can only appear on functions and variables with internal linkage

2813: empty dependent statement in if-statement

This remark indicates that an if statement has no dependent statement, and is not followed by an else statement. For example:

```
if (x <= 0); // remark 2813 is generated here
{
    foo(x);
}
```

You can enable this remark by using `--diag_warning 2813` or `--remarks`. When using the `--remarks` option, you can suppress this remark by using `--diag_suppress 2813`.

2815: empty dependent statement in while-statement

This remark indicates that a while statement has no dependent statement. For example:

```
while (x != 0);
```

You can enable this remark by using `--diag_warning 2815` or `--remarks`. When using the `--remarks` option, you can suppress this remark by using `--diag_suppress 2815`.

2902: unrecognized Unicode source kind (must be one of UTF-8, UTF-16, UTF-16LE, UTF-16BE)

2903: Unicode character with hex value <entity> not representable in preprocessing output

2917: cannot open <entity> file <entity>

2918: cannot open <entity> file <entity>: <entity>

2934: conversion drops "\_\_restrict" qualifier

2935: unable to obtain mapped memory for <entity>: <entity>

2936: array of elements containing a flexible array member is nonstandard

2938: the initialization of <entity> will be done before that of <entity>

In the C++ standard, member variables are initialized in the order they are declared in the class, not in the order they are written in the initializer list. The compiler produces this warning when the order of the initializations in the initializer list does not match the order of declarations in the class. You can enable this warning with `--diag_warning 2938` or `--remarks`.

For example:

```
class Foo {
    int x;
    char y;
public:
    Foo() : y(42), x(32) {}
};
```

results in the message:

```
Warning: #2938-D: the initialization of member "Foo::x" will be done before
that of member "Foo::y"
```

2939: inheritance kind is not allowed in C

2940: inheritance kind is ignored on an enum specifier

2941: modifier is not allowed on an enum specifier

2942: modifier is ignored on an enum specifier

2943: identifier character cannot be represented in Unicode

2944: header name contains characters that cannot be represented in Unicode

2945: <entity> is not a valid locale name

2946: declaring a void parameter list with a template parameter is nonstandard

2949: <entity> is not a variable

2960: invalid template directory:

2969: "\" followed by white space is not a line splice

2970: this `dynamic_cast` cannot be done without runtime type information, which is disabled

The compiler produces this error when a `dynamic_cast` must perform runtime type checking but you have disabled support for RTTI by compiling using the `--no_rtti` option. For example the following code results in this error:

```
class Foo {
    virtual int foo() = 0;
};
class Bar {};
Bar *convert(Foo *x) {
    return dynamic_cast<Bar *>(x);
}
```

2971: conversion to <entity> is ambiguous; direct base selected

2972: an internal buffer would be too large

2973: C++ exception handler used, but exception handling semantics have not been specified

- 2974: type qualifier ignored on constructor
- 2981: explicit template arguments ignored
- 2983: <entity> is not a class type
- 2984: "delete" applied to a pointer-to-array type treated as delete[]  
The compiler produces this warning when the programmer has used the wrong kind of delete operator and the compiler has automatically corrected it. For example the following code results in this warning:
- ```
void f(char (*data)[10]) {  
    delete data;  
}
```
- 2985: "delete" applied to a pointer-to-array type is nonstandard;  
treated as delete[]  
This warning has the same meaning as 2984. The compiler generates this instead of 2984 when you compile with --strict on the command line.
- 2989: type qualifiers are ignored (underlying type is a reference)
- 2990: <entity>, declared using a local type, must be defined in this translation unit
- 2991: <entity>, declared using a type with no linkage, must be defined in this translation unit
- 2997: \_\_builtin\_va\_arg\_pack/\_\_builtin\_va\_arg\_pack\_len can appear only in an inline function with an ellipsis parameter
- 2999: expected a C++ keyword
- 3001: offset is not constant
- 3002: unrecognized #pragma comment type <entity>
- 3006: invalid string in #pragma comment
- 3011: default arguments of <entity> is incompatible with a declaration in another translation unit
- 3012: default arguments of <entity> were different during compilation of <entity>
- 3014: initializer for <entity> is different in another translation unit
- 3015: initializer for <entity> was different during compilation of <entity>
- 3016: a designator into a template-dependent type is not allowed
- 3017: unrecognized conformance kind
- 3018: expected "on" or "off"
- 3019: #pragma conform(forScope) stack is empty
- 3020: no previous #pragma conform(forScope) entry matches <entity>
- 3021: forScope behavior is nonstandard
- 3022: forScope behavior is standard
- 3024: type qualifiers are meaningless here
- 3028: function call requires one argument
- 3029: function call requires a real floating-point argument
- 3033: nonstandard first parameter <entity> of "main", expected "int"

- 3034: nonstandard number of parameters for "main", expected zero or two parameters
- 3035: nonstandard second parameter <entity> of "main", expected "char \*[]" or "char \*\*"
- 3039: "packed" attribute ignored on class with non-POD <entity>
- 3040: error while deleting file <entity>: <entity>
- 3049: SWP instructions are deprecated in architecture ARMv6 and above
- 3050: FLDMX/FSTMX instructions are deprecated
- 3051: instruction is unpredictable in the current instruction set
- 3052: instruction is unpredictable with MSB < LSB
- 3053: instruction is unpredictable with the specified immediate value
- 3054: instruction is unpredictable with the specified condition
- 3055: instruction is unpredictable in IT block
- 3056: instruction is unpredictable with the specified special register
- 3057: instruction is unpredictable with the specified PSR mask
- 3058: immediate not in range <entity>
- 3059: immediate not a multiple of <entity>
- 3060: selected target does not have VFP
- 3061: unrecognized instruction opcode
- 3062: expected "<entity>"
- 3063: expected flag characters from "<entity>"
- 3064: expected special register for MSR/MRS
- 3065: deprecated special register name
- 3066: deprecated special register field specifier (use "<entity>" instead)
- 3067: MRS cannot select fields, use APSR, CPSR or SPSR directly
- 3068: expected a condition code
- 3069: VCVT conversion between these data types not available
- 3070: destination operand type or register sort incorrect
- 3071: source operand type or register sort incorrect
- 3072: data type specifiers do not match a valid encoding for this instruction
- 3073: missing data type specifier
- 3074: expected scalar operand
- 3075: expected data type specifier "<entity>" for destination operand
- 3076: expected data type specifier "<entity>" for source operand(s)
- 3077: writeback with no effect
- 3078: data type specifiers are not allowed on this instruction
- 3079: invalid instruction width qualifiers or data type specifiers
- 3080: unsupported special register

3081: expected end of line or a ";"

## 1.3 List of the old-style armcc error and warning messages

A list of the old-style error and warning messages that **armcc** might still produce.

———— **Note** —————

In ARM Compiler 5.02 and earlier, the numbers in these message IDs were in the range 3000-3499.

---

C4002W: illegal unaligned load or store access - use `__packed` instead

C4008W: splitting LDM/STM has no benefit

Inappropriate use of the switch `--split_ldm`. This option has no significant benefit for cached systems, or for processors with a write buffer.

C4009E: unsupported CPU <entity>

C4016W: unknown option '-<entity><entity>': ignored

C4017W: <entity> may be used before being set

The compiler performs data flow analysis at optimization level `-O1` and above. You can use this information to identify potential problems in the code such as variables being used before being set. However, this is really a by-product of optimization rather than a feature in its own right. The data flow analysis that detects variables being used before being set only analyses hardware register use, that is, variables that are held in processor registers. It does not analyze variables or structures that are allocated on the stack, that is, stored in memory rather than in processor registers.

As code (and also register memory usage) generated by the compiler varies with the level of optimization, the warning might appear for code compiled at one level of optimization but not others. You might see it, for example, at `-O2`, but not `-O1`.

———— **Note** —————

The data flow analysis is not intended to be a fully complete feature. You must only treat C4017W warnings given by the compiler as a guide, and not rely on them to identify faulty code reliably. The compiler never provides as much information as a special purpose tool such as Lint.

---

C4018W: division by zero: <entity>

Constant propagation shows that a divide or remainder operator has a second operand with value 0. It is an error if execution reaches this expression. The compiler returns a result of 0 for a divide by constant 0.

C4038E: Function too large or complicated to compile (0x<num>)

C4041U: I/O error writing '<entity>': <entity>

C4047U: Too many errors

C4048U: out of store while compiling with `-g`. Allocation size was <entity>, system size is <entity>

C4049U: out of store. Allocation size was <entity>, system size is <entity>

A storage allocation request by the compiler failed. Compilation of the debugging tables requested with the `-g` option might require a large amount of memory. Recompiling without `-g`, or with the program split into smaller pieces, might help.

C4050U: Compilation aborted.

C4051E: couldn't write file '<entity>': <entity>

C4052E: couldn't read file '<entity>': <entity>

C4056E: bad option '<s>'

C4057E: bad option '<s1> <s2>'

C4065E: type of input file '<entity>' unknown

C4066E: The code space needed for this object is too large for this version of the compiler

Split the source file into smaller pieces.

C4075E: Can't open <entity> for output

C4078E: stdin ('-') combined with other files

C4079E: <entity> command with no effect

C4301W: configuration file appears to be from a newer version of the compiler

The configuration file is one of the XML files supplied to the compiler with the `--arm_linux_config_file` switches when using `--arm_linux_paths` or GCC command-line translation. For example:

```
armcc --arm_linux_paths --arm_linux_config_file=arm_linux_config.xml
```

This warning indicates the file is from a newer compiler so might contain unsupported features. To avoid incompatibilities, either use the newer version of the compiler that generated the configuration file, or re-generate the configuration file using your current compiler version.

See the following in the compiler document:

[`--arm\_linux\_config\_file=path`](#).

[`--arm\_linux\_paths`](#).

C4302E: configuration file has an invalid version string

This represents an error reading from or writing to an ARM Linux configuration file.

Do the following:

1. Check that the file can be read from and written to and has valid permissions.
2. Try re-generating the configuration file using `--arm_linux_configure`.

See the following in the compiler document:

[`--arm\_linux\_configure`](#).

C4303E: configuration file was not specified

See the description for error C4302E.

C4304E: I/O error reading configuration file <file>

See the description for error C4302E.

C4305E: I/O error writing configuration file <file>

See the description for error C4302E.

C4306E: could not parse configuration file <file>

See the description for error C4302E.

C4307E: unable to read configuration file

See the description for error C4302E.

**C4308W: cannot find system include directory**

When using an ARM Linux mode, `--arm_linux`, `--arm_linux_paths`, or GCC command-line translation, set the `ARMCC5INC` environment variable to `install_directory\include`. This ensures that the compiler can find the `arm_linux` header subdirectory.

See the following in the compiler document:

`--arm_linux`.

`--arm_linux_paths`.

See the following in the *Getting Started Guide*:

*Toolchain environment variables*.

**C4309E: automatic configuration failed - cannot find GCC**

This error is produced when you try to automatically configure the tools with `--arm_linux_configure`, but GCC cannot be found. Use the `--configure_gcc=path_to_gcc` command-line option to specify the path to the GCC executable, such as `arm-none-linux-gnueabi-gcc`.

See the following in the compiler document:

`--arm_linux_configure`.

`--configure_gcc=path`.

**C4310W: automatic configuration is incomplete - cannot determine sysroot path from GCC**

The GCC that was used for the ARM Linux configuration process did not provide a valid `sysroot` path. Use `--configure_sysroot=sysroot_path` to set the path.

See the following in the compiler document:

`--configure_sysroot=path`.

**C4311E: automatic configuration failed - cannot find GLD**

This error is produced when you try to automatically configure the tools with `--arm_linux_configure`, but the GNU linker (`ld`) could not be found. Use the `--configure_gkd=path_to_gcc` command-line option to specify the path to the GNU `ld` executable, such as `arm-none-linux-gnueabi-ld`.

See the following in the compiler document:

`--arm_linux_configure`.

`--configure_gcc=path`.

**C4312E: automatic configuration failed - could not execute GCC**

This error indicates that, when using automatic configuration for ARM Linux by specifying `--arm_linux_configure`, the respective tools (GCC or GNU `ld`) could not be executed or failed when invoked. Check that they have execute permissions, and your GNU toolchain installation is working correctly.

See the following in the compiler document:

`--arm_linux_configure`

**C4313E: automatic configuration failed - could not execute GLD**

See the description of error C4312E.

**C4314W: gcc command line translation - ignoring option with no translation: <option>**

C4315W: gcc command line translation - translation for this command is not fully supported: <option>

C4316W: option is not supported under arm linux: <option>

C4317W: translated cpu or architecture option <option> is not valid

C4318W: unable to read file <file>

C4319W: cannot recognise type of file <file> - file will be ignored

C4320W: cannot find file <file> - file will be ignored

C4321E: automatic configuration failed - could not determine configuration from GCC

When configuring automatically for ARM Linux with `--arm_linux_configure`, the compiler could not determine sufficient information from GCC to produce the configuration. Try a manual configuration by specifying a `sysroot` path with `--configure_sysroot` and a path to the GNU C++ header files with `--configure_cpp_headers`.

See the following in the compiler document:

`--arm_linux_configure`.

`--configure_cpp_headers=path`.

`--configure_sysroot=path`.

C4322W: could not accurately determine library configuration from GCC - configuration might be incomplete

C4323E: automatic configuration failed - GCC internal specs configuration report error: <text>

C4324W: could not determine libstdc++ header file path - specify this manually to ensure that C++ code will compile correctly

The path to the libstdc++ header files could not be determined from GCC. Specify this path with `--configure_cpp_headers=path`

See the following in the compiler document:

`--configure_cpp_headers=path`.

C4327W: cannot determine application entry point function - using <value> as default

C4328W: cannot determine library paths from GNU linker - trying to use defaults

C4329W: option is missing an argument : <option>

C4330E: GCC configuration is invalid

C4331W: script file <file> will be treated as a scatter file

C4332E: I/O error reading via file <file>

C4333E: I/O error closing via file <file>

C4334W: invalid GCC version in configuration file - using default

C4335E: cannot retry because configuration file does not provide path to GNU executable

Displayed when the ARM Linux configuration file specified for GCC fallback does not include the correct path to `gcc`.

See the following in the compiler document:

*Using GCC fallback when building applications.*

*-Warmcc,--gcc\_fallback.*

C4336W: compilation failed - retrying with GNU tools

Displayed if an `armcc` compilation fails and GCC fallback is specified. `armcc` then attempts to run `gcc` to complete the compilation.

See the following in the compiler document:

*Using GCC fallback when building applications.*

*-Warmcc,--gcc\_fallback.*

C4337E: compilation with GNU tools also failed

Displayed if `gcc` fails during GCC fallback.

See the following in the compiler document:

*Using GCC fallback when building applications.*

*-Warmcc,--gcc\_fallback.*

C4338W: compilation with GNU tools succeeded

Displayed when GCC fallback succeeds.

See the following in the compiler document:

*Using GCC fallback when building applications.*

*-Warmcc,--gcc\_fallback.*

C4339W: ambiguous translation mode options specified - using <option>

You must not specify more than one translation mode option to select a particular translation mode. The translation mode options are:

- `--translate_gcc.`
- `--translate_g++.`
- `--translate_gld.`

See the following in the compiler document:

*--translate\_g++.*

*--translate\_gcc.*

*--translate\_gld.*

C4340W: could not obtain license for vectorization (implied by -O3) - defaulting to -fno-tree-vectorize

With GCC command-line translation, -O3 implies vectorization. However, in ARM Compiler 4.1 and earlier, a separate license is required to use the NEON vectorization feature of the compiler. If a NEON vectorization license is not available, the compiler emits this warning and disables vectorization. In ARM Compiler 5.0 and later, a separate NEON vectorization license is not required, so this warning is no longer generated.

See the following in the *Getting Started Guide*:

[Licensed features of ARM Compiler.](#)

See the following in the compiler document:

[-Onum.](#)

C4403E: \_\_alloca\_state not defined

C4419W: dynamic stack alignment veneer inserted in <entity>

This warning is given when compiling \_\_irq functions for --cpu=Cortex-M3-rev0 to force the stack to be 8-byte aligned on entry into the interrupt.

C4421W: write to string literal

There is a write through a pointer that has been assigned to point at a literal string. The behavior is undefined by the ANSI standard. A subsequent read from the location written might not reflect the write.

C4435E: reference to <entity> not allowed

C4447E: option '-E' and input file '<filename>' type conflict

C4484E: Minimum toplevel array alignment must be 1, 2, 4 or 8

C4486W: option '-<optionchar>' causes input file '<filename>' to be ignored

C4487E: read from variable '<var>' with offset out of bounds

For example :

```
void foo(void) {
    unsigned int pnt;
    pnt = (unsigned int)&pnt;
    pnt -= 4;
    pnt = *(unsigned int*)pnt;
}
```

C4488E: write to variable '<var>' with offset out of bounds

C4489E: \_\_vfp\_status() intrinsic not supported for targets without VFP

C4490W: instruction set switching using file extension is deprecated

C4493E: Function alignment must be a power of 2 and greater than 1

C4494E: invalid global register number <num>; 1 to <num> allowed

C4497E: invalid syntax for retention constraint: <text>

C4498E: option conflicts with an arm linux targeting option: <option>

Certain options are expected to be used when targeting ARM Linux, for example to select the correct ABI variant options. This message is given to indicate when an incompatible option is specified.

See the following in the compiler document:

[--arm\\_linux.](#)

## Chapter 2

# Assembler Errors and Warnings

Describes the error and warning messages for the assembler, **armasm**.

It contains the following:

- *2.1 List of the **armasm** error and warning messages on page 2-87.*

## 2.1 List of the armasm error and warning messages

A list of the error and warning messages that **armasm** produces.

### A1017E: :INDEX: cannot be used on a pc-relative expression

The **:INDEX:** expression operator has been applied to a PC-relative expression, most likely a program label. **:INDEX:** returns the offset from the base register in a register-relative expression.

If you require the offset of a label called `<label>` within an area called `<areaname>`, use `<label> - <areaname>`.

See the following in the assembler document:

*Unary operators.*

### A1020E: Bad predefine: <directive>

The operand to the `--predefine` or `--pd` command-line option was not recognized. The directive must be enclosed in quotes if it contains spaces, for example on Windows:

```
--predefine "versionnum SETA 5"
```

If the **SETS** directive is used, the argument to the directive must also be enclosed in quotes, which might require escaping, depending on the operating system and shell. For example:

```
--predefine "versionstr SETS \"5A\""
```

### A1021U: No input file

No input file was specified on the command line. This might be because there was no terminating quote on a quoted argument.

### A1023E: File "<filename>" could not be opened: <reason>

### A1024E: File "<filename>" could not all be loaded: <reason>

### A1042E: Unrecognized APCS qualifier '<qualifier>'

There is an error in the argument given to the `--apcs` command line option. Check the spelling of `<qualifier>`.

### A1051E: Cannot open --depend file '<filename>': <reason>

### A1055E: Cannot open --errors file '<filename>': <reason>

### A1056E: Target cpu '<cpu>' not recognized

The name given in the `--cpu` command line option is not a recognized processor name. Check the spelling of the argument.

Use `--cpu=list` to list the supported processors and architectures.

### A1067E: Output file specified as '<filename1>', but it has already been specified as '<filename2>'

More than one output file, `-o filename`, has been specified on the command line. Misspelling a command line option can cause this.

A1071E: Cannot open listing file '<filename>': <reason>

The file given in the `--list <filename>` command-line option could not be opened. This could be for any of the following reasons:

- The given name is not valid.
- There is no space.
- A read-only file with the same name already exists.
- The file is in use by another process.

Check you have specified the correct path for the file.

A1072E: The specified listing file '<filename>' must not be a .s or .o file

The filename argument to the `--list` command line option has an extension that indicates it is a source or object file. This might be because the filename argument was accidentally omitted from the command line. Check that the correct argument is given to the `--list` command line option.

A1073E: The specified output file '<filename>' must not be a source file

The object file specified on the command line has a filename extension that indicates it is a source file. This might be because the object filename was accidentally omitted from the command line.

A1074E: The specified depend file '<filename>' must not be a source file

The filename argument to the `--depend` command line option has an extension that indicates it is a source (.s) file. This might be because the filename argument was accidentally omitted from the command line. Check that the correct arguments are given.

A1075E: The specified errors file '<filename>' must not be a source file

The filename argument to the `--errors` command line option has an extension that indicates it is a source (.s) file. This might be because the filename argument was accidentally omitted from the command line. Check that the correct arguments are given.

A1085W: Forced user-mode LDM/STM must not be followed by use of banked R8-R14

The ARM architecture does not permit you to access banked registers in the instruction immediately following a User registers LDM or STM. Adding a NOP immediately after the LDM or STM is one way to avoid this.

For example:

```
stmib sp, {r0-r14}^ ; Return a pointer to the frame in a1.  
mov r0, sp
```

change to:

```
stmib sp, {r0-r14}^ ; Return a pointer to the frame in a1.  
nop  
mov r0, sp
```

A1088W: Faking declaration of area AREA |\$\$\$\$\$\$|

This is reported when no AREA directive is specified (see A1105E).

A1099E: Structure stack overflow max stack size <max>

A1100E: Structure stack underflow

A1105E: Area directive missing

This is reported when no AREA directive is specified (see also A1088W).

A1106E: Missing comma

A1107E: Bad symbol type, expect label

A1108E: Multiply defined symbol '<name>'

A1109E: Bad expression type

A1110E: Expected constant expression

A constant expression was expected after, for example, SETA.

See the following in the assembler document:

*Numeric expressions.*

A1111E: Expected constant or address expression

A1112E: Expected address expression

A1113E: Expected string expression

A string expression was expected after, for example, SETS.

See the following in the assembler document:

*String expressions.*

A1114E: Expected register relative expression

A1116E: String operands can only be specified for DCB

A1117E: Register symbol '<name>' already defined

A1118E: No current macro expansion

A1119E: MEND not allowed within conditionals

MEND means END of Macro (not the English word mend).

See the following in the assembler document:

*About macros.*

A1120E: Bad global name

A1121E: Global name '<name>' already exists

A1122E: Locals not allowed outside macros

A1123E: Bad local name

A1125E: Unknown or wrong type of global/local symbol '<name>'

A1126E: Bad alignment boundary, must be a multiple of 2

A1127E: Bad IMPORT/EXTERN name

A1128E: Common name '<sym>' already exists

A1129E: Imported name '<sym>' already exists

A1130E: Bad exported name

A1131E: Bad symbol type for exported symbol '<sym>'

A1132E: REQUIRE directive not supported for <entity> format output

A1133E: Bad required symbol name

A1134E: Bad required symbol type, expect (symbol is either external or label) and (symbol is relocatable and absolute)

A1135E: Area name missing

AREA names starting with any non-alphabetic character must be enclosed in bars, for example change:

```
AREA 1_DataArea, CODE, READONLY
```

to:

```
AREA |1_DataArea|, CODE, READONLY
```

A1136E: Entry address already set

A1137E: Unexpected characters at end of line

This is given when extra characters that are not part of an instruction are found on an instruction line.

For example:

```
ADD r0, r0, r1 comment
```

You could change this to:

```
ADD r0, r0, r1 ; comment
```

A1138E: String "<string>" too short for operation, length must be > <oplength>

A1139E: String overflow, string exceeds <max> characters

A1140E: Bad operand type

A1141E: Relocated expressions may only be added or subtracted

A1142E: Subtractive relocations not supported for <entity> format output

This can occur when subtracting symbols that are in different areas, for example:

```
IMPORT sym1  
IMPORT sym2  
DCD (sym2 - sym1)
```

A1143E: COMMON directive not supported for %s format output

A1144E: DCDO directive not supported for %s format output

A1145E: Undefined exported symbol '<sym>'

A1146E: Unable to open output file <codeFileName>: <reason>

A1147E: Bad shift name

A1148E: Unknown shift name <name>, expected one of LSL, LSR, ASR, ROR, RRX

### A1150E: Bad symbol, not defined or external

This typically occurs in the following cases:

- when the current file requires an `INCLUDE` of another file to define some symbols, for example:

```
"init.s", line 2: Error: A1150E: Bad symbol  
2 00000000 DCD EB1_CSR_0
```

typically requires a definitions file to be included, for example:

```
INCLUDE targets/eb40.inc
```

- when the current file requires `IMPORT` for some symbols, for example:

```
"init.s", line 4: Error: A1150E: Bad symbol  
4 00000000 LDR r0, =||Image$$RAM$$ZI$$Limit||
```

typically requires the symbol to be imported, for example:

```
IMPORT ||Image$$RAM$$ZI$$Limit||
```

### A1151E: Bad register name symbol

Example:

```
MCR p14, 3, R0, Cr1, Cr2
```

The coprocessor registers CR must be labelled as a lowercase `c` for the code to build. The ARM register can be `r` or `R`:

```
MCR p14, 3, r0, c1, c2
```

or

```
MCR p14, 3, R0, c1, c2
```

### A1152E: Unexpected operator

### A1153E: Undefined symbol

### A1154E: Unexpected operand, operator expected

### A1155E: Unexpected unary operator equal to or equivalent to <operator>

### A1156E: Missing open bracket

### A1157E: Syntax error following directive

### A1158E: Illegal line start, should be blank

Some directives, for example, `ENTRY`, `IMPORT`, `EXPORT`, and `GET` must be on a line without a label at the start of the line. This error is given if a label is present.

**A1159E: Label missing from line start**

Some directives, for example, `FUNCTION` or `SETS`, require a label at the start of the line, for example:

```
my_func FUNCTION
```

or

```
label SETS
```

This error is given if the label is missing.

**A1160E: Bad local label number**

A numeric local label is a number in the range 0-99, optionally followed by a name.

See the following in the assembler document:

[Numeric local labels.](#)

**A1161E: Syntax error following local label definition**

**A1162E: Incorrect routine name '<name>'**

**A1163E: Unknown opcode <name> , expecting opcode or Macro**

The most common reasons for this are:

- Forgetting to put some white space on the left hand side margin, before the instruction, for example change:

```
MOV PC,LR
```

to

```
MOV PC, LR
```

- Use of a hardware floating point instruction without using the `--fpu` switch, for example:

```
FMXR FPEXC, r1 ;
```

must be assembled with `armasm --fpu vfp`

- Mis-typing the opcode:

```
ADDD
```

instead of

```
ADD
```

**A1164E: Opcode not supported on selected processor**

The processor selected on the `armasm` command line does not support this instruction.

See the following:

[ARM Architecture Reference Manual.](#)

**A1165E: Too many actual parameters, expecting <actual> parameters**

**A1166E: Syntax error following label**

A1167E: Invalid line start

A1168E: Translate not allowed in pre-indexed form

A1169E: Missing close square bracket

A1170E: Immediate 0x<adr> out of range for this operation, must be below 0x(0x<adr>)

This error is given when a DCB, DCW or DCWU directive is used with an immediate that is too large.

See the following in the assembler document:

*DCB.*

*DCW and DCWU.*

A1171E: Missing close bracket

A1172E: Bad rotator <rotator>, must be even and between 0 and 30

A1173E: ADR/L cannot be used on external symbols

The ADR and ADRL pseudo-instructions can only be used with labels within the same code area. To load an out-of-area address into a register, use LDR instead.

A1174E: Data transfer offset 0x<val> out of range. Permitted values are 0x<mini> to 0x<maxi>

A1175E: Bad register range

A1176E: Branch offset 0x<val> out of range. Permitted values are 0x<mini> to 0x<maxi>

Branches are PC-relative, and have a limited range. If you are using numeric local labels, you can use the ROUT directive to limit their scope. This helps to avoid referring to the wrong label by accident.

See the following in the assembler document:

*Numeric local labels.*

A1179E: Bad hexadecimal number

A1180E: Missing close quote

A1181E: Bad operator

A1182E: Bad based <base> number

A1183E: Numeric overflow

A1184E: Externals not valid in expressions

A1185E: Symbol missing

A1186E: Code generated in data area

An instruction has been assembled into a data area. This can happen if you have omitted the CODE attribute on the AREA directive.

See the following in the assembler document:

*AREA.*

A1187E: Error in macro parameters

A1188E: Register value <val> out of range. Permitted values are <mini> to <maxi>

A1189E: Missing '#'

A1190E: Unexpected '<entity>'

- A1191E: Floating point register number out of range 0 to <maxi>
- A1192E: Coprocessor register number out of range 0 to 15
- A1193E: Coprocessor number out of range 0 to 15
- A1194E: Bad floating-point number
- A1195W: Small floating point value converted to 0.0
- A1196E: Too late to ban floating point
- A1198E: Unknown operand

This can occur when an operand is accidentally mistyped.

For example:

```
armasm init.s -g -PD "ROM_RAM_REMAP SETL {FALS}"
```

must be:

```
armasm init.s -g -PD "ROM_RAM_REMAP SETL {FALSE}"
```

See the following in the assembler document:

[Assembly time substitution of variables.](#)

- A1199E: Coprocessor operation out of range 0 to <maxi>
- A1200E: Structure mismatch expect While/Wend
- A1201E: Substituted line too long, maximum length <max>
- A1202E: No pre-declaration of substituted symbol '<name>'

See the following in the assembler document:

[Assembly time substitution of variables.](#)

- A1203E: Illegal label parameter start in macro prototype
- A1204E: Bad macro parameter default value
- A1205E: Register <reg> occurs multiply in list
- A1206E: Registers should be listed in increasing register number order  
This warning is given if registers in, for example, LDM or STM instructions are not specified in increasing order and the --checkreglist option is used.
- A1207E: Bad or unknown attribute

This error is given when an invalid attribute is given in the AREA directive. For example:

```
AREA test, CODE, READONLY, HALFWORD
```

HALFWORD is invalid, so remove it.

See the following in the assembler document:

[AREA.](#)

- A1209E: ADRL cannot be used with PC as destination
- A1210E: Non-zero data within uninitialized area '<name>'
- A1211E: Missing open square bracket
- A1212E: Division by zero
- A1213E: Attribute <entity> cannot be used with attribute <entity>

- A1214E: Too late to define symbol '<sym>' as register list
- A1215E: Bad register list symbol
- A1216E: Bad string escape sequence
- A1217E: Error writing to code file <codeFileName>: <reason>
- A1219E: Bad APSR, CPSR or SPSR designator

For example:

```
MRS r0, PSR
```

It is necessary to specify which status register to use (CPSR or SPSR), such as, for example:

```
MRS r0, CPSR
```

- A1220E: BLX <address> must be unconditional
- A1221E: Area attribute '<entity>' not supported for <entity> object file format
- A1223E: Comdat Symbol '<name>' is not defined
- A1224E: <entity> format does not allow PC-relative data transfers between areas
- A1225E: ASSOC attribute is not allowed in non-comdat areas
- A1226E: SELECTION attribute is not allowed in non-comdat areas
- A1227E: Comdat Associated area '<name>' undefined at this point in the file
- A1228E: Comdat Associated area '<name>' is not an area name
- A1229E: Missing COMDAT symbol
- A1230E: Missing '}' after COMDAT symbol
- A1234E: Undefined or Unexported Weak Alias for symbol '<sym>'
- A1237E: Invalid register or register combination for this operation
- A1238E: Immediate value must be word aligned when used in this operation
- A1240E: Immediate value cannot be used with this operation
- A1241E: Must have immediate value with this operation
- A1242E: Offset must be word aligned when used with this operation
- A1243E: Offset must be halfword aligned with this operation
- A1244E: Missing '!'
- A1245E: B or BL from Thumb code to ARM code
- A1247E: BLX from ARM code to ARM code, use BL

This occurs when there is a BLX *label* branch from ARM code to ARM code within this assembler file. This is not permitted because BLX *label* always results in a change of instruction set state. The usual solution is to use BL instead.

A1248E: BLX from Thumb code to Thumb code, use BL

This occurs when there is a BLX *label* branch from Thumb code to Thumb code within this assembler file. This is not permitted because BLX *label* always results in a change of instruction set state. The usual solution is to use BL instead.

A1249E: Post indexed addressing mode not available

A1250E: Pre indexed addressing mode not available for this instruction, use [Rn, Rm]

A1253E: Thumb branch to external symbol cannot be relocated: not representable in <fmt>

A1254E: Halfword literal values not supported

In the following example, change the LDRH into LDR, which is the standard way of loading constants into registers:

```
LDRH R3, =constant
```

A1256E: DATA directive can only be used in CODE areas

A1259E: Invalid PSR field specifier, syntax is <PSR>\_ where <PSR> is either CPSR or SPSR

A1260E: PSR field '<entity>' specified more than once

A1261E: MRS cannot select fields, use APSR, CPSR or SPSR directly

This is caused by an attempt to use fields for CPSR or SPSR with an MRS instruction, such as:

```
MRS r0, CPSR_c
```

A1262U: Expression storage allocator failed

A1265U: Structure mismatch: IF or WHILE unmatched at end of INCLUDE file

A1267E: Bad GET or INCLUDE for file <filename>

A1268E: Unmatched conditional or macro

A1269U: unexpected GET on structure stack

A1270E: File "<entity>" not found

A1271E: Line too long, maximum line length is <MaxLineLength>

A1272E: End of input file

A1273E: '\\\' should not be used to split strings

A1274W: '\\\' at end of comment

A1283E: Literal pool too distant, use LTORG to assemble it within 1KB

For Thumb code, the literal pool must be within 1KB of the LDR instruction to access it. See A1284E and A1471W.

A1284E: Literal pool too distant, use LTORG to assemble it within 4KB

For ARM code, a literal pool must be within 4KB of an LDR instruction that is trying to access it. To solve this, add an LTORG directive into your assembly source code at a convenient place.

See the following in the assembler document:

[Load addresses to a register using LDR Rd, =label.](#)

[LTORG.](#)

- A1285E: Bad macro name
- A1286E: Macro already exists
- A1287E: Illegal parameter start in macro prototype
- A1288E: Illegal parameter in macro prototype
- A1289E: Invalid parameter separator in macro prototype
- A1290E: Macro definition too big, maximum length <max>
- A1291E: Macro definitions cannot be nested
- A1310W: Symbol attribute not recognized
- A1311U: macro definition attempted within expansion
- A1312E: Assertion failed
- A1313W: Missing END directive at end of file  
The assembler requires an END directive to know when the code in the file terminates.  
You can add comments or other such information in free format after this directive.
- A1314W: Reserved instruction (using NV condition)
- A1315E: NV condition not supported on targeted CPU
- A1316E: Shifted register operand to MSR has undefined effect
- A1319E: Undefined effect (using PC as Rs)
- A1320E: Undefined effect (using PC as Rn or Rm in register specified shift)
- A1321E: Undefined effect (using PC as offset register)
- A1322E: Unaligned transfer of PC, destination address must be 4 byte aligned, otherwise result is UNPREDICTABLE  
This error is reported when you try to use an LDR instruction to load the PC from a non word-aligned address. For example:

```
AREA Example, CODE
LDR pc, [pc, #6] ; Error - offset must be a multiple of 4
END
```

This code gives an UNPREDICTABLE result.

- A1323E: Reserved instruction (Rm = Rn with post-indexing)
- A1324E: Undefined effect (PC + writeback)
- A1327E: Non portable instruction (LDM with writeback and base in register list, final value of base unpredictable)  
In the LDM instruction, if the base register <Rn> is specified in <registers>, and base register writeback is specified, the final value of <Rn> is UNKNOWN.
- A1328E: Non portable instruction (STM with writeback and base not first in register list, stored value of base unpredictable)  
In the STM instruction, if <Rn> is specified in <registers> and base register writeback is specified:
- If <Rn> is the lowest-numbered register specified in <register\_list>, the original value of <Rn> is stored.
  - Otherwise, the stored value of <Rn> is UNKNOWN.

A1329E: Unpredictable instruction (forced user mode transfer with write-back to base)

This is caused by an instruction such as `PUSH {r0}^` where the ^ indicates access to user registers. Writeback to the base register is not available with this instruction. Instead, the base register must be updated separately, for example:

```
SUB sp, sp,#4
STMID sp, {r0}^
```

Another example is replacing `STMFD R0!, {r13, r14}^` with:

```
SUB r0, r0,#8
STM r0, {r13, r14}^
```

See also A1085W.

A1331E: Unpredictable instruction (PC as source or destination)

A1332E: Unpredictable effect (PC-relative SWP)

A1334E: Undefined effect (use of PC/PSR)

A1335E: Useless instruction (PC cannot be written back)

A1337E: Useless instruction (PC is destination)

A1338E: Dubious instruction (PC used as an operand)

A1339E: Unpredictable if RdLo and RdHi are the same register

A1341E: Branch to unaligned destination, expect destination to be <max> byte aligned

A1342W: <name> of symbol in another AREA will cause link-time failure if symbol is not close enough to this instruction

A1344I: host error: out of memory

A1355U: A Label was found which was in no AREA

This can occur if no white space precedes an assembler directive. Assembler directives must be indented. For example use:

```
IF :DEF: FOO
; code
ENDIF
```

instead of:

```
IF :DEF: FOO
; code
ENDIF
```

Symbols beginning in the first column are assumed to be labels.

**A1356E: Instruction not supported on targeted CPU**

This occurs if you try to use an instruction that is not supported by the selected architecture or processor.

For example:

```
SMULBB r0,r0,r1 ;
```

This can be assembled with:

```
armasm --cpu 5TE
```

See the following:

*[ARM Architecture Reference Manual](#)*.

**A1406E: Bad decimal number**

**A1407E: Overlarge floating point value**

**A1408E: Overlarge (single precision) floating point value**

**A1409W: Small (single precision) floating value converted to 0.0**

**A1411E: Closing '>' missing from vector specifier**

**A1412E: Bad vector length, should be between <min> and <max>**

**A1413E: Bad vector stride, should be between <min> and <max>**

**A1414E: Vector wraps round over itself, length \* stride should not be greater than <max>**

**A1415E: VFPASSERT must be followed by 'VECTOR' or 'SCALAR'**

**A1416E: Vector length does not match current vector length <len>**

**A1417E: Vector stride does not match current vector stride**

**A1418E: Register has incorrect type '<type>' for instruction, expect floating point/double register type**

**A1419E: Scalar operand not in a scalar bank**

**A1420E: Lengths of vector operands are different**

**A1421E: Strides of vector operands are different**

**A1422E: This combination of vector and scalar operands is not allowed**

**A1423E: This operation is not vectorizable**

**A1424E: Vector specifiers not allowed in operands to this instruction**

**A1425E: Destination vector must not be in a scalar bank**

**A1426E: Source vector must not be in a scalar bank**

**A1427E: Operands have a partial overlap**

**A1428E: Register list contains registers of varying types**

**A1429E: Expected register list**

The assembler reports this when `FRAME SAVE` and `FRAME RESTORE` directives are not given register lists.

See the following in the assembler document:

[\*FRAME RESTORE\*](#).

[\*FRAME SAVE\*](#).

**A1430E: Unknown frame directive**

**A1431E: Frame directives are not accepted outside of PROCs/FUNCTIONs**

See the following in the assembler document:

[\*Frame directives\*](#).

**A1432E: Floating-point register type not consistent with selected floating-point architecture**

**A1433E: Only the writeback form of this instruction exists**

The addressing mode specified for the instruction did not include the writeback specifier (that is, a `!` after the base register), but the instruction set only supports the writeback form of the instruction. Either use the writeback form, or replace with instructions that have the required behavior.

**A1435E: {PCSTOREOFFSET} is not defined when assembling for an architecture**

{PCSTOREOFFSET} is only defined when assembling for a processor, not for an architecture.

**A1437E: {ARCHITECTURE} is undefined**

{ARCHITECTURE} is only defined when assembling for an architecture, not for a processor.

**A1446E: Bad or unknown attribute '<attr>'. Use `--apcs /interwork` instead**

For example:

```
AREA test1, CODE, READONLY
AREA test, CODE, READONLY, INTERWORK
```

This code might have originally been intended to work with the legacy ARM Software Development Toolkit (SDT). The `INTERWORK` area attribute is obsolete. To eliminate the error, do the following:

- remove the `", INTERWORK"` from the `AREA` line.
- assemble with `armasm --apcs /interwork foo.s` instead.

**A1447W: Missing END directive at end of file, but found a label named END**

This is caused by the `END` directive not being indented.

**A1448E: Deprecated form of PSR field specifier used (use `_f`)**

**A1449E: Deprecated form of PSR field specifier used (use `_c`)**

A1450E: Deprecated form of PSR field specifier used (use `_cxsf` for future compatibility)

`armasm` supports the full range of MRS and MSR instructions, in the following forms:

```
MRS(cond) Rd, CPSR
MRS(cond) Rd, SPSR
MSR(cond) CPSR_fields, Rm
MSR(cond) SPSR_fields, Rm
MSR(cond) CPSR_fields, #immediate
MSR(cond) SPSR_fields, #immediate
```

where `fields` can be any combination of `cxsf`.

Earlier releases of the assembler permitted other forms of the MSR instruction to modify the control field and flags field:

- `cpsr` or `cpsr_all`, control and flags field
- `cpsr_flg`, flags field only
- `cpsr_ctl`, control field only.

Similar control and flag settings apply for SPSR.

These forms are deprecated and must not be used. If your legacy code contains them, the assembler reports:

```
Deprecated form of PSR field specifier used (use _cxsf)
```

To avoid the warning, in most cases you can modify your code to use `_c`, `_f`, `_cf` or `_cxsf` instead.

See the following in the assembler document:

[\*Conditional execution in ARM state.\*](#)

[\*Conditional execution in Thumb state.\*](#)

[\*General-purpose registers.\*](#)

[\*Access to the inline barrel shifter.\*](#)

See the following FAQ:

[\*armasm: use of MRS and MSR instructions \('Deprecated form of PSR field specifier'\).\*](#)

A1454E: FRAME STATE RESTORE directive without a corresponding FRAME STATE REMEMBER

See the following in the assembler document:

[\*Frame directives.\*](#)

[\*FRAME STATE REMEMBER.\*](#)

[\*FRAME STATE RESTORE.\*](#)

A1456W: INTERWORK area directive is obsolete. Continuing as if `--apcs /inter` selected

For example, the following code generates this warning:

```
AREA test, CODE, READONLY, INTERWORK
```

This code might have originally been intended to work with the legacy ARM Software Development Toolkit (SDT). The `INTERWORK` area attribute is obsolete. To eliminate the warning, do the following:

1. Remove the `", INTERWORK"` from the AREA line.
2. Assemble with `armasm --apcs /interwork foo.s` instead.

See also A1446E.

A1457E: Cannot mix INTERWORK and NOINTERWORK code areas in same file  
INTERWORK and (default) NOINTERWORK code areas cannot be mixed in the same file. This code might have originally been intended to work with the ARM Software Development Toolkit (SDT). The `INTERWORK AREA` attribute is obsolete in the ARM Compiler toolchain.

For example:

```
AREA test1, CODE, READONLY
...
AREA test2, CODE, READONLY, INTERWORK
```

To eliminate the error, carry out the following steps:

1. Move the two AREAs into separate assembly files, for example, `test1.s` and `test2.s`.
2. Remove `, INTERWORK` from the AREA line in `test2.s`.
3. Assemble `test1.s` with `armasm --apcs /nointerwork`.
4. Assemble `test2.s` with `armasm --apcs /interwork`.
5. At link time, the linker adds any necessary interworking veneers.

See also A1446E.

A1458E: DCFD or DCFDU not allowed when `fpu` is `None`

A1459E: Cannot B or BL to a register

This form of the instruction is not permitted. See the following for the permitted forms:

[ARM Architecture Reference Manual](#).

A1461E: Specified processor or architecture does not support Thumb instructions

It is likely that you are specifying an architecture or processor using the `--cpu` option and incorporating Thumb code in the AREA that is generating this error.

For example, in the following command line, the selected architecture, ARMv4, does not support Thumb code:

```
armasm --cpu 4 code.s
```

A1462E: Specified memory attributes do not support this instruction

A1463E: SPACE directive too big to fit in area, area size limit  $2^{32}$

A1464W: ENDP/ENDFUNC without corresponding PROC/FUNC

A1466W: Operator precedence means that expression would evaluate differently in C

*armasm* has always evaluated certain expressions in a different order to C. This warning might help C programmers from being caught out when writing in assembly language.

To avoid the warning, either:

- modify the code to make the evaluation order explicit (that is, add more brackets)
- suppress the warning with the `--unsafe` switch.

See the following in the assembler document:

*Operator precedence.*

A1467W: FRAME ADDRESS with negative offset <offset> is not recommended

A1468W: FRAME SAVE saving registers above the canonical frame address is not recommended

A1469E: FRAME STATE REMEMBER directive without a corresponding FRAME STATE RESTORE

See the following in the assembler document:

*Frame directives.*

*FRAME STATE REMEMBER.*

*FRAME STATE RESTORE.*

A1471W: Directive <directive> may be in an executable position

This can occur with, for example, the LTORG directive (see A1283E & A1284E).

LTORG instructs the assembler to dump literal pool DCD data at this position.

To prevent this warning from occurring, the data must be placed where the processor cannot execute them as instructions. A good place for an LTORG is immediately after an unconditional branch, or after the return instruction at the end of a subroutine.

As a last resort, you could add a branch over the LTORG, to avoid the data being executed, for example:

```
B unique_label
```

```
LTORG
```

```
unique_label
```

A1475E: At least one register must be transferred, otherwise result is UNPREDICTABLE

A1476E: BX r15 at non word-aligned address is UNPREDICTABLE

A1477E: This register combination results in UNPREDICTABLE behavior

This error is generated when you are assembling an instruction that has UNPREDICTABLE results on execution. You must rewrite your code to avoid this UNPREDICTABLE behavior. For example, the following instructions all cause this error when assembling to Thumb, and the target architecture is ARMv6T2 or later:

```
ADD sp, r0, #100 ; error - UNPREDICTABLE use of SP  
CMP pc, #1 ; error - UNPREDICTABLE use of PC  
PUSH {r0, pc} ; error - use of an UNPREDICTABLE register combination
```

A1479W: Requested alignment <alignreq> is greater than area alignment <align>, which has been increased

This is warning about an ALIGN directive that has a coarser alignment boundary than its containing AREA. This is not permitted. To compensate, the assembler automatically increases the alignment of the containing AREA for you. A simple test case that gives the warning is:

```
AREA test, CODE, ALIGN=3
ALIGN 16
mov pc, lr
END
```

In this example, the alignment of the AREA (ALIGN=3) is  $2^3=8$  byte boundary, but the `mov pc, lr` instruction is on a 16-byte boundary, causing the error.

———— **Note** —————

The two alignment types are specified in different ways.

This warning can also occur when using `AREA ... ALIGN=0` to align a code section on a byte boundary. This is not possible. Code sections can only be aligned on:

- a four-byte boundary for ARM code, so use "ALIGN=2"
- a two-byte boundary for Thumb code, so use "ALIGN=1".

See the following in the assembler document:

[ALIGN](#).

[AREA](#).

A1480W: Macro cannot have same name as a directive or instruction

A1482E: Shift option out of range, allowable values are from <min> to <max>

A1484W: Obsolete shift name 'ASL', use LSL instead

The ARM architecture does not have an ASL shift operation. The ARM barrel shifter only has the following shift types:

- ROR.
- ASR.
- LSR.
- LSL.

An arithmetic (that is, signed) shift left is the same as a logical shift left, because the sign bit always gets shifted out.

If the name ASL is used, the assembler reports this warning and silently converts the ASL to LSL.

See the following in the assembler document:

[--unsafe](#).

[ASR](#).

A1485E: LDM/STM instruction exceeds maximum register count <max> allowed with `--split_ldm`

A1486E: ADR/ADRL of a symbol in another AREA is not supported in ELF

The ADR and ADRL pseudo-instructions can only be used with labels within the same code section. To load an out-of-area address into a register, use LDR instead.

- A1487W: Obsolete instruction name 'ASL', use LSL instead**  
This warning is given when the ASL instruction is used in pre-UAL Thumb code, that is, when you assemble using the `--16` command-line option, or you use the `CODE16` directive. See the corresponding ARM ASL message A1484W.
- A1488W: PROC/FUNC at line <lineno> in '<filename>' without matching ENDP/ENDFUNC**
- A1489E: <FPU> is undefined**
- A1490E: <CPU> is undefined**  
{CPU} is only defined by assembling for a processor and not an architecture.
- A1491W: Internal error: Found relocation at offset <offset> with incorrect alignment**  
This might indicate an assembler fault. Contact your supplier.
- A1492E: Immediate 0x<val> out of range for this operation. Permitted values are 0x<mini> to 0x<maxi>**
- A1493E: REQUIRE must be in an AREA**
- A1495W: Target of branch is a data address**  
`armasm` determines the type of a symbol and detects branches to data. To suppress this warning, specify `--diag-suppress 1495`.
- A1496W: Absolute relocation of ROPI address with respect to symbol '<symbol>' at offset <offset> may cause link failure**  
For example, when assembling the following code with `--apcs /ropi`, this warning is given. This is because it generates an absolute relocation (`R_ARM_ABS32`) to a PI code symbol.
- ```
AREA code, CODE
codeaddr DCD codeaddr
END
```
- A1497W: Absolute relocation of RWPI address with respect to symbol '<symbol>' at offset <offset> may cause link failure**  
For example, when assembling the following code with `--apcs /rwpi`, this warning is given. This is because it generates an absolute relocation (`R_ARM_ABS32`) to a PI data symbol.
- ```
AREA data, DATA
dataaddr DCD dataaddr
END
```
- A1498E: Unexpected characters following Thumb instruction**  
For example, the following instruction is valid in both UAL and pre-UAL code:
- ```
ADD r0, r0, r1
```
- However, the following instruction is invalid in pre-UAL Thumb code. The unexpected characters are `, ASR #1`.
- ```
ADD r0, r0, r1, ASR #1
```
- A1499E: Register pair is not a valid contiguous pair**
- A1500E: Unexpected characters when expecting '<eword>'**
- A1501E: Shift option out of range, allowable values are 0, 8, 16 or 24**

- A1502W: Register <reg> is a caller-save register, not valid for this operation
- A1505E: Bad expression type, expect logical expression
- A1506E: Accumulator should be in form accx where x ranges from 0 to <max>
- A1507E: Second parameter of register list must be greater than or equal to the first
- A1508E: Structure mismatch expect Conditional
- A1509E: Bad symbol type, expect label, or weak external symbol
- A1510E: Immediate 0x<imm> cannot be represented by 0-255 and a rotation
- A1511E: Immediate cannot be represented by combination of two data processing instructions
- A1512E: Immediate 0x<val> out of range for this operation. Permitted values are <mini> to <maxi>
- A1513E: Symbol not found or incompatible Symbol type for '<name>'
- A1514E: Bad global name '<name>'
- A1515E: Bad local name '<name>'
- A1516E: Bad symbol '<name>', not defined or external
- A1517E: Unexpected operator equal to or equivalent to <operator>
- A1539E: Link Order dependency '<name>' not an area
- A1540E: Cannot have a link order dependency on self
- A1541E: <code> is not a valid condition code
- A1542E: Macro names <name1> and <name2>[parameter] conflict
- A1543W: Empty macro parameter default value
- A1544E: Invalid empty PSR field specifier, field must contain at least one of c,x,s,f
- A1545U: Too many sections for one <objfmt> file
- A1546W: Stack pointer update potentially breaks 8 byte stack alignment  
The stack must be eight-byte aligned on an external boundary so pushing an odd number of registers causes this warning. For example:

```
PUSH {r0}
```

This warning is suppressed by default. To enable it, use `--diag_warning 1546`.

See the following in the assembler document:

`--diag_warning=tag{, tag}`.

A1547W: PRESERVE8 directive has automatically been set

Example:

```
PUSH {r0,r1}
```

This warning is given because you have not explicitly set the PRESERVE8 directive, but the assembler has set it automatically. This warning is suppressed by default. To enable it, use `--diag_warning 1547`.

See the following in the assembler document:

`--diag_warning=tag{, tag}`.

*REQUIRE8 and PRESERVE8.*

A1548W: Code contains LDRD/STRD indexed/offset from SP but REQUIRE8 is not set

This warning is given when the REQUIRE8 directive is not set when required. For example:

```
PRESERVE8  
STRD r0,[sp,#8]
```

See the following in the assembler document:

*REQUIRE8 and PRESERVE8.*

A1549W: Setting of REQUIRE8 but not PRESERVE8 is unusual

Example:

```
PRESERVE8 {FALSE}  
REQUIRE8  
STRD r0,[sp,#8]
```

A1550U: Input and output filenames are the same

A1551E: Cannot add Comdef area <name> to non-comdat group

A1560E: Non-constant byte literal values not supported

A1561E: MERGE and STRING sections must be data sections

A1562E: Entry size for Merge section must be greater than 0

A1563W: Instruction stalls CPU for <stalls> cycle(s)

The assembler can give information about possible interlocks in your code caused by the pipeline of the processor chosen by the `--cpu` option. To do this, assemble with **armasm** `--diag_warning 1563`.

———— **Note** —————

If the `--cpu` option specifies a multi-issue processor such as Cortex-A8, the interlock warnings are unreliable.

See also warning A1746W.

A1572E: Operator SB\_OFFSET\_11\_0 only allowed on LDR/STR instructions

A1573E: Operator SB\_OFFSET\_19\_12 only allowed on Data Processing instructions

A1574E: Expected one or more flag characters from "<str>"

A1575E: BLX with bit[0] equal to 1 is architecturally UNDEFINED

A1576E: Bad coprocessor register name symbol

A1577E: Bad coprocessor name symbol

A1578E: Bad floating point register name symbol '<sym>'

A1581W: Added <no\_padbytes> bytes of padding at address <address>

By default, the assembler warns when it adds padding bytes to the generated code. This occurs whenever an instruction or directive is used at an address that requires a higher alignment, for example, to ensure ARM instructions start on a four-byte boundary after some Thumb instructions, or where there is a DCB followed by a DCD.

For example:

```
AREA Test, CODE, READONLY
THUMB
ThumbCode
MOVS r0, #1
ADR r1, ARMProg
BX r1
; ALIGN ; <<< uncomment to avoid the first warning
ARM
ARMProg
ADD r0,r0,#1
BX LR
DCB 0xFF
DCD 0x1234
END
```

This code results in the following warnings:

```
A1581W: Added 2 bytes of padding at address 0x6
8 00000008 ARM
A1581W: Added 3 bytes of padding at address 0x11
13 00000014 DCD 0x1234
```

The warning can also occur when using ADR in Thumb-only code. The ADR Thumb pseudo-instruction can only load addresses that are word aligned, but a label within Thumb code might not be word aligned. Use ALIGN to ensure four-byte alignment of an address within Thumb code.

See the following in the assembler document:

[ADR \(PC-relative\).](#)

[ADR \(register-relative\).](#)

[DCB.](#)

[DCD and DCDD.](#)

[ALIGN.](#)

A1582E: Link Order area '<name>' undefined

A1583E: Group symbol '<name>' undefined

A1584W: Mode <mode> not allowed for this instruction

A1585E: Bad operand type (<typ1>) for operator <op>

A1586E: Bad operand types (<typ1>, <typ2>) for operator <op>

A1587E: Too many registers <count> in register list, maximum of <max>

A1593E: Bad Alignment, must match transfer size UIMM \* <dt>

A1595E: Bad Alignment, must match <st> \* <dt>, or 64 when <st> is 4

A1596E: Invalid alignment <align> for dt st combination

- A1598E: Bad Register list length
- A1599E: Out of range subscript, must be between 0 and <max\_index>
- A1600E: Section type must be within range SHT\_LOOS and SHT\_HIUSER
- A1601E: Immediate cannot be represented
- A1603E: This instruction inside IT block has UNPREDICTABLE results
- A1604W: Thumb Branch to destination without alignment to <max> bytes
- A1606E: Symbol attribute <attr1> cannot be used with attribute <attr2>
- A1607E: Thumb-2 wide branch instruction used, but offset could fit in Thumb-1 narrow branch instruction
- A1608W: MOV pc,<rn> instruction used, but BX <rn> is preferred
- A1609W: MOV <rd>,pc instruction does not set bit zero, so does not create a return address

This warning is caused when the current value of the PC is copied into a register while executing in Thumb state. An attempt to create a return address in this fashion fails because bit[0] is not set. Attempting to BX to this instruction causes a state change (to ARM).

To create a return address, you can use:

```
MOV r0, pc
ADDS r0, #1
```

This warning can then be safely suppressed with:

```
--diag_suppress 1609
```

- A1611E: Register list increment of 2 not allowed for this instruction
- A1612E: <type> addressing not allowed for <instr>
- A1615E: Store of a single element or structure to all lanes is UNDEFINED
- A1616E: Instruction, offset, immediate or register combination is not supported by the current instruction set

This error can be caused by attempting to use an invalid combination of operands. For example, in Thumb:

```
MOV r0, #1 ; /* Not permitted */
MOVS r0, #1 ; /* Ok */
```

See the following in the assembler document:

*ARM and Thumb Instructions.*

- A1617E: Specified width is not supported by the current instruction set
- A1618E: Specified instruction is not supported by the current instruction set
- A1619E: Specified condition is not consistent with previous IT
- A1620E: Error writing to file '<filename>': <reason>
- A1621E: CBZ or CBNZ from Thumb code to ARM code

- A1622E: Negative register offsets are not supported by the current instruction set
- A1623E: Offset not supported by the current instruction set
- A1624W: Branch from Thumb code to ARM code
- A1625W: Branch from ARM code to Thumb code
- A1626W: BL from Thumb code to ARM code
- A1627W: BL from ARM code to Thumb code  
This occurs when there is a branch from ARM code to Thumb code (or vice-versa) within this file. The usual solution is to move the Thumb code into a separate assembler file. Then, at link-time, the linker adds any necessary interworking veneers.
- A1630E: Specified processor or architecture does not support ARM instructions  
ARM M-profile processors, for example Cortex-M3 and Cortex-M1, implement only the Thumb instruction set, not the ARM instruction set. It is likely that the assembly file contains some ARM-specific instructions and is being built for one of these processors.
- A1631E: Only left shifts of 1, 2 and 3 are allowed on load/stores
- A1632E: Else forbidden in IT AL blocks
- A1633E: LDR rx,= pseudo instruction only allowed in load word form
- A1634E: LDRD/STRD has no register offset addressing mode in Thumb
- A1635E: CBZ/CBNZ can not be made conditional
- A1636E: Flag setting MLA is not supported in Thumb
- A1637E: Error reading line: <reason>
- A1638E: Writeback not allowed on register offset loads or stores in Thumb
- A1639E: Conditional DCI only allowed in Thumb mode
- A1640E: Offset must be a multiple of four
- A1641E: Forced user-mode LDM/STM not supported in Thumb
- A1642W: Relocated narrow branch is not recommended
- A1643E: Cannot determine whether instruction is working on single or double precision values.
- A1644E: Cannot use single precision registers with FLDMX/LSTMX

A1645W: Substituted <old> with <new>

**armasm** can be configured to issue a warning in cases where it chooses to substitute an instruction. For example:

- `ADD negative_number` is the same as `SUB positive_number`
- `MOV negative_number` is the same as `MVN positive_number`
- `CMP negative_number` is the same as `CMN positive_number`.

For the Thumb instruction set, `UNPREDICTABLE` single register LDMs are transformed into LDRs.

This warning is suppressed by default, but can be enabled with `--diag_warning 1645`.

For example, when the following code is assembled with `--diag_warning 1645`:

```
AREA foo, CODE
ADD r0, #-1
MOV r0, #-1
CMP r0, #-1
```

the assembler reports:

```
Warning: A1645W: Substituted ADD with SUB
3 00000000 ADD r0, #-1
Warning: A1645W: Substituted MOV with MVN
4 00000004 MOV r0, #-1
Warning: A1645W: Substituted CMP with CMN
5 00000008 CMP r0, #-1
```

and the resulting code generated is:

```
foo
0x00000000: e2400001 ..@. SUB r0,r0,#1
0x00000004: e3e00000 ... MVN r0,#0
0x00000008: e3700001 ..p. CMN r0,#1
```

A1647E: Bad register name symbol, expected Integer register

An integer (core) register is expected at this point in the syntax.

A1648E: Bad register name symbol, expected Wireless MMX SIMD register

A1649E: Bad register name symbol, expected Wireless MMX Status/Control or General Purpose register

A1650E: Bad register name symbol, expected any Wireless MMX register

A1651E: TANDC, TEXTRC and TORC instructions with destination register other than R15 is undefined

A1652W: FLDMX/FSTMX instructions are deprecated in ARMv6. Please use FLDMD/FSTMD instructions to save and restore unknown precision values.

A1653E: Shift instruction using a status or control register is undefined

A1654E: Cannot access external symbols when loading/storing bytes or halfwords

A1655E: Instruction is UNPREDICTABLE if halfword/word/doubleword is unaligned

A1656E: Target must be at least word-aligned when used with this instruction

A1657E: Cannot load a byte/halfword literal using WLDRB/WLDRH =constant

A1658W: Support for <opt> is deprecated

An option passed to **armasm** is deprecated.

See the following in the assembler document:

*Assembler command-line options.*

A1659E: Cannot B/BL/BLX between ARM/Thumb and Thumb-2EE

A1660E: Cannot specify scalar index on this register type

A1661E: Cannot specify alignment on this register

A1662E: Cannot specify a data type on this register type

A1663E: A data type has already been specified on this register

A1664E: Data type specifier not recognized

A1665E: Data type size must be one of 8, 16, 32 or 64

A1666E: Data type size for floating-point must be 32 or 64

A1667E: Data type size for polynomial must be 8 or 16

A1668E: Too many data types specified on instruction

A1669E: Data type specifier not allowed on this instruction

A1670E: Expected 64-bit doubleword register expression

A1671E: Expected 128-bit quadword register expression

A1672E: Expected either 64-bit or 128-bit register expression

A1673E: Both source data types must be same type and size

A1674E: Source operand 1 should have integer type and be double the size of source operand 2

A1675E: Data types and sizes for destination must be same as source

A1676E: Destination type must be integer and be double the size of source

A1677E: Destination type must be same as source, but half the size

A1678E: Destination must be untyped and same size as source

A1679E: Destination type must be same as source, but double the size

A1680E: Destination must be unsigned and half the size of signed source

A1681E: Destination must be unsigned and have same size as signed source

A1682E: Destination must be un/signed and source floating, or destination floating and source un/signed, and size of both must be 32-bits

A1683E: Data type specifiers do not match a valid encoding of this instruction

A1684E: Source operand type should be signed or unsigned with size between <min> and <max>

A1685E: Source operand type should be signed, unsigned or floating point with size between <min> and <max>

A1686E: Source operand type should be signed or floating point with size between <min> and <max>

- A1687E: Source operand type should be integer or floating point with size between <min> and <max>
- A1688E: Source operand type should be untyped with size between <min> and <max>
- A1689E: Source operand type should be <n>-bit floating point
- A1690E: Source operand type should be signed with size between <min> and <max>
- A1691E: Source operand type should be integer, floating point or polynomial with size between <min> and <max>
- A1692E: Source operand type should be signed, unsigned or polynomial with size between <min> and <max>
- A1693E: Source operand type should be unsigned or floating point with size between <min> and <max>
- A1694E: Instruction cannot be conditional in the current instruction set
- Conditional instructions are not permitted in the specified instruction set. The instruction *MOVEQ*, for example, is permitted in ARM code, and in Thumb code in architectures in which the *IT* instruction is available.
- A1695E: Scalar index not allowed on this instruction
- A1696E: Expected either 32-bit, 64-bit or 128-bit register expression
- A1697E: Expected either 32-bit or 64-bit VFP register expression
- A1698E: Expected 32-bit VFP register expression
- A1699E: 64-bit data type cannot be used with these registers
- A1700E: Source operand type should be integer with size between <min> and <max>
- A1701E: 16-bit polynomial type cannot be used for source operand
- A1702E: Register *Dm* can not be scalar for this instruction
- A1704E: Register *Dm* must be in the range *D0-D<upper>* for this data type
- A1705W: Assembler converted *Qm* register to *D<rnum>[<idx>]*
- A1706E: Register *Dm* must be scalar
- A1708E: 3rd operand to this instruction must be a constant expression
- A1709E: Expected ARM or scalar register expression
- A1710E: Difference between current and previous register should be <diff>
- A1711E: Scalar registers cannot be used in register list for this instruction
- A1712E: This combination of *LSB* and *WIDTH* results in UNPREDICTABLE behavior
- A1713E: Invalid field specifiers for *APSR*: must be *APSR\_* followed by at least one of *n*, *z*, *c*, *v*, *q* or *g*
- A1714E: Invalid combination of field specifiers for *APSR*
- A1715E: *PSR* not defined on target architecture

A1716E: Destination for VMOV instruction must be ARM integer, 32-bit single-precision, 64-bit doubleword register or 64-bit doubleword scalar register

A1717E: Source register must be an ARM integer, 32-bit single-precision or 64-bit doubleword scalar register

A1718E: Source register must be an ARM integer register or same as the destination register

A1719W: This PSR name is deprecated and may be removed in a future release

A1720E: Source register must be a 64-bit doubleword scalar register

A1721E: Destination register may not have all-lanes specifier

A1722E: Labels not allowed inside IT blocks

A1723W: \_\_RELOC is deprecated, please use the new RELOC directive

A1724E: RELOC may only be used immediately after an instruction or data generating directive

A1725W: 'armasm inputfile outputfile' form of command-line is deprecated

A1726W: Decreasing --max\_cache below 8MB is not recommended

A1727W: Immediate could have been generated using the 16-bit Thumb MOVS instruction

A1728E: Source register must be same type as destination register

A1729E: Register list may only contain 32-bit single-precision or 64-bit doubleword registers

A1730E: Only IA or DB addressing modes may be used with these instructions

A1731E: Register list increment of 2 or more is not allowed for quadword registers

A1732E: Register list must contain between 1 and 4 contiguous doubleword registers

A1733E: Register list must contain 2 or 4 doubleword registers, and increment 2 is only allowed for 2 registers

A1734E: Register list must contain <n> doubleword registers with increment 1 or 2

A1735E: Post-indexed offset must equal the number of bytes loaded/stored (<n>)

A1736E: Number of registers in list must equal number of elements

A1737E: PC or SP can not be used as the offset register

A1738E: Immediate too large for this operation

A1739W: Constant generated using single VMOV instruction; second instruction is a NOP

A1740E: Number of bytes in FRAME PUSH or FRAME POP directive must not be less than zero

A1741E: Instruction cannot be conditional

A1742E: Expected LSL #Imm

A1744E: Alignment on register must be a multiple of 2 in the range 16 to 256

A1745W: This register combination is DEPRECATED and may not work in future architecture revisions

This warning is generated when all of the following conditions are satisfied:

- you are using a deprecated register combination, for example:

```
PUSH    {r0, pc}
```

- you are assembling for a target architecture that supports 32-bit Thumb instructions, in other words ARMv6T2 or later
- you are assembling to ARM code.

———— **Note** —————

- When assembling to Thumb, rather than ARM code, and the target architecture is ARMv6T2 or later, the assembler generates error A1477E instead.
- When assembling for an architecture or processor that does not support 32-bit Thumb instructions, in other words ARM architectures before ARMv6T2, by default no diagnostic is emitted.

A1746W: Instruction stall diagnostics may be unreliable for this CPU

This warning is shown when you enable message A1563W for a processor that is not modelled accurately by the assembler. It indicates that you cannot rely on the output of A1563W when improving your code.

See also warning A1563W.

A1753E: Unrecognized memory barrier option

A1754E: Cannot change the type of a scalar register

A1755E: Scalar index has already been specified on this register

A1756E: Data type must be specified on all registers

A1757W: Symbol attributes must be within square brackets; Any other syntax is deprecated

A1758W: Exporting multiple symbols with this directive is deprecated

A1759E: Specified processor or architecture does not support Thumb-2EE instructions

A1760W: Build Attribute <from> is '<attr>'

A1761W: Difference in build attribute from '<diff>' in <from>

A1762E: Branch offset 0x<val> out of range of 16-bit Thumb branch, but offset encodable in 32-bit Thumb branch

This is caused when assembling for Thumb if an offset to a branch instruction is too large to fit in a 16-bit branch. The `.W` suffix can be added to the instruction to instruct the assembler to generate a 32-bit branch.

A1763W: Inserted an IT block for this instruction

This indicates that the assembler has inserted an IT block to permit a number of conditional instructions in Thumb code. For example:

```
MOVEQ  r0,r1
```

This warning is off by default. It can be enabled using `--diag_warning A1763`.

- A1764W: <name> instructions are deprecated in architecture <arch> and above
- A1765E: Size of padding value on ALIGN must be 1, 2 or 4 bytes  
This is caused when the optional padsiz attribute is used with an ALIGN directive, but has an incorrect size. It does not refer to the parameter to align to. The parameter can be any power of 2 from 2<sup>0</sup> to 2<sup>31</sup>.
- A1766W: Size of padding value for code must be a minimum of <size> bytes; treating as data
- A1767E: Unexpected characters following attribute
- A1768E: Missing '='
- A1769E: Bad NEON or VFP system register name symbol
- A1771E: Bad floating-point bitpattern when expecting <exp>-bit bitpattern
- A1772E: Destination type must be signed or unsigned integer, and source type must be 32-bit or 64-bit floating-point
- A1773E: Floating-point conversion only possible between 32-bit single-precision and 64-bit double-precision types
- A1774E: Fixed-point conversion only possible for 16-bit or 32-bit signed or unsigned types
- A1775E: Conversion between these types is not possible
- A1776E: This operation is not available for 32-bit single-precision floating point types
- A1777E: <n> is out of range for symbol type; value must be between <min> and <max>
- A1778E: <n> is out of range for symbol binding; value must be between <min> and <max>
- A1779E: DCDO cannot be used on READONLY symbol '<key>'
- A1780E: Unknown ATTR directive
- A1781E: Tag #<id> cannot be set by using ATTR
- A1782E: Tag #<id> should be set with ATTR <cmd>
- A1783E: Attribute scope must be a label or section name
- A1784W: Reference to weak definition '<sym>' not relocated
- A1785E: Macro '<macuse>' not found, but '<macdef>' exists

**A1786W:** This instruction using `SP` is deprecated and may not work in future architecture revisions

This warning is generated when all of the following conditions are satisfied:

- you explicitly use the `SP` in a deprecated way, for example:

```
ADD sp, r0, #100
```

- you are assembling for a target architecture that supports 32-bit Thumb instructions, in other words ARMv6T2 or later
- you are assembling to ARM code.

ARM deprecates the explicit use of the `SP` in ARM instructions in any way that is not possible in the corresponding Thumb instruction. Such deprecated register uses are still possible in ARM instructions for backwards compatibility and you can suppress this warning by using the assembler's command line option `--diag_suppress=1786`. However, ARM recommends you modify your code, because it might not work in future architecture revisions.

You can replace the deprecated use of the `SP` shown in the example with a sequence like:

```
ADD r1, r0, #100  
MOV sp, r1
```

———— **Note** ————

- When assembling to Thumb, rather than ARM code, and the target architecture is ARMv6T2 or later, the assembler generates error A1477E instead.
- When assembling for an architecture or processor that does not support 32-bit Thumb instructions, in other words ARM architectures before ARMv6T2, by default no diagnostic is emitted.

**A1787W:** Use of VFP Vector Mode is deprecated in ARMv7

A1788W: Explicit use of PC in this instruction is deprecated and may not work in future architecture revisions

This warning is generated when all of the following conditions are satisfied:

- you explicitly use the PC in a deprecated way, for example:

```
CMP pc, #1
```

- you are assembling for a target architecture that supports 32-bit Thumb instructions, in other words ARMv6T2 or later
- you are assembling to ARM code.

ARM deprecates most explicit uses of the PC in ARM instructions, although they are still possible for backwards compatibility. You can suppress this warning by using the assembler's command line option `--diag_suppress=1788`. However, ARM recommends you modify your code, because it might not work in future architecture revisions.

———— **Note** ————

- When assembling to Thumb rather than ARM code, and the target architecture is ARMv6T2 or later, the assembler generates error A1477E instead.
- When assembling for an architecture or processor that does not support 32-bit Thumb instructions, in other words ARM architectures before ARMv6T2, by default no diagnostic is emitted.

A1789W: Explicit use of PC in this instruction is deprecated and may not work in future architecture revisions, except as destination register

A1790W: Writeback ignored in Thumb LDM loading the base register

This is caused by incorrectly adding an exclamation mark to indicate base register writeback.

For example:

```
LDM r0!, {r0-r4}
```

is not a legal instruction because r0 is the base register and is also in the destination register list. In this case, the assembler ignores the writeback and generates:

```
LDM r0, {r0-r4}
```

A1791W: Previous value of tag #<id> will be overridden

A1792E: Undefined build attributes tag

A1793E: Conversion only possible between 16-bit and 32-bit floating point

A1794E: Conversion operations require two data types

A1795E: Source and destination vector must contain <n> elements

A1796E: Register type not consistent with data type

A1797E: Specified FPU is not compatible with CPU architecture

A1798W: Output is not WYSIWYG (<output>)

A1799W: Output has not been checked for WYSIWYG property

A1800W: No output for line  
A1801E: Instruction is UNPREDICTABLE in current instruction set  
A1803E: Bad system instruction name  
A1804E: Bad CP14 or CP15 register name for instruction  
A1805W: Register is Read-Only  
A1806W: Register is Write-Only  
A1807W: Instruction executes as NOP on target CPU  
A1808E: Generated object file may be corrupt (<reason>)  
A1809W: Instruction aligns PC before using it; section ought to be at least 4 byte aligned

This warning is generated when all the following conditions apply: If these conditions are all met, and the code section containing this instruction is not placed at a 4-byte aligned address when linking, the instruction might operate on or with the wrong address at runtime. This is because the instruction aligns the PC to a 4-byte address before using it.

- you are using a PC-relative offset in a Thumb instruction that requires the PC to be word-aligned
- the code section containing this instruction has less than 4-byte alignment
- the instruction is not relocated at link time (because of a relocation emitted by the assembler).

The following example shows an LDR instruction in Thumb that is diagnosed by this warning because the section has an alignment of 2 bytes:

```
AREA ||.text||, CODE, READONLY, ALIGN=1
THUMB
LDR r0, [pc, #8] ; gives warning A1809W
```

A1810E: Base register writeback value unclear; use '[rn,#n]!' or '[rn],#n' syntax  
A1811E: Size of fill value must be 1, 2 or 4 bytes and a factor of fill size  
A1812W: Instruction cannot be assembled in the opposite instruction set  
A1813W: 32-bit instruction used where 16-bit could have been used  
A1814E: No output file  
A1815E: SHT\_ARM\_EXIDX sections require a link order dependency to be set  
A1816E: Unknown opcode '<name>' in CODE16, but exists in THUMB  
A1817W: ATTR tag #<id> setting ignored in <scope>  
A1818W: ATTR COMPAT flag <flag> and vendor '<vendor>' setting ignored in <scope>  
A1819W: ATTR compatible with tag #<id> setting ignored in <scope>  
A1820E: Register and processor mode not valid for instruction  
A1846E: Invalid field specifiers for CPSR or SPSR: must be followed by at least one of c, x, s or f

**A1847E: Expression requiring more than one relocation not allowed**

This can occur during the assembly of ARM instructions when trying to access data in another area. For example, using:

```
LDR r0, [pc, #label - . - 8]
```

or its equivalent:

```
LDR r0, [pc, #label-{PC}-8]
```

where `label` is defined in a different AREA.

Change your code to use the simpler, equivalent syntax:

```
LDR r0, label
```

This works if `label` is either in the same area or in a different area.

**A1848W: State change in IT block**

**A1875E: Register Rn must be from R0 to R7 in this instruction**

Change the specified register to be in the range R0 to R7.

**A1903E: Line not seen in first pass; cannot be assembled**

This occurs if an instruction or directive does not appear in pass 1 but appears in pass 2 of the assembler.

The following example shows when a line is not seen in pass 1:

```
AREA x, CODE
[ :DEF: foo
num EQU 42 ; Assembler does not see this line during pass 1 because
           ; foo is not defined at this point during pass 1
]
foo DCD num
END
```

**A1907W: Test for this symbol has been seen and may cause failure in the second pass.**

This diagnostic is suppressed by default. Enable it to identify situations that might result in errors A1903E, A1908E, or A1909E.

**A1908E: Label '<name>' value inconsistent: in pass 1 it was <val1>; in pass 2 it was <val2>**

The following example generates this error because in pass 1 the value of `x` is `0x0004+r9`, and in pass 2 the value of `x` is `0x0000+r0`:

```
map 0, r0
if :lnot: :def: sym
    map 0, r9
    field 4
endif
x field 4
sym LDR r0, x
```

**A1909E: Line not seen in second pass; cannot be assembled**

This occurs if an instruction or directive appears in pass 1 but does not appear in pass 2 of the assembler.

The following example shows when a line is not seen in pass 2:

```
AREA x, CODE
[ :LNOT: :DEF: foo
MOV r1, r2 ; Assembler does not see this line during pass 2 because
           ; foo is already defined
]
foo MOV r3, r4
END
```

**A1916E: Unknown built-in variable '<name>'**

**A1993E: This operator requires a relocation that is not supported in <objfmt>**

**A1994E: This directive is not supported in <objfmt>**

**A1995E: Weak definitions are not supported in <objfmt>**

**A1996E: TYPE must only be used after WEAK on IMPORT**

**A1997E: Expected alias for weak extern symbol**

**A1998E: Comdat Associated area must have Comdat Associative selection type**

**A1999E: Comdat Associated area cannot be another Comdat Associated area**

## Chapter 3

# Linker Errors and Warnings

Describes the error and warning messages for the linker, **armlink**.

It contains the following:

- *3.1 Suppressing armlink error and warning messages on page 3-123.*
- *3.2 List of the armlink error and warning messages on page 3-124.*

### 3.1 Suppressing armlink error and warning messages

You can use command-line options to suppress or downgrade some of the diagnostic messages that the linker produces.

All linker warnings are suppressible with `--diag_suppress`, in the same way as compiler warnings. For example:

```
--diag_suppress 6306
```

Some errors such as L6220E, L6238E and L6784E can be downgraded to a warning by using:

```
--diag_warning
```

## 3.2 List of the armlink error and warning messages

A list of the error and warning messages that **armlink** produces.

**L6000U: Out of memory.**

This error is reported by RVCT v4.0 and earlier. For more details on why you might see this error and possible solutions, see the description for error **L6815U**.

**L6001U: Could not read from file <filename>.**

**L6002U: Could not open file <filename>: <reason>**

This indicates that the linker was unable to open a file specified on the linker command line. This can indicate a problem accessing the file or a fault with the command line. Some common examples of this message are:

- 

```
L6002U: Could not open file /armlib/{libname}: No such file or directory
```

Either specify the library path with `--libpath` or set the `ARMCC5LIB` environment variable to `install_directory\lib`.

———— **Note** —————

In ARM Compiler toolchain v5.0 and later, **armlink** does not require the `ARMCC5LIB` environment variable to be set.

- 

```
Error : armlink : L6002: Could not open file errors=ver.txt
```

This is caused by a missing double-dash (`--`) in front of `errors=ver.txt`. If you do not prefix options with `--` or `-`, the linker treats them as input files and fails the link step because it is unable to load all the specified files.

See the following in the linker document:

[\*--libpath=pathlist\*](#).

See the following in the *Getting Started Guide*:

[\*Toolchain environment variables\*](#).

**L6003U: Could not write to file <filename>.**

An file I/O error occurred while reading, opening, or writing to the specified file.

**L6004U: Incomplete library member list <list> for <library>.**

This can occur if there is whitespace in the list of library objects.

The following example fails with Fatal error: **L6004U: Missing library member in member list for x.lib**:

```
armlink x.lib(foo.o, bar.o)
```

The following example succeeds:

```
armlink x.lib(foo.o,bar.o)
```

Another less common cause is a corrupt library, or possibly a library in an unsupported format.

**L6005U: Extra characters on end of member list for <library>.**

L6006U: Overallignment value not specified with OVERALIGN attribute for execution region <regionname>.

See the following in the linker document:

*Syntax of an input section description.*

*Overallignment of execution regions and input sections.*

L6007U: Could not recognize the format of file <filename>.

The linker can recognize object files in ELF format and library files in AR format. The specified file is either corrupt, or is in a file format that the linker cannot recognize.

L6008U: Could not recognize the format of member <mem> from <lib>.

The linker can recognize library member objects in the ELF file format. The specified library member is either corrupt, or is in a file format that the linker cannot recognize.

L6009U: File <filename> : Endianness mismatch.

The endianness of the specified file or object did not match the endianness of the other input files. The linker can handle input of either big endian or little endian objects in a single link step, but not a mixed input of some big and some little endian objects.

L6010U: Could not reopen stderr to file <filename>: <reason>

An file I/O error occurred while reading, opening, or writing to the specified file.

L6011U: Invalid integer constant : <number>.

Specifying an illegal integer constant causes this. An integer can be entered in hexadecimal format by prefixing **&**, **0x**, or **0X**.

L6015U: Could not find any input files to link.

The linker must be provided with at least one object file to link.

For example, if you try to link with:

```
armlink lib.a -o foo.axf
```

the linker reports this error.

You must instead use, for example:

```
armlink foo_1.o foo_2.o lib.a -o foo.axf
```

L6016U: Symbol table missing/corrupt in object/library <object>.

This can occur when linking with libraries built with the GNU tools. This is because GNU **ar** can generate incompatible information.

The workaround is to replace **ar** with **armar** and use the same command-line arguments. Alternatively, the error is recoverable by using **armar -s** to rebuild the symbol table.

L6017U: Library <library> symbol table contains an invalid entry, no member at offset 0x<offset>.

The library might be corrupted. Try rebuilding it.

L6018U: <filename> is not a valid ELF file.

L6019U: <filename> is not a valid 64 bit ELF file.

L6020U: <filename> is not a valid 32 bit ELF file.

L6022U: Object <objname> has multiple <table>.

The object file is faulty or corrupted. This might indicate a compiler fault. Contact your supplier.

- L6024U: Library <library> contains an invalid member name.  
The file specified is not a valid library file, is faulty or corrupted. Try rebuilding it.
- L6025U: Cannot extract members from a non-library file <library>.  
The file specified is not a valid library file, is faulty or corrupted. Try rebuilding it.
- L6026U: ELF file <filename> has neither little or big endian encoding  
The ELF file is invalid. Try rebuilding it.
- L6027U: Relocation #<rel\_class>:<rel\_number> in <objname>(<secname>) has invalid/unknown type.  
This might indicate a compiler fault. Contact your supplier.
- L6028U: Relocation #<rel\_class>:<rel\_number> in <objname>(<secname>) has invalid offset.  
This might indicate a compiler fault. Contact your supplier.
- L6029U: Relocation #<rel\_class>:<rel\_number> in <objname>(<secname>) is wrt invalid/missing symbol.  
The relocation is with respect to a symbol that is either:
- invalid or missing from the object symbol table
  - a symbol that is not suited to be used by a relocation.
- This might indicate a compiler fault. Contact your supplier.
- L6030U: Overalignment <overalignment> for region <regname> must be at least 4 and a power of 2  
See the following in the linker document:
- Execution region attributes.*
- Syntax of an input section description.*
- Overalignment of execution regions and input sections.*
- L6031U: Could not open scatter description file <filename>: <reason>  
An I/O error occurred while trying to open the specified file. This could be because of an invalid filename.
- L6032U: Invalid <text> <value> (maximum <max\_value>) found in <object>
- L6033U: Symbol <symbolname> in <objname> is defined relative to an invalid section.
- L6034U: Symbol <symbolname> in <objname> has invalid value.  
This is most often caused by a section-relative symbol having a value that exceeds the section boundaries.
- L6035U: Relocation #<rel\_class>:<rel\_number> in ZI Section <objname>(<secname>) has invalid type.  
ZI Sections cannot have relocations other than of type R\_ARM\_NONE.
- L6036U: Could not close file <filename>: <reason>  
An I/O error occurred while closing the specified file.
- L6037U: '<arg>' is not a valid argument for option '<option>'.  
The argument is not valid for this option. This could be because of a spelling error, or because of the use of an unsupported abbreviation of an argument.
- L6038U: Could not create a temporary file to write updated SYMDEFS.  
An I/O error occurred while creating the temporary file required for storing the SYMDEFS output.

- L6039W: Relocation from #<rel\_class>:<rel\_number> in <objname>(<secname>) with respect to <symname>. Skipping creation of R-type relocation. No corresponding R-type relocation exists for type <rel\_type>.  
--reloc is used with objects containing relocations that do not have a corresponding R-type relocation.
- L6041U: An internal error has occurred (<clue>).  
Contact your supplier.
- L6042U: Relocation #<rel\_class>:<rel\_number> in <objname>(<secname>) is wrt a mapping symbol(#<idx>, Last Map Symbol = #<last>).  
Relocations with respect to mapping symbols are not permitted. This might indicate a compiler fault. Contact your supplier.
- L6043U: Relocation #<rel\_class>:<rel\_number> in <objname>(<secname>) is with respect to an out of range symbol(#<val>, Range = 1-<max>).  
Relocations can only be made wrt symbols in the range (1-n), where n is the number of symbols.
- L6047U: The size of this image (<actual\_size> bytes) exceeds the maximum allowed for this version of the linker
- L6048U: The linker is unable to continue the link step (<id>). This version of the linker will not create this image.
- L6049U: The linker is unable to continue the link step (<id>). This version of the linker will not link with one or more given libraries.
- L6050U: The code size of this image (<actual\_size> bytes) exceeds the maximum allowed for this version of the linker.
- L6058E: Syntax error parsing linker script <script> at line <lineno> : <token>  
The link ld script has a syntax error at the line number.  
See the following in the linker document:  
*GNU ld script support in armlink.*
- L6064E: ELF Executable file <filename> given as input on command line  
This might be because you specified an object file as output from from the compiler without specifying the -c compiler option. For example:  
**armcc file.c -o file.o**  
**armlink file.o -o file.axf**  
See the following in the compiler document:  
*-c.*
- L6065E: Load region <name> (size <size>) is larger than maximum writable contiguous block size of 0x80000000.  
The linker attempted to write a segment larger than 2GB. The size of a segment is limited to 2GB.
- L6175E: EMPTY region <regname> cannot have any section selectors.
- L6176E: A negative max\_size cannot be used for region <regname> without the EMPTY attribute.  
Only regions with the EMPTY attribute are permitted to have a negative max\_size.

L6177E: A negative `max_size` cannot be used for region `<regname>` which uses the `+offset` form of base address.

Regions using the `+offset` form of base address are not permitted to have a negative `max-size`.

L6188E: Special section `<sec1>` multiply defined by `<obj1>` and `<obj2>`.  
A special section is one that can only be used once, such as "Veneer\$\$Code".

L6195E: Cannot specify both '`<attr1>`' and '`<attr2>`' for region `<regname>`

See the following in the linker document:

*Load region attributes.*

*Execution region attributes.*

*Address attributes for load and execution regions.*

*Inheritance rules for load region address attributes.*

*Inheritance rules for execution region address attributes.*

*Inheritance rules for the RELOC address attribute.*

L6200E: Symbol `<symbolname>` multiply defined by `<object1>` and `<object2>`.

A common example of this:

```
Symbol __stdout multiply defined (by retarget.o and stdio.o).
```

This means that there are two conflicting definitions of `__stdout` present in `retarget.o` and `stdio.o`. The one in `retarget.o` is your own definition. The one in `stdio.o` is the default implementation, which was probably linked-in inadvertently.

`stdio.o` contains a number of symbol definitions and implementations of file functions like `fopen`, `fclose`, and `fflush`.

`stdio.o` is being linked-in because it satisfies some unresolved references.

To identify why `stdio.o` is being linked-in, you must use the `--verbose` link option switch. For example:

```
armlink [... your normal options...] --verbose --list err.txt
```

Then study `err.txt` to see exactly what the linker is linking in, from where, and why.

You might have to either:

- eliminate the calls like `fopen`, `fclose`, and `fflush`
- re-implement the `_sys_xxxx` family of functions.

See the following in the *ARM C and C++ Libraries and Floating-Point Support User Guide*:

*Tailoring input/output functions in the C and C++ libraries.*

L6201E: Object `<objname>` contains multiple entry sections.

The input object specifies more than one entry point. Use the `--entry` command-line option to select the entry point to use.

See the following in the linker document:

*--entry=location.*

L6202E: <objname>(<secname>) cannot be assigned to non-root region '<regionname>'

A root region is a region that has an execution address the same as its load address. The region does not therefore require moving or copying by the scatter-load initialization code.

Certain sections must be placed in a root region in the image, including:

- `__main.o`.
- The linker-generated table (`Region$$Table`).
- Scatter-loading (`__scatter*.o`) objects from the library.
- Decompressor (`__dc*.o`) objects from the library.

If a required section is not placed in a root region, the linker reports, for example:

```
anon$$obj.o(Region$$Table) cannot be assigned to a non-root region 'RAM'.
```

You can use `InRoot$$Sections` to include all required sections in a root region:

```
ROM_LOAD 0x0000 0x4000
{
  ROM_EXEC 0x0000 0x4000 ; root region
  {
    vectors.o (Vect, +FIRST) ; Vector table
    * (InRoot$$Sections) ; All library sections
                        ; that must be in a root region
                        ; for example, __main.o, __scatter*.o,
                        ; dc*.o and * Region$$Table
  }
  RAM 0x10000 0x8000
  {
    * (+RO, +RW, +ZI) ; all other sections
  }
}
```

L6203E: Entry point (<address>) lies within non-root region <regionname>.

The image entry point must correspond to a valid instruction in a root-region of the image.

L6204E: Entry point (<address>) does not point to an instruction.

The image entry point you specified with the `--entry` command-line option must correspond to a valid instruction in the root-region of the image.

See the following in the linker document:

[\*--entry=location.\*](#)

L6205E: Entry point (<address>) must be word aligned for ARM instructions.

This message is displayed because the image entry point you specified with the `--entry` command-line option is not word-aligned. For example, you specified `--entry=0x8001` instead of `--entry=0x8000`.

See the following in the linker document:

[\*--entry=location.\*](#)

L6206E: Entry point (<address>) lies outside the image.

The image entry point you specified with the `--entry` command-line option is outside the image. For example, you might have specified an entry address of `0x80000` instead of `0x8000`, as follows:

```
armlink --entry=0x80000 test.o -o test.axf
```

See the following in the linker document:

*--entry=location.*

L6208E: Invalid argument for `--entry` command: '<arg>'

See the following in the linker document:

*--entry=location.*

L6209E: Invalid offset constant specified for `--entry` (<arg>)

See the following in the linker document:

*--entry=location.*

L6210E: Image cannot have multiple entry points.  
(<address1>,<address2>)

One or more input objects specifies more than one entry point for the image. Use the `--entry` command-line option to select the entry point to use.

See the following in the linker document:

*--entry=location.*

L6211E: Ambiguous section selection. Object <objname> contains more than one section.

This can occur when using the linker option `--keep` on an assembler object that contains more than one AREA. The linker must know which AREA you want to keep.

To solve this, use more than one `--keep` option to specify the names of the AREAs to keep, such as:

```
--keep boot.o(vectors) --keep boot.o(resethandler) ...
```

———— **Note** —————

Using assembler files with more than one AREA might give other problems elsewhere, so this is best avoided.

L6213E: Multiple First section <object2>(<section2>) not allowed.  
<object1>(<section1>) already exists.

Only one FIRST section is permitted.

L6214E: Multiple Last section <object2>(<section2>) not allowed.  
<object1>(<section1>) already exists.

Only one LAST section is permitted.

L6215E: Ambiguous symbol selection for `--First/--Last`. Symbol <symbol> has more than one definition.

See the following in the linker document:

*--first=section\_id.*

*--last=section\_id.*

**L6216E: Cannot use base/limit symbols for non-contiguous section  
 <secname>**

The exception handling index tables generated by the compiler are given the section name `.ARM.exidx`. For more information, see [Exception Handling ABI for the ARM Architecture](#).

At link time these tables must be placed in the same execution region and be contiguous. If you explicitly place these sections non-contiguously using specific selector patterns in your scatter file, then this error message is likely to occur. For example:

```
LOAD_ROM 0x00000000
{
  ER1 0x00000000
  {
    file1.o (+RO) ; from a C++ source
    * (+RO)
  }
  ER2 0x01000000
  {
    file2.o (+RO) ; from a C++ source
  }
  ER3 +0
  {
    * (+RW, +ZI)
  }
}
```

This might produce the following error if exception handling index tables are in both `file1.o` and `file2.o`, because the linker cannot place them in separate regions:

```
Error: L6216E: Cannot use base/limit symbols for non-contiguous
section .ARM.exidx
```

Also, the `.init_array` sections must be placed contiguously within the same region for their base and limit symbols to be accessible.

The correct code is:

```
LOAD_ROM 0x00000000
{
  ER1 0x00000000
  {
    file1.o (+RO) ; from a C++ source
    * (.ARM.exidx) ; Section .ARM.exidx must be placed
                  ; explicitly, otherwise it is shared between
                  ; two regions and the linker is unable to
                  ; decide where to place it.
    *.init_array) ; Section .init_array must be placed
                  ; explicitly, otherwise it is shared between
                  ; two regions and the linker is unable to
                  ; decide where to place it.
    * (+RO)
  }
  ER2 0x01000000
  {
    file2.o (+RO) ; from a C++ source
  }
  ER3 +0
  {
    * (+RW, +ZI)
  }
}
```

In this example, the base and limit symbols are contained in `.init_array` in a single region.

See the following in the *ARM C and C++ Libraries and Floating-Point Support User Guide*:

*C++ initialization, construction and destruction.*

L6217E: Relocation #<rel\_class>:<rel\_number> in <objname>(<secname>) with respect to <symbol>. R\_ARM\_SBREL32 relocation to imported symbol

L6218E: Undefined symbol <symbol> (referred from <objname>).

Some common examples of this are:

- User Error. There is a reference to an undefined or incorrectly defined symbol.

- 

```
Undefined symbol __ARM_switch8 or __ARM_11_<xxxx> functions
```

The helper functions are automatically generated into the object file by the compiler.

———— **Note** —————

An undefined reference error can, however, still be generated if linking objects from legacy projects where the helper functions are in the `h_XXX` libraries (`h` indicates that these are compiler helper libraries, rather than standard C library code).

Re-compile the object or ensure that these libraries can be found by the linker.

- When attempting to refer to a function or entity in C from a function or entity in C++. This is caused by C++ name mangling, and can be avoided by marking C functions `extern "C"`.

- 

```
Undefined symbol thunk{v:0,-44} to Foo_i::~~Foo_i() (referred from Bar_i.o)
```

The symbol `thunk{v:0,-44} to Foo_i::~~Foo_i()` is a wrapper function round the regular `Foo_i::~~Foo_i()`.

`Foo_i` is a derived class of some other base class, therefore:

- it has a base-class vtable for when it is referred to by a pointer to that base class
- the base-class vtable has an entry for the `thunk`
- the destructor `thunk` is output when the actual (derived class) destructor is output.

Therefore, to avoid the error, ensure this destructor is defined.

- 

```
Undefined symbol main (referred from kernel.o)
```

The linker is reporting that your application does not include a `main()` function.

See the following in the *Migration and Compatibility Guide*:

*C and C++ library changes between RVCT v2.2 and RVCT v3.0.*

L6219E: <type> section <object1>(<section1>) attributes {<attributes>} incompatible with neighboring section <object2>(<section2>).

This error occurs when the default ordering rules used by the linker (RO followed by RW followed by ZI) are violated. This typically happens when one uses `+FIRST` or `+LAST`, for example in a scatter file, attempting to force RW before RO.

L6220E: <type> region <regionname> size (<size> bytes) exceeds limit (<limit> bytes).

Example:

```
Execution region ROM_EXEC size (4208184 bytes) exceeds limit (4194304 bytes).
```

This can occur where a region has been given an (optional) maximum length in the scatter file, but the size of the code and data being placed in that region has exceeded the limit. This error is suppressible with `--diag_suppress 6220`.

For example, this might occur when using `.ANYnum` selectors with the `ALIGN` directive in a scatter file to force the linker to insert padding. You might be able to fix this using the `--any_contingency` option.

See the following in the linker document:

*Placement of unassigned sections with the .ANY module selector.*

`--any_contingency`.

`--diag_suppress=tag[,tag,...]`.

L6221E: <type1> region <regionname1> with <addrtype1> range [<base1>,<limit1>) overlaps with <type2> region <regionname2> with <addrtype2> range [<base2>,<limit2>).

This represents an incorrect scatter file. A non-ZI section must have a unique load address and in most cases must have a unique execution address. This error might be because a load region LR2 with a relative base address immediately follows a ZI execution region in a load region LR1. From RVCT v3.1 onwards, the linker no longer assigns space to ZI execution regions.

See the following in the linker document:

*Scatter files containing relative base address load regions and a ZI execution region.*

L6222E: Partial object cannot have multiple ENTRY sections, <e\_>(<e\_sname>) and <oname>(<sname>).

Where objects are being linked together into a partially-linked object, only one of the sections in the objects can have an entry point.

———— **Note** —————

It is not possible in this case to use the linker option `--entry` to select one of the entry points.

L6223E: Ambiguous selectors found for <objname>(<secname>) from Exec regions <region1> and <region2>.

This occurs if the scatter file specifies <objname>(<secname>) to be placed in more than one execution region. This can occur accidentally when using wildcards (\*). The solution is to make the selections more specific in the scatter file.

L6224E: Could not place <objname>(<secname>) in any Execution region.

This occurs if the linker cannot match an input section to any of the selectors in your scatter file. You must correct your scatter file by adding an appropriate selector.

See the following in the linker document:

*Section placement with the linker.*

L6225E: Number <str...> is too long.

L6226E: Missing base address for region <regname>.

L6227E: Using `--reloc` with `--rw-base` without `--split` is not allowed.  
See the following in the linker document:

*`--reloc`.*

*`--rw_base=address`.*

*`--split`.*

L6228E: Expected '`<str1>`', found '`<str2>`'.

L6229E: Scatter description `<file>` is empty.

L6230E: Multiple execution regions (`<region1>`,`<region2>`) cannot select `<secname>`.

L6231E: Missing module selector.

L6232E: Missing section selector.

L6233E: Unknown section selector '`+<selector>`'.

L6234E: `<ss>` must follow a single selector.

For example, in a scatter file:

```
:  
* (+FIRST, +RO)  
:
```

`+FIRST` means place this (single) section first. Selectors that can match multiple sections (for example, `+RO` or `+ENTRY`) are not permitted to be used with `+FIRST` (or `+LAST`). If used together, the error message is generated.

L6235E: More than one section matches selector - cannot all be `FIRST/`  
`LAST`.

See the following in the linker document:

*[Section placement with the FIRST and LAST attributes](#).*

*[Syntax of an input section description](#).*

**L6236E: No section matches selector - no section to be FIRST/LAST.**  
The scatter file specifies a section to be +FIRST or +LAST, but that section does not exist, or has been removed by the linker because it believes it to be unused. Use the linker option `--info unused` to reveal which objects are removed from your project.  
Example:

```
ROM_LOAD 0x00000000 0x4000
{
  ROM_EXEC 0x00000000
  {
    vectors.o (Vect, +First) << error here
    * (+RO)
  }
  RAM_EXEC 0x40000000
  {
    * (+RW, +ZI)
  }
}
```

Some possible solutions are:

- Ensure `vectors.o` is specified on the linker command line.
- Link with `--keep vectors.o` to force the linker not to remove this, or switch off this optimization entirely, with `--no_remove`. ARM does not recommend this.
- ARM recommends that you add the `ENTRY` directive to `vectors.s`, to tell the linker that it is a possible entry point for your application. For example:

```
AREA Vect, CODE
ENTRY ; define this as an entry point
Vector_table
...
```

Then link with `--entry Vector_table` to define the real start of your code.

See the following in the linker document:

[Section placement with the FIRST and LAST attributes.](#)

[--entry=location.](#)

[--info=topic\[,topic,...\].](#)

[--keep=section\\_id.](#)

[--remove, --no\\_remove.](#)

[Syntax of an input section description.](#)

See the following in the assembler document:

[ENTRY.](#)

**L6237E: <objname>(<secname>) contains relocation(s) to unaligned data.**

L6238E: <objname>( <secname>) contains invalid call from '<attr1>' function to '<attr2>' function <sym>.

This linker error is given where a stack alignment conflict is detected in object code. The *ABI for the ARM Architecture* suggests that code maintains eight-byte stack alignment at its interfaces. This permits efficient use of LDRD and STRD instructions (in ARM architecture 5TE and later) to access eight-byte aligned double and long long data types.

Symbols such as ~PRES8 and REQ8 are Build Attributes of the objects:

- PRES8 means the object PREServes eight-byte alignment of the stack
- ~PRES8 means the object does NOT preserve eight-byte alignment of the stack (~ meaning NOT)
- REQ8 means the object REQUIRES eight-byte alignment of the stack.

This link error typically occurs in two cases:

- Where assembler code (that does not preserve eight-byte stack alignment) calls compiled C/C++ code (that requires eight-byte stack alignment).
- Where attempting to link legacy objects that were compiled with older tools with objects compiled with recent tools. Legacy objects that do not have these attributes are treated as ~PRES8, even if they do actually happen to preserve eight-byte alignment.

For example:

```
Error: L6238E: foo.o(.text) contains invalid call from '~PRES8' function to 'REQ8' function foobar
```

This means that there is a function in the object `foo.o` (in the section named `.text`) that does not preserve eight-byte stack alignment, but which is trying to call function `foobar` that requires eight-byte stack alignment.

A similar warning that might be encountered is:

```
Warning: L6306W: '~PRES8' section foo.o(.text) should not use the address of 'REQ8' function foobar
```

where the address of an external symbol is being referred to.

There are two possible solutions to work around this issue:

- Rebuild all your objects/libraries.

If you have any assembler files, you must check that all instructions preserve eight-byte stack alignment, and if necessary, correct them.

For example, change:

```
STMFd sp!, {r0-r3, lr} ; push an odd number of registers
```

to

```
STMFd sp!, {r0-r3, r12, lr} ; push even number of registers
```

The assembler automatically marks the object with the PRES8 attribute if all instructions preserve eight-byte stack alignment, so it is no longer necessary to add the PRESERVE8 directive to the top of each assembler file.

- If you have any legacy objects/libraries that cannot be rebuilt, either because you do not have the source code, or because the old objects must not be rebuilt (for example, for qualification/certification reasons), then you must inspect the legacy objects to check whether they preserve eight-byte alignment or not.

Use `fromelf -c` to disassemble the object code. C/C++ code compiled with ADS 1.1 or later normally preserves eight-byte alignment, but assembled code does not.

If your objects do indeed preserve eight-byte alignment, then the linker error L6238E can be suppressed with the use of `--diag_suppress 6238` on the linker command line.

By using this, you are effectively guaranteeing that these objects are PRES8.

The linker warning L6306W is suppressible with `--diag_suppress 6306`.

See the following FAQ:

#### *8 Byte Stack Alignment.*

L6239E: Cannot call non-interworking <t2> symbol '<sym>' in <obj2> from <t1> code in <obj1>(<sec1>)

Example:

```
Cannot call non-interworking ARM symbol 'ArmFunc' in object foo.o from THUMB code in bar.o(.text)
```

This problem can be caused by `foo.c` not being compiled with the option `--apcs / interwork`, to enable ARM code to call Thumb code (and Thumb to ARM) by linker-generated interworking veneers.

L6241E: <objname>(<secname>) cannot use the address of '<attr1>' function <sym> as the image contains '<attr2>' functions.

When linking with `--strict`, the linker reports conditions that might fail as errors, for example:

```
Error: L6241E: foo.o(.text) cannot use the address of '~IW' function main as the image contains 'IW' functions.
```

IW means interworking, and ~IW means non-interworking.

L6242E: Cannot link object <objname> as its attributes are incompatible with the image attributes.

Each object file generated by the compilation tools includes a set of attributes that indicates the options that it was built with. The linker checks the attributes of each object file it processes. If it finds attributes that are incompatible with those of object files it has loaded previously, it generates this error.

There are three common reasons for this error, each of which produces a different message:

- ```
Error: L6242E: Cannot link object foo.o as its attributes are incompatible with the image attributes. require four-byte alignment of eight-byte datatypes clashes with require eight-byte alignment of eight-byte data types.
```

This can occur when you try to link objects built using RVCT 2.0 or later with objects built using ADS or RVCT 1.2. In ADS and RVCT 1.2, `double` and `long long` data types were 4-byte aligned (unless you used the `-Oldrd` compiler option or the `__align` keyword). In RVCT 2.0, the ABI changed, so that `double` and `long long` data types are 8-byte aligned.

This change means that ADS and RVCT 1.2 objects and libraries using `double` or `long long` data types are not directly compatible with objects and libraries built using RVCT 2.0 or later, and so the linker reports an attribute clash.

To use RVCT 2.x or 3.0 C objects with legacy ADS C objects, compile the RVCT 2.x or 3.0 C code with the `--apcs /adsabi` command line option. This option was deprecated in RVCT 2.2 and removed from RVCT 3.1.

- ```
Error: L6242E: Cannot link object foo.o as its attributes are incompatible with the image attributes. ... pure-endian double clashes with mixed-endian double.
```

This can occur when you are linking objects built using the ARM Compiler toolchain, RVCT or ADS with legacy SDT objects or objects built using either of the compiler options `--fpu softfpa` or `--fpu fpa`. SDT used a non-standard format for little-endian `double` and big-endian `long long`. However ADS and RVCT use industry-standard `double` and `long long` types, except for when the `--fpu softfpa` or `--fpu fpa` options are used. (These options are only supported in RVCT 2.1 and earlier). If you attempt to link object files that use the different formats for little-endian `double` and big-endian `long long` then the linker reports this error.

ARM recommends you rebuild your entire project using RVCT or the ARM Compiler toolchain. If you do not have the source code for an object or library, then try recompiling your code with `--fpu softfpa`.

- ```
Error: L6242E: Cannot link object foo.o as its attributes are incompatible with the image attributes. ... FPA clashes with VFP.
```

This error typically occurs when you attempt to link objects built with different `--fpu` options. ARM recommends you rebuild your entire project using the same `--fpu` options.

See the following FAQ:

[Are legacy objects and libraries compatible with my project?.](#)

L6243E: Selector only matches removed unused sections - no section to be FIRST/LAST.

All sections matching this selector have been removed from the image because they were unused. For more information, use `--info unused`.

L6244E: <type> region <regionname> address (<addr>) not aligned on a <align> byte boundary.

L6245E: Failed to create requested ZI section '<name>'.

L6248E: <objname>( <secname>) in <attr1> region '<r1>' cannot have <rtype> relocation to <symname> in <attr2> region '<r2>'.

This error can occur when you are trying to build position-independent (PI) code. Consider, for example the following code:

```
#include <stdio.h>
char *str = "test";
int main(void)
{
    printf ("%s",str);
}
```

When you compile and link this using:

```
armcc -c --apcs /ropi/rwpi pi.c
armlink --ropi --rwpi pi.o
```

the linker reports the following error message:

```
Error: L6248E: pi.o(.data) in PI region 'ER_RW' cannot have address type
relocation to .conststring in PI region 'ER_RO'.
```

This is because the compiler generates a global pointer `str` that must be initialized to the address of the string in the `.conststring` section. However, absolute addresses cannot be used in a PI system, so the link step fails.

To resolve this, you must re-write the code to avoid the explicit pointer. You can do this using either of the following methods:

- Use a global array instead of a global pointer, for example:

```
#include <stdio.h>
const char str[] = "test";
int main(void)
{
    printf ("%s",str);
}
```

- Use a local pointer instead of a global pointer, for example:

```
#include <stdio.h>
int main(void)
{
    char *str = "test";
    printf ("%s",str);
}
```

———— **Note** —————

If you are using an array of pointers, such as:

```
char * list[] = {"zero", "one", "two"};
```

the linker reports a separate error for each element in the array. In this case, ARM recommends you declare a two dimensional array for the list, with the first dimension as the number of elements in the array, and the second dimension as the maximum size of an element in the array, for example:

```
char list[3][5] = {"zero", "one", "two"};
```

You must change the `printf()` statement to, for example:

```
printf("%s", list[1]);
```

See compiler error number 1359.

L6249E: Entry point (<address>) lies within multiple sections.

L6250E: Object <objname> contains illegal definition of special symbol <symbol>.

L6251E: Object <objname> contains illegal reference to special symbol <symbol>.

L6252E: Invalid argument for --xreffrom/--xrefsto command: '<arg>'

L6253E: Invalid SYMDEF address: <number>.

L6254E: Invalid SYMDEF type : <type>.  
The content of the symdefs file is invalid.

See the following in the linker document:

*Symdefs file format.*

L6255E: Could not delete file <filename>: <reason>  
An I/O error occurred while trying to delete the specified file. The file was either read-only, or was not found.

L6257E: <object>(<secname>) cannot be assigned to overlaid Execution region '<ername>'.

This message indicates a problem with the scatter file.

See the following in the linker document:

*Scatter file syntax.*

L6258E: Entry point (<address>) lies in an overlaid Execution region.  
This message indicates a problem with the scatter file.

See the following in the linker document:

*Scatter file syntax.*

L6259E: Reserved Word '<name>' cannot be used as a <type> region name.  
<name> is a reserved word, so choose a different name for your region.

L6260E: Multiple load regions with the same name (<regionname>) are not allowed.

This message indicates a problem with the scatter file.

See the following in the linker document:

*Scatter file syntax.*

L6261E: Multiple execution regions with the same name (<regionname>) are not allowed.

This message indicates a problem with the scatter file.

See the following in the linker document:

*Scatter file syntax.*

L6263E: <addr> address of <regionname> cannot be addressed from  
<pi\_or\_abs> Region Table in <regtabregionname>

The Region Table contains information used by the C-library initialization code to copy, decompress, or create ZI. This error message is given when the scatter file specifies an image structure that cannot be described by the Region Table.

The error message is most common when PI and non-PI load regions are mixed in the same image.

L6265E: Non-PI Section <obj>(<sec>) cannot be assigned to PI Exec region <er>.

This might be caused by explicitly specifying the wrong ARM library on the linker command-line. Either:

- remove the explicit specification of the ARM library
- replace the library, for example, `c_t.l`, with the correct library.

L6266E: RWPI Section <obj>(<sec>) cannot be assigned to non-PI Exec region <er>.

A file compiled with `--apcs=/rwp` is placed in an execution region that does not have the PI attribute.

L6271E: Two or more mutually exclusive attributes specified for Load region <regname>

This message indicates a problem with the scatter file.

L6272E: Two or more mutually exclusive attributes specified for Execution region <regname>

This message indicates a problem with the scatter file.

L6273E: Section <objname>(<secname>) has mutually exclusive attributes (READONLY and ZI)

This message indicates a problem with the object file.

L6275E: COMMON section <obj1>(<sec1>) does not define <sym> (defined in <obj2>(<sec2>))

Given a set of COMMON sections with the same name, the linker selects one of them to be added to the image and discards all others. The selected COMMON section must define all the symbols defined by any rejected COMMON section, otherwise a symbol that was defined by a rejected section would become undefined again. The linker generates an error if the selected copy does not define a symbol that a rejected copy does. This error is normally caused by a compiler fault. Contact your supplier.

L6276E: Address <addr> marked both as <s1>(from <sp1>(<obj1>) via <src1>) and <s2>(from <sp2>(<obj2>) via <src2>).

The image cannot contain contradictory mapping symbols for a given address, because the contents of each word in the image are uniquely typed as ARM (`$a`) or THUMB (`$t`) code, DATA (`$d`), or NUMBER. It is not possible for a word to be both ARM code and DATA. This might indicate a compiler fault. Contact your supplier.

L6277E: Unknown command '<cmd>'.

L6278E: Missing expected <str>.

L6279E: Ambiguous selectors found for <sym> ('<sel1>' and '<sel2>').

L6280E: Cannot rename <sym> using the given patterns.

See the following in the linker document:

*RENAME steering file command.*

L6281E: Cannot rename both <sym1> and <sym2> to <newname>.

See the following in the linker document:

*RENAME steering file command.*

L6282E: Cannot rename <sym> to <newname> as a global symbol of that name exists (defined) in <obj>).

See the following in the linker document:

*RENAME steering file command.*

L6283E: Object <objname> contains illegal local reference to symbol <symbolname>.

An object cannot contain a reference to a local symbol, because local symbols are always defined within the object itself.

L6285E: Non-relocatable Load region <lr\_name> contains R-Type dynamic relocations. First R-Type dynamic relocation found in <object>(<secname>) at offset 0x<offset>.

This error occurs where there is a PI reference between two separate segments, if the two segments can be moved apart at runtime. When the linker sees that the two sections can be moved apart at runtime it generates a relocation (an R-Type relocation) that can be resolved if the sections are moved from their statically linked address. However the linker faults this relocation (giving error L6285E) because PI regions must not have relocations with respect to other sections as this invalidates the criteria for being position independent.

L6286E: Relocation #<rel\_class>:<rel\_number> in <objname>(<secname>) with respect to {symname|%s}. Value(<val>) out of range(<range>) for (<rtype>)

This error typically occurs in the following situations:

- In handwritten assembly code, where there are not enough bits within the instruction opcode to hold the offset to a symbol.

For example, the offset range is  $\pm 4095$  for an ARM state LDR or STR instruction.

- When the linker is having difficulty placing veneers around a large code section in your image.

When the linker places a veneer near a very large section it must decide whether to place the veneer before or after the section. When the linker has placed the veneer it might have to place more veneers, which could be placed between the original veneer and its target. This would increase the distance between the veneer and its target.

The linker automatically allows for modest increases in distances between veneers and their targets. However, a large number of veneers placed between the original veneer and its target might result in the target moving out of range. If this occurs, the linker generates message L6286E.

To work around this, you can move large code sections away from areas where the linker is placing many veneers. This can be done either by placing large sections in their own regions or by placing them first in the region they are located in using the `+FIRST` directive in the scatter-loading description file.

For example:

```
LOAD 0x0A000000 0x1000000
{
  ROM1 +0x0
  {
    *(+RO)
  }
}
```

This can be changed to:

```
LOAD 0x0A000000 0x1000000
{
  ROM1 +0x0
  {
    *(+RO)
  }
  ROM1A +0x0
  {
    large.o (+RO)
  }
}
```

- When `.ARM.exidx` exception-handling index tables are placed in different execution regions, or too far from exception handling code.

The `.ARM.exidx` exception-handling index tables must be located in a single execution region. Also, the distance from these tables to the C++ code that uses C++ exception handling must be within the range `-0x40000000` to `0x3fffffff`.

Otherwise, the linker reports the following error:

```
L6286: Value(0x9ff38980) out of range(-0x9ff38980) out of
range(-0x40000000 - 0x3fffffff) for relocation #0
(R_ARM_PREL31), wrt symbol xxx in XXXX.o(.ARM.exidx)
```

This behavior is specified in the *Exception Handling ABI for the ARM Architecture* (EHABI). The EHABI states that the R\_ARM\_PREL31 relocation, which .ARM.exidx uses, does not use the highest bit (bit 31) for calculating the relocation.

The most likely cause of this is that C++ code that must access the .ARM.exidx sections, has been split and placed into separate execution regions, outside of the valid range (-0x40000000 to 0x3fffffff).

To resolve this error, if you have memory between the separated execution regions, place the .ARM.exidx section there with the selector \*(.ARM.exidx). For example:

```
LOAD_ROM 0x00000000
{
  ER1 0x00000000 ; The distance from ER2 to ER1 is out of
  { ; range.
    file1.o (+R0) ; From a C++ source.
    * (+R0)
  }
  ERx 0x30000000
  {
    *(.ARM.exidx) ; ARM.exidx to ER1 and ER2 both in range.
  }
  ER2 0x60000000
  {
    file2.o (+R0) ; From a C++ source.
  }
  ER3 +0
  {
    * (+RW, +ZI)
  }
}
```

Otherwise, try placing the code into an execution region close enough to the tables (within the range of -0x40000000 to 0x3fffffff).

In other cases, make sure you have the latest patch installed from [Downloads](#).

For more information, see the following:

[What does "Error: L6286E: Value out of range for relocation" mean?](#)

[Exception Handling ABI for the ARM Architecture](#).

**L6287E: Illegal alignment constraint (<align>) specified for <objname>(<secname>).**

An illegal alignment was specified for an ELF object.

**L6291E: Cannot assign Fixed Execution Region <ername> Load Address:<addr>. Load Address must be greater than or equal to next available Load Address:<load\_addr>.**

See the following in the linker document:

[Execution region attributes](#).

**L6292E: Ignoring unknown attribute '<attr>' specified for region <regname>.**

This error message is specific to execution regions with the FIXED attribute. FIXED means make the load address the same as the execution address. The linker can only do this if the execution address is greater than or equal to the next available load address within the load region.

See the following in the linker document:

[Root execution regions and the FIXED attribute](#).

[Execution region attributes](#).

L6294E: <type> region <regionname> spans beyond 32 bit address space (base <base>, size <size> bytes).

This error message relates to a problem with the scatter file.

L6295E: Relocation #<rel\_class>:<rel\_number> in <objname>(<secname>) with respect to <symname> SBREL relocation requires image to be RWPI

L6296E: Definition of special symbol <sym1> is illegal as symbol <sym2> is absolute.

See L6188E.

L6300W: Common section <object1>(<section1>) is larger than its definition <object2>(<section2>).

This might indicate a compiler fault. Contact your supplier.

L6301W: Could not find file <filename>: <reason>

The specified file was not found in the default directories.

L6302W: Ignoring multiple SHLNAME entry.

There can be only one SHLNAME entry in an edit file. Only the first such entry is accepted by the linker. All subsequent SHLNAME entries are ignored.

L6304W: Duplicate input file <filename> ignored.

The specified filename occurred more than once in the list of input files.

L6305W: Image does not have an entry point. (Not specified or not set due to multiple choices.)

The entry point for the ELF image was either not specified, or was not set because there was more than one section with an entry point linked-in. You must use linker option `--entry` to specify the single, unique entry, for example:

```
--entry 0x0
```

or

```
--entry <label>
```

The label form is typical for an embedded system.

L6306W: '<attr1>' section <objname>(<secname>) should not use the address of '<attr2>' function <sym>.

See L6238E.

L6307W: Relocation #<rel\_class>:<rel\_num> in <objname>(<secname>) with respect to <sym>. Branch to unaligned destination.

L6308W: Could not find any object matching <membername> in library <libraryname>.

The name of an object in a library is specified on the link-line, but the library does not contain an object with that name.

L6309W: Library <libraryname> does not contain any members.

A library is specified on the linker command-line, but the library does not contain any members.

**L6310W: Unable to find ARM libraries.**

This is most often caused by incorrect arguments to `--libpath` or an invalid value for the environment variable `ARMCC5LIB`, if defined.

Set the the correct path with either the `--libpath` linker option or the `ARMCC5LIB` environment variable. The default path for a Windows installation is:

`install_directory\lib`

Ensure this path does not include any of the following:

- `\armlib`
- `\cpplib`
- any trailing slashes (`\`) at the end. These are added by the linker automatically.

Use `--verbose` or `--info libraries` to display where the linker is attempting to locate the libraries.

See the following in the linker document:

[`--info=topic\[,topic,...\]`](#).

[`--libpath=pathlist`](#).

[`--verbose`](#).

See the following in the *Getting Started Guide*:

[\*Toolchain environment variables.\*](#)

**L6311W: Undefined symbol <symbol> (referred from <objname>).**

See L6218E.

**L6312W: Empty <type> region description for region <region>**

**L6313W: Using <oldname> as an section selector is obsolete. Please use <newname> instead.**

For example, use of `IWV$$Code` within the scatter file is obsolete. Replace `IWV$$Code` with `Veneer$$Code`.

**L6314W: No section matches pattern <module>(<section>).**

For example:

```
No section matches pattern foo.*o(ZI).
```

This can be caused by any of the following:

- The file `foo.o` is mentioned in your scatter file, but it is not listed on the linker command line. To resolve this, add `foo.o` to the link line.
- You are trying to place the ZI data of `foo.o` using a scatter file, but `foo.o` does not contain any ZI data. To resolve this, remove the `+ZI` attribute from the `foo.o` line in your scatter file.
- You have used `__attribute__((at(address)))` in your source code to place code and data at a specific address. You have also specified `*(.ARM.__AT_address)` in a scatter file, but you have not specified the address as eight hexadecimal digits. For example, if you specify `__attribute__((at(0x10000)))` in your source code, then you must specify the section name as `*(.ARM.__AT_0x00010000)` in the scatter file.

See the following in the linker document:

[\*Methods of placing functions and data at specific addresses.\*](#)

[\*Placement of sections at a specific address with `\_\_at`.\*](#)

L6315W: Ignoring multiple Build Attribute symbols in Object <objname>. An object can contain at most one absolute BuildAttribute\$. . . symbol. Only the first such symbol from the object symbol table is accepted by the linker. All subsequent ones are ignored.

L6316W: Ignoring multiple Build Attribute symbols in Object <objname> for section <sec\_no>  
An object can contain at most one BuildAttribute\$. . . symbol applicable to a given section. Only the first such symbol from the object symbol table is accepted by the linker. All subsequent ones are ignored.

L6317W: <objname>(<secname>) should not use the address of '<attr1>' function <sym> as the image contains '<attr2>' functions.

L6318W: <objname>(<secname>) contains branch to a non-code symbol <sym>.

This warning means that in the (usually assembler) file, there is a branch to a non-code symbol (in another AREA) in the same file. This is most likely a branch to a label or address where there is data, not code.

For example:

```
AREA foo, CODE
B bar
AREA bar, DATA
DCD 0
END
```

This results in the message:

```
init.o(foo) contains branch to a non-code symbol bar.
```

If the destination has no name:

```
BL 0x200 ; Branch with link to 0x200 bytes ahead of PC
```

the following message is displayed:

```
bootsys.o(BOOTSYS_IVT) contains branch to a non-code symbol <Anonymous Symbol>.
```

This warning can also appear when linking objects generated by GCC. GCC uses linker relocations for references internal to each object. The targets of these relocations might not have appropriate mapping symbols that permit the linker to determine whether the target is code or data, so a warning is generated. By contrast, `armcc` resolves all such references at compile-time.

L6319W: Ignoring <cmd> command. Cannot find section <objname>(<secname>).

For example, when building a Linux application, you might have:

```
--keep *(.init_array)
```

on the linker command-line in your makefile, but this section might not be present when building with no C++, in which case this warning is reported:

```
Ignoring --keep command. Cannot find section *(.init_array)
```

You can often ignore this warning, or suppress it with `--diag_suppress 6319`.

L6320W: Ignoring <cmd> command. Cannot find argument '<argname>'.

L6323W: Relocation #<rel\_class>:<rel\_number> in <objname>(<secname>) with respect to <sym>. Multiple variants exist. Using the <type> variant to resolve ambiguity

L6324W: Ignoring <attr> attribute specified for Load region <regname>. This attribute is applicable to execution regions only. If specified for a Load region, the linker ignores it.

L6325W: Ignoring <attr> attribute for region <regname> which uses the +offset form of base address.

This attribute is not applicable to regions using the +offset form of base address. If specified for a region, which uses the +offset form, the linker ignores it.

A region that uses the +offset form of base address inherits the PI, RELOC, or OVERLAY attributes from either:

- the previous region in the description
- the parent load region if it is the first execution region in the load region.

See the following in the linker document:

[Inheritance rules for load region address attributes.](#)

[Inheritance rules for execution region address attributes.](#)

[Inheritance rules for the RELOC address attribute.](#)

L6326W: Ignoring ZEROPAD attribute for non-root execution region <ername>.

ZEROPAD only applies to root execution regions. A root region is a region whose execution address is the same as its load address, and so does not require moving or copying at run-time.

See the following in the linker document:

[Execution region attributes.](#)

L6329W: Pattern <module>(<section>) only matches removed unused sections.

All sections matching this pattern have been removed from the image because they were unused. For more information, use `--info unused`.

See the following in the linker document:

[Elimination of unused sections.](#)

`--info=topic[,topic,...]`.

L6330W: Undefined symbol <symbol> (referred from <objname>). Unused section has been removed.

This means that an unused section has had its base and limit symbols referenced. For more information, use `--info unused`.

For example, when using a scatter file to place code and data with RVCT 2.1 or later, the linker reports this error if the scatter file includes the linker-generated table `ZISection$Table`. In RVCT 2.1, a new region tables format was introduced which no longer contains `ZISection$Table`.

See the following in the linker document:

*Elimination of unused sections.*

`--info=topic[,topic,...]`.

L6331W: No eligible global symbol matches pattern <pat>.

L6332W: Undefined symbol <sym1> (referred from <obj1>). Resolved to symbol <sym2>.

L6334W: Overalignment <overalignment> for region <regname> cannot be negative.

See the following in the linker document:

*Overalignment of execution regions and input sections.*

L6335W: ARM interworking code in <objname>(<secname>) may contain invalid tailcalls to ARM non-interworking code.

The compiler is able to perform tailcall optimization for improved code size and performance. However, there is a problematic sequence for Architecture 4T code in which a Thumb interworking (IW) function calls (by a veneer) an ARM IW function, which tailcalls an ARM non-interworking (~IW) function. The return from the ARM non-IW function can pop the return address off the stack into the PC instead of using the correct BX instruction. The linker can detect this situation and report this warning.

Thumb IW tailcalls to Thumb non-IW do not occur because Thumb tailcalls with B are so short ranged that they can only be generated to functions in the same ELF section which must also be Thumb.

The warning is pessimistic in that an object *might* contain invalid tailcalls, but the linker cannot be sure because it only looks at the attributes of the objects, not at the contents of their sections.

To avoid the warning, either recompile your entire code base, including any user libraries, with `--apcs /interwork`, or manually inspect the ARM IW function to check for tailcalls (that is, where function calls are made using an ordinary branch B instruction), to check whether this is a real problem. This warning can be suppressed with `--diag_suppress L6335W`.

L6337W: Common code sections <o1>(<s1>) and <o2>(<s2>) have incompatible floating-point linkage

L6339W: Ignoring RELOC attribute for execution region <er\_name>.

Execution regions cannot explicitly be given the RELOC attribute. They can only gain this attribute by inheriting it from the parent load region or the previous execution region if using the `+offset` form of addressing.

See the following in the linker document:

*Execution region attributes.*

L6340W: options first and last are ignored for link type of <linktype>  
The --first and --last options are meaningless when creating a partially-linked object.

L6366E: <object> attributes<attr> are not compatible with the provided cpu and fpu attributes<cli> <diff>.

L6367E: <object>(<section>) attributes<attr> are not compatible with the provided cpu and fpu attributes<cli> <diff>

L6368E: <symbol> defined in <object>(<section>) attributes<attr> are not compatible with the provided cpu and fpu attributes<cli> <diff>

L6369E: <symbol> defined in <object>(ABSOLUTE) are not compatible with the provided cpu and fpu Attributes<cli> <diff>

L6370E: cpu <cpu> is not compatible with fpu <fpu>  
See the following in the linker document:

*--cpu=name.*

*--fpu=name.*

L6371E: Adding attributes from cpu and fpu: <attrs>

L6372E: Image needs at least one load region.

L6373E: libattrs.map file not found in System Library directory <dir>. Library selection may be impaired.

L6384E: No Load Execution Region of name <region> seen yet at line <line>.

This might be because you have used the current base address in a limit calculation in a scatter file. For example:

```
ER_foo 0 ImageBase(ER_foo)
```

L6385W: Addition overflow on line <line>

L6386E: Exec Region Expressions can only be used in base address calculations on line <line>

L6387E: Load Region Expressions can only be used in ScatterAssert expressions on line <line>

See the following in the linker document:

*ScatterAssert function and load address related functions.*

L6388E: ScatterAssert expression <expr> failed on line <line>

See the following in the linker document:

*ScatterAssert function and load address related functions.*

L6389E: Load Region <name> on line <line> not yet complete, cannot use operations that depend on length of region

L6390E: Conditional operator (expr) ? (expr) : (expr) on line <line> has no : (expr).

See the following in the linker document:

*About Expression evaluation in scatter files.*

*Expression rules in scatter files.*

L6404W: FILL value preferred to combination of EMPTY, ZEROPAD and PADVALUE for Execution Region <name>.

See the following in the linker document:

*Execution region attributes.*

L6405W: No .ANY selector matches Section <name>(<objname>).

See the following in the linker document:

*Placement of unassigned sections with the .ANY module selector.*

L6406W: No space in execution regions with .ANY selector matching Section <name>(<objname>).

This occurs if there is not sufficient space in the scatter file regions containing .ANY to place the section listed. You must modify your scatter file to ensure there is sufficient space for the section.

See the following in the linker document:

*Placement of unassigned sections with the .ANY module selector.*

L6407W: Sections of aggregate size 0x<size> bytes could not fit into .ANY selector(s).

This warning identifies the total amount of image data that cannot be placed in any .ANY selectors.

For example, .ANY(+ZI) is placed in an execution region that is too small for the amount of ZI data:

```
ROM_LOAD 0x8000
{
  ROM_EXEC 0x8000
  {
    .ANY(+RO,+RW)
  }
  RAM +0 0x{...} <<< region max length is too small
  {
    .ANY(+ZI)
  }
}
```

See the following in the linker document:

*Placement of unassigned sections with the .ANY module selector.*

L6408W: Output is --fpic yet section <sec> from <obj> has no FPIC attribute.

L6409W: Output is --fpic yet object <obj> has no FPIC attribute.

L6410W: Symbol <sym> with non STV\_DEFAULT visibility <vis> should be resolved statically, cannot use definition in <lib>.

L6411W: No compatible library exists with a definition of startup symbol <name>.

L6412W: Disabling merging for section <sec> from object <obj>, non R\_ARM\_ABS32 relocation from section <srcsec> from object <srcobj>

L6413W: Disabling merging for section <sec> from object <obj>, Section contains misaligned string(s).

L6414E: `--ropi` used without `--rwpi` or `--rw-base`.

See the following in the linker document:

`--ropi`.

`--rw_base=address`.

`--rwpi`.

L6415E: Could not find a unique set of libraries compatible with this image. Suggest using the `--cpu` option to select a specific library.

See the following in the linker document:

`--cpu=name`.

L6416E: Relocation `<type>` at `<relclass>:<idx>` `<objname>`(`<secname>`) cannot be veneered as it has an offset `<offset>` from its target.

L6417W: Relocation `#<rel_class>:<rel_number>` in `<objname>`(`<secname>`) is with respect to a reserved tagging symbol(`#<idx>`).

L6418W: Tagging symbol `<symname>` defined in `<objname>`(`<secname>`) is not recognized.

L6419W: Undefined symbol `<symbol>` (referred from `<objname>`) imported.

L6420E: Ignoring `<oepname>`(`<secname>:<secnum>`) as it is not of a recognized type.

L6422U: PLT generation requires an architecture with ARM instruction support.

For the linker to generate a *Procedure Linkage Table* (PLT), you must be using a target that supports the ARM instruction set. For example, the linker cannot generate a PLT for a Cortex-M3 target.

L6423E: Within the same collection, section `<secname>` cannot have different sort attributes.

L6424E: Within the same collection, section `<secname1>` and section `<secname2>` cannot be separated into different execution regions.

L6425E: Within the same collection, section `<secname>` cannot have their section names with different length.

L6426E: Within the same collection, section `<secname>` cannot have its name duplicated.

L6427E: Cannot rename `<sym>` to `<newname>` as it has already been renamed to `<name>`).

L6429U: Attempt to set maximum number of open files to `<val>` failed with error code `<error>`.

An attempt to increase the number of file handles **armlink** can keep open at any one time has failed.

L6431W: Ignoring incompatible enum size attribute on Symbol `<symbol>` defined in `<object>`(`<section>`).

L6432W: Ignoring incompatible enum size attribute on Object `<object>`(`<section>`).

L6433W: Ignoring incompatible enum size attribute on object `<object>`.

L6434W: Ignoring incompatible `wchar_t` size attribute on Symbol `<symbol>` defined in `<object>`(`<section>`).

- L6435W: Ignoring incompatible wchar\_t size attribute on Section <object>( <section>).
- L6436W: Ignoring incompatible wchar\_t size attribute on object <object>.
- L6437W: Relocation #<rel\_class>:<idx> in <objname>( <secname>) with respect to <armsym>. Branch relocation to untyped symol in object <armobjname>, target state unknown.
- L6438E: \_\_AT section <objname>( <secname>) address <address> must be at least 4 byte aligned.
- L6439W: Multiply defined Global Symbol <sym> defined in <objname>( <secname>) rejected in favour of Symbol defined in <selobj>( <selsec>).
- L6440E: Unexpected failure in link-time code generation
- L6441U: System call to get maximum number of open files failed <error>.
- L6442U: Linker requires a minimum of <min> open files, current system limit is <max> files.
- L6443W: Data Compression for region <region> turned off. Region contains reference to symbol <symname> which depends on a compressed address.  
The linker requires the contents of a region to be fixed before it can be compressed and cannot modify it after it has been compressed. Therefore a compressible region cannot refer to a memory location that depends on the compression process.
- L6444I: symbol visibility : <symname> set to <visibility>.
- L6445I: symbol visibility : <symname> merged to <set\_vis> from existing <old\_vis> and new <new\_vis>.

- L6452E: <object>( <section>) built permitting Thumb is forbidden in an ARM-only link.
- L6453E: <symbol> defined in <object>( <section>) built permitting Thumb is forbidden in an ARM-only link.
- L6454E: <symbol> defined in <object>(ABSOLUTE) built permitting Thumb is forbidden in an ARM-only link.
- L6455E: Symbol <symbolname> has deprecated ARM/Thumb Synonym definitions (by <object1> and <object2>).
- L6459U: Could not create temporary file.
- L6462E: Reference to <sym> from a shared library only matches a definition with Hidden or Protected Visibility in Object <obj>.

L6463U: Input Objects contain <archtype> instructions but could not find valid target for <archtype> architecture based on object attributes. Suggest using --cpu option to select a specific cpu.

See the following in the linker document:

*--cpu=name.*

L6464E: Only one of --dynamic\_debug, --emit-relocs and --emit-debug-overlay-relocs can be selected.

See the following in the linker document:

*--dynamic\_debug.*

*--emit\_debug\_overlay\_relocs.*

*--emit\_relocs.*

L6467W: Library reports remark: <msg>

L6468U: Only --pltgot=direct or --pltgot=none supported for --base\_platform with multiple Load Regions containing code.

See the following in the linker document:

*--base\_platform.*

*--pltgot=type.*

L6469E: --base\_platform does not support RELOC Load Regions containing non RELOC Execution Regions. Please use +0 for the Base Address of Execution Region <ername> in Load Region <lname>.

See the following in the linker document:

*--base\_platform.*

*Inheritance rules for the RELOC address attribute.*

L6470E: PLT section <secname> cannot be moved outside Load Region <lname>.

L6471E: Branch Relocation <rel\_class>:<idx> in section <secname> from object <objname> refers to ARM Absolute <armsym> symbol from object <armobjname>, Suppress error to treat as a Thumb address.

L6475W: IMPORT/EXPORT commands ignored when --override\_visibility is not specified

The symbol you are trying to export, either with an EXPORT command in a steering file or with the --undefined\_and\_export command-line option, is not exported because of low visibility.

See the following in the linker document:

*--override\_visibility.*

*--undefined\_and\_export=symbol.*

*EXPORT.*

L6616E: Cannot increase size of RegionTable <sec\_name> from <obj\_name>

L6617E: Cannot increase size of ZISectionTable <sec\_name> from <obj\_name>

L6629E: Unmatched parentheses expecting ) but found <character> at position <col> on line <line>

This message indicates a parsing error in the scatter file.

- L6630E: Invalid token start expected number or ( but found <character> at position <col> on line <line>  
This message indicates a parsing error in the scatter file.
- L6631E: Division by zero on line <line>  
This message indicates an expression evaluation error in the scatter file.
- L6632W: Subtraction underflow on line <line>  
This message indicates an expression evaluation error in the scatter file.
- L6634E: Pre-processor command in '<filename>' too long, maximum length of <max\_size>  
This message indicates a problem with pre-processing the scatter file.
- L6635E: Could not open intermediate file '<filename>' produced by pre-processor: <reason>  
This message indicates a problem with pre-processing the scatter file.
- L6636E: Pre-processor step failed for '<filename>'  
This message indicates a problem with pre-processing the scatter file.
- L6637W: No input objects specified. At least one input object or library(object) must be specified.  
At least one input object or library(object) must be specified.
- L6638U: Object <objname> has a link order dependency cycle, check sections with SHF\_LINK\_ORDER
- L6640E: PDTable section not least static data address, least static data section is <secname>  
Systems that implement shared libraries with RWPI use a *process data table* (PDT). It is created at static link time by the linker and must be placed first in the data area of the image.  
  
This message indicates that the scatter file does not permit placing the PDT first in the data area of the image.  
  
To avoid the message, adjust your scatter file so that the PDT is placed correctly. This message can also be triggered if you accidentally build object files with `--apcs=/rwp1`.
- L6642W: Unused virtual function elimination might not work correctly, because <obj\_name> has not been compiled with `--vfe`
- L6643E: The virtual function elimination information in section <sectionname> refers to the wrong section.  
This message might indicate a compiler fault. Contact your supplier.
- L6644E: Unexpectedly reached the end of the buffer when reading the virtual function elimination information in section <oepname>(<sectionname>).  
This message might indicate a compiler fault. Contact your supplier.
- L6645E: The virtual function elimination information in section <oepname>(<sectionname>) is incorrect: there should be a relocation at offset <offset>.  
This message might indicate a compiler fault. Contact your supplier.
- L6646W: The virtual function elimination information in section <oepname>(<sectionname>) contains garbage from offset <offset> onwards.  
This message might indicate a compiler fault. Contact your supplier.

L6647E: The virtual function elimination information for <vcall\_objectname>(vcall\_sectionname) incorrectly indicates that section <curr\_sectionname>(object <curr\_objectname>), offset <offset> is a relocation (to a virtual function or RTTI), but there is no relocation at that offset.

This message might indicate a compiler fault. Contact your supplier.

L6649E: EMPTY region <regname> must have a maximum size.

See the following in the linker document:

*Execution region attributes.*

L6650E: Object <objname> Group section <sectionidx> contains invalid symbol index <symidx>.

L6651E: Section <secname> from object <objname> has SHF\_GROUP flag but is not member of any group.

L6652E: Cannot reverse Byte Order of Data Sections, input objects are <inputendian> requested data byte order is <dataendian>.

L6654E: Rejected Local symbol <symname> referred to from a non group member <objname>(nongrpname)

This message might indicate a compiler fault. Contact your supplier.

L6656E: Internal error: the vfe section list contains a non-vfe section called <oepname>(secname).

This message might indicate a compiler fault. Contact your supplier.

L6664W: Relocation #<rel\_class>:<rel\_number> in <objname>(secname) is with respect to a symbol(#<idx> before last Map Symbol #<last>).

L6665W: Neither Lib\$\$Request\$\$armlib Lib\$\$Request\$\$cpplib defined, not searching ARM libraries.

The following code produces this warning:

```
AREA Block, CODE, READONLY
EXPORT func1
;IMPORT ||Lib$$Request$$armlib||
IMPORT printf
func1
LDR r0,=string
BL printf
BX lr
AREA BlockData, DATA
string DCB "mystring"
END
```

The linker has not been told to look in the libraries and so cannot find the symbol `printf`.

This also causes the following error:

```
L6218E: Undefined symbol printf (referred from L6665W.o).
```

If you do not want the libraries, then ignore this message. Otherwise, to fix both the error and the warning uncomment the line:

```
IMPORT ||Lib$$Request$$armlib||
```

L6679W: Data in output ELF section #<sec> '<secname>' was not suitable for compression (<data\_size> bytes to <compressed\_size> bytes).

L6682E: Merge Section <oepname>(spname) is a code section

- L6683E: Merge Section <oepname>(<spname>) has an element size of zero
- L6684E: Section <spname> from object <oepname> has SHF\_STRINGS flag but not SHF\_MERGE flag
- L6685E: Section <spname> from object <oepname> has a branch reloc <rel\_idx> to a SHF\_MERGE section
- L6688U: Relocation #<rel\_class>:<rel\_idx> in <oepname>(<spname>) references a negative element
- L6689U: Relocation #<rel\_class>:<rel\_idx> in <oepname>(<spname>). Destination is in the middle of a multibyte character
- L6690U: Merge Section <spname> from object <oepname> has no symbols
- L6703W: Section <er> implicitly marked as non-compressible.
- L6707E: Padding value not specified with PADVALUE attribute for execution region <regionname>.  
See the following in the linker document:  
*Execution region attributes.*
- L6708E: Could not process debug frame from <secname> from object <oepname>.
- L6709E: Could not associate fde from <secname> from object <oepname>.
- L6713W: Function at offset <offset> in <oepname>(<secname>) has no symbol.
- L6714W: Exception index table section .ARM.exidx from object <oepname> has no data.
- L6720U: Exception table <spname> from object <oepname> present in image, --noexceptions specified.  
See the following in the linker document:  
*--exceptions, --no\_exceptions.*
- L6721E: Section #<secnum> '<secname>' in <oepname> is not recognized and cannot be processed generically.
- L6725W: Unused virtual function elimination might not work correctly, because there are dynamic relocations.
- L6728U: Link order dependency on invalid section number <to> from section number <from>.

L6730W: Relocation #<rel\_class>:<index> in <objname>(<secname>) with respect to <name>. Symbol has ABI type <type>, legacy type <legacy\_type>.

This warning relates to a change in linker behavior between RVCT 2.0 and 2.1.

———— **Note** —————

The following example produces a warning message only when `--strict_relocations` is used, or when the input objects are from RVCT 2.0 or earlier.

Example:

```
AREA foo, CODE, READONLY
CODE32
ENTRY
KEEP
func proc
NOP
ENDP
DCD foo
END
```

In RVCT 2.0 and earlier, the linker determines whether interworking is needed based on the content, which in this example is ARM code. In RVCT 2.1 and later, the linker follows the ABI, which defines that it is the type of the symbol, in this example `STT_SECTION` (which is interpreted as data), that determines whether interworking is applied.

The simplest solution is to move the data into a separate data area in the assembly source file.

Alternatively, you can use `--diag_suppress 6730` to suppress this warning.

L6731W: Unused virtual function elimination might not work correctly, because the section referred to from <secname> does not exist.

L6733W: <objname>(<secname>) contains offset relocation from <lr1name> to <lr2name>, load regions must be rigidly relative.

L6738E: Relocation #<rel\_class>:<relocnum> in <oepname>(<secname>) with respect to <wrtsym> is a GOT-relative relocation, but `_GLOBAL_OFFSET_TABLE_` is undefined.

Some GNU produced images can refer to the symbol named `_GLOBAL_OFFSET_TABLE_`. If there are no GOT Slot generating relocations and the linker is unable to pick a suitable address for the GOT base the linker issues this error message.

L6739E: Version '<vername>' has a dependency to undefined version '<depname>'.

L6740W: Symbol '<symname>' versioned '<vername>' defined in '<symverscr>' but not found in any input object.

L6741E: Versioned symbol binding should be 'local:' or 'global:'.

L6742E: Symbol '<symname>' defined by '<oepname>'. Cannot not match to default version symbol '<defversym>'

L6743E: Relocation #<rel\_class>:<index> in <oepname>(<sname>) with respect to <symname> that has an alternate def. Internal consistency check failed

L6744E: Relocation #<rel\_class>:<index> <oepname>(<sname>) with respect to undefined symbol <symname>. Internal consistency check:

- L6745E: Target CPU <cpuname> does not Support ARM, <objname>(<secname>) contains ARM code
- L6747W: Raising target architecture from <oldversion> to <newversion>.  
If the linker detects objects that specify the obsolete ARMv3, it upgrades these to ARMv4 to be usable with ARM libraries.
- L6748U: Missing dynamic array, symbol table or string table in file <oepname>.
- L6751E: No such sorting algorithm <str> available.
- L6753E: CallTree sorting needs Entry Point to lie within a CallTree Sort ER.
- L6761E: Removing symbol <symname>.
- L6762E: Cannot build '<type>' PLT entries when building a <imgtype>.
- L6763W: '<optname>' cannot be used when building a shared object or DLL. Switching it off
- L6764E: Cannot create a PLT entry for target architecture 4T that calls Thumb symbol <symname>
- L6765W: Shared object entry points must be ARM-state when linking architecture 4T objects.  
This can occur when linking with GNU C libraries. The GNU startup code `crt1.o` does not have any build attributes for the entry point, so the linker cannot determine which execution state (ARM or Thumb) the code runs in. Because the GNU C library startup code is ARM code, you can safely ignore this warning, or you can suppress it by using `--diag_suppress 6765`.
- L6766W: PLT entries for architecture 4T do not support incremental linking.
- L6769E: Relocation #<rel\_class>:<relocnum> in <oepname>(<secname>) with respect to <wrtsym>. No GOTSLOTexists for symbol.
- L6770E: The size and content of the dynamic array changed too late to be fixed.
- L6771W: <oepname>(<secname>) contains one or more address-type relocations in R0 data. Making section RW to be dynamically relocated at run-time.
- L6772W: `IMPORT <symname>` command ignored when building `--sysv`.  
See the following in the linker document:  
`--sysv`.  
*IMPORT steering file command.*
- L6774W: <objname>(<secname>) has debug frame entries of a bad length.
- L6775W: <objname>(<secname>) has FDEs which use CIEs which are not in this section.
- L6776W: The debug frame in <objname>(<secname>) does not describe an executable section.
- L6777W: The debug frame in <objname>(<secname>) has <actual> relocations (expected <expected>)
- L6778W: The debug frame in <objname>(<secname>) uses 64-bit DWARF.
- L6780W: <origvis> visibility removed from symbol '<symname>' through <impexp>.

L6781E: Value(<val>) Cannot be represented by partition number <part> for relocation #<rel\_class>:<rel\_number> (<rtype>, wrt symbol <symname>) in <objname>(<secname>)

L6782W: Relocation #<rel\_class>:<relnum> '<rtype>' in <oepname> may not access data correctly alongside <pltgot\_type> PLT entries

L6783E: Mapping symbol #<symnum> '<msym>' in <oepname>(<secnum>:<secname>) defined at the end of, or beyond, the section size (symbol offset=0x<moffset>, section size=0x<moffset>, sectionsize=0x<secsize>)

This indicates that the address for a section points to a location at the end of or outside of the ELF section. This can be caused by an empty inlined data section and indicates there might be a problem with the object file. You can use `--diag_warning 6783` to suppress this error.

L6784E: Symbol #<symnum> '<symname>' in <oepname>(<secnum>:<secname>) with value <value> has size 0x<size> that extends to outside the section.

The linker encountered a symbol with a size that extends outside of its containing section. This message is only a warning by default in the RVCT 2.2 SP1 and later toolchains. Use `--diag_warning 6784` to suppress this error.

L6785U: Symbol '<symname>' marked for import from '<libname>' already defined by '<oepname>'

L6786W: Mapping symbol #<symnum> '<msym>' in <oepname>(<secnum>:<secname>) defined at unaligned offset=0x<moffset>

L6787U: Region table handler '<handlername>' needed by entry for <regionname> was not found.

L6788E: Scatter-loading of execution region <er1name> to [<base1>,<limit1>) will cause the contents of execution region <er2name> at [<base2>,<limit2>) to be corrupted at run-time.

This occurs when scatter-loading takes place and an execution region is put in a position where it partially or wholly overwrites another execution region (which can be itself or another region).

For example, the following code generates this error:

```
LOAD_ROM 0x0000 0x4000
{
  EXEC1 0x4000 0x4000
  {
    * (+RW,+ZI)
  }
  EXEC2 0x0000 0x4000
  {
    * (+RO)
  }
}
```

and reports:

```
Error: L6788E: Scatter-loading of execution region EXEC2 will cause the
contents of execution region EXEC2 to be corrupted at run-time.
```

This code does not generate the error:

```
LOAD_ROM 0x0000 0x4000
{
  EXEC1 0x0000 0x4000
  {
    * (+RO)
  }
  EXEC2 0x4000 0x4000
  {
    * (+RW,+ZI)
  }
}
```

See the following in the linker document:

[Information about scatter files.](#)

L6789U: Library <library> member <filename> : Endianness mismatch.

L6790E: Relocation #<rel\_class>:<relnum> in <objname>(<secname>) with respect to <symname>. May not IMPORT weak reference through GOT-generating relocation

L6791E: Unknown personality routine <pr> at 0x<offset><oepname>(<secname>).

L6792E: Descriptor at offset 0x<offset><oepname>(<secname>).

L6793E: Expecting Landing pad reference at offset 0x<offset> in cleanup descriptor <oepname>(<secname>).

L6794E: Expecting Landing pad reference at offset 0x<offset> in catch descriptor <oepname>(<secname>).

L6795E: Expecting RTTI reference at offset 0x<offset> in catch descriptor <oepname>(<secname>).

L6796E: Descriptor at offset 0x<offset><oepname>(<secname>) overruns end of section.

L6797E: Data at Offset 0x<offset> in exception table <oepname>(<secname>) overruns end of section

L6798E: Expecting RTTI reference at offset 0x<offset> in Function Specification descriptor <oepname>(<secname>).

L6799E: Expecting Landing Pad reference at offset 0x<offset> in Function Specification descriptor <oepname>(<secname>).

A landing pad is code that cleans up after an exception has been raised. If the linker detects old-format exception tables, it automatically converts them to the new format.

This message does not appear unless you are using a later version of the linker with an earlier version of the compiler.

L6800W: Cannot convert generic model personality routine at 0x<offset><oepname>(<secname>).

A personality routine unwinds the exception handling stack. If the linker detects old-format exception tables then it automatically converts them to the new format. This message indicates a fault in the compiler. Contact your supplier.

L6801E: <objname>(<secname>) containing <secarmthumb> code cannot use the address of '~IW (The user intended not all code should interwork)' <funarmthumb> function <sym>.

The linker can diagnose where a non-interworking (~IW) function has its address taken by code in the other state. This error is disabled by default, but can be enabled by linking with `--strict`. The error can be downgraded to a warning with `--diag_warning 6801` and subsequently suppressed completely if required with `--diag_suppress 6801`

Where code, for example, in `a.c` uses the address of a non-interworking function in `t.c`:

```
armcc -c a.c
armcc --thumb -c t.c
armlink t.o a.o --strict
```

reports:

```
Error: L6801E: a.o(.text) containing ARM code cannot use the address of '~IW'
Thumb function foo.
```

L6802E: Relocation #<rel\_class>:<idx> in <objname>(<secname>) with respect to <armsym>. Thumb Branch to non-Thumb symbol in <armobjname>(<armsecname>).

L6803W: Relocation #<rel\_class>:<idx> in <objname>(<secname>) with respect to <armsym>. Thumb Branch is unlikely to reach target in <armobjname>(<armsym>).

L6804W: Legacy use of symbol type STT\_FUNC detected

L6805E: Relocation #<rel\_class>:<idx> in <objname>(<secname>) with respect to <armsym>. Branch to untyped Absolute symbol in <armobjname>, target state unknown

L6806W: Relocation #<rel\_class>:<idx> in <objname>(<secname>) with respect to <othersym>. Branch to untyped symbol in <otherobjname>(<othersecname>), ABI requires external code symbols to be of type STT\_FUNC.

L6807E: Relocation #<rel\_class>:<idx> in <objname>(<secname>) with respect to <othersym>. Branch to untyped symbol in same section. State change is required.

L6809W: Relocation <rel\_class>:<idx> in <objname>(<secname>) is of deprecated type <rtype>, please see ARMELF for ABI compliant alternative

L6810E: Relocation <rel\_class>:<idx> in <objname>(<secname>) is of obsolete type <rtype>

Relocation errors and warnings are most likely to occur if you are linking object files built with previous versions of the ARM tools.

To show relocation errors and warnings, use the `--strict_relocations` switch. This option enables you to ensure ABI compliance of objects. It is off by default, and deprecated and obsolete relocations are handled silently by the linker.

See the following in the linker document:

*[--strict\\_relocations](#), [--no\\_strict\\_relocations](#).*

L6812U: Unknown symbol action type, please contact your supplier.

L6813U: Could not find Symbol <symname> to rename to <newname>.

See the following in the linker document:

*[RENAME steering file command](#).*

L6815U: Out of memory. Allocation Size:<alloc\_size> System Size:<system\_size>.

This error is reported by ARM Compiler toolchain v4.1 and later. It provides information about the amount of memory available and the amount of memory required to perform the link step.

This error occurs because the linker does not have enough memory to link your target object. This is not common, but might be triggered for a number of reasons, such as:

- linking very large objects or libraries together
- generating a large amount of debug information
- having very large regions defined in your scatter file.

In these cases, your workstation might run out of virtual memory.

This issue might also occur if you use the `FIXED` scatter-loading attribute. The `FIXED` attribute forces an execution region to become a root region in ROM at a fixed address. The linker might have to add padding bytes between the end of the previous execution region and the `FIXED` region, to generate the ROM image. The linker might run out of memory if large amounts of padding are added when the address of the `FIXED` region is far away from the end of the execution region. The link step might succeed if the gap is reduced.

See the following in the linker document:

*Execution region attributes.*

*Root execution regions and the FIXED attribute.*

While the linker can generate images of almost any size, it requires a larger amount of memory to run and finish the link. Try the following solutions to improve link-time performance, to avoid the `Out of memory` error:

1. Shut down all non-essential applications and processes when you are linking.

For example, if you are running under Eclipse, try running your linker from the command-line, or exiting and restarting Eclipse between builds.

2. Use the 64-bit version of the linker.

If you are using a 64-bit operating system, it is possible to make use of a 64-bit version of armlink.

See the following in the *Getting Started Guide*:

*Changing to the 64-bit linker.*

3. Use the `--no_debug` linker option.

This command tells the linker to create the object without including any debug information.

See the following in the linker document:

*--debug, --no\_debug.*

———— **Note** —————

It is not possible to perform source level debugging if you use this option.

4. Reduce debug information.

If you do not want to use the `--no_debug` option, there are other methods you can use to try to reduce debug information.

See the following in the compiler document:

*Methods of reducing debug information in objects and libraries.*

You can also use the fromelf utility to strip debug information from objects and libraries that you do not have to debug.

See the following in the fromelf document:

*--strip=option[,option,...].*

5. Use partial linking.

You can use partial linking to split the link stage over a few smaller operations. Doing this also stops duplication of the object files in memory in the final link.

See the following in the linker document:

*--partial.*

6. Increase memory support on Windows operating systems.

On some Windows operating systems it is possible to increase the virtual address space from 2GB (the default) to 3GB.

For more information, see the following Microsoft article:

*Memory Support and Windows Operating Systems.*

7. Use the `--no_eager_load_debug` linker option.

This option is available in RVCT 4.0 build 697 and later. It causes the linker to remove debug section data from memory after object loading. This lowers the peak memory usage of the linker at the expense of some linker performance, because much of the debug data has to be loaded again when the final image is written.

See the following in the linker document:

*--eager\_load\_debug, --no\_eager\_load\_debug.*

If you are still experiencing the same problem, raise a support case.

L6828E: Relocation #<rel\_class>:<idx> in <objname>(<secname>) with respect to <symname>, Branch source address <srcaddr> cannot reach next available pool at [<pool\_base>,<pool\_limit>). Please use the `--vener_pool_size` option to increase the contingency.

The `--vener_inject_type=pool` veneer generation model requires branches to veneers in the pool to be able to reach the pool limit, which is the highest possible address a veneer can use. If a branch is later found that cannot reach the pool limit, and **armlink** is able to fit all the veneers in the pool into the lower pool limit, then **armlink** reduces the pool limit to accommodate the branch. Error message L6828 is issued only if **armlink** is unable to lower the pool limit.

See the following in the linker document:

*--vener\_inject\_type=type.*

L6898E: Relocation #<rel\_class>:<idx> in <objname>(<secname>) with respect to <armsym>. ARM branch to non-ARM/Thumb symbol in <armobjname>(<armsecname>).

L6899E: Existing SYMDEFS file '<filename>' is read-only.

L6900E: Expected parentheses to specify priority between AND and OR operators.

L6901E: Expected symbol name.

L6902E: Expected a string.

L6903E: Cannot execute '<text>' in '<clause>' clause of script.

L6904E: Destination symbol of rename operation clashes with another rename.

L6905E: Source symbol of rename operation clashes with another rename.

L6906E: (This is the rename operation which it clashes with.)

L6907E: Expected an expression.

L6910E: Expected a phase name.

L6912W: Symbol <symname> defined at index <idx> in <oepname>(<secname>), has ABI symbol type <symtype> which is inconsistent with mapping symbol type <maptype>.

L6913E: Expected execution region name.

L6914W: option <spurious> ignored when using --<memoption>.

### L6915E: Library reports error: <msg>

The message is typically one of the following:

- Error: L6915E: Library reports error: scatter-load file declares no heap or stack regions and `__user_initial_stackheap` is not defined.

or

```
Error: L6915E: Library reports error: The semihosting
__user_initial_stackheap cannot reliably set up a usable heap region if
scatter loading is in use
```

It is most likely that you have not re-implemented `__user_setup_stackheap()` or you have not defined `ARM_LIB_STACK` or `ARM_LIB_HEAP` regions in the respective scatter file.

#### ———— Note —————

`__user_setup_stackheap()` supersedes the deprecated function `__user_initial_stackheap()`.

See the following in the *Software Development Guide*:

[Placing the stack and heap.](#)

See the following in the *ARM C and C++ Libraries and Floating-Point Support User Guide*:

[\\_\\_user\\_setup\\_stackheap\(\)](#).

[Legacy function \\_\\_user\\_initial\\_stackheap\(\)](#).

See the following in the linker document:

[Reserving an empty region.](#)

- Error: L6915E: Library reports error: `__use_no_semihosting` was requested but <function> was referenced.

Where <function> represents `__user_initial_stackheap`, `_sys_exit`, `_sys_open`, `_sys_tmpnam`, `_ttywrch`, `system`, `remove`, `rename`, `_sys_command_string`, `time`, or `clock`.

This error can appear when retargeting semihosting-using functions, to avoid any `SVC` or `BKPT` instructions being linked-in from the C libraries.

Ensure that no semihosting-using functions are linked in from the C library by using:

```
#pragma import(__use_no_semihosting)
```

See the following in the *ARM C and C++ Libraries and Floating-Point Support User Guide*:

[Using the libraries in a nonsemihosting environment.](#)

If there are still semihosting-using functions being linked in, the linker reports this error.

To resolve this, you must provide your own implementations of these C library functions.

The `emb_sw_dev` directory contains examples of how to re-implement some of the more common semihosting-using functions. See the file `retarget.c`.

See the following for more information on semihosting-using C library functions:

*ARM C and C++ Libraries and Floating-Point Support User Guide.*

———— **Note** —————

The linker does not report any semihosting-using functions such as, for example, `__semihost()`, in your own application code.

To identify which semihosting-using functions are still being linked-in from the C libraries:

1. Link with **armlink** `--verbose --list err.txt`
2. Search `err.txt` for occurrences of `__I$use$semihosting`

For example:

```
...
Loading member sys_exit.o from c_4.1.
reference : __I$use$semihosting
definition: _sys_exit
...
```

This shows that the semihosting-using function `_sys_exit` is linked-in from the C library. To prevent this, you must provide your own implementation of this function.

- Error: L6915E: Library reports error: `__use_no_heap` was requested, but `<reason>` was referenced

If `<reason>` represents `malloc`, `free`, `__heapstats`, or `__heapvalid`, the use of `__use_no_heap` conflicts with these functions.

- Error: L6915E: Library reports error: `__use_no_heap_region` was requested, but `<reason>` was referenced

If `<reason>` represents `malloc`, `free`, `__heapstats`, `__heapvalid`, or `__argv_alloc`, the use of `__use_no_heap_region` conflicts with these functions.

L6916E: Relocation #`<rel_class>:<idx>` in `<oepname>(<spname>)`.  
R\_ARM\_CALL for conditional BL instruction).

L6917E: Relocation #`<rel_class>:<idx>` in `<oepname>(<spname>)`.  
R\_ARM\_JUMP24 for BLX instruction.

L6918W: Execution region `<ername>` placed at `0x<eraddr>` needs padding to ensure alignment `<spalign>` of `<oepname>(<spname>)`.

L6922E: Section `<objname>(<secname>)` has mutually exclusive attributes (READONLY and TLS)

L6923E: Relocation #`<rel_class>:<idx>` in `<oepname>(<spname>)` with respect to `<symname>`. TLS relocation `<type>` to non-TLS symbol in `<symobjname>(<symsecname>)`.

L6924E: Relocation #`<rel_class>:<idx>` in `<oepname>(<spname>)` with respect to `<symname>`. Non-TLS relocation `<type>` to STT\_TLS symbol in `<symobjname>(<symsecname>)`.

L6925E: Ignoring `<token>` attribute for region `<region>`. MemAccess support has been removed.

L6926E: Relocation #`<rel_class>:<idx>` in `<oepname>(<spname>)` has incorrect relocation type `<rtype>` for instruction encoding `0x<bl>`.

L6927E: Relocation #<rel\_class>:<idx> in <oepname>(<spname>) has incorrect relocation type <rtype> for instruction encoding 0x<b11><b12>.

L6932W: Library reports warning: <msg>

See the following in the *Migration and Compatibility Guide*:

*Linker changes between RVCT v3.1 and RVCT v4.0.*

L6935E: Debug Group contents are not identical, <name> with signature sym <sig> from objects (<new>) and (<old>)

L6936E: Multiple RESOLVE clauses in library script for symbol '<sym>'.

L6937E: Multiple definitions of library script function '<func>'.

L6939E: Missing alignment for region <regname>.

L6940E: Alignment <alignment> for region <regname> must be at least 4 and a power of 2 or MAX.

L6941W: chmod system call failed for file <filename> error <perr>

L6942E: Execution Region <ername> contains multiple <type>, sections:

L6966E: Alignment <alignment> for region <regname> cannot be negative.

L6967E: Entry point (<address>) points to a THUMB instruction but is not a valid THUMB code pointer.

L6968E: Could not parse Linux Kernel version \"<kernel>\".

L6969W: Changing AT Section <name> type from RW to RO in <ername>.

L6971E: <objname>(<secname>) type <type> incompatible with <prevobj>(<prevname>) type <prevtype> in er <ername>.

You might see this message when placing `__at` sections with a scatter file. For example, the following code in `main.c` and the related scatter file gives this error:

```
int variable __attribute__((at(0x200000)));
```

```
LR1 0x0000 0x20000
{
  ER1 0x0 0x20000
  {
    *(+RO)
  }
  ER2 0x8000 0x20000
  {
    main.o
  }
  RAM 0x200000 (0x1FF00-0x20000)
  {
    *(+RW, +ZI)
  }
}
```

The variable has the type ZI, and the linker attempts to place it at address `0x200000`. However, this address is reserved for RW sections by the scatter file. This produces the error:

Error: L6971E: `stdio_streams.o(.data)` type RW incompatible with `main.o(.ARM.__AT_0x00200000)` type ZI in er RAM.

To fix this, change the address in your source code, for example:

```
int variable __attribute__((at(0x210000)));
```

See the following in the linker document:

[Methods of placing functions and data at specific addresses.](#)

[Placement of sections at a specific address with `\_\_at`.](#)

L6972E: <objname>(<secname>) with required base `0x<required>` has been assigned base address `0x<actual>`.

L6973E: Error placing AT section at address `0x<addr>` in overlay ER <ername>.

For example, you attempted to use `__attribute__((at(address)))` to place a section when building a DLL or application with an overlay region.

`__attribute__((at(address)))` requires that you specify a fixed location in a scatter file with `.ARM.__at_address`. In this case, you must also specify the `--no_autoat` linker option.

See the following in the linker document:

[Placement of sections at a specific address with `\_\_at`.](#)

`--autoat, --no_autoat.`

L6974E: AT section <name> does not have a base address.

See the following in the linker document:

[Placement of sections at a specific address with `\_\_at`.](#)

L6975E: <objname>(<secname>) cannot have a required base and SHF\_MERGE.

L6976E: <objname>(<secname>) cannot have a required base and SHF\_LINK\_ORDER.

L6977E: <objname>(<secname>) cannot be part of a contiguous block of sections

L6978W: <objname>(<secname>) has a user defined section type and a required base address.

L6979E: <objname>(<secname>) with required base address cannot be placed in Position Independent ER <ername>.

L6980W: FIRST and LAST ignored for <objname>(<secname>) with required base address.

See the following in the linker document:

*Section placement with the FIRST and LAST attributes.*

L6981E: \_\_AT incompatible with BPABI and SystemV Image types

See the following in the linker document:

*Restrictions on placing \_\_at sections.*

L6982E: AT section <objname>(<spname>) with base <base> limit <limit> overlaps address range with AT section <obj2name>(<sp2name>) with base <base2> limit <limit2>.

See the following in the linker document:

*Placement of sections at a specific address with \_\_at.*

L6983E: AT section <objname>(<spname>) with required base address <base> out of range for ER <ername> with base <erbase> and limit <erlimit>.

This can occur if you specify `__attribute__((at(address)))` in your code, `.ARM.__at_address` in your scatter file, and `--no_autoat` option on the linker command line. In this case, the address part of `.ARM.__at_address` must be specified as eight hexadecimal digits. For example:

```
int x1 __attribute__((at(0x4000))); // defined in function.c
; scatter file
LR1 0x0
{
    ... function.o(.ARM.__at_0x00004000)
    ...
}
```

See the following in the linker document:

*Placement of sections at a specific address with \_\_at.*

*--autoat, --no\_autoat.*

L6984E: AT section <objname>(<spname>) has required base address <base> which is not aligned to section alignment <alignment>.

See the following in the linker document:

*Placement of sections at a specific address with \_\_at.*

L6985E: Unable to automatically place AT section <objname>(<spname>) with required base address <base>. Please manually place in the scatter file using the `--no_autoat` option.

See the following in the linker document:

*Placement of sections at a specific address with \_\_at.*

*--autoat, --no\_autoat.*

## Chapter 4

# ELF Image Converter Errors and Warnings

Describes the error and warning messages for the ELF image converter, **fromelf**.

It contains the following:

- *4.1 List of the fromelf error and warning messages on page 4-174.*

## 4.1 List of the fromelf error and warning messages

Lists the error and warning messages that **fromelf** produces.

Q0105E: Load region #<segindex> extends beyond top of address space.

Q0106E: Out of Memory.

Q0107E: Failed writing output file '<filename>': <reason>

Q0108E: Could not create output file '<filename>': <reason>

Q0119E: No output file specified.

Q0120E: No input file specified.

Q0122E: Could not open file '<filename>': <reason>

If <reason> is Invalid argument, this might be because you have invalid characters on the command line. For example, on Windows you might have used the escape character \ when specifying a filter with an archive file:

```
fromelf --elf --strip=all t.a\(test*.o\) -o filtered/
```

On Windows, use:

```
fromelf --elf --strip=all t.a(test*.o) -o filtered/
```

See the following in the fromelf document:

[input\\_file](#).

Q0128E: File i/o failure.

This error can occur if you specify a directory for the `--output` command-line option, but you did not terminate the directory with a path separator. For example, `--output=my_elf_files/`.

See the following in the fromelf document:

[--output=destination](#).

Q0129E: Not a 32 bit ELF file.

Q0130E: Not a 64 bit ELF file.

Q0131E: Invalid ELF identification number found.

This error is given if you attempt to use fromelf on a file which is not in ELF format, or which is corrupted. Object (.o) files and executable (.axf) files are in ELF format.

Q0132E: Invalid ELF section index found <idx>.

Q0133E: Invalid ELF segment index found <idx>.

Q0134E: Invalid ELF string table index found <idx>.

Q0135E: Invalid ELF section entry size found.

Q0136E: ELF Header contains invalid file type.

Q0137E: ELF Header contains invalid machine name.

Q0138E: ELF Header contains invalid version number.

See Q0131E.

Q0147E: Failed to create Directory <dir>: <reason>

If <reason> is File exists, this might be because you have specified a directory that has the same name as a file that already exists. For example, if a file called **filtered** already exists, then the following command produces this error:

```
fromelf --elf --strip=all t.a(test*.o) -o filtered/
```

The path separator character / informs fromelf that **filtered** is a directory.

See the following in the fromelf document:

*--output=destination.*

Q0171E: Invalid st\_name index into string table <idx>.

See Q0131E.

Q0172E: Invalid index into symbol table <idx>.

See Q0131E.

Q0186E: This option requires debugging information to be present

The --fieldoffsets option requires the image to be built with dwarf debug tables.

Q0425W: Incorrectly formed virtual function elimination header in file

This might indicate a compiler fault. Contact your supplier.

Q0426E: Error reading vtable information from file

This might indicate a compiler fault. Contact your supplier.

Q0427E: Error getting string for symbol in a vtable

This might indicate a compiler fault. Contact your supplier.

Q0433E: Diagnostic style <style> not recognised

Q0440E: No relocation sections for <secname>

Q0447W: Unknown Diagnostic number (<num>)

Q0448W: Read past the end of the compressed data while decompressing section '<secname>' #<secnum> in <file>

This might indicate an internal fault. Contact your supplier.

Q0449W: Write past the end of the uncompressed data buffer of size <bufsize> while decompressing section '<secname>' #<secnum> in <file>

This might indicate an internal fault. Contact your supplier.

Q0450W: Section '<secname>' #<secnum> in file <file> uses a mixture of legacy and current ABI relocation types.

Q0451W: Option '--strip symbols' used without '--strip debug' on an ELF file that has debug information.

Q0452W: Option '--strip filesymbols' used without '--strip debug' on an ELF file that has debug information.

Q0453W: Stripping path names from '<path1>' and '<path2>' produces a duplicate file name '<filename>'.

Q0454E: In ELF file: <details>

## Chapter 5

# Librarian Errors and Warnings

Describes the error and warning messages for the ARM librarian, **armar**.

It contains the following:

- [5.1 List of the armar error and warning messages on page 5-177.](#)

## 5.1 List of the armar error and warning messages

Lists the error and warning messages that **armar** produces.

L6800U: Out of memory

L6825E: Reading archive '<archive>' : <reason>

L6826E: '<archive>' not in archive format

L6827E: '<archive>': malformed symbol table

L6828E : '<archive>': malformed string table

L6829E: '<archive>': malformed archive (at offset <offset>)

L6830E: Writing archive '<archive>' : <reason>

L6831E: '<member>' not present in archive '<archive>'

L6832E: Archive '<archive>' not found : <reason>

L6833E: File '<filename>' does not exist

L6835E: Reading file '<filename>' : <reason>

L6836E: '<filename>' already exists, so will not be extracted

L6838E: No archive specified

L6839E: One of the actions -[<actions>] must be specified

L6840E: Only one action option may be specified

L6841E: Position '<position>' not found

L6842E: Filename '<filename>' too long for file system

L6843E: Writing file '<filename>' : <reason>

L6874W: Minor variants of archive member '<member>' include no base variant

Minor variants of the same function exist within a library. Find the two equivalent objects and remove one of them.

L6875W: Adding non-ELF object '<filename>' to archive '<name>'

## Chapter 6

# Other Errors and Warnings

Describes error and warning messages that might be displayed by any of the tools.  
It contains the following:

- *6.1 Internal faults and other unexpected failures on page 6-179.*
- *6.2 List of other error and warning messages on page 6-180.*

## 6.1 Internal faults and other unexpected failures

Internal faults indicate that the tool has failed an internal consistency check or has encountered some unexpected input that it could not deal with. They might point to a potential issue in the tool itself.

For example:

```
Internal fault: [0x87ecef:5010591]
```

contains:

- the message description (**Internal fault**)
- a six hex digit fault code for the error that occurred (**0x87ecef**).

In RVCT 2.2 and earlier this was a four digit code.

- the version number (501 is ARM Compiler 5.01)
- the build number (0591 in this example).

If you see an internal fault, contact your supplier.

To facilitate the investigation, try to send only the single source file or function that is causing the error, plus the command-line options used.

It might be necessary to preprocess the file (that is, to take account of files added with `#include`). To do this, pass the file through the preprocessor as follows:

```
armcc <options> -E sourcefile.c > PPsourcefile.c
```

where `<options>` are your normal compile switches, such as `-O2`, `-g`, `-I`, `-D`, but without `-c`.

Check that the error is still reproducible with the preprocessed file. For example, compile it with:

```
armcc <options> -c PPsourcefile.c
```

Then provide the `PPsourcefile.c` file and the `<options>` to your supplier.

## 6.2 List of other error and warning messages

A list of the error and warning messages that any of the tools in the ARM Compiler toolchain produce.

———— **Note** —————

When the message is displayed, the *X* prefixing the message number is replaced by an appropriate letter relating to the tool. For example, the code X3900U is displayed as L3900U by the linker when you have specified an unrecognized option.

- 
- X3900U: Unrecognized option '<dashes><option>'.  
<option> is not recognized by the tool. This could be because of a spelling error or the use of an unsupported abbreviation of an option.
- X3901U: Missing argument for option '<option>'.  
X3902U: Recursive via file inclusion depth of <limit> reached in file '<file>'.  
X3903U: Argument '<argument>' not permitted for option '<option>'.  
Possible reasons include malformed integers or unknown arguments.
- X3904U: Could not open via file '<file>'.  
X3905U: Error when reading from via file '<file>'.  
X3906U: Malformed via file '<file>'.  
X3907U: Via file '<file>' command too long for buffer.  
X3908U: Overflow: '<string>' will not fit in an integer.  
X3910W: Old syntax, please use  
'<hyphens><option><separator><parameter>'.  
X3912W: Option '<option>' is deprecated.  
X3913W: Could not close via file '<file>'.  
X3915W: Argument '<argument>' to option '<option>' is deprecated  
X3916U: Unexpected argument for option '<dashes><option>'  
X3917U: Concatenated options cannot have arguments: -<option> <arg>  
X9905E: cannot use --apcs=/hardfp without floating point hardware  
X9906E: cannot use --apcs=/hardfp with fpu <fpu\_option>  
X9907E: unable to select no floating point support  
X9908E: --fpmode=none overrides --fpu choice

# Appendix A

## **Errors and Warnings Reference Guide Document Revisions**

Describes the technical changes that have been made to the Errors and Warnings Reference Guide.

It contains the following:

- *A.1 Revisions for Errors and Warnings Reference Guide on page Appx-A-182.*

## A.1 Revisions for Errors and Warnings Reference Guide

The following technical changes have been made to the Errors and Warnings Reference Guide.

**Table A-1 Differences between issue I and issue J**

| Change                                                                                               | Topics affected                                                                                                                                                                                     |
