This preface introduces the *ARM® Compiler Errors and Warnings Reference Guide*. It contains the following:

About this book

The ARM Compiler Errors and Warnings Reference Guide provides lists of the errors and warnings that each of the compilation tools can generate.

Using this book

This book is organized into the following chapters:

**Chapter 1 C and C++ Compiler Errors and Warnings**
Describes the error and warning messages for the C and C++ compiler, **armcc**.

**Chapter 2 Licensing Errors and Warnings**
Describes license-related error and warning messages that might be displayed by the assembler, the linker, or the ELF image converter.

**Chapter 3 Assembler Errors and Warnings**
Describes the error and warning messages for the assembler, **armasm**.

**Chapter 4 Linker Errors and Warnings**
Describes the error and warning messages for the linker, **armlink**.

**Chapter 5 ELF Image Converter Errors and Warnings**
Describes the error and warning messages for the ELF image converter, **fromelf**.

**Chapter 6 Librarian Errors and Warnings**
Describes the error and warning messages for the ARM librarian, **armar**.

**Chapter 7 Other Errors and Warnings**
Describes error and warning messages that might be displayed by any of the tools.

**Appendix A Errors and Warnings Reference Guide Document Revisions**
Describes the technical changes that have been made to the Errors and Warnings Reference Guide.

Glossary

The ARM Glossary is a list of terms used in ARM documentation, together with definitions for those terms. The ARM Glossary does not contain terms that are industry standard unless the ARM meaning differs from the generally accepted meaning.

See the [ARM Glossary](#) for more information.

Typographic conventions

**italic**
Introduces special terminology, denotes cross-references, and citations.

**bold**
Highlights interface elements, such as menu names. Denotes signal names. Also used for terms in descriptive lists, where appropriate.

**monospace**
Denotes text that you can enter at the keyboard, such as commands, file and program names, and source code.

**monospace**
Denotes a permitted abbreviation for a command or option. You can enter the underlined text instead of the full command or option name.

**monospace italic**
Denotes arguments to monospace text where the argument is to be replaced by a specific value.

**monospace bold**
Denotes language keywords when used outside example code.
Encloses replaceable terms for assembler syntax where they appear in code or code fragments. For example:

```
MRC p15, 0, <Rd>, <CRn>, <CRm>, <Opcode_2>
```

**SMALL CAPITALS**

Used in body text for a few terms that have specific technical meanings, that are defined in the *ARM glossary*. For example, *IMPLEMENTATION DEFINED*, *IMPLEMENTATION SPECIFIC*, *UNKNOWN*, and *UNPREDICTABLE*.

### Feedback

**Feedback on this product**

If you have any comments or suggestions about this product, contact your supplier and give:

- The product name.
- The product revision or version.
- An explanation with as much information as you can provide. Include symptoms and diagnostic procedures if appropriate.

**Feedback on content**

If you have comments on content then send an e-mail to errata@arm.com. Give:

- The title *ARM® Compiler Errors and Warnings Reference Guide*.
- The number ARM DUI0496M.
- If applicable, the page number(s) to which your comments refer.
- A concise explanation of your comments.

ARM also welcomes general suggestions for additions and improvements.

--- **Note** ---

ARM tests the PDF only in Adobe Acrobat and Acrobat Reader, and cannot guarantee the quality of the represented document when used with any other PDF reader.

### Other information

- *ARM Information Center*.
- *ARM Technical Support Knowledge Articles*.
- *Support and Maintenance*.
- *ARM Glossary*. 
Chapter 1
C and C++ Compiler Errors and Warnings

Describes the error and warning messages for the C and C++ compiler, armcc.

It contains the following sections:
• 1.1 Suppressing armcc error and warning messages on page 1-11.
• 1.2 List of the armcc error and warning messages on page 1-12.
1.1 Suppressing armcc error and warning messages

You can use command-line options to control the severity of the diagnostic messages that the compiler produces.

The compiler normally warns of potential portability problems and other hazards.

When porting legacy code (for example, in old-style C) to the ARM® Compiler, many warnings might be reported. It might be tempting to disable all such warnings with --w. ARM recommends however that for portability reasons, you change the code to make it ANSI compatible rather than suppressing the warnings.

Some warnings are suppressed by default. To override this, use the --strict_warnings switch to enable all suppressed warnings.

By default, optimization messages, for example most of the messages between 1593 and 2159, are not warnings. To treat optimization messages as warnings, use the --diag_warning=optimizations option.

**Related information**

--diag_warning=tag[,tag,...] compiler option.
--strict_warnings compiler option.
-W compiler option.
# 1.2 List of the armcc error and warning messages

A list of the error and warning messages that armcc produces.

--- Note ---

- License-related error messages can be found in the 2.1 List of the licensing error and warning messages on page 2-97 section.
- In ARM Compiler 5.02 and earlier, the IDs for the messages in the form C4XXX were in the range 3000-3499.

</tr>
<tr>
<td></td>
<td><code>/*nested</code></td>
</tr>
<tr>
<td></td>
<td><code>/*comment*/</code></td>
</tr>
<tr>
<td>10</td>
<td>&quot;#&quot; not expected here</td>
</tr>
<tr>
<td>11</td>
<td>unrecognized preprocessing directive</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td><code>#foo</code></td>
</tr>
<tr>
<td>12</td>
<td>parsing restarts here after previous syntax error</td>
</tr>
<tr>
<td>13</td>
<td>expected a file name</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td><code>#include &lt;&gt;</code></td>
</tr>
</tbody>
</table>
14: extra text after expected end of preprocessing directive
   For example:
   
   #if EMBEDDED foo
   
   or:

   #include <stdio.h> foo

   or:

   ifdef SOMETHING
   :
   endif SOMETHING

   The endif does not expect or require any argument. Enclosing the trailing part of the line in a
   comment fixes the problem:

   endif /* SOMETHING */

16: <entity> is not a valid source file name
17: expected a "]"
18: expected a ")"
19: extra text after expected end of number
   For example:

   int a = 37r;

20: identifier <entity> is undefined
   For example, when compiled for C++, the code:

   void foo( arg ) { }

   results in the message:

   Error: #20: identifier <arg> is undefined

   Another example of code that can cause this error is:

   int foo(void)
   {
   int a = 4;
   a = i;
   }

   which results in the message:

   Error: #20: identifier "i" is undefined
   
   because i has not been declared.

21: type qualifiers are meaningless in this declaration
22: invalid hexadecimal number
23: integer constant is too large
24: invalid octal digit
   For example:

   int a = 0378;

25: quoted string should contain at least one character
   For example:

   char a = '';

26: too many characters in character constant
   For example, the following code produces this warning because the multibyte character consists
   of more bytes than can fit into an int:

   int a = 'abcde';
27: character value is out of range
   This error can occur when a character value described by a hex constant is too large to be
   represented in a char variable, for example:
   
   ```
   char x = '\x100';
   ```

28: expression must have a constant value
29: expected an expression
30: floating constant is out of range
31: expression must have integral type
32: expression must have arithmetic type
33: expected a line number
34: invalid line number
35: #error directive: <entity>
36: the #if for this directive is missing
37: the #endif for this directive is missing
   An open #if was still active, but was not closed with #endif before the end of file.
38: directive is not allowed -- an #else has already appeared
39: division by zero
40: expected an identifier
   This error is raised if preprocessor statements are incorrectly formatted, for example if an
   identifier which must immediately follow a #define preprocessor command is missing.
   This error can also occur when code uses a keyword as an identifier, for example:
   
   ```
   int if = 0;
   ```

41: expression must have arithmetic or pointer type
42: operand types are incompatible (<type> and <type>)
44: expression must have pointer type
45: #undef may not be used on this predefined name
46: <entity> is predefined; attempted redefinition ignored
47: incompatible redefinition of macro <entity>
   A macro has been defined twice, with different replacement strings.
   For example:
   
   ```
   #define TEST 0
   #define TEST 1
   ```
   causes the compiler to produce:
   
   Warning: #47-D: incompatible redefinition of macro "TEST" (declared at line 1)
   
   If it is necessary to do this, undefine the macro using #undef before the second definition.
   If you want to define a macro, unless it already has a definition, you can use conditional
   preprocessing, for example:
   
   ```
   #ifndef TEST
   #define TEST 0
   #endif
   ```
   Compiling this with armcc -c foo.c defines TEST to be 0 (the default).
   Compiling this with armcc -c -DTEST=1 foo.c defines TEST to be 1.

49: duplicate macro parameter name
50: "##" may not be first in a macro definition
51: "##" may not be last in a macro definition
52: expected a macro parameter name
53: expected a ":"
54: too few arguments in invocation of <entity>
55: too many arguments in invocation of <entity>
56: operand of sizeof may not be a function
57: this operator is not allowed in a constant expression
58: this operator is not allowed in a preprocessing expression
59: function call is not allowed in a constant expression
60: this operator is not allowed in an integral constant expression
61: integer operation result is out of range
62: shift count is negative
63: shift count is too large
64: declaration does not declare anything
   For example:
   
   int;

65: expected a ";

66: enumeration value is out of "int" range
   This diagnostic message is generated by the compiler when an enum constant is outside the
   range of a signed int.

   For example, the compiler generates this warning when the following code is compiled in C
   mode:

   typedef enum
   {
       Bit31 = 0x80000000
   } Bits;

   _______ Note _______
   This description applies to RVCT 2.2 and later.

   _______ Note _______
   C mode:
   • the warning is produced but the compiler promotes the constants to unsigned
   • the switch --strict always produces this message as an error.

   _______ Note _______
   C++ mode:
   • by default the out-of-range constants are promoted to unsigned without a warning and also
     when --strict is used

   As a work around for cases where the message is an error use the following code example:

   typedef enum
   {
       Bit31 = (int)0x80000000
   } Bits;

   An overflow no longer occurs, and so no error is reported.

   _______ Note _______
   The value of Bit31 is now negative because it is a signed int.

   See the following in the armcc User Guide:

   Structures, unions, enumerations, and bitfields.

67: expected a "}
68: integer conversion resulted in a change of sign
   The constant is too large to be represented in a signed long, and therefore has been given
   unsigned type.

   Example:

   long l = 2147483648;
69: integer conversion resulted in truncation
70: incomplete type is not allowed
   Example:
   
   typedef struct {
       unsigned char size;
       char string[];
   } FOO;

   By not declaring a size for the array in the structure, the compiler is not able to allocate a size of
   the structure. Incomplete types are permitted in --gnu and --c99 modes.

71: operand of sizeof may not be a bit field
75: operand of "*" must be a pointer
76: argument to macro is empty
77: this declaration has no storage class or type specifier
78: a parameter declaration may not have an initializer
79: expected a type specifier
   The ellipses to denote variadic functions, such as printf(), must follow at least one parameter.
   For example, change:
   
   int foo( ... );

   to:
   
   int foo( int bar, ... );

80: a storage class may not be specified here
81: more than one storage class may not be specified
82: storage class is not first
83: type qualifier specified more than once
84: invalid combination of type specifiers
   The type name or type qualifier cannot be used in the same declaration as the second type name
   or type qualifier. For example:
   
   typedef int int;

85: invalid storage class for a parameter
86: invalid storage class for a function
87: a type specifier may not be used here
88: array of functions is not allowed
89: array of void is not allowed
90: function returning function is not allowed
91: function returning array is not allowed
92: identifier-list parameters may only be used in a function definition
93: function type may not come from a typedef
94: the size of an array must be greater than zero
   Zero-sized arrays are permitted only when in --gnu mode, for example:
   
   char name[0];

95: array is too large
   There is a limit of 4GB on the maximum size of arrays or structures.
96: a translation unit must contain at least one declaration
97: a function may not return a value of this type
98: an array may not have elements of this type
99: a declaration here must declare a parameter
100: duplicate parameter name
101: <entity> has already been declared in the current scope
102: forward declaration of enum type is nonstandard
103: class is too large
104: struct or union is too large
   There is a limit of 4GB on the maximum size of arrays or structures.
105: invalid size for bit field
   Bit fields must not be larger than the size of the type.
   For example, with --strict:
   
   ```c
   struct X{
     int y:5000;
   };
   ```

106: invalid type for a bit field
   Bit fields must have integral type.
   Example:
   
   ```c
   struct X{
     float x:5;
     float y:2;
   };
   ```

107: zero-length bit field must be unnamed
108: signed bit field of length 1
109: expression preceding parentheses of apparent call must have (pointer-to-)
   function type
110: expected either a definition or a tag name
111: statement is unreachable
112: expected "while"
114: <entity> was referenced but not defined
115: a continue statement may only be used within a loop
116: a break statement may only be used within a loop or switch
   Example:
   
   ```c
   void foo(void){
     int a=0;
     continue;
   }
   ```
   or:
   
   ```c
   void bar(void){
     int a=0;
     break;
   }
   ```

117: non-void <entity> should return a value
118: a void function may not return a value
119: cast to type <type> is not allowed
120: return value type does not match the function type
121: a case label may only be used within a switch
122: a default label may only be used within a switch
124: default label has already appeared in this switch
125: expected a "(
126: expression must be an lvalue
127: expected a statement
128: loop is not reachable
129: a block-scope function may only have extern storage class
130: expected a "{
131: expression must have pointer-to-class type
132: expression must have pointer-to-struct-or-union type
133: expected a member name
134: expected a field name
135: <entity> has no member <entity>
136: <entity> has no field <entity>
137: expression must be a modifiable lvalue
138: taking the address of a register variable is not allowed
139: taking the address of a bit field is not allowed
140: too many arguments in function call
Function declaration does not match the number of parameters in an earlier function prototype.

Example:

    extern void foo(int x);
    void bar(void)
    {
        foo(1,2);
    }

141: unnamed prototyped parameters not allowed when body is present
142: expression must have pointer-to-object type
143: program too large or complicated to compile
144: a value of type <type> cannot be used to initialize an entity of type <type>
The initializing string for a fixed size character array is exactly as long as the array size, leaving
no room for a terminating \0, for example:

    char name[5] = "Hello";

The name array can hold up to 5 characters. "Hello" does not fit because C strings are always
null-terminated (for example, "Hello\0"). The compiler reports:

Error: #144: a value of type "const char [6]" cannot be used to initialize an entity
of type "char [5]"

A similar error is also raised if there is an implicit cast of non-zero int to pointer.

For example:

    void foo_func( void )
    {
        char *foo=1;
    }

results in the message:

    #144: a value of type "int" cannot be used to initialize an entity of type "char *"

For the cast, this error can be suppressed with the use of the --loose_implicit_cast switch.

145: <entity> may not be initialized
146: too many initializer values
147: declaration is incompatible with <entity>
The following incorrect C code causes an error in all modes. This can be downgraded from an
error to a warning by using --diag_warning 147, or suppressed completely by using
--diag_suppress 147.

    typedef enum { e } E;
    typedef enum { f } F;
    E g(void);
    F g(void);

148: <entity> has already been initialized
149: a global-scope declaration may not have this storage class
150: a type name may not be redeclared as a parameter
151: a typedef name may not be redeclared as a parameter
152: conversion of nonzero integer to pointer
153: expression must have class type
154: expression must have struct or union type
155: old-fashioned assignment operator
156: old-fashioned initializer
157: expression must be an integral constant expression
158: expression must be an lvalue or a function designator
159: declaration is incompatible with previous <entity>
160: external name conflicts with external name of <entity>
161: unrecognized #pragma
163: could not open temporary file <entity>
164: name of directory for temporary files is too long (<entity>)
165: too few arguments in function call
    Function prototype is defined with a number of parameters that does not match the number of
parameters passed in the function call.
    
    For example:
    
    ```c
    extern void foo(int x);
    void bar(void)
    {
      foo();
    }
    ```
166: invalid floating constant
167: argument of type <type> is incompatible with parameter of type <type>
168: a function type is not allowed here
169: expected a declaration
    This can occur when attempting to compile some C++ header files with the C compiler instead
of the C++ compiler.
170: pointer points outside of underlying object
171: invalid type conversion
172: external/internal linkage conflict with previous declaration
    The compiler suppresses errors about linkage disagreements, where functions are implicitly
declared as extern and later re-declared as static, unless the --strict option is used. For
example:
    
    ```c
    extern void foo(void);
    static void foo(void){}
    ```
173: floating-point value does not fit in required integral type
174: expression has no effect
175: subscript out of range
177: <entity> was declared but never referenced
    By default, unused declaration warnings are given for:
    • Local (within a function) declarations of variables, typedefs, and functions.
    • Labels (always within a function).
    • Top-level static functions and static variables.
    
    The --diag_suppress 177 option suppresses these warnings.
178: "&" applied to an array has no effect
179: right operand of "%" is zero
180: argument is incompatible with formal parameter
181: argument is incompatible with corresponding format string conversion
For example when compiling with --strict, the following code:

```c
unsigned long foo = 0x1234;
printf("%08X", foo);
```
results in the warning:
```
Warning: #181-D: argument is incompatible with corresponding format string conversion
```
To avoid the warning, the code could be rewritten as follows:

```c
unsigned long foo = 0x1234;
printf("%0lX", foo);
```
or alternatively:

```c
unsigned int foo = 0x1234;
printf("%0X", foo);
```

%0X can be used for char, short or int. Use 1X for a long integer, even though both ints and longs are 32-bits wide on an ARM processor.

182: could not open source file <entity> (no directories in search list)
183: type of cast must be integral
184: type of cast must be arithmetic or pointer
185: dynamic initialization in unreachable code
186: pointless comparison of unsigned integer with zero
For example:

```c
unsigned short foo;
if (foo<0) printf("This never happens");
```
gives a warning that the comparison between an unsigned value, for example char or int, with zero always evaluates to false.

187: use of "=" where "==" may have been intended
For example:

```c
int main(void)
{
    int a;
    const int b =1;
    if (a=b);
}
```
If the assignment in the if statement is intentional, then you can avoid the warning by adding an explicit comparison. For example, change the if statement in the example to:

```c
if ((a=b)!=0);
```

188: enumerated type mixed with another type
189: error while writing <entity> file
190: invalid intermediate language file
191: type qualifier is meaningless on cast type
The C specification states that a cast does not yield an lvalue, so a cast to a qualified type has the same effect as a cast to the unqualified version of the type. This warning is to inform you that the type qualifier has no effect, although the code is still legal. The warning is suppressible with --diag_suppress 191.

For example:

```c
val2 = (const float)val1;
```
is equivalent to:

```c
val2 = (float)val1;
```
192: unrecognized character escape sequence
This error is commonly associated with the attempted use of non-ASCII character sets, such as
16-bit Unicode characters. The compiler supports multibyte character sets, such as Unicode.
Source files are compiled according to the selected locale of that machine. It is possible to use
Escape processing (as recommended by Kernighan and Ritchie, section A2.5.2) to encode
specific values instead.

For example:

```
char *p = "\x12\x34\x56\x78"; // 12 34 56 78
```

In character and string escapes, if the character following the \ has no special meaning, the value
of the escape is the character itself, for example, \s is the same as s and the warning is given.

193: zero used for undefined preprocessing identifier <entity>
194: expected an asm string
195: an asm function must be prototyped
196: an asm function may not have an ellipsis
219: error while deleting file <entity>
220: integral value does not fit in required floating-point type
221: floating-point value does not fit in required floating-point type
222: floating-point operation result is out of range
223: function <entity> declared implicitly
   This is a common warning that occurs where there is no prototype for a function.
   For example:

```
void foo(void)
{
    printf("foo");
}
```
   To fix this, add #include <stdio.h> to include the prototype for printf().

   For ANSI C, you can suppress this warning with --diag_suppress 223. This is useful when
   compiling old-style C in ANSI C mode.

224: the format string requires additional arguments
225: the format string ends before this argument
226: invalid format string conversion
227: macro recursion
228: trailing comma is nonstandard
229: bit field cannot contain all values of the enumerated type
230: nonstandard type for a bit field
   In strict ANSI C90, the only types permitted for a bit field are int, signed int, and unsigned int.
   For example:

```
struct X {
    char y:2;
};
```

231: declaration is not visible outside of function
232: old-fashioned typedef of "void" ignored
233: left operand is not a struct or union containing this field
234: pointer does not point to struct or union containing this field
235: variable <entity> was declared with a never-completed type
236: controlling expression is constant
237: selector expression is constant
238: invalid specifier on a parameter
239: invalid specifier outside a class declaration
240: duplicate specifier in declaration
241: a union is not allowed to have a base class
242: multiple access control specifiers are not allowed
243: class or struct definition is missing
244: qualified name is not a member of class <type> or its base classes
245: a nonstatic member reference must be relative to a specific object
246: a nonstatic data member may not be defined outside its class
247: <entity> has already been defined
   A typical example of this is where a variable name has been used more than once.
   This can sometimes occur when compiling legacy code that relies on tentative declarations.
   Tentative declarations permit a variable to be declared and initialized as separate statements
   such as:

   int a;
   int a = 1;

   Tentative declarations are permitted by default for C code, but produce an error with C++ code.

248: pointer to reference is not allowed
249: reference to reference is not allowed
250: reference to void is not allowed
251: array of reference is not allowed
252: reference <entity> requires an initializer
253: expected a ","
254: type name is not allowed
   This occurs when a typedef name is being used directly in an expression, for example:
   
   typedef int footype;
   int x = footype; // reports Error: #254: type name is not allowed

   To fix this, first create an instance of that type, for example, a variable of the new type:
   
   typedef int footype;
   footype bar = 1;
   int x = bar;

255: type definition is not allowed
256: invalid redeclaration of type name <entity>
257: const <entity> requires an initializer
258: "this" may only be used inside a nonstatic member function
259: constant value is not known
260: explicit type is missing ("int" assumed)
261: access control not specified (<entity> by default)
262: not a class or struct name
263: duplicate base class name
264: invalid base class
265: <entity> is inaccessible
   For C++ only, the -std=diag_warning 265 option downgrades access control errors to warnings.
   For example:

   class A { void f() {}; }; // private member
   A a;
   void g() { a.f(); } // erroneous access

   results in the message:

   Error: #265-D: function "A::f" is inaccessible

266: <entity> is ambiguous
267: old-style parameter list (anachronism)
268: declaration may not appear after executable statement in block
269: conversion to inaccessible base class <type> is not allowed
274: improperly terminated macro invocation
276: name followed by "::" must be a class or namespace name
277: invalid friend declaration
278: a constructor or destructor may not return a value
279: invalid destructor declaration
280: declaration of a member with the same name as its class
281: global-scope qualifier (leading "::") is not allowed
282: the global scope has no <entity>
283: qualified name is not allowed
284: NULL reference is not allowed
285: initialization with "<...>" is not allowed for object of type <type>
286: base class <type> is ambiguous
287: derived class <type> contains more than one instance of class <type>
288: cannot convert pointer to base class <type> to pointer to derived class <type>
-- base class is virtual
289: no instance of constructor <entity> matches the argument list
290: copy constructor for class <type> is ambiguous
291: no default constructor exists for class <type>
292: <entity> is not a nonstatic data member or base class of class <type>
293: indirect nonvirtual base class is not allowed
294: invalid union member -- class <type> has a disallowed member function
296: invalid use of non-lvalue array
297: expected an operator
298: inherited member is not allowed
299: cannot determine which instance of <entity> is intended
300: a pointer to a bound function may only be used to call the function
301: typedef name has already been declared (with same type)
302: <entity> has already been defined
304: no instance of <entity> matches the argument list
305: type definition is not allowed in function return type declaration
306: default argument not at end of parameter list
307: redefinition of default argument
308: more than one instance of <entity> matches the argument list:
309: more than one instance of constructor <entity> matches the argument list:
310: default argument of type <type> is incompatible with parameter of type <type>
311: cannot overload functions distinguished by return type alone
312: no suitable user-defined conversion from <type> to <type> exists
314: only nonstatic member functions may be virtual
315: the object has type qualifiers that are not compatible with the member function
316: program too large to compile (too many virtual functions)
317: return type is not identical to nor covariant with return type <type> of overridden virtual function <entity>
318: override of virtual <entity> is ambiguous
319: pure specifier ("= 0") allowed only on virtual functions
320: badly-formed pure specifier (only "= 0" is allowed)
321: data member initializer is not allowed
322: object of abstract class type <type> is not allowed:
323: function returning abstract class <type> is not allowed:
324: duplicate friend declaration
325: inline specifier allowed on function declarations only
326: "inline" is not allowed
327: invalid storage class for an inline function
328: invalid storage class for a class member
329: local class member <entity> requires a definition
330: <entity> is inaccessible
332: class <type> has no copy constructor to copy a const object
333: defining an implicitly declared member function is not allowed
334: class <type> has no suitable copy constructor
335: linkage specification is not allowed
336: unknown external linkage specification
337: linkage specification is incompatible with previous <entity>
    If the linkage for a function is redeclared with an incompatible specification to a previous declaration this error is produced.

For example:

```c
int foo(void);
int bar(void)
{
    int x;
    x = foo();
    return x;
}
extern "C" int foo(void)
{
    return 0;
}
```

results in the message:

```
Error: #337: linkage specification is incompatible with previous "foo" (declared at line 1)
```

338: more than one instance of overloaded function <entity> has "C" linkage
339: class <type> has more than one default constructor
340: value copied to temporary, reference to temporary used
341: "operator<entity>" must be a member function
342: operator may not be a static member function
343: no arguments allowed on user-defined conversion
344: too many parameters for this operator function
345: too few parameters for this operator function
346: nonmember operator requires a parameter with class type
347: default argument is not allowed
348: more than one user-defined conversion from <type> to <type> applies:
349: no operator <entity> matches these operands
350: more than one operator <entity> matches these operands:
351: first parameter of allocation function must be of type "size_t"
352: allocation function requires "void *" return type
353: deallocation function requires "void" return type
354: first parameter of deallocation function must be of type "void *"
355: type must be an object type
356: base class <type> has already been initialized
357: base class name required -- <type> assumed (anachronism)
358: <entity> provides no initializer for:
359: implicitly generated constructor for class <type> cannot initialize:
360: <entity> defines no constructor to initialize the following:
    This indicates that you have a const structure or a structure containing a const. It is issued as a friendly warning to assist with error 369. This can safely be ignored providing that the const members of structures are appropriately initialized.
369: <entity> has an uninitialized const or reference member
    This indicates that you have an instance of a const structure or a structure containing a const
    that has not been correctly initialized. You must either initialize it correctly for every instance or
    provide a constructor to initialize it.
370: <entity> has an uninitialized const field
371: class <type> has no assignment operator to copy a const object
372: class <type> has no suitable assignment operator
373: ambiguous assignment operator for class <type>
375: declaration requires a typedef name
377: "virtual" is not allowed
378: "static" is not allowed
379: cast of bound function to normal function pointer (anachronism)
380: expression must have pointer-to-member type
381: extra ";" ignored
    In C, this can be caused by an unexpected semicolon at the end of a declaration line, for
    example:

    ```c
    int x;;
    ```

    This might occur inadvertently when using macros.

    Similarly, in C++, this might be caused by constructions like:

    ```cpp
    class X { ... } ; ;
    ```

    This probably resulted from some macro usage, for example:

    ```cpp
    #define M(c) class c { ... } ;
    M(X);
    ```

    The extra semicolon is illegal because empty declarations are illegal.

382: in-class initializer for nonstatic member is nonstandard
384: no instance of overloaded <entity> matches the argument list
386: no instance of <entity> matches the required type
387: delete array size expression used (anachronism)
389: a cast to abstract class <type> is not allowed:
390: function "main" may not be called or have its address taken
391: a new-initializer may not be specified for an array
392: member function <entity> may not be redeclared outside its class
393: pointer to incomplete class type is not allowed
394: reference to local variable of enclosing function is not allowed
395: single-argument function used for postfix <entity> (anachronism)
397: implicitly generated assignment operator cannot copy:
398: cast to array type is nonstandard (treated as cast to <type>)
399: <entity> has an operator new<entity>() but no default operator delete<entity>()
400: <entity> has a default operator delete<entity>() but no operator new<entity>()
401: destructor for base class <entity> is not virtual
403: invalid redeclaration of member <entity>
404: function "main" may not be declared inline
405: member function with the same name as its class must be a constructor
406: using nested <entity> (anachronism)
407: a destructor may not have parameters
408: copy constructor for class <type> may not have a parameter of type <type>
409: <entity> returns incomplete type <type>
410: protected <entity> is not accessible through a <type> pointer or object
411: a parameter is not allowed
412: an "asm" declaration is not allowed here
413: no suitable conversion function from <type> to <type> exists
414: delete of pointer to incomplete class
415: no suitable constructor exists to convert from <type> to <type>
416: more than one constructor applies to convert from <type> to <type>:
417: more than one conversion function from <type> to <type> applies:
418: more than one conversion function from <type> to a built-in type applies:
424: a constructor or destructor may not have its address taken
426: temporary used for initial value of reference to non-const (anachronism)
427: qualified name is not allowed in member declaration
428: enumerated type mixed with another type (anachronism)
429: the size of an array in "new" must be non-negative
430: returning reference to local temporary
432: "enum" declaration is not allowed
433: qualifiers dropped in binding reference of type <type> to initializer of type <type>
434: a reference of type <type> (not const-qualified) cannot be initialized with a value of type <type>
435: a pointer to function may not be deleted
436: conversion function must be a nonstatic member function
437: a template declaration is not allowed here
438: expected a "<"
439: expected a">
440: template parameter declaration is missing
441: argument list for <entity> is missing
442: too few arguments for <entity>
443: too many arguments for <entity>
445: %n1 is not used in declaring the parameter types of %n2
446: two nested types have the same name: %no1 and %nod2 (cfront compatibility)
447: global %no1 was declared after nested %nod2 (cfront compatibility)
449: more than one instance of %n matches the required type
450: the type "long long" is nonstandard
452: return type may not be specified on a conversion function
456: excessive recursion at instantiation of <entity>
457: <entity> is not a function or static data member
458: argument of type <type> is incompatible with template parameter of type <type>
459: initialization requiring a temporary or conversion is not allowed
460: declaration of <entity> hides function parameter
461: initialization of <entity> is not non-const
462: return type may not be specified on a conversion function
463: "template" is not allowed
464: <type> is not a class template
466: "main" is not a valid name for a function template
467: invalid reference to <entity> (union/nonunion mismatch)
468: a template argument may not reference a local type
469: tag kind of <entity> is incompatible with declaration of <entity>
470: the global scope has no tag named <entity>
471: <entity> has no tag member named <entity>
472: member function typedef (allowed for cfront compatibility)
473: <entity> may be used only in pointer-to-member declaration
475: a template argument may not reference a non-external entity
476: name followed by ":::~" must be a class name or a type name
478: type used as destructor name does not match type <type>
479: <entity> redeclared "inline" after being called
481: invalid storage class for a template declaration
482: %nd is an inaccessible type (allowed for cfront compatibility)
484: invalid explicit instantiation declaration
485: <entity> is not an entity that can be instantiated
486: compiler generated <entity> cannot be explicitly instantiated
inline <entity> cannot be explicitly instantiated
%n cannot be instantiated -- no template definition was supplied
<entity> cannot be instantiated -- it has been explicitly specialized
no instance of %n matches the specified type
declaring a void parameter list with a typedef is nonstandard
When the compiler is not in C99 mode, this error is produced by a function declaration f(V)
where V is a void type.
Using a parameter that is a typedef to void to mean that the function has no parameters is only
permitted in C99 mode.
global %n1 used instead of %n2 (cfront compatibility)
template parameter <entity> may not be redeclared in this scope
declaration of <entity> hides template parameter
template argument list must match the parameter list
extra parameter of postfix "operator%s" must be of type "int"
an operator name must be declared as a function
operator name is not allowed
<entity> cannot be specialized in the current scope
nonstandard form for taking the address of a member function
The C++ standard requires that a pointer to a member be named using a qualifier and an
ampersand character, for example &A::f.
too few template parameters -- does not match previous declaration (declared <entity>)
too many template parameters -- does not match previous declaration (declared <entity>)
function template for operator delete(void *) is not allowed
class template and template parameter may not have the same name
a template argument may not reference an unnamed type
this operation on an enumerated type requires an applicable user-defined
operator function
type qualifier on a reference type is not allowed
a value of type <type> cannot be assigned to an entity of type <type>
pointless comparison of unsigned integer with a negative constant
cannot convert to incomplete class <type>
const object requires an initializer
object has an uninitialized const or reference member
nonstandard preprocessing directive
<entity> may not have a template argument list
initialization with "<...>" expected for aggregate object
pointer-to-member selection class types are incompatible (<type> and <type>)
pointless friend declaration
"." used in place of ":" to form a qualified name
non-const function called for const object (anachronism)
a dependent statement may not be a declaration
a parameter may not have void type
For example:
void foo(void a) { }
this operator is not allowed in a template argument expression
try block requires at least one handler
handler requires an exception declaration
handler is masked by default handler
handler is potentially masked by previous handler for type <type>
use of a local type to specify an exception
redundant type in exception specification
exception specification is incompatible with that of previous <entity>
540: support for exception handling is disabled; use --exceptions to enable
541: allowing all exceptions is incompatible with previous <entity>
542: could not create instantiation request file <entity>
543: non-arithmetic operation not allowed in nontype template argument
544: use of a local type to declare a nonlocal variable
545: use of a local type to declare a function
546: transfer of control bypasses initialization of:

Example:

```c
int main(void){
    int choice = 1;
    int z = 1;
    switch(choice){
    case 1:
        int y = 1;
        z = y + z;
        break;
    case 2:
        break;
    }
    return 0;
}
```

In this example, y is an initialized variable that is in scope but is unused in the other cases. A transfer from the condition of the switch statement to a case label, bypassing the initialization of y, conflicts with the C++ Standard.

The usual way to fix this is to enclose the case that declares y in braces. The following code limits the scope of y to case 1, so an attempt to use it elsewhere causes an error:

```c
case 1:   {
    int y = 1;
    z = y + z;
} break;
```

Because y is a Plain Old Data (POD) type, an alternative is to not use initialization:

```c
case 1:
    int y;
    y = 1;
    z = y + z;
    break;
```

This approach has the disadvantage that if code outside of case 1 uses y, and accidentally expects it to have the value assigned in case 1, no warning is given.

548: transfer of control into an exception handler
549: <entity> is used before its value is set
550: <entity> was set but never used
551: <entity> cannot be defined in the current scope
552: exception specification is not allowed
553: external/internal linkage conflict for <entity>
554: <entity> will not be called for implicit or explicit conversions
555: tag kind of <entity> is incompatible with template parameter of type <type>
556: function template for operator new(size_t) is not allowed
558: pointer to member of type <type> is not allowed
559: ellipsis is not allowed in operator function parameter list
560: <entity> is reserved for future use as a keyword
561: invalid macro definition:
562: invalid macro undredefinition:
563: invalid <entity> output file <filename>
564: cannot open <entity> output file <filename>: <reason>
565: IL file name must be specified if input is
570: error in debug option argument
571: invalid option:
572: back end requires name of IL file
573: could not open IL file
574: invalid number:
575: incorrect host CPU id
576: invalid instantiation mode:
577: invalid error limit:
585: virtual function tables can only be suppressed when compiling C++
586: anachronism option can be used only when compiling C++
587: instantiation mode option can be used only when compiling C++
588: automatic instantiation mode can be used only when compiling C++
589: implicit template inclusion mode can be used only when compiling C++
590: exception handling option can be used only when compiling C++
591: strict mode is incompatible with K&R mode
592: strict mode is incompatible with cfront mode
593: missing source file name
594: output files may not be specified when compiling several input files
595: too many arguments on command line
596: an output file was specified, but none is needed
597: IL display requires name of IL file
598: a template parameter may not have void type
599: excessive recursive instantiation of %n due to instantiate-all mode
600: strict mode is incompatible with allowing anachronisms
601: a throw expression may not have void type
602: local instantiation mode is incompatible with automatic instantiation
603: parameter of abstract class type <type> is not allowed:
604: array of abstract class <type> is not allowed:
605: floating-point template parameter is nonstandard
606: this pragma must immediately precede a declaration
607: this pragma must immediately precede a statement
608: this pragma must immediately precede a declaration or statement
609: this kind of pragma may not be used here
611: overloaded virtual function <entity> is only partially overridden in <entity>
612: specific definition of inline template function must precede its first use
613: invalid error tag in diagnostic control option:
614: invalid error number in diagnostic control option:
615: parameter type involves pointer to array of unknown bound
616: parameter type involves reference to array of unknown bound
617: pointer-to-member-function cast to pointer to function
618: struct or union declares no named members
619: nonstandard unnamed field
620: nonstandard unnamed member
624: <entity> is not a type name
625: cannot open precompiled header input file <entity>: <reason>
626: precompiled header file <entity> is either invalid or not generated by this version of the compiler
627: precompiled header file <entity> was not generated in this directory
628: header files used to generate precompiled header file <entity> have changed
629: the command line options do not match those used when precompiled header file <entity> was created
630: the initial sequence of preprocessing directives is not compatible with those of precompiled header file <entity>
631: unable to obtain mapped memory for <entity>: <reason>
This can occur if you are trying to use a large Precompiled Header (PCH), and you have a size limitation on the TMP directory that the ARM Compiler toolchain uses. A possible workaround is to remove the TMP environment variable. This forces the tools to create temporary files in the current working directory.

See the following in the Getting Started Guide:

TMP and TMPDIR environment variables for temporary file directories.

See the following in the armcc User Guide:

Precompiled Header (PCH) files.

632: "<entity>": using precompiled header file "<entity>"
633: "<entity>": creating precompiled header file "<entity>"
634: memory usage conflict with precompiled header file <entity>
This can occur if a PCH file cannot be mapped back into the build because the required parts of the address space of the compiler are not available.

See also error 631.

635: invalid PCH memory size
636: PCH options must appear first in the command line
637: insufficient memory for PCH memory allocation
638: precompiled header files may not be used when compiling several input files
639: insufficient preallocated memory for generation of precompiled header file (<entity> bytes required)
640: very large entity in program prevents generation of precompiled header file
641: <entity> is not a valid directory
642: cannot build temporary file name
643: "restrict" is not allowed
644: a pointer or reference to function type may not be qualified by "restrict"
646: a calling convention modifier may not be specified here
647: conflicting calling convention modifiers
648: strict mode is incompatible with Microsoft mode
649: cfront mode is incompatible with Microsoft mode
650: calling convention specified here is ignored
651: a calling convention may not be followed by a nested declarator
652: calling convention is ignored for this type
654: declaration modifiers are incompatible with previous declaration
655: the modifier <entity> is not allowed on this declaration
656: transfer of control into a try block
657: inline specification is incompatible with previous <entity>
658: closing brace of template definition not found
659: wchar_t keyword option can be used only when compiling C++
660: invalid packing alignment value
661: expected an integer constant
662: call of pure virtual function
A pure virtual function is being called, for example:

```c++
struct T { T(); virtual void pvfn() = 0; }; // a pure virtual function
T::T() { pvfn(); } // warning given here
```

By default, calling a pure virtual function results in:
1. a call to the library function __cxa_pure_virtual()
2. the __cxa_pure_virtual() function raising the signal SIGPVFN
3. the signal being trapped by the default_signal_handler
4. the handler displaying Pure virtual fn called on the console using semihosting.

See the following in the `armcc User Guide`:

**Calling a pure virtual function.**

663: invalid source file identifier string
664: a class template cannot be defined in a friend declaration
665: "asm" is not allowed
666: "asm" must be used with a function definition
667: "asm" function is nonstandard
668: ellipsis with no explicit parameters is nonstandard
669: "&..." is nonstandard
670: invalid use of "&..."
672: temporary used for initial value of reference to const volatile (anachronism)
673: a reference of type <entity> cannot be initialized with a value of type <entity>
674: initial value of reference to const volatile must be an lvalue
675: SVR4 C compatibility option can be used only when compiling ANSI C
676: using out-of-scope declaration of <entity>
677: strict mode is incompatible with SVR4 C mode
678: call of <entity> cannot be inlined
679: <entity> cannot be inlined
680: invalid PCH directory:
681: expected __except or __finally
682: a __leave statement may only be used within a __try
688: <entity> not found on pack alignment stack
689: empty pack alignment stack
690: RTTI option can be used only when compiling C++
691: <entity>, required for copy that was eliminated, is inaccessible
692: <entity>, required for copy that was eliminated, is not callable because reference parameter cannot be bound to rvalue
693: <typeinfo> must be included before typeid is used
694: <entity> cannot cast away const or other type qualifiers
695: the type in a dynamic_cast must be a pointer or reference to a complete class type, or void *
696: the operand of a pointer dynamic_cast must be a pointer to a complete class type
697: the operand of a reference dynamic_cast must be an lvalue of a complete class type
698: the operand of a runtime dynamic_cast must have a polymorphic class type
699: bool option can be used only when compiling C++
701: an array type is not allowed here
702: expected an "="
703: expected a declarator in condition declaration
704: <entity>, declared in condition, may not be redeclared in this scope
705: default template arguments are not allowed for function templates
706: expected a ",", or ">
707: expected a template parameter list
708: incrementing a bool value is deprecated
709: bool type is not allowed
710: offset of base class <entity> within class <entity> is too large
711: expression must have bool type (or be convertible to bool)
712: array new and delete option can be used only when compiling C++
713: <entity> is not a variable name
714: __based modifier is not allowed here
715: __based does not precede a pointer operator, __based ignored
716: variable in __based modifier must have pointer type
717: the type in a const_cast must be a pointer, reference, or pointer to member to an object type
718: a const_cast can only adjust type qualifiers; it cannot change the underlying type
719: mutable is not allowed
720: redeclaration of <entity> is not allowed to alter its access
722: use of alternative token "<:;" appears to be unintended
723: use of alternative token "%:" appears to be unintended
724: namespace definition is not allowed
725: name must be a namespace name
726: namespace alias definition is not allowed
727: namespace-qualified name is required
728: a namespace name is not allowed
729: invalid combination of DLL attributes
730: <entity> is not a class template
731: array with incomplete element type is nonstandard
732: allocation operator may not be declared in a namespace
733: deallocation operator may not be declared in a namespace
734: <entity> conflicts with using-declaration of <entity>
735: using-declaration of <entity> conflicts with <entity>
736: namespaces option can be used only when compiling C++
737: using-declaration ignored -- it refers to the current namespace
738: a class-qualified name is required
739: %n has no actual member %sq
744: incompatible memory attributes specified
745: memory attribute ignored
746: memory attribute may not be followed by a nested declarator
747: memory attribute specified more than once
748: calling convention specified more than once
749: a type qualifier is not allowed
750: <entity> was used before its template was declared
751: static and nonstatic member functions with same parameter types cannot be overloaded
752: no prior declaration of <entity>
753: a template-id is not allowed
754: a class-qualified name is not allowed
755: <entity> may not be redeclared in the current scope
756: qualified name is not allowed in namespace member declaration
757: <entity> is not a type name
758: explicit instantiation is not allowed in the current scope
759: <entity> cannot be explicitly instantiated in the current scope
760: <entity> explicitly instantiated more than once
761: typename may only be used within a template
762: special_subscript_cost option can be used only when compiling C++
763: typename option can be used only when compiling C++
764: implicit typename option can be used only when compiling C++
765: nonstandard character at start of object-like macro definition
766: exception specification for virtual <entity> is incompatible with that of overridden <entity>
767: conversion from pointer to smaller integer
768: exception specification for implicitly declared virtual <entity> is incompatible with that of overridden <entity>
769: <entity>, implicitly called from <entity>p2, is ambiguous
770: option "explicit" can be used only when compiling C++
771: "explicit" is not allowed
772: declaration conflicts with <entity> (reserved class name)
773: only "()" is allowed as initializer for array <entity>
774: "virtual" is not allowed in a function template declaration
775: invalid anonymous union -- class member template is not allowed
776: template nesting depth does not match the previous declaration of <entity>
777: this declaration cannot have multiple "template <...>" clauses
778: option to control the for-init scope can be used only when compiling C++
779: <entity>, declared in for-loop initialization, may not be redeclared in this scope
780: reference is to <entity> -- under old for-init scoping rules it would have been <entity>
781: option to control warnings on for-init differences can be used only when compiling C++
782: definition of virtual <entity> is required here
783: empty comment interpreted as token-pasting operator "##"
784: a storage class is not allowed in a friend declaration
785: template parameter list for <entity> is not allowed in this declaration
786: <entity> is not a valid member class or function template
787: not a valid member class or function template declaration
788: a template declaration containing a template parameter list may not be followed by an explicit specialization declaration
789: explicit specialization of <entity> must precede the first use of <entity>
790: explicit specialization is not allowed in the current scope
791: partial specialization of <entity> is not allowed
792: <entity> is not an entity that can be explicitly specialized
793: explicit specialization of <entity> must precede it's first use
794: template parameter <entity> may not be used in an elaborated type specifier
795: specializing <entity> requires "template<...>" syntax
798: option "old_specializations" can be used only when compiling C++
799: specializing <entity> without "template<...>" syntax is nonstandard
800: this declaration may not have extern "C" linkage
801: <entity> is not a class or function template name in the current scope
802: specifying a default argument when redeclaring an unreferenced function template is nonstandard
803: specifying a default argument when redeclaring an already referenced function template is not allowed
804: cannot convert pointer to member of base class <type> to pointer to member of derived class <type> -- base class is virtual
805: exception specification is incompatible with that of <entity><entity>
806: allowing all exceptions is incompatible with <entity>
807: unexpected end of default argument expression
808: default-initialization of reference is not allowed
809: uninitialized <entity> has a const member
810: uninitialized base class <type> has a const member
811: const <entity> requires an initializer -- class <type> has no user-provided default constructor
812: const object requires an initializer -- class <type> has no user-provided default constructor
option "implicit_extern_c_type_conversion" can be used only when compiling C++

strict mode is incompatible with long preserving rules

type qualifier on return type is meaningless

For example:

```c
__packed void foo( void ) { }
```

The __packed qualifier is ignored because the return type cannot be __packed.

in a function definition a type qualifier on a "void" return type is not allowed

static data member declaration is not allowed in this class

template instantiation resulted in an invalid function declaration

"..." is not allowed

option "extern_inline" can be used only when compiling C++

extern inline <entity> was referenced but not defined

invalid destructor name for type <type>

destructor reference is ambiguous -- both <entity> and <entity> could be used

virtual inline <entity> was never defined

<entity> was never referenced

only one member of a union may be specified in a constructor initializer list

support for "new[]" and "delete[]" is disabled

double" used for "long double' in generated C code

<entity> has no corresponding operator delete<entity> (to be called if an exception is thrown during initialization of an allocated object)

support for placement delete is disabled

no appropriate operator delete is visible

pointer or reference to incomplete type is not allowed

invalid partial specialization -- <entity> is already fully specialized

incompatible exception specifications

returning reference to local variable

omission of explicit type is nonstandard ("int" assumed)

A function has been declared or defined with no return type.

Example, with the code:

```c
foo(void){
    int a;
}
```

an int result is assumed.

If you want it to return no result, use void as the return type. This is widespread in old-style C.

The --diag_suppress 837 option suppresses this warning.

See also message number 938, that is a special case of this message for main().

more than one partial specialization matches the template argument list of <entity>

a template argument list is not allowed in a declaration of a primary template

partial specializations may not have default template arguments

<entity>1 is not used in or cannot be deduced from the template argument list of <entity>

the template argument list of the partial specialization includes a nontype argument whose type depends on a template parameter

this partial specialization would have been used to instantiate <entity>

this partial specialization would have made the instantiation of <entity> ambiguous

expression must have integral or enum type

expression must have arithmetic or enum type

expression must have arithmetic, enum, or pointer type
850: type of cast must be integral or enum
851: type of cast must be arithmetic, enum, or pointer
852: expression must be a pointer to a complete object type
854: a partial specialization nontype argument must be the name of a nontype parameter or a constant
855: return type is not identical to return type <type> of overridden virtual function <entity>
856: option "guiding_decls" can be used only when compiling C++
857: a partial specialization of a class template must be declared in the namespace of which it is a member
858: <entity> is a pure virtual function
859: pure virtual <entity> has no overrider
860: __declspec attributes ignored
861: invalid character in input line
862: function returns incomplete type <type>
863: effect of this "#pragma pack" directive is local to <entity>
864: <entity> is not a template
865: a friend declaration may not declare a partial specialization
866: exception specification ignored
867: declaration of "size_t" does not match the expected type <type>
868: space required between adjacent "">" delimiters of nested template argument lists (">>" is the right shift operator)
869: could not set locale <entity> to allow processing of multibyte characters
870: invalid multibyte character sequence
871: template instantiation resulted in unexpected function type of <type> (the meaning of a name may have changed since the template declaration -- the type of the template is <type>)
872: ambiguous guiding declaration -- more than one function template <entity> matches type <type>
873: non-integral operation not allowed in nontype template argument
874: option ""embedded_c++" can be used only when compiling C++
875: Embedded C++ does not support templates
876: Embedded C++ does not support exception handling
877: Embedded C++ does not support namespaces
878: Embedded C++ does not support run-time type information
879: Embedded C++ does not support the new cast syntax
880: Embedded C++ does not support using-declarations
881: Embedded C++ does not support "mutable"
882: Embedded C++ does not support multiple or virtual inheritance
883: invalid Microsoft version number:
884: pointer-to-member representation <entity> has already been set for <entity>
885: <type> cannot be used to designate constructor for <type>
886: invalid suffix on integral constant
887: operand of __uuidof must have a class or enum type for which __declspec(uuid("...")) has been specified
888: invalid GUID string in __declspec(uuid("..."))
889: option "vla" can be used only when compiling C
890: variable length array with unspecified bound is not allowed
891: an explicit template argument list is not allowed on this declaration
892: an entity with linkage cannot have a type involving a variable length array
893: a variable length array cannot have static storage duration
894: <entity> is not a template
896: expected a template argument
898: nonmember operator requires a parameter with class or enum type
899: option "enum_overloading" can be used only when compiling C++
901: qualifier of destructor name %t1 does not match type %t2
902: type qualifier ignored
903: option "nonstd_qualifier_deduction" can be used only when compiling C++
904: a function declared "dllimport" may not be defined
905: incorrect property specification; correct form is
    __declspec(property(get=name1,put=name2))
906: property has already been specified
907: __declspec(property) is not allowed on this declaration
908: member is declared with __declspec(property), but no "get" function was specified
909: the __declspec(property) "get" function %sq is missing
910: member is declared with __declspec(property), but no "put" function was specified
911: the __declspec(property) "put" function %sq is missing
912: ambiguous class member reference -- <entity> used in preference to <entity>
916: cannot convert pointer to member of derived class <type> to pointer to member of base class <type> -- base class is virtual
917: invalid directory for instantiation files:
918: option "one_instantiation_per_object" can be used only when compiling C++
921: an instantiation information file name may not be specified when compiling several input files
922: option "one_instantiation_per_object" may not be used when compiling several input files
923: more than one command line option matches the abbreviation "--<entity>":
925: type qualifiers on function types are ignored
927: late/early tiebreaker option can be used only when compiling C++
928: incorrect use of va_start
929: incorrect use of va_arg
930: incorrect use of va_end
931: pending instantiations option can be used only when compiling C++
932: invalid directory for #import files:
933: an import directory can be specified only in Microsoft mode
934: a member with reference type is not allowed in a union
935: "typedef" may not be specified here
936: redeclaration of <entity> alters its access
937: a class or namespace qualified name is required

This error can be generated if you have references to older ARM tools on your PATH environment variable, and for the following ARM environment variables:

- ARMCONF
- ARMDLL
- ARMHOME
- ARMINC
- ARMLIB

Remove these environment variables and any references to older tools on your PATH, then repeat the compilation.

The following example shows the use of `va_start()`:

```c
#include <stdio.h>
#include <stdarg.h>

void error(char *fmt, ...)
{
    va_list args;
    va_start(args, fmt);
    vprintf(format, args);
    va_end(args);
}
```

929: incorrect use of va_arg
930: incorrect use of va_end
931: pending instantiations option can be used only when compiling C++
932: invalid directory for #import files:
933: an import directory can be specified only in Microsoft mode
934: a member with reference type is not allowed in a union
935: "typedef" may not be specified here
936: redeclaration of <entity> alters its access
937: a class or namespace qualified name is required
938: return type "int" omitted in declaration of function "main"
main() has been declared or defined with no return type.

For example:

```c
main(void){
  int a;
}
```
is reported as an error by the compiler if compiled with --strict.

If you want it to return no result, use void as the return type. This is widespread in old-style C.

For ANSI C, the --diag_suppress 938 option suppresses this warning.

For C++, this always results in an error.

See also message number 837 for more general cases.

939: pointer-to-member representation <entity> is too restrictive for <entity>

940: missing return statement at end of non-void <entity>
A return type has been defined for a function, but no value is returned.

Example:

```c
int foo(int a)
{
  printf("Hello %d", a);
}
```

941: duplicate using-declaration of <entity> ignored

942: enum bit-fields are always unsigned, but enum <type> includes negative
enumerator

943: option "class_name_injection" can be used only when compiling C++

944: option "arg_dep_lookup" can be used only when compiling C++

945: option "friend_injection" can be used only when compiling C++

946: name following "template" must be a template

948: nonstandard local-class friend declaration -- no prior declaration in the
enclosing scope

949: specifying a default argument on this declaration is nonstandard

950: option \"\"nonstd_using_decl\" can be used only when compiling C++

951: return type of function "main" must be "int"

952: a nontype template parameter may not have class type

953: a default template argument cannot be specified on the declaration of a member
of a class template outside of its class

954: a return statement is not allowed in a handler of a function try block of a
constructor

955: ordinary and extended designators cannot be combined in an initializer
designation

956: the second subscript must not be smaller than the first

957: option \"\"designators\" can be used only when compiling C

958: option \"\"extended_designators\" can be used only when compiling C

959: declared size for bit field is larger than the size of the bit field type;
truncated to <entity> bits

960: type used as constructor name does not match type <type>

961: use of a type with no linkage to declare a variable with linkage

962: use of a type with no linkage to declare a function

963: return type may not be specified on a constructor

964: return type may not be specified on a destructor

965: incorrectly formed universal character name

966: universal character name specifies an invalid character

967: a universal character name cannot designate a character in the basic character
set
968: this universal character is not allowed in an identifier
969: the identifier __VA_ARGS__ can only appear in the replacement lists of variadic macros
970: the qualifier on this friend declaration is ignored
971: array range designators cannot be applied to dynamic initializers
972: property name cannot appear here
973: \"inline\" used as a function qualifier is ignored
974: option \"compound_literals\" can be used only when compiling C
975: a variable-length array type is not allowed
976: a compound literal is not allowed in an integral constant expression
977: a compound literal of type <type> is not allowed
978: a template friend declaration cannot be declared in a local class
979: ambiguous "?" operation: second operand of type <type> can be converted to third operand type <type>, and vice versa
980: call of an object of a class type without appropriate operator() or conversion functions to pointer-to-function type
982: there is more than one way an object of type <type> can be called for the argument list:
983: typedef name has already been declared (with similar type)
984: operator new and operator delete cannot be given internal linkage
985: storage class "mutable" is not allowed for anonymous unions
986: invalid precompiled header file
987: abstract class type <type> is not allowed as catch type:
988: a qualified function type cannot be used to declare a nonmember function or a static member function
989: a qualified function type cannot be used to declare a parameter
990: cannot create a pointer or reference to qualified function type
991: extra braces are nonstandard
992: invalid macro definition:
   Incorrect use of -D on the compile line, for example, "-D##"
993: subtraction of pointer types <type> and <type> is nonstandard
994: an empty template parameter list is not allowed in a template template parameter declaration
995: expected "class"
996: the "class" keyword must be used when declaring a template template parameter
997: <entity> is hidden by <entity> -- virtual function override intended?
998: a qualified name is not allowed for a friend declaration that is a function definition
999: <entity> is not compatible with <entity>
1000: a storage class may not be specified here
1001: class member designated by a using-declaration must be visible in a direct base class
1003: Sun mode is incompatible with cfront mode
1004: strict mode is incompatible with Sun mode
1005: Sun mode is only allowed when compiling C++
1006: a template template parameter cannot have the same name as one of its template parameters
1007: recursive instantiation of default argument
1009: <entity> is not an entity that can be defined
1010: destructor name must be qualified
1011: friend class name may not be introduced with "typename"
1012: a using-declaration may not name a constructor or destructor
1013: a qualified friend template declaration must refer to a specific previously declared template
1014: invalid specifier in class template declaration
1015: argument is incompatible with formal parameter
1016: prefix form of ARM function qualifier not permitted in this position
1017: Duplicate ARM function qualifiers not permitted
1018: ARM function qualifiers not permitted on this declaration/definition
   Examples of ARM function qualifiers are __svc, __pure, and __irq.

   See the following in the armcc User Guide:
   
   Keywords and operators.

1019: function qualifier <entity> not permitted on a non-static member function
1020: __irq functions must take no arguments
1021: __irq functions must return no result
1022: cannot have pointer nor reference to <entity> function
1023: __global_reg not allowed on this declaration
1024: invalid global register number; 1 to 8 allowed
   An invalid register is being used in __global_reg.
   Example:
   
   __global_reg(786) int x;

1025: __svc parameter <entity> is not within permitted range (0 to 0xffffff) for ARM
   SVC instruction
   SVC numbers are limited to the range 0 to 0xffffff for ARM code, and 0 to 0xFF for Thumb
code.
   For standard semihosting SVCs, 0x123456 is used for ARM code and 0xAB is used for Thumb
code.
1026: taking the address of a global register variable is not allowed
1027: __svc_indirect function must have arguments
1028: conflicting global register declaration with <entity>
1029: __packed ignored for non-pointer parameter
1030: <entity> <type> previously declared without __packed
1031: Definition of <type> in packed <type> must be __packed
   The compiler faults a non-packed child structure contained in a packed parent structure. This
   includes the case where the substructure is an array.
   For example:
   
   typedef struct ChildStruct {
   int a;
   } ChildStruct;
   typedef __packed struct ParentStruct {
   ChildStruct child[1];
   } ParentStruct;

   results in the message:

   Error: #1031: Definition of "ChildStruct" in packed "ParentStruct" must be __packed

   See the following in the armcc User Guide:
   
   __packed.

1032: Definition of nested anonymous <entity> in packed <type> must be __packed
1033: <entity> incompatible with function definition
1034: __irq functions must not be the target of a function call
1035: single-precision operand implicitly converted to double-precision
1037: __global_reg is not valid on this declaration
1038: invalid alignment specified; only integer powers of 2 allowed
1039: conflicting alignment declaration with <entity>
1040: under-alignment not allowed
1041: alignment for an auto object may not be larger than 8
For example:

```c
int main(void){
    __align(16) int foo = 10;
}
```

__align is not permitted for a local variable foo, so the error is given.
See the following in the armcc User Guide:

__align.

1042: <entity> cannot be dynamically initialized when compiled position independent
1043: <entity> cannot be const because it contains a mutable member
For example:

```c
struct foo { int a; mutable int b; }
extern const struct foo bar;
```

When the compiler is in ROPI or RWPI mode, it disallows const objects from containing mutable members.
The reason for this restriction is that in these modes, the compiler addresses read-only data differently from read-write data. It therefore must know whether an object is in the RO or RW data section. In the following example, this restriction means that bar cannot contain any mutable members and is therefore in the RO data section:

```c
struct foo;
extern const struct foo bar;
const struct foo *get_foo() { return &bar; }
```

See the following in the armcc User Guide:

--apcs=qualifier...qualifier.

1044: option "dep_name" can be used only when compiling C++
1045: loop in sequence of "operator->" functions starting at class <type>
1046: <entity> has no member class <entity>
1047: the global scope has no class named <entity>
1048: recursive instantiation of template default argument
1049: access declarations and using-declarations cannot appear in unions
1050: <entity> is not a class member
1051: nonstandard member constant declaration is not allowed
1052: option \"ignore_std\" can be used only when compiling C++
1053: option "parse_templates" can be used only when compiling C++
1054: option "dep_name" cannot be used with "no_parse_templates"
1055: language modes specified are incompatible
1056: invalid redeclaration of nested class
1057: type containing an unknown-size array is not allowed
1058: a variable with static storage duration cannot be defined within an inline function
1059: an entity with internal linkage cannot be referenced within an inline function with external linkage
1060: argument type <type> does not match this type-generic function macro
1062: friend declaration cannot add default arguments to previous declaration
1063: <entity> cannot be declared in this scope
1064: the reserved identifier <entity> may only be used inside a function
1065: this universal character cannot begin an identifier
1066: expected a string literal
1067: unrecognized STDC pragma
1068: expected \"ON\", \"OFF\", or \"DEFAULT\"
1069: a STDC pragma may only appear between declarations in the global scope or before any statements or declarations in a block scope
1070: incorrect use of va_copy
1071: <entity> can only be used with floating-point types
1072: complex type is not allowed
1073: invalid designator kind
1074: floating-point value cannot be represented exactly
1075: complex floating-point operation result is out of range
1076: conversion between real and imaginary yields zero
1077: an initializer cannot be specified for a flexible array member
1078: imaginary *= imaginary sets the left-hand operand to zero
1079: standard requires that <entity> be given a type by a subsequent declaration ("int" assumed)
1080: a definition is required for inline <entity>
1081: conversion from integer to smaller pointer
1082: a floating-point type must be included in the type specifier for a _Complex or _Imaginary type
1083: Inline assembler syntax error

   In ARM Compiler 4.1p2 and earlier, this error can be generated when inline assembly code contains instructions that are not supported by the inline assembler (for example, the WFI instruction). In 4.1p3 and later, including all ARM Compiler 5 versions, the following error is raised instead:

1084: This instruction not permitted in inline assembler

1084: This instruction not permitted in inline assembler
1085: Missing operand
1086: Operand is wrong type
1087: Operand should be constant
1088: Wrong number of operands
1089: Invalid PSR operand
1090: Expected PSR operand
1091: Invalid shift specified
1092: Should be acc0
1093: Must be a modifiable lvalue
1094: Expected a register expression
1095: Expected a label or function name
1096: Instruction cannot be conditional
1097: Expected a [ or ]
1098: Expected a shift operation
1099: Unexpected ]
1100: Register specified shift not allowed
1101: Pre-Indexed addressing not allowed
1102: Post-Indexed addressing not allowed
1103: Writeback not allowed in the addressing mode
1104: Expected {
1105: Expected }
1106: Too many registers in register list
1107: Only ^ valid here
1108: Cannot mix virtual register and C/C++ expressions in register list
1109: Only virtual registers can be specified in a register range
1110: User mode register selection/CPSR update not supported in inline assembler. Use embedded assembler or out-of-line assembler
1111: Expected a coprocessor name
1112: Expected a coprocessor register name
These errors are given by the inline assembler if either of the following occurs:
• the coprocessor number is accidentally omitted from an MCR or MRC instruction
• an invalid coprocessor number or coprocessor register number has been given.

This is an example of correct use:

```c
void foo()
{
    int reg0;
    __asm
    { MRC p15, 0, reg0, c1, c0, 0
    }
}
```

1113: Inline assembler not permitted when generating Thumb code
1114: this feature not supported on target architecture/processor
Example when compiled with armcc --cpu 4T:

```c
int main(void) {
    int a,b,c;
    __asm {
        QADD a,b,c
    }
    return(a);
}
```
results in an error message because the saturated add instruction is only supported in ARMv5TE and later.

1115: Cannot assign to const operand
1116: Register list cannot be empty
1117: Unqualified virtual function not allowed
1118: Expected a newline
1119: Reference to static variable not allowed in __asm function
1120: Reference to static function not allowed in __asm function
1121: Pointer to data member not allowed in __asm function
1123: base class <type> is a virtual base class of <type>
1124: base class <type> is not virtual base class of <type>
1125: <entity> has no member function <entity>
1126: "__asm" is not allowed in this declaration
1127: Member initializer list not permitted for __asm constructors
1128: try block not permitted for __asm constructors
1129: Order of operands not compatible with previous compiler versions
1130: __align not permitted in typedef
1131: Non portable instruction (LDM with writeback and base in reg. list, final value of base unpredictable)
1132: Non portable instruction (STM with writeback and base not first in reg. list, stored value of base unpredictable)
1133: Expression operands not permitted with virtual base register
1134: literal treated as "long long"
The constant is too large to be represented in a signed long, and therefore has been treated as a (signed) long long.

For example:

```c
int foo(unsigned int bar)
{
    return (bar == 2147483648);
}
```

gives a warning because 2147483648 is one greater than the maximum value permitted for a signed long. To eliminate the warning, if the constant should be treated as a (64-bit) long long type rather than a signed long, explicitly add an Ll or LL suffix, or, if it should be treated as an unsigned integer, add a U suffix.

For example:

```c
int foo(unsigned int bar)
{
    return (bar == 2147483648U);
}
```

See the following in the armcc User Guide:

long long.

1135: literal treated as "unsigned long long"
The constant is too large to be represented in a signed long long, and therefore has been given type unsigned long long. See also error number 1134.

1137: Expected a comma
1138: Unexpected comma after this expression
1139: MRRC operation opcode must lie in range 0-15
1140: MCRR operation opcode must lie in range 0-15
1141: CDP operation opcode must lie in range 0-15
1142: MRC operation opcode must lie in range 0-7
1143: MCR operation opcode must lie in range 0-7
1144: opcode_2 must lie in range 0-7
1145: LDC/STC extra opcode must lie in range 0-255
1146: LDC/STC offset must lie in range -1020 to +1020 and be word aligned
1147: Constant operand out of range
1148: floating-point operator is not permitted with --fpu=none
1149: floating-point return type in function definition is not permitted with --fpu=none
1150: floating-point parameter type in function definition is not permitted with --fpu=none
1151: floating-point variable definition with initialiser is not permitted with --fpu=none
1152: polymorphic base classes need to be exported as well
1153: Cannot assign physical registers in this register list
1154: Can only specify an even-numbered physical register here
1155: Can only specify an assignment to a physical register here
1156: Can only specify an assignment from a physical register here
1157: Can only specify physical registers in a corrupted register list
1158: PSR operand not valid here
1159: Expected an unambiguous label or function name
1160: Calls to destructors for temporaries will overwrite the condition flags updated by this instruction
1161: Cannot directly modify the stack pointer SP (r13)
1162: Cannot directly modify the link register LR (r14)
1163: Cannot directly modify the program counter PC (r15)
1164: Offset must be word-aligned
1165: types cannot be declared in anonymous unions
1166: returning pointer to local variable
1167: returning pointer to local temporary
1168: option "export" can be used only when compiling C++
1169: option "export" cannot be used with "no_dep_name"
1170: option "export" cannot be used with "implicit_include"
1171: declaration of <entity> is incompatible with a declaration in another translation unit
1172: the other declaration is <entity>
1175: a field declaration cannot have a type involving a variable length array
1176: declaration of <entity> had a different meaning during compilation of <entity>
1177: expected "template"
1178: "export" cannot be used on an explicit instantiation
1179: "export" cannot be used on this declaration
1180: a member of an unnamed namespace cannot be declared "export"
1181: a template cannot be declared "export" after it has been defined
1182: a declaration cannot have a label
1183: support for exported templates is disabled
1185: <entity> already defined during compilation of <entity>
1186: <entity> already defined in another translation unit
1187: a nonstatic local variable may not be used in a __based specification
1188: the option to list makefile dependencies may not be specified when compiling more than one translation unit
1190: the option to generate preprocessed output may not be specified when compiling more than one translation unit
1191: a field with the same name as its class cannot be declared in a class with a user-declared constructor
1192: "implicit_include" cannot be used when compiling more than one translation unit
1193: exported template file <entity> is corrupted
1194: <entity> cannot be instantiated -- it has been explicitly specialized in the translation unit containing the exported definition
1196: the object has type qualifiers that are not compatible with the member <entity>
1197: no instance of <entity> matches the argument list and object (the object has type qualifiers that prevent a match)
1198: an attribute specifies a mode incompatible with <type>
1199: there is no type with the width specified
1200: invalid alignment value specified by attribute
1201: invalid attribute for <type>
1202: invalid attribute for <entity>
1204: attribute <entity> does not take arguments
1206: expected an attribute name
1207: unknown attribute <attribute>
1208: attributes may not appear here
1209: invalid argument to attribute <entity>
1211: in "goto *expr", expr must have type "void *"
1212: "goto *expr" is nonstandard
1213: taking the address of a label is nonstandard
1214: file name specified more than once:
1215: #warning directive: <entity>
1217: the "transparent_union" attribute only applies to unions, and <type> is not a union
1218: the "transparent_union" attribute is ignored on incomplete types
1219: <type> cannot be transparent because <entity> does not have the same size as the first field
1220: <type> cannot be transparent because it has a field of type <type> which is not the same size as the first field
1222: attribute <attribute> does not apply to local variables
1224: attributes are not permitted in a function definition
1226: the second constant in a case range must be larger than the first
1227: an asm name is not permitted in a function definition
1228: an asm name is ignored in a typedef
1229: unknown register name "<entity>"
1230: modifier letter '<<entity>>' ignored in asm operand
1231: unknown asm constraint modifier '<<entity>>'
1232: unknown asm constraint letter '<<entity>>'
1233: asm operand has no constraint letter
1234: an asm output operand must have one of the '=' or '+' modifiers
1235: an asm input operand may not have the '=' or '+' modifiers
1237: too many colons in asm statement
1238: register "<entity>" used more than once
1239: register "<entity>" is both used and clobbered
1240: register "<entity>" clobbered more than once
1241: register "<entity>" has a fixed purpose and may not be used in an asm statement
1242: register "<entity>" has a fixed purpose and may not be clobbered in an asm statement
1243: an empty clobbers list must be omitted entirely
1244: expected an asm operand
1245: expected a register to clobber
1246: "format" attribute requires an ellipsis parameter
1247: first substitution argument is not the first variable argument
1248: format argument index is greater than number of parameters
1249: format argument does not have string type
1250: the "template" keyword used for syntactic disambiguation may only be used within a template
1253: attribute does not apply to non-function type <type>
1254: arithmetic on pointer to void or function type
1255: storage class must be auto or register
1256: <type> would have been promoted to <type> when passed through the ellipsis parameter; use the latter type instead
1257: <entity> is not a base class member
1258: __super cannot appear after "\"::\"
1259: __super may only be used in a class scope
1260: __super must be followed by "\"::\"
1262: mangled name is too long
1263: Offset must be half-word aligned
1264: Offset must be double-word aligned
1265: converting to and from floating-point type is not permitted with --fpu=none
1266: Operand should be a constant expression
1267: Implicit physical register <entity> should be defined as a variable
1268: declaration aliased to undefined entity <entity>
1269: declaration does not match its alias <entity>
1270: entity declared as alias cannot have definition
1271: variable-length array field type will be treated as zero-length array field type
1272: nonstandard cast on lvalue ignored
1273: unrecognized flag name
1274: void return type cannot be qualified
1275: the auto specifier is ignored here (invalid in standard C/C++)
1276: a reduction in alignment without the "packed" attribute is ignored
1277: a member template corresponding to <entity> is declared as a template of a different kind in another translation unit
1278: excess initializers are ignored
1279: va_start can appear only in a function with an ellipsis parameter
1280: the "short_enums" option is only valid in GNU C and GNU C++ modes
1281: invalid export information file %s1 at line number %s2
1282: variable <entity> cannot be used in a register range
1283: A physical register name is required here
1284: A register range cannot be specified here
1285: Implicit physical register <entity> has not been defined
1286: LDRD/STRD instruction will be expanded
   When LDRD and STRD instructions are used in inline assembler the compiler expands these into
two LDR or STR instructions before being passed through the compiler optimization stage.
The optimization stage normally combines the two LDR or STR instruction back into a single
LDRD or STRD instruction, however it is possible in some cases that a LDRD or STRD is not used.
1287: LDM/STM instruction may be expanded
   The compiler expands LDM and STM instructions in inline assembly code into a number of LDR or
STR instructions, before passing through the compiler optimization stage.
The optimization stage normally changes the LDR or STR instructions back into LDM or STM
instructions, although it is possible that in some cases a single LDM or STM instruction is not used.
1288: Implicit ARM register <entity> was not defined due to name clash
1289: statement expressions are only allowed in block scope
1291: an asm name is ignored on a non-register automatic variable
1293: assignment in condition
   In a context where a boolean value is required, for example in the controlling expression for an
if, while, or for statement, or the first operand of a conditional expression, the expression
contains one of the following instead:
   • A bitwise not operator (~). It is likely that a logical not operator (!) was intended.
   • An assignment operator (=). This could be a mis-typed equality operator (==). For example:
   ```c
   int main(void)
   {
       int a,b;
       if (a=b);
   }
   ```
   In either case, if the operator was used intentionally, it might be possible to suppress the warning
by adding an explicit comparison against zero.
For example, change the if statement in the example to:
   ```c
   if ((a=b)!=0);
   ```
This warning can also be suppressed by using the --diag_suppress 1293 option.
See also message number 187, which applies when you compare against a constant.
The compiler accepts both old-style and new-style function declarations. The difference between them is shown in the following example:

```c
// new style
int add2(int a, int b)
{
    return a+b;
}
// old style
int oldadd2(a,b)
int a;
int b;
{
    return a+b;
}
```

When compiling old-style functions in C mode, the compiler reports:

```
Warning: #1294-D: Old-style function oldadd2
```

This warning is normally given when a declaration without argument types is encountered in ANSI C mode. In ANSI C, declarations like this are deprecated. However, it is sometimes useful to suppress this warning with the `--diag_suppress 1295` option when porting old code.

In C++:

```c++
void foo();
```

means:

```c++
void foo(void);
```

and no warning is generated.
1296: extended constant initialiser used
The expression used as a constant initializer might not be portable.
This warns that there is a constant initializer that does not follow the strict rules of ANSI C.
The solution is to rewrite your code to be ANSI compliant.
The following examples show code that generates this warning, and suggest potential alternatives for achieving the same goal with ANSI C compliant code.
Compiling with --diag_suppress 1296 suppresses the warning.

Example 1:
This code generates warning 1296 when x and y are static objects, that is, global variables or static local variables, because the C standard does not permit a cast of a pointer to an integer in a constant expression:

```c
int x;
int y = (int) &x;
```

ANSI C requires the initializer for a static object to be a constant expression. `(int) &x` is not considered to be a constant expression.

Be aware that addresses are not arithmetic types, so this example C code is disallowed for ANSI C. Unfortunately, this is a common ANSI non-compliance amongst other compilers, and can result in problems when porting legacy code to ARM. This is why the ARM compiler issues a warning rather than an error.

An ANSI C compliant alternative method would be to rewrite the code so that y is a pointer to x:

```c
int x;
int* y = &x;
```

Example 2:
This code, compiled with the --c90 switch, generates warning 1296:

```c
const int foo_table[] = { (int)"foo", 0, 1, 2};
```

An ANSI C compliant alternative method would be to rewrite the code as follows:

```c
const char* foo_table[] = { "foo", 0, (char*)1, (char*)2};
```

Example 3:
This code generates warning 1296 because the C standard does not permit a cast of a pointer to a long integer in a constant expression:

```c
char value;
long array[] = {
    (long)&value,
    (long)"string"
};
```

An ANSI C compliant alternative method would be to rewrite the code to use pointers:

```c
char value;
char *array[] = {
    (char*)&value,
    (char*)"string"
};
```

This solution works because pointer-to-pointer casts are allowed in C.
1297: Header file not guarded against multiple inclusion
This warning is given when an unguarded header file is #included.

An unguarded header file is a header file not wrapped in a declaration such as:

```c
#ifndef foo_h
#define foo_h
/* body of include file */
#endif
```

This warning is off by default. It can be enabled with:

`--diag_warning 1297`

1298: Header file is guarded by 'entity', but does not define it
Example:

```c
#ifndef MYHEADER_H
//#define MYHEADER_H
#endif
```

To correct the code, remove the comment slashes (//). This warning is off by default. It can be enabled with:

`--diag_warning 1298`

1299: members and base-classes will be initialized in declaration order, not in member initialisation list order

1300: entity inherits implicit virtual
This warning is issued when a non-virtual member function of a derived class hides a virtual member of a parent class. For example:

```c
struct Base { virtual void f(); }
struct Derived : Base { void f(); }
```

results in the message:

```c
Warning: #1300-D: f inherits implicit virtual
struct Derived : Base { void f(); }
```

Adding the virtual keyword in the derived class prevents the warning. For C++, specifying the `--diag_suppress 1300` option suppresses the implicit virtual warning.

1301: padding inserted in struct entity
For the members of the structure to be correctly aligned, some padding has been inserted between members. This warning is off by default and can be enabled with `--diag_warning 1301` or `--remarks`.

For example:

```c
struct X {
  char x;
  int y;
}
```

results in the message:

```c
Warning: #1301-D: padding inserted in struct X
```

The compiler can also warn of padding added at the end of a struct or between structs, see message number 2530.

1302: type too large to be returned in registers - __value_in_regs ignored
1303: using --force_new_nothrow: added "throw()"
1304: operator new missing exception specification
1305: using --force_new_nothrow: added "(::std::nothrow)"
1307: floating point argument not permitted with --fpu=none
1308: Base class <type> of __packed class <type> must be __packed
1309: unrecognized UPC pragma
1310: shared block size does not match one previously specified
1311: bracketed expression is assumed to be a block size specification rather than an array dimension
1312: the block size of a shared array must be greater than zero
1313: multiple block sizes not allowed
1314: strict or relaxed requires shared
1315: THREADS not allowed in this context
1316: block size specified exceeds the maximum value of <entity>
1317: function returning shared is not allowed
1319: one dimension of an array of a shared type must be a multiple of THREADS when the number of threads is nonconstant
1320: shared type inside a struct or union is not allowed
1321: parameters may not have shared types
1322: a dynamic THREADS dimension requires a definite block size
1323: shared variables must be static or extern
1324: argument of upc_blocksizeof is a pointer to a shared type (not shared type itself)
1325: affinity expression ignored in nested upc forall
1326: branching into or out of a upc forall loop is not allowed
1327: affinity expression must have a shared type or point to a shared type
1328: affinity has shared type (not pointer to shared)
1329: shared void* types can only be compared for equality
1330: UPC mode is incompatible with C++ and K&R modes
1331: null (zero) character in input line ignored
1332: null (zero) character in string or character constant
1333: null (zero) character in header name
1334: declaration in for-initializer hides a declaration in the surrounding scope
1335: the hidden declaration is <entity>
1336: the prototype declaration of <entity>fd is ignored after this unprototyped redeclaration
1338: <entity>pd must have external C linkage
1339: variable declaration hides declaration in for-initializer
1340: typedef <entity> may not be used in an elaborated type specifier
1341: call of zero constant ignored
1342: parameter <entity> may not be redeclared in a catch clause of function try block
1343: the initial explicit specialization of <entity> must be declared in the namespace containing the template
1344: \"cc\" clobber ignored
1345: "template" must be followed by an identifier
1346: MYTHREAD not allowed in this context
1347: layout qualifier cannot qualify pointer to shared
1348: layout qualifier cannot qualify an incomplete array
1349: declaration of <entity> hides handler parameter
1350: nonstandard cast to array type ignored
1351: this pragma cannot be used in a _Pragma operator (a #pragma directive must be used)
1352: field uses tail padding of a base class
1353: GNU C++ compilers may use bit field padding
1355: abstract class <type> has a non-virtual destructor, calling delete on a pointer to this class is undefined behaviour
1356: an asm name is not allowed on a nonstatic member declaration
1357: static initialisation of <entity> using address of <entity> may cause link failure -ropi

See error number 1359.
1358: static initialisation of extern const <entity> using address of <entity> cannot be lowered for ROPI
1359: static initialisation of <entity> using address of <entity> may cause link failure -rwpi

Warnings 1357 and 1359 highlight code constructs that are not position independent (PI) and that might cause a subsequent link step to fail.

The following code, when compiled with --apcs /ropi:

```c
char *str = "test"; /* global pointer */
```

results in the message:

```
Warning: #1357-D: static initialisation of variable "str" using address of string literal may cause link failure --ropi
```

because the global pointer `str` must be initialized to the address of the char string `test` in the .constdata section, but absolute addresses cannot be used in a PI system.

The following code, when compiled with --apcs /rwpi:

```c
int bar;
int *foo = &bar; /* global pointer */
```

results in the message:

```
Warning: #1359-D: static initialisation of variable "foo" using address of bar may cause link failure --rwpi
```

because the global pointer `foo` must be initialized to the address of `bar` in the .data section, but absolute addresses cannot be used in a PI system.

The following workarounds are possible:

- Change your code to avoid use of a global pointer. You can, for example, use a global array or local pointer instead.
- Do the initialization at run-time, for example:

```c
int bar;
int *foo;
```

Then write code inside a function that sets `foo = &bar;`. This is because when generating code as opposed to statically initializing data, the compiler has scope to work around the ROPI/RWPI constraints.

See also the linker error L6248E.

1360: static initialisation of extern const <entity> using address of <entity> cannot be lowered for RWPI

For example, when compiled with --apcs /rwpi:

```c
extern int y;
int* const x = &y;
int* foo()
{
    return(x);
}
```

produces a warning because prefixing `y` by `extern` prevents the compiler defining a direct address offset between the variables `x` and `y`.

1361: <entity> was declared "deprecated"
1362: unrecognized format function type <entity> ignored
1363: base class <entity> uses tail padding of base class <entity>
1364: the "init_priority" attribute can only be used for definitions of static data members and namespace scope variables of class types
1365: requested initialization priority is reserved for internal use
1366: this anonymous union/struct field is hidden by <entity>
1367: invalid error number
1368: invalid error tag
1369: expected an error number or error tag
1370: size of class is affected by tail padding
1371: labels can be referenced only in function definitions
1372: transfer of control into a statement expression is not allowed
1374: this statement is not allowed inside of a statement expression
1375: a non-POD class definition is not allowed inside of a statement expression
1376: destructible entities are not allowed inside of a statement expression
1377: a dynamically-initialized local static variable is not allowed inside of a statement expression
1378: a variable-length array is not allowed inside of a statement expression
1379: a statement expression is not allowed inside of a default argument
1381: Type of result operand is narrower than actual result
1382: nonstandard conversion between pointer to function and pointer to data
1383: interface types cannot have virtual base classes
1384: interface types cannot specify "private" or "protected"
1385: interface types can only derive from other interface types
1386: <type> is an interface type
1387: interface types cannot have typedef members
1388: interface types cannot have user-declared constructors or destructors
1389: interface types cannot have user-declared member operators
1390: interface types cannot be declared in functions
1392: interface types cannot have data members
1393: interface types cannot contain friend declarations
1395: interface types cannot be nested class types
1396: interface types cannot have member templates
1397: interface types cannot have static member functions
1398: this pragma cannot be used in a __pragma operator (a #pragma directive must be used)
1399: qualifier must be base class of <type>
1400: declaration must correspond to a pure virtual member function in the indicated base class
1401: integer overflow in internal computation due to size or complexity of <type>
1402: integer overflow in internal computation
1403: __w64 can only be specified on int, long, and pointer types
1404: potentially narrowing conversion when compiled in an environment where int, long, or pointer types are 64 bits wide
1405: current value of pragma pack is <entity>
1406: arguments for pragma pack(show) are ignored
1409: earlier __declspec(align(...)) ignored
1410: expected an argument value for the <entity> attribute parameter
1411: invalid argument value for the <entity> attribute parameter
1412: expected a boolean value for the <entity> attribute parameter
1413: a positional argument cannot follow a named argument in an attribute
1414: attribute <entity> has no parameter named <entity>
1415: expected an argument list for the <entity> attribute
1416: expected a ",", or "]"
1417: attribute argument <entity> has already been given a value
1418: a value cannot be assigned to the <entity> attribute
1419: a throw expression may not have pointer-to-incomplete type
1420: alignment-of operator applied to incomplete type
1421: <entity> may only be used as a standalone attribute
1422: <entity> attribute cannot be used here
1424: attributes are not allowed here
1425: invalid argument value for the <entity> attribute parameter
1426: too many attribute arguments
1427: conversion from inaccessible base class <type> is not allowed
1428: option "export" requires distinct template signatures
1429: string literals with different character kinds cannot be concatenated
1430: GNU layout bug not emulated because it places virtual base <entity> outside <entity> object boundaries
1431: virtual base <entity> placed outside <entity> object boundaries
1432: nonstandard qualified name in namespace member declaration
1433: reduction in alignment ignored
1434: const qualifier ignored
1436: __breakpoint argument must be an integral compile-time constant
1437: __breakpoint argument must be within 0-65535 when compiling for ARM
1438: __breakpoint argument must be within 0-255 when compiling for Thumb
1439: BKPT instruction is not supported on target architecture/processor
1440: oversize bitfield layout will change -- consider preceeding with "<entity>:0;"
1441: nonstandard cast on lvalue
   The C specification states "An assignment operator shall have a modifiable lvalue as its left operand" and "a cast does not yield an lvalue".
1442: polymorphic base classes need to be exported if they are to be used for exported derivation
1443: polymorphic base classes inherited via virtual derivation need to be exported
1444: polymorphic base classes inherited via virtual derivation need all virtual functions to be exported
1445: invalid GNU asm qualifiers
1446: non-POD class type passed through ellipsis
1447: a non-POD class type cannot be fetched by va_arg
   The ISO C++ standard defines that the non-required arguments of a variadic function must be of type Plain Old Data (POD), such as an int or a char, but not structs or classes.
   To avoid the error or warning, the address of a class or struct could be given instead.
1448: the 'u' or 'U' suffix must appear before the 'l' or 'L' suffix in a fixed-point literal
1449: option \"fixed_point\" can be used only when compiling C
1450: integer operand may cause fixed-point overflow
1451: fixed-point constant is out of range
1452: fixed-point value cannot be represented exactly
1453: constant is too large for long long; given unsigned long long type (nonstandard)
1454: layout qualifier cannot qualify pointer to shared void
1455: duplicate THREADS in multidimensional array type
1456: a strong using-directive may only appear in a namespace scope
1457: <entity> declares a non-template function -- add <> to refer to a template instance
1458: operation may cause fixed-point overflow
1459: expression must have integral, enum, or fixed-point type
1460: expression must have integral or fixed-point type
1461: function declared with "noreturn" does return
1462: asm name ignored because it conflicts with a previous declaration
1463: class member typedef may not be redeclared
1464: taking the address of a temporary
1465: attributes are ignored on a class declaration that is not also a definition
1466: fixed-point value implicitly converted to floating-point type
1467: fixed-point types have no classification
1468: a template parameter may not have fixed-point type
1469: hexadecimal floating-point constants are not allowed
1470: option \"named_address_spaces\" can be used only when compiling C
1.2 List of the armcc error and warning messages

1471: floating-point value does not fit in required fixed-point type
1472: value cannot be converted to fixed-point value exactly
1473: fixed-point conversion resulted in a change of sign
1474: integer value does not fit in required fixed-point type
1475: fixed-point operation result is out of range
1476: multiple named address spaces
1477: variable with automatic storage duration cannot be stored in a named address space
1478: type cannot be qualified with named address space
1479: function type cannot be qualified with named address space
1480: field type cannot be qualified with named address space
1481: fixed-point value does not fit in required floating-point type
1482: fixed-point value does not fit in required integer type
1483: value does not fit in required fixed-point type
1484: option "named_registers" can be used only when compiling C
1485: a named-register storage class is not allowed here
1486: <entity> redeclared with incompatible named-register storage class
1487: named-register storage class cannot be specified for aliased variable
1488: named-register storage specifier is already in use
1489: option "embedded_c" cannot be combined with options to control individual
Embedded C features
1490: invalid EDG_BASE directory:
1492: invalid predefined macro entry at line <entity>: <reason>
1493: invalid macro mode name <entity>
1494: incompatible redefinition of predefined macro <entity>
1495: redeclaration of <entity> is missing a named-register storage class
1496: named register is too small for the type of the variable
1497: arrays cannot be declared with named-register storage class
1498: const_cast to enum type is nonstandard
1499: option "embedded_c" can be used only when compiling C
1500: __svc parameter <entity> is not within permitted range (0 to 0xff) for Thumb SVC instruction
1501: too many arguments for __svc or __svc_indirect function
1502: arguments for __svc or __svc_indirect function must have integral type
1503: __svc_indirect function must have arguments
1504: first argument for __svc_indirect function must have integral type
1505: result of __svc or __svc_indirect function must be returned in integer registers
1506: source file <entity> has bad format
1507: error while writing <entity> file: <reason>
1508: cannot overload functions distinguished by function qualifier alone
1509: function qualifier <entity> not permitted on a virtual member function
1510: function "__attribute__((__<entity>__))" present on overridden virtual function <entity> must be present on overriding function
1511: function qualifier <entity> is not identical on overridden virtual function <entity>
1512: function qualifier <entity> present on overridden virtual function <entity>
must be present on overriding function
1513: a named address space qualifier is not allowed here
1514: an empty initializer is invalid for an array with unspecified bound
1515: function returns incomplete class type <type>
1516: <entity> has already been initialized; the out-of-class initializer will be ignored
1517: declaration hides <entity>
1518: a parameter cannot be allocated in a named address space
1519: invalid suffix on fixed-point or floating-point constant
1520: a register variable cannot be allocated in a named address space
1521: expected "SAT" or "DEFAULT"
1522: <entity> has no corresponding member operator delete<entity> (to be called if an exception is thrown during initialization of an allocated object)
1523: a thread-local variable cannot be declared with "dllimport" or "dllexport"
1524: a function return type cannot be qualified with a named address space
1525: an initializer cannot be specified for a flexible array member whose elements have a nontrivial destructor
1526: an initializer cannot be specified for an indirect flexible array member
1527: invalid GNU version number:
1528: variable attributes appearing after a parenthesized initializer are ignored
1529: the result of this cast cannot be used as an lvalue
1530: negation of an unsigned fixed-point value
1531: this operator is not allowed at this point; use parentheses
1533: register names can only be used for register variables
1534: named-register variables cannot have void type
1536: parameters cannot have link scope specifiers
1537: multiple link scope specifiers
1538: link scope specifiers can only appear on functions and variables with external linkage
1539: a redeclaration cannot weaken a link scope
1540: link scope specifier not allowed on this declaration
1541: nonstandard qualified name in global scope declaration
1542: implicit conversion of a 64-bit integral type to a smaller integral type (potential portability problem)
1543: explicit conversion of a 64-bit integral type to a smaller integral type (potential portability problem)
1544: conversion from pointer to same-sized integral type (potential portability problem)
1546: friend specifier is not allowed in a class definition; friend specifier is ignored
1547: only static and extern variables can use thread-local storage
1548: multiple thread-local storage specifiers
1549: virtual <entity> was not defined (and cannot be defined elsewhere because it is a member of an unnamed namespace)
1550: carriage return character in source line outside of comment or character/string literal
1551: expression must have fixed-point type
1552: invalid use of access specifier is ignored
1553: pointer converted to bool
1554: pointer-to-member converted to bool
1555: storage specifier ignored
1556: dllexport and dllimport are ignored on class templates
1557: base class dllexport/dllimport specification differs from that of the derived class
1558: redeclaration cannot add dllexport/dllimport to <entity>

If this message is suppressed, the behavior is as though the dllexport or dllimport had been omitted. For example:

```c
void f(void);
_declspec(dllimport) void f(void) {} /* suppress treats as void f(void) { } */
```
1559: dllexport/dllimport conflict with <entity>od; dllexport assumed
This indicates that an entity is marked as both dllimport and dllexport. In this case, the compiler assumes that the entity is dllexport.

In the following example, the function definition foo() conflicts with the declaration __declspec(dllimport) void foo(). In this situation, the compiler assumes dllexport.

```c
---test.cpp---
__declspec(dllimport) void foo();
void foo()
{
}
-----------
armcc -c test.cpp
"test.cpp", line 3: Warning: #1559-D: dllexport/dllimport conflict with "foo"
(declared at line 1); dllexport assumed
fromelf -s test.o
...
# Symbol Name   Value       Bind Sec Type Vis Size
====================================================================
6 _Z3foov       0x00000000  Gb   1   Code Pr  0x4
...
```

The warning message and the symbol visibility indicate that the function foo() is dllexport assumed.

1560: cannot define dllimport entity
1561: dllexport/dllimport requires external linkage
1562: a member of a class declared with dllexport/dllimport cannot itself be declared with such a specifier
1563: field of class type without a DLL interface used in a class with a DLL interface
1564: parenthesized member declaration is nonstandard
1565: white space between backslash and newline in line splice ignored
1566: dllexport/dllimport conflict with <entity>od; dllimport/dllexport dropped
1567: invalid member for anonymous member class -- class <type> has a disallowed member function
1568: nonstandard reinterpret_cast
1569: positional format specifier cannot be zero
1570: a local class cannot reference a variable-length array type from an enclosing function
1571: member <entity> already has an explicit dllexport/dllimport specifier
1572: a variable-length array is not allowed in a function return type
1573: variable-length array type is not allowed in pointer to member of type <type>
1574: the result of a statement expression cannot have a type involving a variable-length array
1575: Load/Store with translation not supported in inline assembler. Use embedded assembler or out-of-line assembler
1576: Flag-setting multiply instructions not supported in inline assembler. Use embedded assembler or out-of-line assembler
1577: Flag-setting MOV/MVN instructions with constant operand not supported in inline assembler. Use embedded assembler or out-of-line assembler
1578: an asm name is ignored on an automatic variable
1579: Could not inline: Unknown exception handling code
1581: Could not optimize: Loop profiling inhibited for this function - max needed as intrinsic
1582: Could not optimize: This variable-size private array inhibits concurrency
1583: Not allowed to write to output file. Output suppressed
1584: Could not optimize: Unable to transform temporary variables
1585: Feature-dependent error
1586: Mixed data sizes in one loop disabled by user
1587: Could not optimize: A data type in this line prevents optimization of the loop
1588: Could not optimize: This loop exit could not be translated
1589: Illegal array dimensions
1590: Could not optimize: Too large to optimize - reduce file or loop size
1591: Illegal arithmetic expression
1592: Unbalanced parentheses
1593: Could not optimize: Use of unsigned index prevents optimization
1594: Could not optimize: Loop parameters must be integer for full optimization
1595: Illegal number of arguments to intrinsic function
1596: Could not optimize: Function reference prevents high-level loop optimization
1597: String of length 0 is not allowed
1598: Could not optimize: Feedback of scalar value from one loop pass to another
1599: Could not optimize: Not enough useful work to optimize
1600: Could not optimize: Cannot translate this type conversion
1601: Improper elseif statement
1602: Illegal subroutine
1603: Improper nesting of loops
1604: Could not optimize: Reference to this function inhibits optimization
1605: Statement expands line past size of buffer
1606: Problem in writing output file -- check permissions
1607: Array not declared

1745: Could not optimize: Potential data dependency due to pointer, use restrict qualifier if ok
1746: Subroutine name may not be used as variable
1749: Inconsistent number of arguments in function references
1750: Optimization: Loop re-rolled
1751: Might not be able to optimize: Input contains reserved word
1752: Illegal use of =
1754: Dim and mask arguments are not handled
1755: Could not optimize: These vector constants cannot be handled
1756: Could not optimize: This transformational function cannot be translated
1757: Optimization: Associative transformation required to handle this function
1759: Could not optimize: Non-unit stride interferes with vector optimization
1760: Specified scope on this directive is not valid - ignored
1771: Could not optimize: Volatile items prevent analysis
1773: Could not optimize: Generated expression would be too complex
1774: Exceeded maximum number of symbols allowed after optimization
1775: Could not optimize: GNU extension prevents inlining
1789: Could not optimize: Array dimension too small for optimization
1790: Invalid parameter statement
1791: Source for routine not found
1792: Error reading expansion file
1793: Expansion routine is too big for automatic expansion
1794: Error encountered parsing expansion routine
1795: Invalid argument expression on expansion call
1796: Argument directory table overflow
1797: Argument mismatch between call and expansion routine
1798: Could not optimize: Nesting level too deep for automatic expansion
1799: Internal fault: too many new labels generated. Please contact your supplier
1800: Could not optimize: Exceeded maximum number of expanded functions
1801: Optimization: Function expanded
1802: Source for function not found in input file
1803: Could not optimize: Increment of loop is 0
1805: Could not optimize: Bit constants not handled
1807: Could not optimize: table overflow in inline expansion
1808: Variable appears only as formal argument
1809: Function in expanded routine conflicts with non-function
1810: Overflow in iteration count expression
1811: Argument constant on left hand side of assignment statement
1812: Function references with conflicting number of arguments
1813: Conflicting function definitions
1814: Could not optimize: code size affects optimizations
1816: Missing if or braces
1819: Missing end of for
1820: Conversion between these two data types is not possible
1821: Error in logical expression
1822: Could not optimize: Data too complex for this reduction operation to vectorize
1823: Could not optimize: Function was passed as an argument
1824: Could not optimize: Not enough vector operations to justify translation
1825: Could not optimize: Cannot vectorize complex conditionals
1826: Could not optimize: Parallel syntax prevents expansion
1828: Character illegal in this context
1829: Could not optimize: Byte data type not supported for vectorization
1831: Optimization: Constant propagated
1832: Definition deleted
1833: Conflicting declaration for generated function
1834: Error opening output file (possibly permission denied)
1835: Inappropriate placement of directive - ignored
1838: Inappropriate argument to permutation directive - ignored
1840: Order of arithmetic operations may have been changed
1841: Stripmining required for this loop
1842: Repeated redimension declaration - directive ignored
1843: Duplicate label in expansion routine
1844: Too many labels in expansion routine
1845: Arithmetic expression reduces to illegal divide by 0
1846: Integer constant is not in the permitted range
1847: Could not optimize: Use of pointer variable
1849: Argument must be a nonnegative integer constant or parameter
1850: Could not optimize: Unrolling parameter too large
1853: Could not optimize: Loop contains too many statements to unroll
1858: Could not optimize: Reduction scalar type mismatch
1861: Could not optimize: This store into array prevents optimization of outer loop
1864: Could not optimize: Not enough work to justify concurrency optimization
1866: Could not optimize: Non-integer subscript
1877: Could not optimize: Use of loop index outside the loop
1885: Could not optimize: Loop bounds exceed array dimensions
1886: Optimization: Loops optimized with parallel section
1887: Reservations required
1888: Could not optimize: Inappropriate data type for vectorization
1889: Could not optimize: Alternate code generation suppressed due to program size
1890: Nesting of command files greater than 9
1891: Invalid program statement
1892: Could not optimize: Use of logical arrays prevents vectorization
1893: Error in -k option -- ignored
1894: Optimization: Iterations peeled from loop in order to avoid dependence
1895: Optimization: Redundant if eliminated
1896: Optimization: Logical clause simplified
1902: Actual argument dimensions are less than temporary argument dimensions
1903: Data types of arguments do not match
1904: Could not optimize: Scalar actual argument passed to temporary array argument
1909: Could not optimize: Width of temporary array does not match width of actual array
1910: Could not optimize: Statement inhibits expansion
1911: Could not optimize: Subroutine used as a function reference
1912: Could not optimize: Function used in a call statement prevents expansion
1913: Improper argument list in directive
1915: Could not optimize: Switch inhibits expansion with character arguments
1916: Could not optimize: Constant argument inhibits inline expansion
1917: Could not optimize: Constant argument is the destination of a read
1918: Could not optimize: User parallel directives inhibit transformation
1919: Could not optimize: Could not determine character substring length
1920: A label on an include statement is not allowed
1921: May be used before defined
1922: Could not optimize: Width of temporary array and/or actual array cannot be determined
1923: Could not optimize: Functions in arithmetic if statements are not expanded
1924: Potential discrepancy between actual and temporary array widths
1925: Illegal use of unsubscripted array
1926: Cannot have constant or function on left-hand side of assignment
1927: Parameter on left-hand side of assignment is illegal
1928: Left-hand side of assignment has more than 1 operand
1930: Expected equal sign, remainder of line ignored
1931: Expected closing parenthesis, one is assumed
1932: Could not optimize: Too many symbols for automatic expansion
1933: Could not optimize: Array or constant argument passed to do-loop index prevents expansion
1935: Directive has invalid or missing argument list
1936: Expected positive integer - invalid argument
1937: Expected a variable - invalid argument
1938: Variable not found
1939: Table overflow
1942: Could not optimize: Not enough vectorizable work to justify translation
1945: Could not optimize: Inline assembly block found
1947: Could not optimize: Cannot transform this combination of data types and operations
1948: PGO: hot loop; optimization defaults overridden.
1949: PGO: cold loop; optimization suppressed.
1950: PGO: hot function; optimization defaults overridden.
1951: PGO: cold function; optimization suppressed.
1953: PGO: cold loop; invariant IF removal suppressed.
1954: PGO: hot loop; default inlining criteria overridden.
1955: PGO: cold loop; inlining suppressed.
1956: PGO: hot loop; unrolling enabled.
1970: Could not optimize: Conformability problems
1971: Repeated switch parameters not allowed
1972: Could not optimize: Statement function contains optimization inhibitors
1973: Optimization: Moved invariant if outside of an inner loop
1974: Optimization: Inner loop stripped and strip loop moved outside outer loop
1975: Could not optimize: Store into array with missing subscript inhibits outer loop
1976: Could not optimize: Unable to make conditional arrays conformable
1977: Could not optimize: Problems in inner loop prevent optimization of outer loop
1978: Could not optimize: Unable to optimize user-selected loop
1979: Could not optimize: This operation inhibits loop transformation
1980: Optimization: Moved invariant if outside of an outer loop
1981: Could not optimize: Incompatible options (fixed, free) prevent expansion
1982: Could not optimize: Incompatible options (onetrip, noonetrip) prevent expansion
1983: Could not optimize: Incompatible options (mixed, nomixed) prevent expansion
1984: Could not optimize: Incompatible option (autodbl) prevents expansion
1985: Optimization: Loop chopped (size)
1986: Optimization: Loop chopped (intrinsic)
1987: Optimization: Loop switched
1988: Optimization: Alternate code generated
1991: More data items than variables in data statement
1992: More variables than data items in data statement
1993: Number of arguments does not match
1994: Argument data types do not match
1995: Constant or expression passed to modified variable
1997: Optimization: Constant-length loop unrolled

2430: Could not inline: Conflicting structure definitions
2431: Could not inline: Conflicting structure typedef usage
2432: Could not inline: Recursive function
2433: Could not inline: Static variables in function
2434: Could not inline: Structure name conflict
2435: Could not inline: Inlined function not by itself
2436: Not used
2437: Could not inline: Nesting level too deep
2438: Could not inline: Void function used in expression
2439: Could not inline: Identifier declaration
2440: Could not inline: Argument levels of indirection do not match
2441: Could not inline: Conflicting enumerator declaration
2442: Could not inline: Cannot remove function from expression
2443: Could not inline: Cannot resolve multi-dimensional argument
2444: Could not inline: A local variable conflicts with a global variable
2445: Illegal shape statement
2446: Illegal dimensions on partially specified shape object
2447: Illegal dimensions on fully specified shape object
2448: Multiple shape information
2449: A valid shape identifier must follow the ':'
2450: Must declare a type for parallel variable
2451: Illegal use of left indexing
2452: Parallel variable has illegal shape information
2453: Could not translate: unknown shape information
2454: Could not translate parallel function
2455: Invalid argument or number of arguments in function
2456: Must allocate an unspecified or partially specified shape
2457: Allocating shape that exceeds the maximum assumed
2458: Requested rank does not match partially defined shape rank
2459: Cannot translate DPC or C*
2460: Rank of shape exceeds assumed rank of compiler
2461: All dimensions of left indexing must be specified, if any
2462: Number of left indices exceeds maximum
2463: Unsupported feature:
2464: Number of initializers cannot exceed number of aggregate members
2465: A structure or union type may not contain a parallel member
2466: Bitfield must be non-negative integer constant
2467: Incompatible shapes in expression
2468: Identifiers ending with _ are reserved
2469: Function prototype specifies a parallel argument
2470: Could not inline: function returns pointer to function
1.2 List of the armcc error and warning messages

2471: Could not inline: could not handle formal argument of this type
2472: Could not inline: reference to static function
2473: Internal fault: error during transformation. Please contact your supplier
2474: Could not optimize parallel pointers
2475: Cannot create void descriptor for global symbol, try renaming
2476: Could not resolve reference to overloaded function
2477: Dpce keyword not recognized
2478: Must declare at least one declarator, tag, or enum member
2479: Improper use of keyword
2480: Cannot take the address of an element of a parallel operand
2481: Fully specified shapes cannot be assigned
2482: First operand of a conditional expression must have scalar type
2483: Illegal operator for nonparallel left-hand side and parallel right-hand side
2484: Illegal prototype definition
2485: Incompatible shape definitions
2486: Shape expressions of 'void' must be a prototype or pointer
2487: An object of type void cannot be declared
2488: A shape-specifier must only follow type-specifier
2489: A nodal or elemental function must specify a parameter list
2490: An elemental function must not contain parallel objects
2491: An elemental function must not contain parallel syntax
2492: An elemental function must only call elemental functions
2493: An elemental function cannot have static variables
2494: A nodal function must only call nodal and elemental funcs
2495: A nodal function must not reference file-scope identifiers
2496: An elemental function cannot return shape- or parallel-type
2497: An elemental function cannot have parallel-type parameters
2498: A nodal function may not have non-void parallel arguments
2499: Array dimension must be a constant integral expression greater than zero
2500: File scope shape-definition must be a constant integral expression
2501: Shape-definition must be an integral expression greater than zero
2502: A structure or union may not contain a shape-type member
2503: Operation between two pointer types is not allowed here
2504: Operation between a pointer type and a non-integral type is not allowed here
2505: Arguments of a conditional expression must be compatible parallel types
2506: Parallel operand of ? operator must have scalar element type
2507: Operands of ? operator must have compatible types
2508: Operands of ? operator must be compatible struct or union
2509: Operands of ? operator must be pointers to compatible types
2510: Cannot take the address of an lvalue with parallel index
2511: Cannot optimize this expression as it is not of integral type
2512: Cannot cast between a parallel pointer and a non-parallel pointer
2513: Block or scale specifier must be integral value greater than zero
2514: Function reference under context
2515: Expression too complex to be inlined
2516: High Level Optimization halted: assembly code in routine
2517: attempt to obtain value of write-only object
2518: assignment to write-only bit fields is not supported
2519: Unable to determine constant iteration count for this loop
2520: Function may have side effects that prevent optimization
2521: Casts of typedefs inhibit optimization
2522: Could not inline function: address of constant argument taken
2523: use of inline assembler is deprecated
2524: #pragma pop with no matching #pragma push
#pragma push and #pragma pop save and restore the current pragma state.
Each pop must be paired with a push, so an error is raised for the following code:

```c
#pragma push
#pragma pop
#pragma pop
```

2525: #pragma push with no matching #pragma pop
#pragma push and #pragma pop save and restore the current pragma state.
Each push must be paired with a pop.

2529: expression must be an integral constant in range <entity> to <entity>
2530: padding added to end of struct <entity>
The compiler can warn of padding added at the end of a struct or between structs. This warning is off by default. You can enable it with --diag_warning 2530 or --remarks.

For example:

```c
typedef struct {
  int x;
  char y;
} A;
typedef struct {
  int p;
  int q;
} B;
```

results in the message:

```
Warning: #2530-D: padding added to end of struct 'anonymous'
```

The compiler can also warn of padding inserted within a struct, see message number 1301.

2531: dllimport/dllexport applied to a member of an unnamed namespace
2532: support for trigraphs is disabled
2533: the <entity> attribute can only appear on functions and variables with external linkage
2534: strict mode is incompatible with treating namespace std as an alias for the global namespace
2540: invalid symbolic operand name <entity>
2541: a symbolic match constraint must refer to one of the first ten operands
2542: use of __if_exists is not supported in this context
2543: __if_exists block not closed in the same scope in which it was opened
2544: thread-local variable cannot be dynamically initialized
2545: conversion drops '__unaligned' qualifier
2546: some enumerator values cannot be represented by the integral type underlying the enum type
2547: default argument is not allowed on a friend class template declaration
2548: multicharacter character literal (potential portability problem)
2549: expected a class, struct, or union type
2550: second operand of offsetof must be a field
2551: second operand of offsetof may not be a bit field
2552: cannot apply offsetof to a member of a virtual base
2553: offsetof applied to non-POD types is nonstandard
2554: default arguments are not allowed on a friend declaration of a member function
2555: default arguments are not allowed on friend declarations that are not definitions
2556: redeclaration of <entity> previously declared as a friend with default arguments is not allowed
2557: invalid qualifier for <type> (a derived class is not allowed here)
2558: invalid qualifier for definition of class <type>
2559: no prior push_macro for %sq
2560: wide string literal not allowed
2562: %sq is only allowed in C
2563: __ptr32 and __ptr64 must follow a "\""
2564: __ptr32 and __ptr64 cannot both apply
2565: template argument list of <entity> must match the parameter list
2566: an incomplete class type is not allowed
2567: complex integral types are not supported
2568: __real and __imag can only be applied to complex values
2569: __real/__imag applied to real value
2570: <entity> was declared deprecated (<entity>)
2571: invalid redefinition of <entity>
2572: __thiscall can only appear on nonstatic member function declarations
2573: __thiscall not allowed on function with ellipsis parameter
2574: explicit specialization of <entity> must precede its first use (<entity>)
2575: a sealed class type cannot be used as a base class
2576: duplicate class modifier
2577: a member function cannot have both the "abstract" and "sealed" modifiers
2578: a sealed member cannot be pure virtual
2579: nonvirtual function cannot be declared with "abstract" or "sealed" modifier
2580: member function declared with "override" does not override a base class member
2581: cannot override sealed <entity>
2582: <entity> was declared with the class modifier "abstract"
2583: dupeicate function modifier
2584: invalid character for char16_t literal
2585: __LPREFIX cannot be applied to char16_t or char32_t literals
2586: unrecognized calling convention <entity>, must be one of:
2587: underlying type of enum type must be an integral type
2588: sentinel argument must correspond to an ellipsis parameter
2589: __declspec(implementation_key(...) can appear only between #pragma
2590: start_map_region and #pragma stop_map_region
2591: #pragma start_map_region already active: pragma ignored
2592: no #pragma start_map_region is currently active: pragma ignored
2593: <entity> cannot be used to name a destructor (a type name is required)
2594: nonstandard empty wide character literal treated as L'\0'
2595: "typename" may not be specified here
2596: a non-placement operator delete must be visible in a class with a virtual
2597: destructor
2598: name linkage conflicts with previous declaration of <entity>
2599: alias creates cycle of aliased entities
2600: a variable with static storage duration allocated in a specific register cannot
2601: be declared with an initializer
2602: a variable allocated in a specific register must have POD type
2603: predefined meaning of <entity> discarded
2604: declaration hides built-in <entity>
2605: declaration overloads built-in <entity>
2606: static member function not permitted here
2607: designator may not specify a non-POD subobject
2608: anonymous union qualifier is nonstandard
anonymous union qualifier is ignored
__declspec(\%s) ignored (it has no meaning for a C struct)
specifiers after comma between declarations are nonstandard
nonstandard specifier ignored
attributes are ignored on an enum declaration that is not also a definition
declaring a reference with \"mutable\" is nonstandard
a condition declaration for an array is always true
static assertion failed with \%sq
visibility attribute ignored because it conflicts with a previous declaration
field name resolves to more than one offset -- see \%nod1 and \%nod2
\%sq is not a field name
case label value has already appeared in this switch \%p
a member function cannot have internal linkage
the option to list macro definitions may not be specified when compiling more than one translation unit
unexpected parenthesis after declaration of \%n (malformed parameter list or invalid initializer?)
parentheses around a string initializer are nonstandard
a variable declared with an auto type specifier cannot appear in its own initializer
cannot deduce \"auto\" type
initialization with \"{...}\" is not allowed for \"auto\" type
\"auto\" type cannot appear in top-level array type
\"auto\" type cannot appear in top-level function type
a member of type \%t cannot have an in-class initializer
a member with an in-class initializer must be const
cannot deduce \"auto\" type (initializer required)
\"auto\" type is \%t1 for this entity, but was previously implied to be \%t2
invalid constructor declaration
invalid use of a type qualifier
a union cannot be abstract or sealed
\"auto\" is not allowed here
definition of base class type not completed yet
\"extern template\" cannot refer to a specialization of static \%nd
\"extern template\" cannot follow explicit instantiation of \%n
__declspec(restrict) requires a function returning a pointer type
the \"report_gnu_extensions\" option is only valid in GNU C and GNU C++ modes
variable-length array types are nonstandard
designators are nonstandard
designator syntax is a GNU extension
compound literals are nonstandard
statement expressions are a GNU extension
asm name ignored for previously defined entity
attributes are a GNU extension
extended asm syntax is a GNU feature
volatile asm declarations are a GNU extension
asm name specifiers are a GNU extension
the \"__restrict\" qualifier is nonstandard
\"typeof\" is a GNU extension
modifying the size or signedness of a typedef is nonstandard
zero-length arrays are a GNU extension
flexible array members are nonstandard
attribute \"nonnull\" references nonpointer parameter
argument for attribute \"nonnull\" is larger than number of parameters
no parameter has pointer type
null argument provided for parameter marked with attribute \"nonnull\"
2749: the destructor for %t1 has been suppressed because the destructor for %t2 is inaccessible
2750: the suppressed destructor for %t is needed
2751: routine is both "inline" and "noinline"
2752: invalid cleanup routine
2753: attribute \"cleanup\" requires automatic storage duration
2754: attribute \"cleanup\" does not apply to parameters
2755: cleanup routine has invalid type
2756: call of cleanup routine requires suspect conversion
2757: __sptr and __uptr must follow a \"*\"
2758: __sptr and __uptr cannot both be specified
2759: widening pointer conversion from %t1 to %t2 extends sign bit
2760: __sptr and __uptr do not apply to pointer-to-member types
2761: the declaration of the copy assignment operator for %t has been suppressed because %n is const
2762: the declaration of the copy assignment operator for %t has been suppressed because %n has reference type
2763: the declaration of the copy assignment operator for %t1 has been suppressed because that of %t2 was suppressed
2764: the declaration of the copy assignment operator for %t1 has been suppressed because that of %t2 is ambiguous
2765: the declaration of the copy assignment operator for %t1 has been suppressed because that of %t2 is inaccessible
2766: the declaration of the copy constructor for %t1 has been suppressed because that of %t2 was suppressed
2767: the declaration of the copy constructor for %t1 has been suppressed because that of %t2 is ambiguous
2768: the declaration of the copy constructor for %t1 has been suppressed because that of %t2 is inaccessible
2769: the destructor for %t1 will not be called because it is inaccessible and the destructor for %t2 was suppressed
2770: definition at end of file not followed by a semicolon or a declarator
2771: first argument must be a pointer to integer or enumeration type
2772: synchronized operations are valid only on objects of size 1, 2, 4, or 8
2773: extra arguments ignored
2774: '=' assumed following macro name %sq in command-line definition
2775: white space is required between the macro name %sq and its replacement text
2776: result of call is not used
2777: attribute \"warn_unused_result\" is ignored for void return type
2778: dllimport/dllexport is ignored on redefinition using a qualified name
2779: too many characters in character literal -- extra leading characters ignored
2780: %n cannot be declared inline after its definition %p
2781: __fp16 cannot be specified as the type of a function argument
2782: __fp16 cannot be specified as the return type of a function
2783: wchar_t has been disabled
2784: __attribute__((at)) missing for bitbanded variable
2785: attribute \"\"virtual\"\" is ignored here
2786: a template argument may not reference a type with no name linkage
2787: a template argument may not reference a variable-length array type
2788: a universal character name cannot designate a surrogate code point
2789: #include_next cannot be used in the primary source file
2790: %no1 cannot be specified in a template member definition -- %no2 assumed instead
2791: attribute %sq is ignored on local function declaration
2792: concatenation with %sq in %n does not create a valid token
2793: %no is ambiguous (%n2 assumed)
2797: a type qualifier is not allowed on a static member function
2798: a type qualifier is not allowed on a constructor or destructor
2799: a type qualifier is not allowed on operator new or operator delete
2800: a type qualifier is not allowed on a nonmember function
2801: __assume expression with side effects discarded
2802: requested constructor/destructor priority is reserved for internal use
2803: unrecognized GCC pragma
2804: unrecognized GCC visibility pragma directive
2805: unrecognized visibility kind
2806: visibility pragma was still active
2807: no matching visibility push
2808: typeid of incomplete type
2810: array %n assumed to have one element
2811: restrict qualifier is ignored
2812: attributes ignored here
2813: empty dependent statement in if-statement
   This remark indicates that an if statement has no dependent statement, and is not followed by
   an else statement. For example:
   
   if (x <= 0); // remark 2813 is generated here
   {
     foo(x);
   }
   
   You can enable this remark by using --diag_warning 2813 or --remarks. When using the
   --remarks option, you can suppress this remark by using --diag_suppress 2813.

2814: empty dependent statement in \"else\" clause of if-statement
2815: empty dependent statement in while-statement
   This remark indicates that a while statement has no dependent statement. For example:
   
   while (x != 0);
   
   You can enable this remark by using --diag_warning 2815 or --remarks. When using the
   --remarks option, you can suppress this remark by using --diag_suppress 2815.

2816: static %n treated as extern because it was referenced but not defined
2817: temporary used for conditional class rvalue result (C++ core issue #446
   resolution)
2818: %t1 reference to pointer to class is not supported; downgrading the severity
   from error will treat the type as pointer to class %t2
2819: class %t has an implicitly instantiated key function %no
2820: string literal too long -- excess characters ignored
2821: Could not optimize: Expression-temporary destructor prevents inlining
2822: Could not optimize: ARM virtual function elimination code prevents inlining
2823: Structure pointer inhibits loop optimization
2824: Could not inline: Data types of arguments do not match
2825: VLD/VTM are not supported in inline assembler
2826: LDRD/STRD with implicit second operand (rt2 = rt+1) not supported. Specify rt2
   explicitly
2827: SETEND is not supported in inline assembler
2828: Cannot encode the shift
2829: Cannot perform desired action on condition flags
2830: Cannot do desired conditional execution
2831: Can only shift by 0, 8, 16 and 24
2832: Cannot encode requested width
2834: Cannot encode the shift type
2842: Cannot encode desired transfer size
2843: Cannot encode desired load/store mode
2846: bitfieldMsb not unsigned 5-bit immediate
2847: bitfieldLsb not unsigned 5-bit immediate
2848: (bitfieldMsb - bitfieldLsb) not unsigned 5-bit immediate
2851: Cannot encode instruction condition
2852: Cannot encode immediate in 8-bits and a rotation
2854: Cannot encode immediate in 8-bits, 8-bits shifted left or 8-bits duplicated in all, odd or even bytes
2855: Cannot encode shift by register
2856: rd and rn must be same register
2857: rd and rm must be same register
2858: rd,rn must be PC,LR
2861: Cannot encode desired IT condition sequence
2862: Cannot encode desired register list
2863: Cannot encode writeback
2864: Cannot encode writeback
2865: Cannot encode desired load/store multiple mode
2866: Cannot encode desired load/store multiple PSR / user-register mode
2867: Cannot encode desired load/store translate/sign-extend
2872: cannot encode M-profile system registers
2873: cannot encode desired status register
2874: cannot encode desired PSR mask
2876: Cannot encode desired cps alif action
2877: Cannot encode desired cps alif mask
2878: Cannot encode desired cps processor mode
2879: rn must be PC
2884: Cannot encode desired register sort
2885: Cannot encode desired compressed constant
2887: Cannot encode desired vtb length
2889: Cannot encode desired register list count
2890: Cannot encode desired register list spacing
2891: Cannot encode desired alignment hint
2897: Cannot encode instruction
2898: Instruction has unpredictable behaviour
2899: Instruction is deprecated and may not work in future architecture revisions
2900: Expected XScale accumulator register
2901: Expected an inline assembly instruction
2902: unrecognized Unicode source kind (must be one of UTF-8, UTF-16, UTF-16LE, UTF-16BE)
2903: Unicode character with hex value <entity> not representable in preprocessing output
2904: vector_size attribute requires an arithmetic or enum type
2905: vector size is too large
2906: vector size must be a power of two
2907: vector size must be a multiple of the element size
2908: mixed vector-scalar operation not allowed
2909: operation requires two vectors of the same size
2910: template-dependent vector size is not allowed
2913: vector_size attribute is not allowed with a complex element type
2915: vector operation requires identical element types
2916: vector operation does not apply to vector with non-integral type
2917: cannot open <entity> file <entity>
2918: cannot open <entity> file <entity>: <entity>
2933: IL output
2934: conversion drops "__restrict" qualifier
2935: unable to obtain mapped memory for <entity>: <entity>
2936: array of elements containing a flexible array member is nonstandard
2937: a template parameter may not have a vector type
2938: the initialization of <entity> will be done before that of <entity>
In the C++ standard, member variables are initialized in the order they are declared in the class, not in the order they are written in the initializer list. The compiler produces this warning when the order of the initializations in the initializer list does not match the order of declarations in the class. You can enable this warning with --diag_warning 2938 or --remarks.

For example:

```cpp
class Foo {
  int x;
  char y;
public:
  Foo() : y(42), x(32) {}
};
```
results in the message:

```
Warning: #2938-D: the initialization of member "Foo::x" will be done before that of member "Foo::y"
```

2940: inheritance kind is ignored on an enum specifier
2942: modifier is ignored on an enum specifier
2943: identifier character cannot be represented in Unicode
2944: header name contains characters that cannot be represented in Unicode
2945: <entity> is not a valid locale name
2946: declaring a void parameter list with a template parameter is nonstandard
2947: lambdas option can be used only when compiling C++
2948: explicit capture matches default
2949: <entity> is not a variable
2950: a variable with static storage duration cannot be captured in a lambda
2951: "this" cannot be captured by reference
2952: "this" cannot be used inside the body of this lambda
2953: a member of an outer-scope anonymous union cannot be referenced inside the body of a lambda
2954: an enclosing-function local variable cannot be referenced in a lambda body unless it is in the capture list
2955: invalid reference to an outer-scope local variable in a lambda body
2956: a local variable outside the current function scope cannot be captured
2957: the enclosing-function "this" cannot be referenced in a lambda body unless it is in the capture list
2958: the body of a value-returning lambda with no explicit return type must be a single return statement
2959: lambda captured variable of type %t1 cannot be copied to closure class field of type %t2
2960: invalid template directory:
2968: enumeration value is outside the range of its underlying type (%t)
2969: "\" followed by white space is not a line splice
2970: this dynamic_cast cannot be done without runtime type information, which is disabled

The compiler produces this error when a dynamic_cast must perform runtime type checking but you have disabled support for RTTI by compiling using the --no_rtti option. For example the following code results in this error:

```cpp
class Foo {
  virtual int foo() = 0;
};
class Bar {};
Bar *convert(Foo *x) {
  return dynamic_cast<Bar*>(x);
}
```

2971: conversion to <entity> is ambiguous; direct base selected
2972: an internal buffer would be too large
2973: C++ exception handler used, but exception handling semantics have not been specified
2974: type qualifier ignored on constructor
2975: a variable captured by a lambda cannot have a type involving a variable-length array
2976: conversion between incompatible vector types
2977: expected a "{" introducing a lambda body
2978: rvalue references option can be used only when compiling C++
2979: a type qualifier is not allowed on a lambda
2980: a name cannot appear more than once in a capture-list
2981: explicit template arguments ignored
2982: a lambda is not allowed in a constant expression
2983: <entity> is not a class type
2984: "delete" applied to a pointer-to-array type treated as delete[]
   The compiler produces this warning when the programmer has used the wrong kind of delete operator and the compiler has automatically corrected it. For example, the following code results in this warning:
   
   ```cpp
   void f(char (*data)[10]) {
     delete data;
   }
   ```
2985: "delete" applied to a pointer-to-array type is nonstandard; treated as delete[]
   This warning has the same meaning as message number 2984. The compiler generates this instead of 2984 when you compile with --strict on the command line.
2986: %n cannot be called with the given argument list
2987: an rvalue reference cannot be bound to an lvalue
2988: a nontype template parameter cannot have rvalue reference type
2989: type qualifiers are ignored (underlying type is a reference)
2990: <entity>, declared using a local type, must be defined in this translation unit
2991: <entity>, declared using a type with no linkage, must be defined in this translation unit
2992: the operand of an rvalue reference dynamic_cast must have a complete class type
2993: "= default\" can only appear on default constructors, copy/move constructors, copy/move assignment operators, and destructors
2994: "= delete\" can only appear on the first declaration of a function
2995: %npd cannot be referenced -- it is a deleted function
2996: a lambda is not allowed in an unevaluated expression
2997: __builtin_va_arg_pack/__builtin_va_arg_pack_len can appear only in an inline function with an ellipsis parameter
2998: "= default\" cannot be specified on a friend declaration
2999: expected a C++ keyword
3000: this cast to an rvalue reference type is invalid because the underlying type %t is incomplete
3001: offset is not constant
3002: unrecognized #pragma comment type <entity>
3003: option to control whether "auto\" is a type specifier can be used only when compiling C++
3004: option to control whether "auto\" is a storage class can be used only when compiling C++
3005: the type specifier and storage class specifier meanings of "auto\" cannot both be disabled
3006: invalid string in #pragma comment
3007: deleted function overrides nondeleted %n
3008: nondeleted function overrides deleted %n
3009: the default constructor of %t cannot be referenced -- it is a deleted function
3010: an rvalue reference is not allowed as a catch type
3011: default arguments of <entity> is incompatible with a declaration in another translation unit
3012: default arguments of <entity> were different during compilation of <entity>
3013: %nI cannot be specialized because it is deleted
3014: initializer for <entity> is different in another translation unit
3015: initializer for <entity> was different during compilation of <entity>
3016: a designator into a template-dependent type is not allowed
3017: unrecognized conformance kind
3018: expected "on" or "off"
3019: #pragma conform(forScope) stack is empty
3020: no previous #pragma conform(forScope) entry matches <entity>
3021: forScope behavior is nonstandard
3022: forScope behavior is standard
3023: function \"main\" cannot be deleted
3024: type qualifiers are meaningless here
3025: invalid type for defaulted assignment operator
3026: function templates cannot be defaulted
3027: invalid type for defaulted constructor
3028: function call requires one argument
3029: function call requires a real floating-point argument
3030: a copy constructor with a default argument cannot be defaulted
3031: a predeclared function cannot be deleted
3032: %nfd, required for copy that was eliminated, cannot be referenced -- it is a deleted function
3033: nonstandard first parameter <entity> of "main", expected "int"
3034: nonstandard number of parameters for "main", expected zero or two parameters
3035: nonstandard second parameter <entity> of "main", expected "char *[[]" or "char **"
3036: %sT was specified as both a system and non-system include directory -- the non-system entry will be ignored
3037: option to control move constructors and move assignment operators can be used only when compiling C++
3040: error while deleting file <entity>: <entity>
3041: volatile type qualifier ignored for variables with __global_reg storage class
3042: detected use of ARM inline assembly in a Thumb function; automatically promoted function to ARM
3043: automatic promotion of functions to ARM is deprecated; use \"#pragma arm\" instead
3044: \"#pragma arm\" preceded by incompatible inline assembly
3045: \"#pragma thumb\" preceded by incompatible inline assembly
3046: unfinished IT block
3047: conditional instruction will be emitted as a conditional branch and unconditional instruction
3048: inline assembly not permitted when generating Thumb1 code
3049: SWP instructions are deprecated in architecture ARMv6 and above
3050: FLDMX/FSTMX instructions are deprecated
3051: instruction is unpredictable in the current instruction set
3052: instruction is unpredictable with MSB < LSB
3053: instruction is unpredictable with the specified immediate value
3054: instruction is unpredictable with the specified condition
3055: instruction is unpredictable in IT block
3056: instruction is unpredictable with the specified special register
3057: instruction is unpredictable with the specified PSR mask
3058: immediate not in range <entity>
3059: immediate not a multiple of <entity>
3060: selected target does not have floating-point hardware
1 C and C++ Compiler Errors and Warnings
1.2 List of the armcc error and warning messages

3061: unrecognized instruction opcode
3062: expected "<entity>"
3063: expected flag characters from "<entity>"
3064: expected special register for MSR/MRS
3065: deprecated special register name
3066: deprecated special register field specifier (use "<entity>" instead)
3067: MRS cannot select fields, use APSR, CPSR or SPSR directly
3068: expected a condition code
3069: VCVT conversion between these data types not available
3070: destination operand type or register sort incorrect
3071: source operand type or register sort incorrect
3072: data type specifiers do not match a valid encoding for this instruction
3073: missing data type specifier
3074: expected scalar operand
3075: expected data type specifier "<entity>" for destination operand
3076: expected data type specifier "<entity>" for source operand(s)
3077: writeback with no effect
3078: data type specifiers are not allowed on this instruction
3079: invalid instruction width qualifiers or data type specifiers
3080: unsupported special register
3081: expected end of line or a ";"
3082: option to enable GNU-C89-style inlining can be used only when compiling C
3083: function was previously declared without the "gnu_inline" attribute
3084: the "gnu_inline" attribute is ignored on non-inline functions
3085: anonymous unions are only supported in --gnu mode, or when enabled with #pragma anon_unions
3086: anonymous structs are only supported in --gnu mode, or when enabled with #pragma anon_unions
3087: anonymous structs are only supported in --gnu mode, or when enabled with #pragma anon_unions
3088: __stack_chk_guard must be data
3089: __stack_chk_fail must be a function
3090: value of constant expression must fit fully within the bitmask <mask>
3091: a trailing return type requires the "auto" type specifier
3092: a trailing return type cannot appear in a nested declarator
3093: a function declarator with a trailing return type must be preceded by a simple "auto" type specifier
3094: "auto" function requires a trailing return type
3095: a member template cannot have a pure specifier
3096: std::nullptr_t converted to bool
3097: attribute <attribute> does not allow an empty argument list
3098: attribute <attribute> does not apply here
3099: attribute <attribute> does not apply to bit fields
3100: attribute <attribute> requires a bit field
3101: attribute <attribute> does not apply to member functions
3102: attribute <attribute> requires a member function
3103: attribute <attribute> does not apply to virtual functions
3104: attribute <attribute> requires a virtual function
3105: attribute <attribute> does not apply to pure virtual functions
3106: attribute <attribute> requires a pure virtual function
3107: attribute <attribute> does not apply to register variables
3108: attribute <attribute> requires a register variable
3109: attribute <attribute> did not appear on original declaration
3110: attributes are not allowed here
3111: attribute <attribute> must appear in a class definition
3112: "final" applied to a pure virtual function
3123: cannot override "final" <entity>
3124: <entity> previously declared without the carries_dependency attribute
3125: invalid initializer for array <entity>
3126: must specify C++11 mode when building runtime library
3127: attribute <attribute> does not apply to function types
3128: attribute <attribute> requires a function type
3129: attribute <attribute> does not apply to nonstatic member functions
3130: attribute <attribute> does not apply to automatic variables
3131: attribute <attribute> requires an automatic variable
3132: attribute <attribute> does not apply to a variable or function with external linkage
3133: attribute <attribute> requires a local variable
3134: attributes ignored here
3135: attribute does not apply to any entity
3136: bad attribute argument substitution
3137: the argument of the "tls_model" attribute must be "global-dynamic", "local-dynamic", "initial-exec", or "local-exec"
3138: the declaration <entity> specified a different "tls_model" argument
3139: attribute <attribute> does not apply to inline functions
3140: attribute <attribute> requires a inline function
3141: both file names in an include_alias pragma must use the same delimiter characters
3142: comparison between signed and unsigned operands
3143: attribute <attribute> ignored on unnamed type
3144: attribute <attribute> ignored because no definition follows
3145: thread locality is incompatible with a previous declaration of <entity>
3146: this enclosing-function local variable cannot be referenced in this lambda body because an enclosing lambda does not allow implicit captures
3147: this attribute argument contains unmatched parentheses, brackets, or braces
3148: a call to __builtin_fpclassify requires five integral arguments followed by one floating-point argument
3149: the last argument in a call to __builtin_fpclassify must have a real floating-point type
3150: alignment cannot be set to less than the default alignment
3151: attributes are not allowed on explicit instantiations
3152: attribute <attribute> does not apply to a definition
3153: attribute <attribute> requires a definition
3154: standard attributes cannot appear on friend declarations that are not definitions
3155: specified alignment (<n>) is different from alignment (<n>) specified on a previous declaration
3156: alignment attribute must also appear on definition <entity>
3157: <entity> may not be used in the type-id of the alias-declaration
3159: <type> cannot be transparent because its first field has a floating-point type
3160: <type> cannot be transparent because its first field is a bit field
3161: virtual function of a "base_check" class overrides a base class member but lacks the "override" attribute
3162: "hiding" attribute specified on a declaration that does not hide a base class declaration
3163: "hiding" attribute specified on a declaration referred to by the using-declaration <entity>
3164: attribute "hiding" is required on a declaration (in a "base_check" class) that hides <entity>
3165: <entity> is not defined in this translation unit but depends on a local type
3166: <entity> is not defined in this translation unit but depends on a type with no linkage
3167: attribute <attribute> is missing in another translation unit
3168: attribute <attribute> conflicts with another translation unit
3169: the "nonstd_gnu_keywords" option is only valid in GNU C and GNU C++ modes
3170: use of a const variable in a constant expression is nonstandard in C
3171: an initializer cannot be specified for a flexible array member with automatic storage duration
3173: a "final" class type cannot be used as a base class
3174: exported templates are no longer in the standard C++ language
3175: a template-dependent designator is not allowed
3176: second operand of offsetof may not be a field with reference type
3177: long lifetime temporaries are incompatible with other requested newer language features
3178: wide character string literal will not be quoted in diagnostics
3179: missing arguments for attribute <attribute>
3180: options "c++11" and "c++11 sfinae" require a different compiler configuration
3181: template parameter pack not at end of parameter list
3182: a parameter pack declaration is not allowed here
3183: a parameter pack cannot have a default
3184: C++/CLI can be enabled only in Microsoft C++ mode
3185: "value__" cannot be used as the name of an enumerator constant (it is a reserved name in this context)
3186: an explicit enumerator value is required in an enumeration type with boolean underlying type
3188: parameter pack <entity> was referenced but not expanded
3189: pack expansion does not make use of any argument packs
3190: pack %sq does not have the same number of elements as %sq2
3192: vector_size attribute is not allowed with an enumeration type
3193: a property cannot be both static and virtual
3194: an indexed property cannot be trivial
3195: this declaration cannot appear in a property definition
3196: a qualified function type cannot be used to declare an accessor function
3197: an accessor function cannot have an ellipsis parameter
3198: a "get" accessor was already declared for this property <property>
3199: a "set" accessor was already declared for this property <property>
3200: a "get" accessor cannot have a parameter
3201: return type of "get" accessor does not match property type
3202: return type of "set" accessor must be void
3203: a property cannot declare an empty list of indices
3204: a property index cannot have type void
3205: index type does not match the corresponding parameter in the "set" accessor
3206: index type does not match the corresponding parameter in the "get" accessor
3207: index type is missing in the "set" accessor
3208: index type is missing in the "get" accessor
3209: "set" accessor is missing its value parameter
3210: accessor function has too many parameters
3211: the last parameter of the "set" accessor does not match the property type
3212: %sq requires C++/CLI mode
3213: error in Win32 API "<entity>": <entity>
3214: #using may only be used at global scope
3216: member name %sq is reserved by %nd
3217: expected a "[
3218: C++/CLI mode requires microsoft_version => 1600
3219: a default-indexed property cannot be static
3220: a property accessor cannot be both static and virtual
3221: a top-level visibility specifier cannot appear on a nested type declaration
3222: a top-level visibility specifier requires a type definition
3223: a trivial property cannot have a reference type
3224: a trivial property cannot have a const or volatile type
3225: %nd was previously declared as a different kind of enumeration type
3226: a variable captured by a lambda cannot have a managed class type
3227: virtual function overriding with a covariant return type is not allowed in a managed class
3228: array of handles is not allowed
3229: handle to array is not allowed
3230: handle to function is not allowed
3231: handle to void is not allowed
3232: a field cannot be a tracking reference
3233: a variable with static storage duration cannot have a ref class type
3234: a managed class cannot be unnamed
3235: a managed class cannot be local
3236: %nd was previously declared as a different kind of class
3237: <entity> was previously declared as a different kind of class template
3238: literal data members can only be members of managed classes
3239: a literal data member must be initialized
3240: const has no effect on a literal data member
3241: a managed class cannot be local
3242: initonly data members can only be members of managed classes
3243: const has no effect on an initonly data member
3244: <entity> has no "get" accessor
3245: <entity> has no "set" accessor
3246: a static constructor cannot have parameters
3247: a static constructor cannot be a member template
3248: a compound lvalue is not allowed as an asm output operand
3249: properties can only be members of managed classes
3250: a type qualifier is not allowed on a member function of a managed class
3251: an ordinary pointer to a C++/CLI ref class or interface class is not allowed
3252: an ordinary reference to a C++/CLI ref class or interface class is not allowed
3253: override specifier does not name a base class member function
3254: override specifier designates a nonvirtual member <entity>
3255: member function overrides <entity> which is already overridden by <entity>
3256: at most one visibility specifier is allowed
3257: type <type> used for delegate definition is not a function type
3258: delegate member types can only be members of managed classes
3259: a tracking reference to a delegate type is not allowed
3260: a delegate type is not allowed here
3261: this pack expansion produced an empty list of expressions, and an expression is needed here
3262: an event cannot be both static and virtual
3263: events can only be members of managed classes
3264: this declaration cannot appear in an event definition
3265: event type must be a handle-to-delegate type
3266: an \"add\" accessor was already declared for this event %p
3267: a \"remove\" accessor was already declared for this event %p
3268: a \"raise\" accessor was already declared for this event %p
3269: an event accessor cannot be both static and virtual
3270: return type of "add" and "remove" accessors must be void
3271: event accessor is missing its value parameter
3272: accessor function has too many parameters
3277: the type <entity> of the parameter of the event accessor does not match the event type (<entity>)
3278: the type of the "raise" accessor does not match the event's delegate invocation type
3279: an event definition must include both "add" and "remove" accessors
3280: a static conversion function must accept exactly one argument
3281: static operator must have a parameter type T, T&, T%%, or T^ with T = %t
3282: the operand of sizeof... must be a parameter pack name
3283: the sizeof... operator can be used only in a variadic template
3284: event name cannot appear here
3285: a handle to a non-managed class is not allowed
3286: a handle to an unscoped enum type is not allowed
3287: "property" attribute not allowed in managed class
3288: a pure specifier ("\"= 0\") followed by a definition is nonstandard
3289: the managed nullptr type cannot be used here
3290: the "&" operator cannot be used to take the address of an object with a ref class type
3291: array of managed class is not allowed
3292: a variable with static storage duration cannot have a handle or tracking reference type
3293: a variable captured by a lambda cannot be a handle or tracking reference
3294: a C++/CLI parameter array requires a handle to a one-dimensional CLI array type
3295: could not import metadata from file %sq
3296: the cli namespace cannot be extended
3297: the element type of a cli::array must be a handle or value type
3298: invalid number of dimensions for cli::array type
3299: a cli::interior_ptr/cli::pin_ptr must point to a standard class, a value class, an integer, a handle, or a standard pointer
3300: <type> cannot be a class member
3301: a parameter of type cli::pin_ptr is not allowed
3302: invalid finalizer declaration
3303: a finalizer may not have parameters
3304: a type qualifier is not allowed on a finalizer
3305: a return type may not be specified on a finalizer
3306: a using-declaration may not name a finalizer
3307: a finalizer name must be qualified
3308: qualifier of finalizer name <entity> does not match type <type>
3309: <entity> cannot be used to name a finalizer (a type name is required)
3310: invalid finalizer name for type %
3311: finalizer reference is ambiguous -- both <entity> and <entity> could be used
3312: a finalizer can only be a member of a ref class
3314: type used as finalizer name does not match type %
3315: a finalizer does not exist for this type
3316: the "%%" operator can be used only on an object with a managed class type
3317: a pointer, handle, or reference to a cli::interior_ptr is not allowed
3318: a pointer, handle, or reference to a cli::pin_ptr is not allowed
3319: a pointer or reference to a C++/CLI array is not allowed
3320: a C++/CLI array type is not allowed here
3321: a C++/CLI ref class can only derive from a ref class or from interface classes
3322: a C++/CLI value class can only derive from interface classes
3323: a C++/CLI interface class can only derive from interface classes
3324: a ref class can have at most one direct ref base class (%t is already such a base)
3325: a standard class cannot derive from a managed class
3326: a managed class cannot have a virtual base
3327: a managed class cannot have a "private" or "protected" base
3328: the "override" modifier requires a virtual function declaration with an explicit "virtual" keyword
3329: the "abstract" modifier requires a virtual function declaration with an explicit "virtual" keyword
3330: the "sealed" modifier requires a virtual function declaration with an explicit "virtual" keyword
3331: a named override specifier requires a virtual function declaration with an explicit "virtual" keyword
3332: a cli::pin_ptr return type is not allowed
3333: attribute <entity> applies in C++/CLI mode only
3334: a simple (non-tracking) reference cannot be bound to an entity on the managed heap
3336: "%s" not loaded from default assemblies
3337: list initialization syntax is a C++11 feature
3338: operand of sizeof may not be a ref class type or interface class type
3339: invalid number of subscripts for this cli::array type
3340: a pointer-to-member is not valid for a managed class
3341: private virtual member function of managed class is not "sealed"
3342: modifier is not allowed on a destructor
3343: modifier is not allowed on a finalizer
3344: "virtual" has no effect on a destructor of a managed class
3345: "new" or "override" is required because this declaration matches <entity>
3346: "new" or "virtual" is required because this declaration matches <entity>
3347: "new" or "override" are not valid here because the matching %nd is a member of an interface
3348: "new" modifier without a matching base ref class member
3349: %nd overridden with reduced access
3350: a reference of type %t1 cannot be initialized with a value of type %t2
3351: a copy constructor cannot be declared in a value class
3352: a default constructor cannot be declared in a value class
3353: a destructor cannot be declared in a value class
3354: an assignment operator cannot be declared in a value class
3355: non-value class %t cannot be the type of a member of a value class
3356: option "cppccl" requires a different compiler configuration
3357: exception specifications are not allowed on member functions of managed classes
3358: a managed class cannot declare a friend
3361: a local class definition is not allowed in a member function of a managed class
3362: a local lambda is not allowed in a member function of a managed class
3363: a member function of a C++/CLI interface type cannot have a definition
3364: a property definition must include at least one accessor ("get" or "set")
3365: default-indexed property conflicts with %nd
3366: <entity> cannot be used because it follows a parameter pack and cannot be deduced from the parameters of <entity>
3367: this pack expansion produced more than one expression, and a single expression is needed here
3368: type must correspond to System::Boolean, System::Byte, System::SByte, System::Int16, System::UInt16, System::Int32, System::UInt32, System::Int64, or System::UInt64
3369: call of an object of a handle type without appropriate operator() or conversion functions to pointer-to-function type
3370: an unnamed parameter pack declaration cannot be parenthesized
3371: variadic templates can be enabled only when compiling C++
3372: property definition conflicts with <entity>
3375: a generic parameter cannot have a default
3376: a generic can only have type parameters
3377: to be used with "for each" statements, type <entity> must provide nonstatic member function <entity>
3378: "for each" cannot use member <entity> because it is static
3379: in this "for each" statement, no instance of %no is callable with an empty argument list
3380: "for each" cannot use member function "MoveNext" because the return type is invalid
3381: a "for each" statement cannot operate on an expression of type <entity>
3382: to be used with "for each" statements, type <entity> must provide a non-indexed property <property>
3384: in this "for each" statement, <entity> is not a valid enumerator (returned by "GetEnumerator" of <entity>)
3385: expected "in"
3386: class % has no suitable assignment operator (after operator synthesis)
3387: %sq is not a generic parameter
3388: <entity> is not a generic parameter of the innermost generic parameter list
3389: invalid generic constraint
3390: invalid use of event member (only subscription, unsubscription, and invocation are allowed)
3391: invoking an event with no "raise" accessor is invalid
3392: only "+=" and "-=" are valid for events
3393: typeid of a managed type is not allowed
3394: CLI typeid of a managed pointer type is not allowed
3395: name followed by "::typeid" must be a type name
3396: a member %sq of this type is reserved within a managed class -- destructor intended?
3397: a member <entity> of this type is reserved within a managed class -- finalizer intended?
3398: System::IDisposable::Dispose is missing or invalid
3399: System::Object::Finalize is missing or invalid
3400: <entity> does not override System::Object::Finalize
3401: the operand of a handle dynamic_cast must be a handle to a complete class type
3402: the operand of a tracking-reference dynamic_cast must be an lvalue of a complete class type
3403: the type in a dynamic_cast to a handle or tracking reference type must refer to a complete class
3404: an interior pointer cannot be cast to a native pointer
3405: explicit conversion operators can only be declared in ref and value class types
3406: explicit conversion operator cannot be virtual
3407: expression must have arithmetic or unscoped enum type
3408: expression must have arithmetic, unscoped enum, or pointer type
3409: expression must have integral or unscoped enum type
3410: expression must have integral, unscoped enum, or fixed-point type
3411: a built-in binary operator applied to a scoped enumeration requires two operands of the same type
3412: gcnew cannot allocate an entity of type <entity>
3413: placement syntax cannot be used with gcnew
3414: new can only be used with simple value types
3415: new cannot be used on a managed class (gcnew should be used instead)
3416: new cannot be used on a handle type
3417: gcnew for a C++/CLI array must have a new initializer or an array initializer
3418: an array initializer can only be used to initialize a C++/CLI array type
3419: gcnew does not allow auto
3420: too many array bounds
3421: too few array bounds
3422: too few arguments for <entity>
3423: too many arguments for <entity>
3425: no declaration of <entity> accepts the number of generic arguments supplied
3426: invalid delegate initializer -- must be a function
3427: invalid delegate initializer -- more than one function matches the delegate type
3428: invalid delegate initializer -- function does not match the delegate type
3429: invalid delegate initializer -- an object is needed in addition to a function
3430: invalid delegate initializer -- function is not a member of a managed class
3431: invalid delegate initializer -- object is not needed for the specified function
3432: invalid delegate initializer -- object has type %t1 but type %t2 is expected
3433: taking the address of a member function of a managed class is not allowed
3434: invalid delegate initializer -- expected either "(<function-address>)" or "(<object-handle>, <member-address>)"
3435: class fails to implement interface member %nd
3436: gcnew cannot be used to allocate a native array
3437: a C++/CLI interface class cannot declare an assignment operator
3438: a C++/CLI interface class cannot be sealed
3439: a destructor or finalizer declaration cannot include a named override specifier
3440: an override specifier cannot designate a destructor or finalizer
3441: a named override specifier is allowed only in a managed class
3442: no member designated by the named override specifier matches the type of this member
3443: a static constructor declaration cannot include a named override specifier
3444: a scoped enumeration type must have a name
3446: transfer of control into a finally block is not allowed
3447: return statement inside a finally block is not allowed
3448: try block requires at least one handler or finally clause
3449: a managed object must be thrown by handle
3450: a managed object must be caught by handle
3451: a break statement cannot be used in a finally block
3452: a continue statement cannot be used in a finally block
3453: builtin offsetof cannot be used when subscripting is overloaded
3454: duplicate constraint
3455: more than one class constraint: %t1 and %t2
3456: more than one constraint clause for %n
3457: initonly static data members must have an initializer or be initialized in a static constructor
3458: GNU attributes on a template redeclaration have no effect
3459: GNU attributes on a template redeclaration have no effect (the attributes of the original declaration <entity> apply instead)
3460: a C++/CLI parameter array must be the last parameter
3461: a function with a C++/CLI parameter array cannot have default arguments
3462: a C++/CLI parameter array cannot be followed by an ellipsis parameter
3463: a C++/CLI parameter array is not allowed in an operator function parameter list
3464: __inline and __forceinline are not allowed here
3465: a data member cannot have a C++/CLI interface class type
3466: a variable cannot have a C++/CLI interface class type
3467: a parameter cannot have a C++/CLI interface class type
3468: a function return type cannot be an C++/CLI interface class type
3469: an array of generic parameter type is not allowed
3470: a pointer, handle, or reference to a generic parameter type is not allowed
3471: an initonly field cannot have a ref class type
3472: a reference cannot be bound to an initonly field
3473: taking the address of an initonly field is not allowed
3474: an initonly field can only be modified by the instance constructor of its containing class
3475: a static initonly field can only be modified by the static constructor of its containing class
3476: member function will be invoked on a copy of the initonly field
3477: expression must have pointer or handle type
3478: a move constructor or move assignment operator is used to copy an lvalue here, which may destroy the source object
3479: member selection on a C++/CLI generic entity must use the "->" syntax, not "."
3480: a ref class type cannot derive from <type>
3481: a generic class must be managed (i.e., a ref class, a value class, or an interface class)
3482: a sealed class cannot be used as a constraint
3483: the type in a dynamic_cast cannot be a generic type that might be a value type
3484: a universal character name must designate a valid code point
3485: generic constraints do not match those of <entity>
3486: __underlying_type only applies to enumeration types
3487: expected only one operand expression for this cast
3488: Unicode character with hex value <value> not representable in the system default code page
3489: nonstandard conversion of bound pointer-to-member to a function pointer
3490: access specifier <entity> is deprecated -- use <entity> instead
3491: a static accessor function is not permitted in a nonstatic property or event definition
3492: <type> has both a value class and ref class constraint
3493: <type> and <type> involve circular naked type constraints
3494: <type> is not a valid type constraint
3495: precompiled header file %sq not used (because it is incomplete)
3496: % is not a valid generic argument
3497: assembly_info attribute applied to an invalid type
3498: <type> does not satisfy the ref class constraint of generic parameter <type>
3499: <type> does not satisfy the value class constraint of generic parameter <type>
3500: %t1 does not satisfy the gcnew constraint of generic parameter %t2 because it is abstract
3501: %t1 does not satisfy the gcnew constraint of generic parameter %t2 because it does not have a public default constructor
3502: generic parameter %t1 does not satisfy the gcnew constraint of generic parameter %t2 because it does not have the gcnew constraint
3503: <entity> does not satisfy the <entity> type constraint of generic parameter <entity>
3504: constraint on generic parameter <type> differs from previous declaration (<entity>)
3505: a member of a managed class cannot be a standard array
3506: a member of a non-managed class cannot be a handle
3507: a member of a non-managed class cannot be a tracking reference
3508: unsafe reinterpret_cast of handle
3509: a template argument may not reference a generic type parameter
3510: an expression list is not allowed in this subscript operation (use parentheses around a top-level comma operator)
3511: expression must have pointer-to-object or handle-to-CLI-array type
3512: unrecognized attribute <entity>
3513: a member of a managed class cannot be of a non-managed class type
3514: a member of a non-managed class cannot have a ref class type or interface class type
3516: a delegate may not be declared as a template
3517: a generic cannot be explicitly specialized
3518: a generic cannot be declared in a class template
3519: a template cannot be declared in a generic class
3520: a literal field cannot be declared "static"
3521: "long float" is a nonstandard extension -- use "double" instead
3522: a standard class cannot be nested in a managed class
3523: __clrcall is valid only in C++/CLI mode
3524: __clrcall not allowed on function with ellipsis parameter
3525: <entity> is not allowed here
3526: a trivial property or event cannot be used to override <entity>
3527: expected an iterator variable name
3528: the iterator type in this "for each" statement is %t, which is not a pointer type or an iterator-like class type
3529: the iterator type in this "for each" statement is <entity>, which is not a pointer type or an iterator-like class type
3530: the iterator type in this "for each" statement is %t, which is not a pointer type or an iterator-like class type
3531: packing attribute on the parent type is ignored for this field of non-POD type <type>
3532: <entity> not implemented because this declaration is not public and has no named override specifier
3533: this declaration is missing the gnu_inline attribute specified in the previous declaration <entity>
3534: a member function of a managed class cannot have an ellipsis parameter
3535: previously-declared %n invalid as iterator of "for each" statement
3536: calling convention ignored because the function type involves a generic parameter; __clrcall used instead
3537: a function type involving a generic parameter cannot have an ellipsis parameter
3538: "virtual\" is required to override the matching %nd
3539: "virtual\" is required to implement the matching <entity>
3540: an initonly data member cannot be volatile
3541: a member <entity> of this type is reserved within a managed class -- CLR operators must be declared using the keyword "operator"
3542: a tracking reference to non-const cannot be bound to a constant
3543: attributes ignored here because they do not apply to a declared entity
3544: a tracking reference to System::String is not allowed
3545: invalid use of a generic class <type> with pending constraints (probably caused by an invalid metadata file)
3546: a pending constraint clause is only allowed for generic class declarations (but not generic class definitions)
3547: empty initializer list not allowed here
3548: a template cannot be declared in a managed class
3549: a generic declaration is not allowed here
3550: interface types cannot have member generics
3551: Unicode character not Latin-1, truncated to low-order byte
3552: to be used with range-based "for" statements, type <type> must provide function <entity>
3553: the iterator type in this range-based "for" statement is <entity>, which is not a pointer type or an iterator-like class type
3554: the iterator type in this range-based "for" statement is <entity>, which is not a pointer type or an iterator-like class type
3555: the iterator type in this range-based "for" statement is <entity>, which is not a pointer type or an iterator-like class type
3556: a range-based "for\" statement cannot operate on an array of unknown size or incomplete type %
3557: return types for "begin" and "end" functions used in a range-based "for" statement must be the same ("begin" return type is <entity>, "end" return type is <entity>)
3558: <entity>, required to destroy temporary that was eliminated, is inaccessible
3559: in this range-based "for" statement, no instance of <entity> matches the argument list
3560: this range-based "for" statement requires a suitable <entity> function and none was found
3561: this "for each" statement requires a suitable <entity> function and none was found
3562: <entity> has a metadata representation not representable using C++/CLI
3563: expected "..."
3564: <type> in __implements list is not an interface
3565: an __implements list must precede virtual function declarations
3566: <type> specified "__implements ..." in its list of bases, but is missing a matching __implements list
3567: the result of dereferencing a handle to a ref or interface class type must be used
3568: expected a ")"; pragma ignored
3569: a using-declaration or access declaration cannot appear in a managed class
3570: Note: %nd could have been called but was not considered because it is inaccessible
3571: an abstract member function of a C++/CLI managed class cannot have a definition
3572: declaring this unary "operator*" can change the meaning of dereferencing a handle (use static member operators to explicitly indicate applicable types)
3573: an interface class cannot contain a nonstatic data member
3574: #pragma GCC system_header cannot be used in the primary source file
3575: %n is too large to be inlined
3576: option to control move operations can be used only when compiling C++
3577: move operations cannot be generated when rvalue constructors are copy constructors
3578: option to control move operations cannot be used when rvalue references are disabled
3579: "final" cannot be used for managed classes (use "sealed" instead)
3580: a cast to CLI interface class <entity> is not allowed -- cast to handle intended?
3581: cannot create an object of a CLI interface class
3582: this declaration hides the nonstandard declaration of <entity> because the underlying types are incompatible
3583: pointer comparison result is constant, because operand can never be null
3584: an object of the incomplete type <type> cannot be value-initialized
3585: a reference cannot be value-initialized
3586: expected a "{" or a "{" not a copy-list-initialization
3587: copy-list-initialization cannot use a constructor marked "explicit"
3588: pointer to member of type void is not allowed
3589: pointer to member of reference type is not allowed
3590: a brace-enclosed list is not allowed here
3591: an operator->* member is not allowed in a managed class
3592: assembly metadata refers to non-existent assembly
3593: attribute <entity> conflicts with earlier attribute <entity>
3594: <entity> was previously declared with a different base type
3595: "enum class" and "enum struct" cannot be used here (use plain "enum" instead)
3596: only one level of braces is allowed on an initializer for an object of type <type>
3597: <entity> cannot be used as an enumeration type name
3598: in a lambda with an implicit return type, all return statements must return the same type
3599: a braced-initializer cannot be used with "new auto"
3617: the definition of std::initializer_list does not contain the expected
creator
3618: declaration hides <entity>
3619: invalid template parameter list for std::initializer_list (it should be one
ordinary type parameter with no default)
3620: a brace-enclosed list cannot be passed for an ellipsis parameter
3621: an #include <initializer_list> is needed prior to a use of
std::initializer_list, including an implicit use
3622: the "inline" keyword cannot be used on a namespace alias declaration
3623: the previous declaration of <entity> was not declared inline
3624: a redeclaration of inline <entity> must be declared inline
3625: the first argument must be an integer constant
3626: a designator cannot be used with a non-aggregate type <entity>
3627: a designator for an anonymous union member can only appear within braces
corresponding to that anonymous union
3628: function prototype tags can only be enabled when compiling C
3629: braces cannot be omitted for this subobject initializer
3630: invalid narrowing conversion from <type> to <type>
3631: invalid narrowing conversion from <type> to <type> : constant value does not fit
in destination type
3632: cast to incomplete array type <type> is not allowed
3633: invalid narrowing conversion from <type> to <type> : constant value cannot be
represented exactly in destination type
3634: a parenthesized initializer for a non-class entity must be an expression, not a
brace-enclosed list
3635: a brace-enclosed list does not provide a return type for this lambda
3636: the declared exception specification is incompatible with the generated one
3637: scoped enumeration types are a C++11 feature
3638: a function type cannot be value-initialized
3639: list-initialization of an object type <type> is not allowed because the type is
incomplete
3640: std::initializer_list has a destructor, and is not supposed to -- library is
misconfigured
3641: explicit enum base types are a C++11 feature
3642: this constant expression has type <entity> instead of the required <entity>
type
3643: a "new" of an std::initializer_list object is unlikely to work as expected
because the underlying array will be destroyed at the end of the full expression
3645: "noexcept" is ignored on a function type that is not the type of a function
declaration
3646: "defined" is always false in a macro expansion in Microsoft mode
3647: <type> cannot be the element type of an initializer list because it is not a
complete object type
3648: mismatched delimiters in default argument expression
3649: nonstandard conversion of pointer-to-member to a function pointer
3650: dynamic exception specifications are deprecated
3651: <entity> cannot be partially specialized in the current scope
3652: <entity> was previously declared constexpr
3653: <entity> was previously not declared constexpr
3654: a constexpr variable declaration must be a definition
3655: "constexpr" is not valid here
3656: a constexpr function must contain exactly one return statement
3657: statement may not appear in a constexpr function
3658: statement may not appear in a constexpr constructor
3659: a function cannot be both constexpr and virtual
3660: a constexpr function cannot have a nonliteral return type %t
3661: a constexpr function cannot have a parameter of nonliterals type <type>
3662: unsequenced uses of <entity> in expression may produce undefined results
3663: the optional third argument of a call to __builtin_assumed_aligned must have integral type
3664: a destructor cannot be constexpr
3665: address supplied for mmap must be aligned on a page boundary:
3666: the body of a constexpr constructor cannot be a function try block
3667: constexpr <entity> provides no initializer for:
3669: calling the default constructor for <type> does not produce a constant value
3670: the default constructor for <type> is not constexpr
3671: a constexpr variable must have a literal type or a reference type
3672: a constructor for a class with virtual bases cannot be constexpr
3673: function call must have a constant value in a constant expression
3674: function "main" may not be declared constexpr
3675: a constexpr member function is only permitted in a literal class type
3676: a class or enumeration type definition cannot appear in a constexpr function or constructor body
3677: only GNU-style attributes are permitted here
3678: nonstandard use of "auto" to both deduce the type from an initializer and to announce a trailing return type
3679: declaring a void parameter list with a qualified void type is nonstandard
3680: the qualifier on this local declaration is ignored
3681: this constant expression has type <type> instead of the required <type> type
3682: an instantiation of __bases or __direct_bases requires a class type
3683: the argument of __bases and __direct_bases must be a type template parameter
3684: <entity> can only be used in template contexts
3685: constexpr function return is non-constant
3686: constexpr constructor calls non-constexpr <entity>
3687: constructor cannot be constexpr because the initializer of <entity> is not a constant expression
3688: non-constant initializer for constexpr constructor
3689: the generated default constructor for <type> cannot be used in an initializer for its own data member
3690: instantiation of initializer of <entity> depends on its own value
3691: defaulted default constructor cannot be constexpr because the corresponding implicitly declared default constructor would not be constexpr
3692: expression not folded to a constant due to excessive constexpr function call nesting (possible infinite recursion)
3693: invalid binary number
3694: a union can have at most one field initializer -- <entity> also has an initializer
3695: a constexpr static data member cannot be declared with an incomplete type <type>
3696: constexpr constructor of a union must initialize one of its fields
3697: constexpr constructor fails to initialize an anonymous union (defined <entity>)
3698: a constexpr static data member declaration requires an in-class initializer
3699: maximum constexpr depth/count options can be used only when compiling C++
3700: expression not folded to a constant due to excessive constexpr function call complexity
3701: unrestricted union options can be used only when compiling C++
3702: constexpr constructor must initialize direct base class <type>
3703: creation of an std::initializer_list object in a field initializer is unlikely to work as expected because the underlying array will be destroyed at the end of the full expression
3704: "this" cannot be used in a constant expression
3705: an empty initializer is not valid for this union type (which member should be initialized is ambiguous)
3706: "constexpr" is not allowed on an explicit instantiation directive
3707: cannot determine the exception specification of the default constructor due to a circular dependency
3708: anonymous union defined <entity>
3709: this constructor uses the initializer of <entity>, which would result in unbounded recursion
3710: anonymous union defined <entity> cannot be default-initialized because it has a deleted default constructor or destructor
3711: an initializer is not allowed on a local declaration of an extern variable
3712: an initializer is not allowed on a local declaration of a named register variable
3713: expression is not constant due to a dangling pointer (points to a temporary whose lifetime has ended)
3714: unrestricted unions cannot be enabled in Microsoft mode
3715: constructor delegates directly or indirectly to itself
3716: a delegating constructor cannot have other mem-initializers
3717: a ref-qualifier is not allowed here
3718: overloading two member functions with the same parameter types requires that they both have ref-qualifiers or both lack ref-qualifiers
3719: invalid character in raw string delimiter -- raw string indicator ignored
3720: parenthesis terminating raw string delimiter not found after 16 characters -- raw string indicator ignored
3721: ending delimiter for raw string not found
3722: a parameter pack must be the final template argument in a partial specialization
3723: a pointer-to-member function with type %t can only be used with an lvalue object
3724: a pointer-to-member function with type %t can only be used with an rvalue object
3725: the parameter of this defaulted copy-constructor cannot be const because a base or member copy constructor parameter is non-const
3726: the parameter of this defaulted assignment operator cannot be const because a base or member copy assignment parameter is non-const
3727: an anonymous union must contain at least one nonstatic data member
3728: option "delegating_constructors" requires a different compiler configuration
3729: delegating constructors are not permitted with both of --cpp_compatible and --exceptions
3730: section name conflicts with previous declaration %s
3731: intrinsic is deprecated
3732: use of this instruction in inline assembler is deprecated
3733: __irq functions cannot be generated for this architecture
C4001E: R%ld corrupted but possibly reused later. This code may not work correctly
C4002W: illegal unaligned load or store access - use __packed instead
C4003E: FPU %s is incompatible with selected CPU option
C4004E: apcs /interwork is only allowed when compiling for processors that support Thumb instructions
C4005E: specified processor or architecture does not support Thumb instructions
C4006E: specified processor or architecture does not support ARM instructions
C4007E: Uninitialised or corrupted use of PSR. This code may not work correctly
C4008W: splitting LDM/STM has no benefit
   Inappropriate use of the switch --split_ldm. This option has no significant benefit for cached systems, or for processors with a write buffer.
C4009E: unsupported CPU <entity>
C4010W: -g defaults to -O2 if no optimisation level is specified
C4011W: support for --apcs /adsabi is deprecated
C4013W: support for --apcs {option|%s} is deprecated
C4014W: software stackchecking is no longer supported
C4016W: unknown option '-<entity><entity>': ignored
C4017W: <entity> may be used before being set

The compiler performs data flow analysis at optimization level -O1 and above. You can use this information to identify potential problems in the code such as variables being used before being set. However, this is really a by-product of optimization rather than a feature in its own right. The data flow analysis that detects variables being used before being set only analyzes hardware register use, that is, variables that are held in processor registers. It does not analyze variables or structures that are allocated on the stack, that is, stored in memory rather than in processor registers.

As code (and also register memory usage) generated by the compiler varies with the level of optimization, the warning might appear for code compiled at one level of optimization but not others. You might see it, for example, at -O2, but not -O1.

Note

- The data flow analysis is not intended to be a fully complete feature. You must only treat C4017W warnings given by the compiler as a guide, and not rely on them to identify faulty code reliably. The compiler never provides as much information as a special purpose tool such as Lint.
- In ARM Compiler 5.04 and later, this warning is suppressed by default. To enable it, use --diag_warning=C4017.

C4018W: division by zero: <entity>

Constant propagation shows that a divide or remainder operator has a second operand with value 0. It is an error if execution reaches this expression. The compiler returns a result of 0 for a divide by constant 0.

C4038E: Function too large or complicated to compile (0x<num>)
C4039E: I/O error on object stream: %s
C4041U: I/O error writing '%s': %s
C4047U: Too many errors
C4048U: out of store while compiling with -g. Allocation size was %lu, system size is %lu A storage allocation request by the compiler failed. Compilation of the debugging tables requested with the -g option may require a great deal of memory. Recompiling without -g, or with the program broken into smaller pieces, may help.
C4049U: out of store. Allocation size was %lu, system size is %lu
C4050U: Compilation aborted.
C4051E: couldn't write file '<entity>': <entity>
C4052E: couldn't read file '<entity>': <entity>
C4053W: couldn't read profile '%s': %s
C4054W: couldn't read profile '%s': file does not contain valid profile data
C4056E: bad option '<s>'
C4057E: bad option '<s1> <s2>'
C4065E: type of input file '<entity>' unknown
C4066E: The code space needed for this object is too large for this version of the compiler

Split the source file into smaller pieces.
C4075E: Can't open <entity> for output
C4078E: stdin ('-') combined with other files
C4079E: <entity> command with no effect
C4301W: configuration file appears to be from a newer version of the compiler
The configuration file is one of the XML files supplied to the compiler with the
--arm_linux_config_file switches when using --arm_linux_paths or GCC command-line
translation. For example:

armcc --arm_linux_paths --arm_linux_config_file=arm_linux_config.xml

This warning indicates the file is from a newer compiler so might contain unsupported features.
To avoid incompatibilities, either use the newer version of the compiler that generated the
configuration file, or re-generate the configuration file using your current compiler version.
See the following in the armcc User Guide:

--arm_linux_config_file=path.

--arm_linux_paths.

C4302E: configuration file has an invalid version string
This represents an error reading from or writing to an ARM Linux configuration file.
Do the following:
1. Check that the file can be read from and written to and has valid permissions.
2. Try re-generating the configuration file using --arm_linux_configure.
See the following in the armcc User Guide:

--arm_linux_configure.

C4303E: configuration file was not specified
See the description for error C4302E.

C4304E: I/O error reading configuration file <file>
See the description for error C4302E.

C4305E: I/O error writing configuration file <file>
See the description for error C4302E.

C4306E: could not parse configuration file <file>
See the description for error C4302E.

C4307E: unable to read configuration file
See the description for error C4302E.

C4308W: cannot find system include directory
When using an ARM Linux mode, --arm_linux, --arm_linux_paths, or GCC command-line
translation, set the ARMCC5INC environment variable to install_directory\include. This
ensures that the compiler can find the arm_linux header subdirectory.
See the following in the armcc User Guide:

--arm_linux.

--arm_linux_paths.

See the following in the Getting Started Guide:
Toolchain environment variables.

C4309E: automatic configuration failed - cannot find GCC
This error is produced when you try to automatically configure the tools with
--arm_linux_configure, but GCC cannot be found. Use the --configure_gcc=path_to_gcc
command-line option to specify the path to the GCC executable, such as arm-none-linux-
gnueabi-gcc.
See the following in the armcc User Guide:

--arm_linux_configure.

--configure_gcc=path.
C4310W: automatic configuration is incomplete - cannot determine sysroot path from GCC

The GCC that was used for the ARM Linux configuration process did not provide a valid sysroot path. Use \texttt{--configure_sysroot=sysroot\_path} to set the path.

See the following in the \texttt{armcc User Guide}:

\texttt{--configure_sysroot=path}.

C4311E: automatic configuration failed - cannot find GLD

This error is produced when you try to automatically configure the tools with \texttt{--arm\_linux\_configure}, but the GNU linker (ld) could not be found. Use the \texttt{--configure_gkd=path\_to\_gcc} command-line option to specify the path to the GNU ld executable, such as \texttt{arm-none-linux-gnueabi-ld}.

See the following in the \texttt{armcc User Guide}:

\texttt{--arm\_linux\_configure}.

\texttt{--configure_gcc=path}.

C4312E: automatic configuration failed - could not execute GCC

This error indicates that, when using automatic configuration for ARM Linux by specifying \texttt{--arm\_linux\_configure}, the respective tools (GCC or GNU ld) could not be executed or failed when invoked. Check that they have execute permissions, and your GNU toolchain installation is working correctly.

See the following in the \texttt{armcc User Guide}:

\texttt{--arm\_linux\_configure}.

\texttt{--configure_gcc=path}.

C4313E: automatic configuration failed - could not execute GLD

See the description of error C4312E.

C4314W: gcc command line translation - ignoring option with no translation: <option>

C4315W: gcc command line translation - translation for this command is not fully supported: <option>

C4316W: option is not supported under arm linux: <option>

C4317W: translated cpu or architecture option <option> is not valid

C4318W: unable to read file <file>

C4319W: cannot recognise type of file <file> - file will be ignored

C4320W: cannot find file <file> - file will be ignored

C4321E: automatic configuration failed - could not determine configuration from GCC

When configuring automatically for ARM Linux with \texttt{--arm\_linux\_configure}, the compiler could not determine sufficient information from GCC to produce the configuration. Try a manual configuration by specifying a sysroot path with \texttt{--configure_sysroot} and a path to the GNU C++ header files with \texttt{--configure_cpp_headers}.

See the following in the \texttt{armcc User Guide}:

\texttt{--arm\_linux\_configure}.

\texttt{--configure_cpp_headers=path}.

\texttt{--configure_sysroot=path}.

C4322W: could not accurately determine library configuration from GCC - configuration might be incomplete

C4323E: automatic configuration failed - GCC internal specs configuration report error: <text>
CA324W: could not determine libstdc++ header file path - specify this manually to ensure that C++ code will compile correctly
   The path to the libstdc++ header files could not be determined from GCC. Specify this path with --configure_cpp_headers=path
   See the following in the armcc User Guide:
   --configure_cpp_headers=path.

C4325E: out of memory reading configuration
C4326W: translated floating point option %s is not valid with specified cpu %s
C4327W: cannot determine application entry point function - using <value> as default
C4328W: cannot determine library paths from GNU linker - trying to use defaults
C4329W: option is missing an argument : <option>
C4330E: no Linux library configuration matches the options given
C4331W: script file <file> will be treated as a scatter file
C4332E: I/O error reading via file <file>
C4333E: I/O error closing via file <file>
C4334W: invalid GCC version in configuration file - using default
C4335E: cannot retry because configuration file does not provide path to GNU executable
   Displayed when the ARM Linux configuration file specified for GCC fallback does not include the correct path to gcc.
   See the following in the armcc User Guide:
   Using GCC fallback when building applications.
   -Warmcc,--gcc_fallback.

C4336W: compilation failed - retrying with GNU tools
   Displayed if an armcc compilation fails and GCC fallback is specified. armcc then attempts to run gcc to complete the compilation.
   See the following in the armcc User Guide:
   Using GCC fallback when building applications.
   -Warmcc,--gcc_fallback.

C4337E: compilation with GNU tools also failed
   Displayed if gcc fails during GCC fallback.
   See the following in the armcc User Guide:
   Using GCC fallback when building applications.
   -Warmcc,--gcc_fallback.

C4338W: compilation with GNU tools succeeded
   Displayed when GCC fallback succeeds.
   See the following in the armcc User Guide:
   Using GCC fallback when building applications.
   -Warmcc,--gcc_fallback.
CA339W: ambiguous translation mode options specified - using <option>

You must not specify more than one translation mode option to select a particular translation mode. The translation mode options are:

- --translate_gcc.
- --translate_g++.
- --translate_gld.

See the following in the *armcc User Guide*:

--translate_g++.
--translate_gcc.
--translate_gld.

CA340W: could not obtain license for vectorization (implied by -O3) - defaulting to -fno-tree-vectorize

With GCC command-line translation, -O3 implies vectorization. However, in ARM Compiler 4.1 and earlier, a separate license is required to use the NEON vectorization feature of the compiler. If a NEON vectorization license is not available, the compiler emits this warning and disables vectorization. In ARM Compiler 5.0 and later, a separate NEON vectorization license is not required, so this warning is no longer generated.

See the following in the *Getting Started Guide*:

**Licensed features of ARM Compiler.**

See the following in the *armcc User Guide*:

- Onum.

CA342W: argument '%s' to the '%s' option is not valid
CA343W: hardware floating-point linkage is not compatible with the ARM Linux ABI
CA344E: --library_interface {libopt|%s} is not compatible with software floating point calling convention.
CA345W: I/O error reading file %s : %s
CA346W: I/O error reading or writing temporary file: %s
CA347E: cannot invoke GNU assembler - no path to GNU as was configured
CA348W: multiple -x options are not supported; the first will take precedence
CA349E: invalid GCC version specified
CA350W: GCC version provided on the command line is older than the version of the GCC used for configuration
CA351E: GCC option is not applicable to ARM: %s
CA352E: A GCC emulation mode or --arm_linux_paths must be specified.
CA354E: invalid target triple specified
CA355E: --no_integer Literal pools not yet supported on this architecture
CA356E: Execute only not yet supported on this architecture
CA357W: Loop optimizations can only be enabled at -O3 -Otime or -O2 -Otime --vectorize
CA358E: Execute only is not compatible with {option|%s}
CA359E: Only Thumb state code may be execute only
CA360E: {option1|%s} is not compatible with {option2|%s}
CA365E: Subtool invocation error: {err_str|%s}
CA366W: Vectorization can only be enabled for targets with NEON capability
CA367W: Vectorization can only be enabled at -O3 -Otime or -O2 -Otime
CA368W: Selected target does not support bit-banding
CA443E: __alloca_state not defined
CA446E: Please contact your supplier.
CA4419W: dynamic stack alignment veneer inserted in <entity>

This warning is given when compiling __irq functions for --cpu=Cortex-M3-rev0 to force the stack to be 8-byte aligned on entry into the interrupt.
write to string literal
There is a write through a pointer that has been assigned to point at a literal string. The behavior is undefined by the ANSI standard. A subsequent read from the location written might not reflect the write.

C4433E: {option|\%s} selection is incompatible with restrictions in this toolkit
C4435E: reference to <entity> not allowed
C4447E: option '-E' and input file '<filename>' type conflict
C4463E: Invalid combination of memory access attributes
C4464E: Maximum pointer alignment must be a power of 2
C4466W: Feedback line ignored, unrecognised pattern
C4484E: Minimum toplevel array alignment must be 1, 2, 4 or 8
C4486W: option '-<optionchar>' causes input file '<filename>' to be ignored

For example:

```c
void foo(void) {
  unsigned int pntr;
  pntr = (unsigned int)&pntr;
  pntr -= 4;
  pntr = *(unsigned int*)pntr;
}
```

write to variable '<var>' with offset out of bounds

C4491E: stack frame (%d) is larger than stack limit
C4494E: invalid global register number <num>; 1 to <num> allowed
C4497E: invalid syntax for retention constraint: <text>
C4498E: option conflicts with an arm linux targeting option: <option>

Certain options are expected to be used when targeting ARM Linux, for example to select the correct ABI variant options. This message is given to indicate when an incompatible option is specified.

See the following in the armcc User Guide:

`--arm_linux.`
Chapter 2
Licensing Errors and Warnings

Describes license-related error and warning messages that might be displayed by the assembler, the linker, or the ELF image converter.

It contains the following sections:

• 2.1 List of the licensing error and warning messages on page 2-97.
2.1 List of the licensing error and warning messages

A list of the error and warning messages that are caused by license-related issues.

The license error codes have three components; a prefix letter, an error number, and a suffix letter:

LNNNND

The prefix letter \( L \) indicates the tool that generated the error:

- For the compiler, armcc, the error code starts with \( C \).
- For the assembler, armasm, the error code starts with \( A \).
- For the linker, armlink, the error code starts with \( L \).
- For the ELF image converter, fromelf, the error code starts with \( Q \).

The error numbers, NNNN, are identical for each tool.

The suffix letter, D, indicates the severity of the error:

- \( W \) means warning.
- \( E \) means error.
- \( F \) means fatal.

A9503E, C9503E, L9503E, Q9503E

Keys for \(<\text{targetName}>\) back-end could not be found in product definition.

A9506E, C9506E, L9506E, Q9506E

Message received by \(<\text{targetName}>\) back-end is not valid.

A9507E, C9507E, L9507E, Q9507E

\(<\text{targetName}>\) back-end returned status=<status> with invalid version number
\(<\text{versionNumberReceived}>\).

A9511E, C9511E, L9511E, Q9511E

Unable to determine the current toolkit. Ensure that ARM_TOOL_VARIANT is set correctly.

A9515E, C9515E, L9515E, Q9515E

There is at least one feature CheckedOut for module \(<\text{moduleName}>\). Unregister is not allowed until you CheckedIn all the features.

System clock tampering detected. License checkout will fail.

License information retrieval for feature <featureName> with version <version> was cancelled because no back-end is associated with it.

No generation date specified, but relative expiry dates present.

<target> is not available with your current toolkit and license. Ensure that ARM_TOOL_VARIANT is set correctly for your toolkit.
Chapter 3
Assembler Errors and Warnings

Describes the error and warning messages for the assembler, armasm.

It contains the following sections:
• 3.1 List of the armasm error and warning messages on page 3-101.
3.1 List of the armasm error and warning messages

A list of the error and warning messages that armasm produces.

Note

License-related error messages can be found in the 2.1 List of the licensing error and warning messages on page 2-97 section.

A1017E: :INDEX: cannot be used on a pc-relative expression
The :INDEX: expression operator has been applied to a PC-relative expression, most likely a program label. :INDEX: returns the offset from the base register in a register-relative expression.

If you require the offset of a label called <label> within an area called <areaname>, use <label> - <areaname>.

See the following in the armasm User Guide:
Unary operators.

A1020E: Bad predefine: <directive>
The operand to the --predefine or --pd command-line option was not recognized. The directive must be enclosed in quotes if it contains spaces, for example on Windows:

--predefine "versionnum SETA 5"

If the SETS directive is used, the argument to the directive must also be enclosed in quotes, which might require escaping, depending on the operating system and shell. For example:

--predefine "versionstr SETS \"5A\""

A1021U: No input file
No input file was specified on the command line. This might be because there was no terminating quote on a quoted argument.

A1023E: File "<filename>" could not be opened: <reason>
A1024E: File "<filename>" could not all be loaded: <reason>
A1042E: Unrecognized APCS qualifier '<qualifier>'
There is an error in the argument given to the --apcs command line option. Check the spelling of <qualifier>.

A1051E: Cannot open --depend file '<filename>': <reason>
A1055E: Cannot open --errors file '<filename>': <reason>
A1056E: Target cpu '<cpu>' not recognized
The name given in the --cpu command line option is not a recognized processor name. Check the spelling of the argument.

Use --cpu=list to list the supported processors and architectures.

A1067E: Output file specified as '<filename1>', but it has already been specified as '<filename2>'
More than one output file, -o filename, has been specified on the command line. Misspelling a command line option can cause this.

A1071E: Cannot open listing file '<filename>': <reason>
The file given in the --list <filename> command-line option could not be opened. This could be for any of the following reasons:
• The given name is not valid.
• There is no space.
• A read-only file with the same name already exists.
• The file is in use by another process.

Check you have specified the correct path for the file.
A1072E: The specified listing file '<filename>' must not be a .s or .o file
The filename argument to the --list command line option has an extension that indicates it is a source or object file. This might be because the filename argument was accidentally omitted from the command line. Check that the correct argument is given to the --list command line option.

A1073E: The specified output file '<filename>' must not be a source file
The object file specified on the command line has a filename extension that indicates it is a source file. This might be because the object filename was accidentally omitted from the command line.

A1074E: The specified depend file '<filename>' must not be a source file
The filename argument to the --depend command line option has an extension that indicates it is a source (.s) file. This might be because the filename argument was accidentally omitted from the command line. Check that the correct arguments are given.

A1075E: The specified errors file '<filename>' must not be a source file
The filename argument to the --errors command line option has an extension that indicates it is a source (.s) file. This might be because the filename argument was accidentally omitted from the command line. Check that the correct arguments are given.

A1085W: Forced user-mode LDM/STM must not be followed by use of banked R8-R14
The ARM architecture does not permit you to access banked registers in the instruction immediately following a User registers LDM or STM. Adding a NOP immediately after the LDM or STM is one way to avoid this.

For example:

```asm
stmib sp, {r0-r14}^ ; Return a pointer to the frame in a1.
mov r0, sp
```

change to:

```asm
stmib sp, {r0-r14}^ ; Return a pointer to the frame in a1.
nop
mov r0, sp
```

A1088W: Faking declaration of area AREA $$$$$$$
This is reported when no AREA directive is specified. See also message number A1105E.

A1099E: Structure stack overflow max stack size <max>
A1100E: Structure stack underflow
A1105E: Area directive missing
This is reported when no AREA directive is specified. See also message number A1088W.

A1106E: Missing comma
A1107E: Bad symbol type, expect label
A1108E: Multiply defined symbol '<name>'
A1109E: Bad expression type
A1110E: Expected constant expression
A constant expression was expected after, for example, SETA.

See the following in the armasm User Guide:

**Numeric expressions.**

A1111E: Expected constant or address expression
A1112E: Expected address expression
A1113E: Expected string expression
A string expression was expected after, for example, SETS.

See the following in the armasm User Guide:

**String expressions.**

A1114E: Expected register relative expression
A1116E: String operands can only be specified for DCB
A1117E: Register symbol '<name>' already defined
A1118E: No current macro expansion
A1119E: MEND not allowed within conditionals

   MEND means END of Macro (not the English word mend).

   See the following in the armasm User Guide:
   About macros.

A1120E: Bad global name
A1121E: Global name '<name>' already exists
A1122E: Locals not allowed outside macros
A1123E: Bad local name
A1125E: Unknown or wrong type of global/local symbol '<name>'
A1126E: Bad alignment boundary, must be a multiple of 2
A1127E: Bad IMPORT/EXTERN name
A1128E: Common name '<sym>' already exists
A1129E: Imported name '<sym>' already exists
A1130E: Bad exported name
A1131E: Bad symbol type for exported symbol '<sym>'
A1132E: REQUIRE directive not supported for <entity> format output
A1133E: Bad required symbol name
A1134E: Bad required symbol type, expect (symbol is either external or label) and
   (symbol is relocatable and absolute)
A1135E: Area name missing

   AREA names starting with any non-alphabetic character must be enclosed in bars, for example
   change:

   AREA 1_DataArea, CODE, READONLY

   to:

   AREA |1_DataArea|, CODE, READONLY

A1136E: Entry address already set
A1137E: Unexpected characters at end of line

   This is given when extra characters that are not part of an instruction are found on an instruction
   line.

   For example:

   ADD r0, r0, r1 comment

   You could change this to:

   ADD r0, r0, r1 ; comment

A1138E: String "<string>" too short for operation, length must be > <oplength>
A1139E: String overflow, string exceeds <max> characters
A1140E: Bad operand type
A1141E: Relocated expressions may only be added or subtracted
A1142E: Subtractive relocations not supported for <entity> format output

   This can occur when subtracting symbols that are in different areas, for example:

   IMPORT sym1
   IMPORT sym2
   DCD (sym2 - sym1)

A1143E: COMMON directive not supported for %s format output
A1144E: DCDO directive not supported for %s format output
A1145E: Undefined exported symbol '<sym>'
A1146E: Unable to open output file <filename>: <reason>
A1147E: Bad shift name
A1148E: Unknown shift name <name>, expected one of LSL, LSR, ASR, ROR, RRX
A1150E: Bad symbol, not defined or external
This typically occurs in the following cases:

• When the current file requires an INCLUDE of another file to define some symbols, for example:

```
"init.s", line 2: Error: A1150E: Bad symbol
  2 00000000 DCD EBI_CSR_0
```

In this case, the solution is to include the required definitions file. For example:

```
INCLUDE targets/eb40.inc
```

• When the current file requires IMPORT for some symbols, for example:

```
"init.s", line 4: Error: A1150E: Bad symbol
  4 00000000 LDR r0, =||Image$$RAM$$ZI$$Limit||
```

In this case, the solution is to import the required symbol, for example:

```
IMPORT ||Image$$RAM$$ZI$$Limit||
```

A1151E: Bad register name symbol
Example:

```
MCR p14, 3, R0, Cr1, Cr2
```

The coprocessor registers CR must be labeled as a lowercase c for the code to build. The ARM register can be r or R:

```
MCR p14, 3, r0, c1, c2
```

or

```
MCR p14, 3, R0, c1, c2
```

A1152E: Unexpected operator
A1153E: Undefined symbol
A1154E: Unexpected operand, operator expected
A1155E: Unexpected unary operator equal to or equivalent to <operator>
A1156E: Missing open bracket
A1157E: Syntax error following directive
A1158E: Illegal line start, should be blank
Some directives, for example, ENTRY, IMPORT, EXPORT, and GET must be on a line without a label at the start of the line. This error is given if a label is present.

A1159E: Label missing from line start
Some directives, for example, FUNCTION or SETS, require a label at the start of the line, for example:

```
my_func FUNCTION
```

or

```
label SETS
```

This error is given if the label is missing.

A1160E: Bad local label number
A numeric local label is a number in the range 0-99, optionally followed by a name.

See the following in the armasm User Guide:

`Numeric local labels.`

A1161E: Syntax error following local label definition
A1162E: Incorrect routine name '<name>'
A1163E: Unknown opcode <name>, expecting opcode or Macro

The most common reasons for this are:

• Forgetting to put white space in the left hand margin, before the instruction. For example, change the following:

```
MOV PC,LR
```

to:

```
MOV PC,LR
```

• Use of a hardware floating point instruction without using the --fpu switch. For example:

```
FMXR FPEXC, r1;
```

must be assembled with armasm --fpu=vfp

• Mis-typing the opcode:

```
ADDD
```

instead of:

```
ADD
```

A1164E: Opcode not supported on selected processor

The processor selected on the armasm command line does not support this instruction.

See the following:

A1165E: Too many actual parameters, expecting <actual> parameters
A1166E: Syntax error following label
A1167E: Invalid line start
A1168E: Translate not allowed in pre-indexed form
A1169E: Missing close square bracket
A1170E: Immediate 0x<adr> out of range for this operation, must be below (0x<adr>)

This error is given when a DCB, DCW or DCWU directive is used with an immediate that is too large.

See the following in the armasm User Guide:

• DCB.
• DCW and DCWU.

A1171E: Missing close bracket
A1172E: Bad rotator <rotator>, must be even and between 0 and 30
A1173E: ADR/L cannot be used on external symbols

The ADR and ADR/L pseudo-instructions can only be used with labels within the same code area. To load an out-of-area address into a register, use LDR instead.

A1174E: Data transfer offset 0x<val> out of range. Permitted values are 0x<min> to 0x<max>
A1175E: Bad register range
A1176E: Branch offset 0x<val> out of range. Permitted values are 0x<min> to 0x<max>

Branches are PC-relative, and have a limited range. If you are using numeric local labels, you can use the ROUT directive to limit their scope. This helps to avoid referring to the wrong label by accident.

See the following in the armasm User Guide:

*Numeric local labels.*

A1179E: Bad hexadecimal number
A1180E: Missing close quote
A1181E: Bad operator
A1182E: Bad based <base> number
A1183E: Numeric overflow
A1184E: Externals not valid in expressions
A1185E: Symbol missing
A1186E: Code generated in data area
   An instruction has been assembled into a data area. This can happen if you have omitted the
   CODE attribute on the AREA directive.
   See the following in the armasm User Guide:
   AREA.

A1187E: Error in macro parameters
A1188E: Register value <val> out of range. Permitted values are <min> to <max>
A1189E: Missing '#'
A1190E: Unexpected '<entity>'
A1191E: Floating point register number out of range 0 to <maxi>
A1192E: Coprocessor register number out of range 0 to 15
A1193E: Coprocessor number out of range 0 to 15
A1194E: Bad floating-point number
A1195W: Small floating point value converted to 0.0
A1196E: Too late to ban floating point
A1198E: Unknown operand
   This can occur when an operand is accidentally mistyped.
   For example:
   armasm init.s -g -PD "ROM_RAM_REMAP SETL {FALS}"
   must be:
   armasm init.s -g -PD "ROM_RAM_REMAP SETL {FALSE}"
   See the following in the armasm User Guide:
   Assembly time substitution of variables.

A1199E: Coprocessor operation out of range 0 to <maxi>
A1200E: Structure mismatch expect While/Wend
A1201E: Substituted line too long, maximum length <max>
A1202E: No pre-declaration of substituted symbol '<name>'
   See the following in the armasm User Guide:
   Assembly time substitution of variables.

A1203E: Illegal label parameter start in macro prototype
A1204E: Bad macro parameter default value
A1205E: Register <reg> occurs multiply in list
A1206E: Registers should be listed in increasing register number order
   This warning is given if registers in, for example, LDM or STM instructions are not specified in
   increasing order and the --checkreglist option is used.
A1207E: Bad or unknown attribute
   This error is given when an invalid attribute is given in the AREA directive. For example:
   AREA test, CODE, READONLY, HALFWORD
   HALFWORD is invalid, so remove it.
   See the following in the armasm User Guide:
   AREA.

A1209E: ADRL cannot be used with PC as destination
A1210E: Non-zero data within uninitialized area '<name>'
A1211E: Missing open square bracket
A1212E: Division by zero
A1213E: Attribute <entity> cannot be used with attribute <entity>
A1214E: Too late to define symbol '<sym>' as register list
A1215E: Bad register list symbol
A1216E: Bad string escape sequence
A1217E: Error writing to code file <codeFileName>: <reason>
A1219E: Bad APSR, CPSR or SPSR designator

For example:

MRS r0, PSR

It is necessary to specify which status register to use (CPSR or SPSR), such as, for example:

MRS r0, CPSR

A1220E: BLX <address> must be unconditional
A1221E: Area attribute '<entity>' not supported for <entity> object file format
A1223E: Comdat Symbol '<name>' is not defined
A1224E: <entity> format does not allow PC-relative data transfers between areas
A1225E: ASSOC attribute is not allowed in non-comdat areas
A1226E: SELECTION attribute is not allowed in non-comdat areas
A1227E: Comdat Associated area '<name>' undefined at this point in the file
A1228E: Comdat Associated area '<name>' is not an area name
A1229E: Missing COMDAT symbol
A1230E: Missing '}' after COMDAT symbol
A1234E: Undefined or Unexported Weak Alias for symbol '<sym>'
A1237E: Invalid register or register combination for this operation
A1238E: Immediate value must be word aligned when used in this operation
A1240E: Immediate value cannot be used with this operation
A1241E: Must have immediate value with this operation
A1242E: Offset must be word aligned when used with this operation
A1243E: Offset must be halfword aligned with this operation
A1244E: Missing '!
A1245E: B or BL from Thumb code to ARM code
A1246E: B or BL from ARM code to Thumb code
A1247E: BLX from ARM code to ARM code, use BL
This occurs when there is a BLX label branch from ARM code to ARM code within this assembler file. This is not permitted because BLX label always results in a change of instruction set state. The usual solution is to use BL instead.
A1248E: BLX from Thumb code to Thumb code, use BL
This occurs when there is a BLX label branch from Thumb code to Thumb code within this assembler file. This is not permitted because BLX label always results in a change of instruction set state. The usual solution is to use BL instead.
A1249E: Pre indexed addressing mode not available
A1250E: Pre indexed addressing mode not available for this instruction, use [Rn, Rm]
A1253E: Thumb branch to external symbol cannot be relocated: not representable in <fmt>
A1254E: Halfword literal values not supported
In the following example, change the LDRH into LDR, which is the standard way of loading constants into registers:

LDRH R3, =constant

A1256E: DATA directive can only be used in CODE areas
A1259E: Invalid PSR field specifier, syntax is <PSR>_ where <PSR> is either CPSR or SPSR
A1260E: PSR field '<entity>' specified more than once
A1261E: MRS cannot select fields, use APSR, CPSR or SPSR directly
This is caused by an attempt to use fields for CPSR or SPSR with an MRS instruction. For example:

MRS r0, CPSR_c

A1262U: Expression storage allocator failed
A1265U: Structure mismatch: IF or WHILE unmatched at end of INCLUDE file
A1267E: Bad GET or INCLUDE for file <filename>
A1268E: Unmatched conditional or macro
A1269U: unexpected GET on structure stack
A1270E: File "<entity>" not found
A1271E: Line too long, maximum line length is <MaxLineLength>
A1272E: End of input file
A1273E: '\\' should not be used to split strings
A1274W: '\\' at end of comment
A1283E: Literal pool too distant, use LTORG to assemble it within 1KB
For Thumb code, a literal pool must be within 1KB of an LDR instruction that is trying to access it. See also messages A1284E and A1471W.
A1284E: Literal pool too distant, use LTORG to assemble it within 4KB
For ARM code, a literal pool must be within 4KB of an LDR instruction that is trying to access it. To solve this, add an LTORG directive into your assembly source code at a convenient place. See the following in the armasm User Guide:
• Load addresses to a register using LDR Rd, =label.
• LTORG.
A1285E: Bad macro name
A1286E: Macro already exists
A1287E: Illegal parameter start in macro prototype
A1288E: Illegal parameter in macro prototype
A1289E: Invalid parameter separator in macro prototype
A1290E: Macro definition too big, maximum length <max>
A1291E: Macro definitions cannot be nested
A1310W: Symbol attribute not recognized
A1311U: macro definition attempted within expansion
A1312E: Assertion failed
A1313W: Missing END directive at end of file
The assembler requires an END directive to know when the code in the file terminates. You can add comments or other such information in free format after this directive.
A1314W: Reserved instruction (using NV condition)
A1315E: NV condition not supported on targeted CPU
A1316E: Shifted register operand to MSR has undefined effect
A1319E: Undefined effect (using PC as Rs)
A1320E: Undefined effect (using PC as Rn or Rm in register specified shift)
A1321E: Undefined effect (using PC as offset register)
A1322E: Unaligned transfer of PC, destination address must be 4 byte aligned, otherwise result is UNPREDICTABLE
This error is reported when you try to use an LDR instruction to load the PC from a non word-aligned address. For example:

AREA Example, CODE
LDR pc, [pc, #6] ; Error - offset must be a multiple of 4
END

This code gives an UNPREDICTABLE result.
A1323E: Reserved instruction (Rm = Rn with post-indexing)
A1324E: Undefined effect (PC + writeback)
A1327E: Non portable instruction (LDM with writeback and base in register list, final value of base unpredictable)
   In the LDM instruction, if the base register <Rn> is specified in <registers>, and base register writeback is specified, the final value of <Rn> is UNKNOWN.

A1328E: Non portable instruction (STM with writeback and base not first in register list, stored value of base unpredictable)
   In the STM instruction, if <Rn> is specified in <registers> and base register writeback is specified:
   • If <Rn> is the lowest-numbered register specified in <register_list>, the original value of <Rn> is stored.
   • Otherwise, the stored value of <Rn> is UNKNOWN.

A1329E: Unpredictable instruction (forced user mode transfer with write-back to base)
   This is caused by an instruction such as PUSH {r0}^ where the ^ indicates access to user registers. Writeback to the base register is not available with this instruction. Instead, the base register must be updated separately. For example:

   ```
   SUB sp, sp,#4
   STMID sp, {r0}^  
   ```

   Another example is replacing STMFD R0!, {r13, r14}^ with:

   ```
   SUB r0, r0,#8
   STM r0, {r13, r14}^  
   ```

   See also message A1085W.

A1331E: Unpredictable instruction (PC as source or destination)
A1332E: Unpredictable effect (PC-relative SWP)
A1334E: Undefined effect (use of PC/PSR)
A1335E: Useless instruction (PC cannot be written back)
A1337E: Useless instruction (PC is destination)
A1338E: Dubious instruction (PC used as an operand)
A1339E: Unpredictable if RdLo and RdHi are the same register
A1341E: Branch to unaligned destination, expect destination to be <max> byte aligned
A1342W: <name> of symbol in another AREA will cause link-time failure if symbol is not close enough to this instruction
A1344I: host error: out of memory
A1355U: A Label was found which was in no AREA
   This can occur if no white space precedes an assembler directive. Assembler directives must be indented. For example use:

   ```
   IF :DEF: FOO
   ; code
   ENDF   
   ```

   instead of:

   ```
   IF :DEF: FOO
   ; code
   ENDF   
   ```

   Symbols beginning in the first column are assumed to be labels.
A1356E: Instruction not supported on targeted CPU
This occurs if you try to use an instruction that is not supported by the selected architecture or processor.

For example:

```
SMULBB r0,r0,r1;
```

This can be assembled with:

```
armasm --cpu 5TE
```

See the following:

A1406E: Bad decimal number
A1407E: Overlarge floating point value
A1408E: Overlarge (single precision) floating point value
A1409W: Small (single precision) floating value converted to 0.0
A1411E: Closing '>' missing from vector specifier
A1412E: Bad vector length, should be between <min> and <max>
A1413E: Bad vector stride, should be between <min> and <max>
A1414E: Vector wraps round over itself, length * stride should not be greater than <max>
A1415E: VFPASSERT must be followed by 'VECTOR' or 'SCALAR'
A1416E: Vector length does not match current vector length <len>
A1417E: Vector stride does not match current vector stride
A1418E: Register has incorrect type '<type>' for instruction, expect floating point/double register type
A1419E: Scalar operand not in a scalar bank
A1420E: Lengths of vector operands are different
A1421E: Strides of vector operands are different
A1422E: This combination of vector and scalar operands is not allowed
A1423E: This operation is not vectorizable
A1424E: Vector specifiers not allowed in operands to this instruction
A1425E: Destination vector must not be in a scalar bank
A1426E: Source vector must not be in a scalar bank
A1427E: Operands have a partial overlap
A1428E: Register list contains registers of varying types
A1429E: Expected register list

The assembler reports this when `FRAME SAVE` and `FRAME RESTORE` directives are not given register lists.

See the following in the `armasm User Guide`:

- `FRAME RESTORE`.
- `FRAME SAVE`.

A1430E: Unknown frame directive
A1431E: Frame directives are not accepted outside of PROCs/FUNCTIONs

See the following in the `armasm User Guide`:

*Frame directives.*

A1432E: Floating-point register type not consistent with selected floating-point architecture
A1433E: Only the writeback form of this instruction exists

The addressing mode specified for the instruction did not include the writeback specifier (that is, a '!' after the base register), but the instruction set only supports the writeback form of the instruction. Either use the writeback form, or replace with instructions that have the required behavior.
A1434E: Architecture attributes '<attr1>' and '<attr2>' conflict
A1435E: {PCSTOREOFFSET} is not defined when assembling for an architecture
{PCSTOREOFFSET} is only defined when assembling for a processor, not for an architecture.
A1437E: {ARCHITECTURE} is undefined
{ARCHITECTURE} is only defined when assembling for an architecture, not for a processor.
A1446E: Bad or unknown attribute '<attr>'. Use --apcs /interwork instead
For example:

```
AREA test1, CODE, READONLY
AREA test, CODE, READONLY, INTERWORK
```

This code might have originally been intended to work with the legacy ARM Software Development Toolkit (SDT). The INTERWORK area attribute is obsolete. To eliminate the error, do the following:
• remove the "INTERWORK" from the AREA line.
• assemble with armasm --apcs /interwork foo.s instead.

A1447W: Missing END directive at end of file, but found a label named END
This is caused by the END directive not being indented.
A1448E: Deprecated form of PSR field specifier used (use _f)
A1449E: Deprecated form of PSR field specifier used (use _c)
A1450E: Deprecated form of PSR field specifier used (use _cxsf for future compatibility)

```c
armasm supports the full range of MRS and MSR instructions, in the following forms:
```
MRS(cond) Rd, CPSR
MRS(cond) Rd, SPSR
MSR(cond) CPSR_fields, Rm
MSR(cond) SPSR_fields, Rm
MSR(cond) CPSR_fields, #immediate
MSR(cond) SPSR_fields, #immediate
```

where fields can be any combination of cxsf.

Legacy versions of the assembler permitted other forms of the MSR instruction to modify the control field and flags field:
• cpsr or cpsr_all, control and flags field
• cpsr_flg, flags field only
• cpsr_ctl, control field only.

Similar control and flag settings apply for SPSR.

These forms are deprecated and must not be used. If your legacy code contains them, the assembler reports:

```
Deprecated form of PSR field specifier used (use _cxsf)
```

To avoid the warning, in most cases you can modify your code to use _c, _f, _cf or _cxsf instead.

See the following in the armasm User Guide:
• Conditional execution in ARM state.
• Conditional execution in Thumb state.
• General-purpose registers.
• Access to the inline barrel shifter.

See the following FAQ:

```
armasm: use of MRS and MSR instructions (‘Deprecated form of PSR field specifier’).
```
A1454E: FRAME STATE RESTORE directive without a corresponding FRAME STATE REMEMBER

See the following in the armasm User Guide:

- Frame directives.
- FRAME STATE REMEMBER.
- FRAME STATE RESTORE.

A1456W: INTERWORK area directive is obsolete. Continuing as if --apcs /inter selected

For example, the following code generates this warning:

```assembly
AREA test, CODE, READONLY, INTERWORK
```

This code might have originally been intended to work with the legacy ARM Software Development Toolkit (SDT). The INTERWORK area attribute is obsolete. To eliminate the warning, do the following:

1. Remove the ", INTERWORK" from the AREA line.
2. Assemble with armasm --apcs /interwork foo.s instead.

See also message A1446E.

A1457E: Cannot mix INTERWORK and NOINTERWORK code areas in same file

INTERWORK and (default) NOINTERWORK code areas cannot be mixed in the same file. This code might have originally been intended to work with the ARM Software Development Toolkit (SDT). The INTERWORK AREA attribute is obsolete in the ARM Compiler toolchain.

For example:

```assembly
AREA test1, CODE, READONLY
AREA test2, CODE, READONLY, INTERWORK
```

To eliminate the error, carry out the following steps:

1. Move the two AREAs into separate assembly files, for example, test1.s and test2.s.
2. Remove , INTERWORK from the AREA line in test2.s.
3. Assemble test1.s with armasm --apcs /nointerwork.
4. Assemble test2.s with armasm --apcs /interwork.
5. At link time, the linker adds any necessary interworking veneers.

See also message A1446E.

A1458E: DCFD or DCFDU not allowed when fpu is None

A1459E: Cannot B or BL to a register

This form of the instruction is not permitted. See the following for the permitted forms:

A1461E: Specified processor or architecture does not support Thumb instructions

It is likely that you are specifying an architecture or processor using the --cpu option and incorporating Thumb code in the AREA that is generating this error.

For example, in the following command line, the selected architecture, ARMv4, does not support Thumb code:

```
armasm --cpu 4 code.s
```

A1462E: Specified memory attributes do not support this instruction

A1463E: SPACE directive too big to fit in area, area size limit 2^32

A1464W: ENDP/ENDFUNC without corresponding PROC/FUNC
A1466W: Operator precedence means that expression would evaluate differently in C. armasm has always evaluated certain expressions in a different order to C. This warning might help C programmers from being caught out when writing in assembly language. To avoid the warning, do either of the following:

- Modify the code to make the evaluation order explicit, by adding brackets.
- Suppress the warning with the --unsafe switch.

See the following in the armasm User Guide:

Operator precedence.

A1467W: FRAME ADDRESS with negative offset <offset> is not recommended
A1468W: FRAME SAVE saving registers above the canonical frame address is not recommended
A1469E: FRAME STATE REMEMBER directive without a corresponding FRAME STATE RESTORE
See the following in the armasm User Guide:

- Frame directives.
- FRAME STATE REMEMBER.
- FRAME STATE RESTORE.

A1471W: Directive <directive> may be in an executable position
This can occur with, for example, the LTORG directive (see messages A1283E and A1284E). LTORG instructs the assembler to dump literal pool DCD data at this position.

To prevent this warning, the data must be placed where the processor cannot execute them as instructions. A good place for an LTORG is immediately after an unconditional branch, or after the return instruction at the end of a subroutine.

As a last resort, you could add a branch over the LTORG to avoid the data being executed. For example:

```
B unique_label
LTORG
unique_label
```

A1475E: At least one register must be transferred, otherwise result is UNPREDICTABLE
A1476E: BX r15 at non word-aligned address is UNPREDICTABLE
A1477E: This register combination results in UNPREDICTABLE behavior
This error is generated when you are assembling an instruction that has UNPREDICTABLE results on execution. You must rewrite your code to avoid this UNPREDICTABLE behavior. For example, the following instructions all cause this error when assembling to Thumb, and the target architecture is ARMv6T2 or later:

```
ADD sp, r0, #100 ; error - UNPREDICTABLE use of SP
CMP pc, #1 ; error - UNPREDICTABLE use of PC
PUSH {r0, pc} ; error - use of an UNPREDICTABLE register combination
```
A1479W: Requested alignment <alignreq> is greater than area alignment <align>, which has been increased

This is warning about an ALIGN directive that has a coarser alignment boundary than its containing AREA. This is not permitted. To compensate, the assembler automatically increases the alignment of the containing AREA for you. A simple test case that gives the warning is:

```
AREA test, CODE, ALIGN=3
ALIGN 16
mov pc, lr
END
```

In this example, the alignment of the AREA (ALIGN=3) is \(2^3=8\) byte boundary, but the mov pc, lr instruction is on a 16-byte boundary, causing the error.

Note

The two alignment types are specified in different ways.

This warning can also occur when using AREA ... ALIGN=0 to align a code section on a byte boundary. This is not possible. Code sections can only be aligned on:

- a four-byte boundary for ARM code, so use "ALIGN=2"
- a two-byte boundary for Thumb code, so use "ALIGN=1".

See the following in the armasm User Guide:

- ALIGN.
- AREA.

A1480W: Macro cannot have same name as a directive or instruction

A1481E: Object file format does not support this area alignment

A1482E: Shift option out of range, allowable values are from <min> to <max>

A1484W: Obsolete shift name 'ASL', use LSL instead

The ARM architecture does not have an ASL shift operation. The ARM barrel shifter only has the following shift types:

- ROR.
- ASR.
- LSR.
- LSL.

An arithmetic (that is, signed) shift left is the same as a logical shift left, because the sign bit always gets shifted out.

If the name ASL is used, the assembler reports this warning and converts the ASL to LSL.

See the following in the armasm User Guide:

- --unsafe.
- ASR.

A1485E: LDM/STM instruction exceeds maximum register count <max> allowed with --split_ldm

A1486E: ADR/ADRL of a symbol in another AREA is not supported in ELF

The ADR and ADRL pseudo-instructions can only be used with labels within the same code section. To load an out-of-area address into a register, use LDR instead.

A1487W: Obsolete instruction name 'ASL', use LSL instead

This warning is given when the ASL instruction is used in pre-UAL Thumb code, that is, when you assemble using the --16 command-line option, or you use the CODE16 directive. See the corresponding ARM ASL message A1484W.

A1488W: PROC/FUNC at line <lineno> in '<filename>' without matching ENDP/ENDFUNC

A1489E: <FPU> is undefined

A1490E: <CPU> is undefined

{CPU} is only defined by assembling for a processor and not an architecture.
A1491W: Internal error: Found relocation at offset <offset> with incorrect alignment.
This might indicate an assembler fault. Contact your supplier.
A1492E: Immediate 0x<val> out of range for this operation. Permitted values are
0x<min> to 0x<max>
A1493E: REQUIRE must be in an AREA
A1495W: Target of branch is a data address
armasm determines the type of a symbol and detects branches to data. To suppress this warning,
specify --diag-suppress 1495.
A1496W: Absolute relocation of ROPI address with respect to symbol '<symbol>' at
offset <offset> may cause link failure
For example, when assembling the following code with --apcs /ropi, this warning is given.
This is because it generates an absolute relocation (R_ARM_ABS32) to a PI code symbol.

```
AREA code, CODE
codeaddr DCD codeaddr
END
```

A1497W: Absolute relocation of RWPI address with respect to symbol '<symbol>' at
offset <offset> may cause link failure
For example, when assembling the following code with --apcs /rwpi, this warning is given.
This is because it generates an absolute relocation (R_ARM_ABS32) to a PI data symbol.

```
AREA data, DATA
dataaddr DCD dataaddr
END
```

A1498E: Unexpected characters following Thumb instruction
For example, the following instruction is valid in both UAL and pre-UAL code:

```
ADD r0, r0, r1
```
However, the following instruction is invalid in pre-UAL Thumb code. The unexpected
characters are , ASR #1.

```
ADD r0, r0, r1, ASR #1
```

A1499E: Register pair is not a valid contiguous pair
A1500E: Unexpected characters when expecting '<word>'
A1501E: Shift option out of range, allowable values are 0, 8, 16 or 24
A1502W: Register <reg> is a caller-save register, not valid for this operation
A1505E: Bad expression type, expect logical expression
A1506E: Accumulator should be in form accx where x ranges from 0 to <max>
A1507E: Second parameter of register list must be greater than or equal to the first
A1508E: Structure mismatch expect Conditional
A1509E: Bad symbol type, expect label, or weak external symbol
A1510E: Immediate 0x<imm> cannot be represented by 0-255 and a rotation
A1511E: Immediate cannot be represented by combination of two data processing
instructions
A1512E: Immediate 0x<val> out of range for this operation. Permitted values are <min>
to <max>
A1513E: Symbol not found or incompatible Symbol type for '<name>'
A1514E: Bad global name '<name>'
A1515E: Bad local name '<name>'
A1516E: Bad symbol '<name>', not defined or external
A1517E: Unexpected operator equal to or equivalent to <operator>
A1519E: Link Order dependency '<name>' not an area
A1540E: Cannot have a link order dependency on self
A1541E: <code> is not a valid condition code
A1542E: Macro names <name1> and <name2>[parameter] conflict
A1543W: Empty macro parameter default value
A1544E: Invalid empty PSR field specifier, field must contain at least one of c,x,s,f
A1545U: Too many sections for one <objfmt> file
A1546W: Stack pointer update potentially breaks 8 byte stack alignment
The stack must be eight-byte aligned on an external boundary so pushing an odd number of
registers causes this warning. For example:

```
PUSH {r0}
```

This warning is suppressed by default. To enable it, use --diag_warning 1546.
See the following in the armasm User Guide:
```
--diag_warning=tag{, tag}.
```

A1547W: PRESERVE8 directive has automatically been set
Example:

```
PUSH {r0,r1}
```

This warning is given because you have not explicitly set the PRESERVE8 directive, but the
assembler has set it automatically. This warning is suppressed by default. To enable it, use
```
--diag_warning 1547.
```
See the following in the armasm User Guide:
```
• --diag_warning=tag{, tag}.
• REQUIRE8 and PRESERVE8.
```

A1548W: Code contains LDRD/STRD indexed/offset from SP but REQUIRE8 is not set
This warning is given when the REQUIRE8 directive is not set when required. For example:

```
PRESERVE8
STRD r0,[sp,#8]
```

See the following in the armasm User Guide:
```
REQUIRE8 and PRESERVE8.
```

A1549W: Setting of REQUIRE8 but not PRESERVE8 is unusual
Example:

```
PRESERVE8 {FALSE}
REQUIRE8
STRD r0,[sp,#8]
```

A1550U: Input and output filenames are the same
A1551E: Cannot add Comdef area <name> to non-comdat group
A1560E: Non-constant byte literal values not supported
A1561E: MERGE and STRING sections must be data sections
A1562E: Entry size for Merge section must be greater than 0
A1563W: Instruction stalls CPU for <stalls> cycle(s)
The assembler can give information about possible interlocks in your code caused by the
pipeline of the processor chosen by the --cpu option. To do this, assemble with
```
armasm --diag_warning 1563.
```

Note
If the --cpu option specifies a multi-issue processor such as Cortex-A8, the interlock warnings
are unreliable.

See also warning A1746W.

A1572E: Operator SB_OFFSET_11_0 only allowed on LDR/STR instructions
A1573E: Operator SB_OFFSET_19_12 only allowed on Data Processing instructions
A1574E: Expected one or more flag characters from "<str>"
A1575E: BLX with bit[0] equal to 1 is architecturally UNDEFINED
A1576E: Bad coprocessor register name symbol
A1577E: Bad coprocessor name symbol
A1578E: Bad floating point register name symbol '<sym>'
A1581W: Added <no_padbytes> bytes of padding at address <address>

By default, the assembler warns when it adds padding bytes to the generated code. This occurs whenever an instruction or directive is used at an address that requires a higher alignment, for example, to ensure ARM instructions start on a four-byte boundary after some Thumb instructions, or where there is a DCB followed by a DCD.

For example:

```
AREA Test, CODE, READONLY
THUMB
ThumbCode
MOVS r0, #1
ADR r1, ARMProg
BX r1
; ALIGN ; <<< uncomment to avoid the first warning
ARM
ARMProg
ADD r0,r0,#1
BX LR
DCB 0xFF
DCD 0x1234
END
```

This code results in the following warnings:

A1581W: Added 2 bytes of padding at address 0x6
A1581W: Added 3 bytes of padding at address 0x11

The warning can also occur when using ADR in Thumb-only code. The ADR Thumb pseudo-instruction can only load addresses that are word aligned, but a label within Thumb code might not be word aligned. Use ALIGN to ensure four-byte alignment of an address within Thumb code.

See the following in the `armasm User Guide`:
- `ADR (PC-relative)`.
- `ADR (register-relative)`.
- `ALIGN`.
- `DCB`.
- `DCD and DCDU`.

A1582E: Link Order area '<name>' undefined
A1583E: Group symbol '<name>' undefined
A1584E: Mode <mode> not allowed for this instruction
A1585E: Bad operand type (<typ1>) for operator <op>
A1586E: Bad operand types (<typ1>, <typ2>) for operator <op>
A1587E: Too many registers <count> in register list, maximum of <max>
A1588E: Align only available on VLD and VST instructions
A1589E: Element index must remain constant across all registers
A1590E: Mix of subscript and non-subscript elements not allowed
A1593E: Bad Alignment, must match transfer size UIMM * <dt>
A1595E: Bad Alignment, must match <st> * <dt>, or 64 when <st> is 4
A1596E: Invalid alignment <align> for dt st combination
A1597E: Register increment of 2 not allowed when dt is 8
A1598E: Bad Register list length
A1599E: Out of range subscript, must be between 0 and <max_index>
A1600E: Section type must be within range SHT_LOOS and SHT_HIUSER
A1601E: Immediate cannot be represented
A1603E: This instruction inside IT block has UNPREDICTABLE results
A1604W: Thumb Branch to destination without alignment to <max> bytes
A1606E: Symbol attribute <attr1> cannot be used with attribute <attr2>
A1607E: Thumb-2 wide branch instruction used, but offset could fit in Thumb-1 narrow branch instruction
A1608W: MOV pc,<rn> instruction used, but BX <rn> is preferred
A1609W: MOV <rd>,pc instruction does not set bit zero, so does not create a return address

This warning is caused when the current value of the PC is copied into a register while executing in Thumb state. An attempt to create a return address in this fashion fails because bit[0] is not set. Attempting to BX to this instruction causes a state change (to ARM).

To create a return address, you can use:

```
MOV r0, pc
ADDS r0, #1
```

This warning can then be safely suppressed with:

```
--diag_suppress 1609
```

A1611E: Register list increment of 2 not allowed for this instruction
A1612E: <type> addressing not allowed for <instr>
A1613E: Invalid register or register combination for this operation, <registers>, expected one of <expected>
A1614E: Scalar access not allowed when dt is 64
A1615E: Store of a single element or structure to all lanes is UNDEFINED
A1616E: Instruction, offset, immediate or register combination is not supported by the current instruction set

This error can be caused by attempting to use an invalid combination of operands. For example, in Thumb:

```
MOV r0, #1 ; /* Not permitted */
MOVS r0, #1 ; /* Ok */
```

See the following in the armasm User Guide:

**ARM and Thumb Instructions.**

A1617E: Specified width is not supported by the current instruction set
A1618E: Specified instruction is not supported by the current instruction set
A1619E: Specified condition is not consistent with previous IT
A1620E: Error writing to file '<filename>': <reason>
A1621E: CBZ or CBNZ from Thumb code to ARM code
A1622E: Negative register offsets are not supported by the current instruction set
A1623E: Offset not supported by the current instruction set
A1624W: Branch from Thumb code to ARM code
A1625W: Branch from ARM code to Thumb code
A1626W: BL from Thumb code to ARM code
A1627W: BL from ARM code to Thumb code

This occurs when there is a branch from ARM code to Thumb code (or vice-versa) within this file. The usual solution is to move the Thumb code into a separate assembler file. Then, at link-time, the linker adds any necessary interworking veneers.

A1630E: Specified processor or architecture does not support ARM instructions

ARM M-profile processors, for example Cortex-M3 and Cortex-M1, implement only the Thumb instruction set, not the ARM instruction set. It is likely that the assembly file contains some ARM-specific instructions and is being built for one of these processors.

A1631E: Only left shifts of 1, 2 and 3 are allowed on load/stores
A1632E: Else forbidden in IT AL blocks
A1633E: LDR rX,= pseudo instruction only allowed in load word form
A1634E: LDRD/STRD has no register offset addressing mode in Thumb
A1635E: CBZ/CBNZ can not be made conditional
A1636E: Flag setting MLA is not supported in Thumb
A1637E: Error reading line: <reason>
A1638E: Writeback not allowed on register offset loads or stores in Thumb
A1639E: Conditional DCI only allowed in Thumb mode
A1640E: Offset must be a multiple of four
A1641E: Forced user-mode LDM/STM not supported in Thumb
A1642W: Relocated narrow branch is not recommended
A1643E: Cannot determine whether instruction is working on single or double precision values.
A1644E: Cannot use single precision registers with FLDMX/LSTMX

A1645W: Substituted <old> with <new>

armasm can be configured to issue a warning in cases where it chooses to substitute an instruction. For example:

- ADD negative_number is the same as SUB positive_number
- MOV negative_number is the same as MVN positive_number
- CMP negative_number is the same as CMN positive_number.

For the Thumb instruction set, UNPREDICTABLE single register LDMs are transformed into LDRs.

This warning is suppressed by default, but can be enabled with --diag_warning 1645.

For example, when the following code is assembled with --diag_warning 1645:

```
AREA foo, CODE
ADD r0, #-1
MOV r0, #-1
CMP r0, #-1
```

the assembler reports:

```
Warning: A1645W: Substituted ADD with SUB
3 00000000 ADD r0, #1
Warning: A1645W: Substituted MOV with MVN
4 00000004 MOV r0, #1
Warning: A1645W: Substituted CMP with CMN
5 00000008 CMP r0, #1
```

and the resulting code generated is:

```
foo
0x00000000: e2400001 ..@. SUB r0,r0,#1
0x00000004: e3e00000 .... MVN r0,#0
0x00000008: e3700001 ..p. CMN r0,#1
```

A1647E: Bad register name symbol, expected Integer register
An integer (core) register is expected at this point in the syntax.
A1648E: Bad register name symbol, expected Wireless MMX SIMD register
A1649E: Bad register name symbol, expected Wireless MMX Status/Control or General Purpose register
A1650E: Bad register name symbol, expected any Wireless MMX register
A1651E: TANDC, TEXTRC and TORC instructions with destination register other than R15 is undefined
A1652W: FLDMX/FSTMX instructions are deprecated in ARMv6. Please use FLDMD/FSTMD instructions to save and restore unknown precision values.
A1653E: Shift instruction using a status or control register is undefined
A1654E: Cannot access external symbols when loading/storing bytes or halfwords
A1655E: Instruction is UNPREDICTABLE if halfword/word/doubleword is unaligned
A1656E: Target must be at least word-aligned when used with this instruction
A1657E: Cannot load a byte/halfword literal using WLDXB/WLDXR =constant
A1658W: Support for <opt> is deprecated
An option passed to armasm is deprecated.

See the following in the armasm User Guide:

Assembler command-line options.

A1659E: Cannot B/BL/BLX between ARM/Thumb and Thumb-2EE
A1660E: Cannot specify scalar index on this register type
A1661E: Cannot specify alignment on this register type
A1662E: Cannot specify a data type on this register type
A1663E: A data type has already been specified on this register
A1664E: Data type specifier not recognized
A1665E: Data type size must be one of 8, 16, 32 or 64
A1666E: Data type size for floating-point must be 32 or 64
A1667E: Data type size for polynomial must be 8 or 16
A1668E: Too many data types specified on instruction
A1669E: Data type specifier not allowed on this instruction
A1670E: Expected 64-bit doubleword register expression
A1671E: Expected 128-bit quadword register expression
A1672E: Expected either 64-bit or 128-bit register expression
A1673E: Both source data types must be same type and size
A1674E: Source operand 1 should have integer type and be double the size of source operand 2
A1675E: Data types and sizes for destination must be same as source
A1676E: Destination type must be integer and be double the size of source
A1677E: Destination type must be same as source, but half the size
A1678E: Destination must be untyped and same size as source
A1679E: Destination type must be same as source, but double the size
A1680E: Destination must be unsigned and half the size of signed source
A1681E: Destination must be unsigned and have same size as signed source
A1682E: Destination must be un/signed and source floating, or destination floating and source un/signed, and size of both must be 32-bits
A1683E: Data type specifiers do not match a valid encoding of this instruction
A1684E: Source operand type should be signed or unsigned with size between <min> and <max>
A1685E: Source operand type should be signed, unsigned or floating point with size between <min> and <max>
A1686E: Source operand type should be signed or floating point with size between <min> and <max>
A1687E: Source operand type should be integer or floating point with size between <min> and <max>
A1688E: Source operand type should be untyped with size between <min> and <max>
A1689E: Source operand type should be <n>-bit floating point
A1690E: Source operand type should be signed with size between <min> and <max>
A1691E: Source operand type should be integer, floating point or polynomial with size between <min> and <max>
A1692E: Source operand type should be signed, unsigned or polynomial with size between <min> and <max>
A1693E: Source operand type should be unsigned or floating point with size between <min> and <max>
A1694E: Instruction cannot be conditional in the current instruction set
    Conditional instructions are not permitted in the specified instruction set. The instruction MOV EQ, for example, is permitted in ARM code, and in Thumb code in architectures in which the IT instruction is available.
A1695E: Scalar index not allowed on this instruction
A1696E: Expected either 32-bit, 64-bit or 128-bit register expression
A1697E: Expected either 32-bit or 64-bit VFP register expression
A1698E: Expected 32-bit VFP register expression
A1699E: 64-bit data type cannot be used with these registers
A1700E: Source operand type should be integer with size between <min> and <max>
A1701E: 16-bit polynomial type cannot be used for source operand
A1702E: Register Dm can not be scalar for this instruction
A1704E: Register Dm must be in the range D0-D<upper> for this data type
A1705W: Assembler converted Qm register to D<rnum>[<idx>]
A1706E: Register Dm must be scalar
A1708E: 3rd operand to this instruction must be a constant expression
A1709E: Expected ARM or scalar register expression
A1710E: Difference between current and previous register should be <diff>
A1711E: Scalar registers cannot be used in register list for this instruction
A1712E: This combination of LSB and WIDTH results in UNPREDICTABLE behavior
A1713E: Invalid field specifiers for APSR: must be APSR_ followed by at least one of n, z, c, v, q or g
A1714E: Invalid combination of field specifiers for APSR
A1715E: PSR not defined on target architecture
A1716E: Destination for VMOV instruction must be ARM integer, 32-bit single-precision, 64-bit doubleword register or 64-bit doubleword scalar register
A1717E: Source register must be an ARM integer, 32-bit single-precision or 64-bit doubleword scalar register
A1718E: Source register must be an ARM integer register or same as the destination register
A1719W: This PSR name is deprecated and may be removed in a future release
A1720E: Source register must be a 64-bit doubleword scalar register
A1721E: Destination register may not have all-lanes specifier
A1722E: Labels not allowed inside IT blocks
A1723W: __RELOC is deprecated, please use the new RELOC directive
A1724E: RELOC may only be used immediately after an instruction or data generating directive
A1725W: 'armasm inputfile outputfile' form of command-line is deprecated
A1726W: Decreasing --max_cache below 8MB is not recommended
A1727W: Immediate could have been generated using the 16-bit Thumb MOVS instruction
A1728E: Source register must be same type as destination register
A1729E: Register list may only contain 32-bit single-precision or 64-bit doubleword registers
A1730E: Only IA or DB addressing modes may be used with these instructions
A1731E: Register list increment of 2 or more is not allowed for quadword registers
A1732E: Register list must contain between 1 and 4 contiguous doubleword registers
A1733E: Register list must contain 2 or 4 doubleword registers, and increment 2 is only allowed for 2 registers
A1734E: Register list must contain <n> doubleword registers with increment 1 or 2
A1735E: Post-indexed offset must equal the number of bytes loaded/stored (<n>)
A1736E: Number of registers in list must equal number of elements
A1737E: PC or SP can not be used as the offset register
A1738E: Immediate too large for this operation
A1739W: Constant generated using single VMOV instruction; second instruction is a NOP
A1740E: Number of bytes in FRAME PUSH or FRAME POP directive must not be less than zero
A1741E: Instruction cannot be conditional
A1742E: Expected LSL #Imm
A1744E: Alignment on register must be a multiple of 2 in the range 16 to 256
A1745W: This register combination is DEPRECATED and may not work in future architecture revisions
This warning is generated when all of the following conditions are satisfied:
• You are using a deprecated register combination, for example:
  ```assembly
  PUSH {r0, pc}
  ```
• You are assembling for a target architecture that supports 32-bit Thumb instructions, in other words ARMv6T2 or later.
• You are assembling to ARM code.

Note
• When assembling to Thumb, rather than ARM code, and the target architecture is ARMv6T2 or later, the assembler generates error A1477E instead.
• When assembling for an architecture or processor that does not support 32-bit Thumb instructions, in other words ARM architectures before ARMv6T2, by default no diagnostic is emitted.

A1746W: Instruction stall diagnostics may be unreliable for this CPU
This warning is shown when you enable message A1563W for a processor that is not modeled accurately by the assembler. It indicates that you cannot rely on the output of A1563W when improving your code.

See also warning A1563W.

A1753E: Unrecognized memory barrier option
A1754E: Cannot change the type of a scalar register
A1755E: Scalar index has already been specified on this register
A1756E: Data type must be specified on all registers
A1757E: Symbol attributes must be within square brackets; Any other syntax is deprecated
A1758E: Exporting multiple symbols with this directive is deprecated
A1759E: Specified processor or architecture does not support Thumb-2EE instructions
A1760W: Build Attribute `<from>` is `<attr>'
A1761W: Difference in build attribute from '<diff>' in `<from>'
A1762E: Branch offset 0x<val> out of range of 16-bit Thumb branch, but offset encodable in 32-bit Thumb branch
This is caused when assembling for Thumb if an offset to a branch instruction is too large to fit in a 16-bit branch. The .W suffix can be added to the instruction to instruct the assembler to generate a 32-bit branch.
A1763W: Inserted an IT block for this instruction
This indicates that the assembler has inserted an IT block to permit a number of conditional instructions in Thumb code. For example:

```assembly
MOVEQ r0,r1
```
This warning is off by default. It can be enabled using --diag_warning A1763.

A1764W: `<name>` instructions are deprecated in architecture `<arch>` and above
A1765E: Size of padding value on ALIGN must be 1, 2 or 4 bytes
This is caused when the optional padsize attribute is used with an ALIGN directive, but has an incorrect size. It does not refer to the parameter to align to. The parameter can be any power of 2 from 2^0 to 2^31.
A1766E: Size of padding value for code must be a minimum of `<size>` bytes; treating as data
A1767E: Unexpected characters following attribute
A1768E: Missing '='
A1769E: Bad NEON or VFP system register name symbol
A1771E: Bad floating-point bitpattern when expecting <exp>-bit bitpattern
A1772E: Destination type must be signed or unsigned integer, and source type must be 32-bit or 64-bit floating-point
A1773E: Floating-point conversion only possible between 32-bit single-precision and 64-bit double-precision types
A1774E: Fixed-point conversion only possible for 16-bit or 32-bit signed or unsigned types
A1775E: Conversion between these types is not possible
A1776E: This operation is not available for 32-bit single-precision floating point types
A1777E: <n> is out of range for symbol type; value must be between <min> and <max>
A1778E: <n> is out of range for symbol binding; value must be between <min> and <max>
A1779E: DCDO cannot be used on READONLY symbol '<key>'
A1780E: Unknown ATTR directive
A1781E: Tag #<id> cannot be set by using ATTR
A1782E: Tag #<id> should be set with ATTR <cmd>
A1783E: Attribute scope must be a label or section name
A1784W: Reference to weak definition '<sym>' not relocated
A1785E: Macro '<macuse>' not found, but '<macdef>' exists
A1786W: This instruction using SP is deprecated and may not work in future architecture revisions

This warning is generated when all of the following conditions are satisfied:
- You explicitly use the SP in a deprecated way, for example:

```
ADD sp, r0, #100
```
- You are assembling for a target architecture that supports 32-bit Thumb instructions, in other words ARMv6T2 or later.
- You are assembling to ARM code.

ARM deprecates the explicit use of the SP in ARM instructions in any way that is not possible in the corresponding Thumb instruction. Such deprecated register uses are still possible in ARM instructions for backwards compatibility and you can suppress this warning by using the assembler’s command line option --diag_suppress=1786. However, ARM recommends you modify your code, because it might not work in future architecture revisions.

You can replace the deprecated use of the SP shown in the example with a sequence like:

```
ADD r1, r0, #100
MOV sp, r1
```

--- Note ---

- When assembling to Thumb, rather than ARM code, and the target architecture is ARMv6T2 or later, the assembler generates error A1477E instead.
- When assembling for an architecture or processor that does not support 32-bit Thumb instructions, in other words ARM architectures before ARMv6T2, by default no diagnostic is emitted.

A1787W: Use of VFP Vector Mode is deprecated in ARMv7
A1788W: Explicit use of PC in this instruction is deprecated and may not work in future architecture revisions
This warning is generated when all of the following conditions are satisfied:
• You explicitly use the PC in a deprecated way, for example:
  
  CMP pc, #1

• You are assembling for a target architecture that supports 32-bit Thumb instructions, in other words ARMv6T2 or later.
• You are assembling to ARM code.

ARM deprecates the explicit use of the SP in ARM instructions in any way that is not possible in the corresponding Thumb instruction. Such deprecated register uses are still possible in ARM instructions for backwards compatibility and you can suppress this warning by using the assembler’s command line option --diag_suppress=1786. However, ARM recommends you modify your code, because it might not work in future architecture revisions.

Note
• When assembling to Thumb, rather than ARM code, and the target architecture is ARMv6T2 or later, the assembler generates error A1477E instead.
• When assembling for an architecture or processor that does not support 32-bit Thumb instructions, in other words ARM architectures before ARMv6T2, by default no diagnostic is emitted.

A1789W: Explicit use of PC in this instruction is deprecated and may not work in future architecture revisions, except as destination register
A1790W: Writeback ignored in Thumb LDM loading the base register
This is caused by incorrectly adding an exclamation mark to indicate base register writeback.

For example:

LDM r0!, {r0-r4}

is not a legal instruction because r0 is the base register and is also in the destination register list. In this case, the assembler ignores the writeback and generates:

LDM r0, {r0-r4}

A1791W: Previous value of tag #<id> will be overridden
A1792E: Undefined build attributes tag
A1793E: Conversion only possible between 16-bit and 32-bit floating point
A1794E: Conversion operations require two data types
A1795E: Source and destination vector must contain <n> elements
A1796E: Register type not consistent with data type
A1797E: Specified FPU is not compatible with CPU architecture
A1798W: Output is not WYSIWYG (<output>)
A1799W: Output has not been checked for WYSIWYG property
A1800W: No output for line
A1801E: Instruction is UNPREDICTABLE in current instruction set
A1803E: Bad system instruction name
A1804E: Bad CP14 or CP15 register name for instruction
A1805E: Register is Read-Only
A1806E: Register is Write-Only
A1807W: Instruction executes as NOP on target CPU
A1808E: Generated object file may be corrupt (<reason>)
A1809W: Instruction aligns PC before using it; section ought to be at least 4 byte aligned

This warning is generated when all the following conditions apply:

- You are using a PC-relative offset in a Thumb instruction that requires the PC to be word-aligned.
- The code section containing this instruction has less than 4-byte alignment.
- The instruction is not relocated at link time (because of a relocation emitted by the assembler).

If these conditions are all met, and the code section containing this instruction is not placed at a 4-byte aligned address when linking, the instruction might operate on or with the wrong address at runtime. This is because the instruction aligns the PC to a 4-byte address before using it.

The following example shows an LDR instruction in Thumb that is diagnosed by this warning because the section has an alignment of 2 bytes:

```
AREA ||.text||, CODE, READONLY, ALIGN=1
THUMB
LDR r0, [pc, #8] ; gives warning A1809W
```

A1810E: Base register writeback value unclear; use 'rn,#n!' or 'rn,#n' syntax

A1811E: Size of fill value must be 1, 2 or 4 bytes and a factor of fill size

A1812W: Instruction cannot be assembled in the opposite instruction set

A1813W: 32-bit instruction used where 16-bit could have been used

A1814E: No output file

A1815E: SHT_ARM_EXIDX sections require a link order dependency to be set

A1816E: Unknown opcode 'name' in CODE16, but exists in THUMB

A1817W: ATTR tag #<id> setting ignored in <scope>

A1818W: ATTR COMPAT flag <flag> and vendor '<vendor>' setting ignored in <scope>

A1819W: ATTR compatible with tag #<id> setting ignored in <scope>

A1820E: Register and processor mode not valid for instruction

A1821E: Expected constant or register expression

A1822E: Expected list of 32-bit extension registers

A1823E: Expected list of 64-bit extension registers

A1824E: Expected core register or 32-bit, 64-bit or 128-bit extension register

A1825E: Expected constant or 32-bit extension register

A1826E: Expected constant or 64-bit extension register

A1827E: Expected constant or 128-bit extension register

A1828E: Expected core register or 32-bit extension register

A1829E: Expected core register or 64-bit extension register

A1830E: Expected core register or 128-bit extension register

A1831E: Expected constant, floating-point constant, core register or 64-bit extension register

A1832E: Expected floating-point constant, core register or 32-bit extension register

A1833E: Expected constant or '{option}', where option is a constant from 0 to 255

A1834E: Expected register or address expression

A1835E: Too few data types specified on instruction

A1836E: Expected '<dt>' data type for destination

A1837E: Expected '<dt>' data type for first source

A1838E: Unexpected characters when expecting '<word1>' or '<word2>'

A1839E: Destination register must be scalar

A1840E: First source register must be scalar

A1841E: Alignment specified on base register not valid for instruction

A1842E: Syntax not allowed for a pseudo-instruction

A1843E: Literal load not supported for instruction

A1844E: Literal type not supported

A1845E: Register type not available in current instruction set
A1846E: Invalid field specifiers for CPSR or SPSR: must be followed by at least one of c, x, s or f
A1847E: Expression requiring more than one relocation not allowed
This can occur during the assembly of ARM instructions when trying to access data in another area. For example, using:

```
LDR r0, [pc, #label - . - 8]
```

or its equivalent:

```
LDR r0, [pc, #label-(PC)-8]
```

where label is defined in a different AREA.
Change your code to use the simpler, equivalent syntax:

```
LDR r0, label
```

This works if label is either in the same area or in a different area.

A1848W: State change in IT block
A1849E: Scalar index on operand out of range for data type
A1850E: Width must be before any data type qualifiers
A1851E: Invalid line start - local label not supported on this directive
A1852E: Use of VFP Vector Mode is not supported on target FPU
A1853E: Alignment of instruction or target must be at least <n>-byte aligned
A1854E: Unknown opcode '<name>', maybe wrong target CPU?
A1856E: Shifted register operand not allowed
A1857E: Specified shift not allowed
A1858E: Flag setting form of this instruction not available
A1859E: Flag preserving form of this instruction not available
A1860E: Register operands must be from R0 to R7 in this instruction
A1861E: Option '<opt>' is obsolete.
A1862E: Data type size for floating-point must be 16 or 32
A1863E: Data type size for floating-point must be 32
A1864E: Data type size for floating-point must be 16, 32 or 64
A1865W: '#' not seen before constant expression
A1866E: Bitfield LSB out of range. Permitted values are 0 to <max>
A1867E: Register <field> must not be PC
A1870W: Area '<name>' has incorrect attributes, expect '<attrs>'
A1871E: Immediate 0x<imm> cannot be represented by 0-255 shifted left by 0-23 or duplicated in all, odd or even bytes
This error occurs when armasm cannot encode the instruction with the specified immediate.
For example, in ARM Compiler 4.1 and above, the following instruction causes this error, in Thumb state:

```
ADDS r0, r1, #-20
```

A workaround is to use the equivalent SUBS instruction instead:

```
SUBS r0, r1, #20
```

A1872E: Shift by register not allowed
A1873E: Only the non-writeback form of this instruction exists
A1874E: Specified register list cannot be loaded or stored in target instruction set
A1875E: Register Rn must be from R0 to R7 in this instruction
Change the specified register to be in the range R0 to R7.
A1876W: Use of '|' as a synonym for the :OR: operator is deprecated.
A1877E: Specified register for <field> not allowed in current instruction set
A1878E: Offset must be <reqalign>-byte aligned when used with this operation
A1879E: Specified addressing mode not available
A1880E: Data transfer size not available
A1881E: <mode> load/store mode is not permitted
A1882E: Destination and first source register must be same
A1883E: Destination and second source register must be same
A1884E: Specified AIF bits not available on target CPU
A1885E: Cannot change processor mode in current instruction set
A1886E: Invalid operand size for add with carry-in: must be 16 or 32
A1887E: Specified source data type not allowed; must be one of: <str>
A1888E: Specified destination data type not allowed; must be one of: <str>
A1889E: Specified register type not available on target architecture
A1890E: Specified shift results in UNPREDICTABLE behaviour
A1891E: With this register combination, writeback results in UNPREDICTABLE behaviour
A1892W: Writeback with this register combination is deprecated and may not work in future architecture revisions
A1893E: The specified flags result in UNPREDICTABLE behaviour
A1894E: The specified immediate results in UNPREDICTABLE behaviour
A1895E: The specified condition results in UNPREDICTABLE behaviour
A1896E: Specified alignment not supported on this instruction
A1897E: Bitfield width out of range. Permitted values are 1 to <max>
A1898E: Target cannot be relocated. No suitable relocation exists for this instruction
A1899E: Specified operator is only allowed on the following instructions: <instrs>
A1900W: Deprecated system instruction name
A1901E: Specified system instruction not supported on target architecture
A1902E: Specified special register not supported on target architecture
A1903E: Line not seen in first pass; cannot be assembled

This occurs if an instruction or directive does not appear in pass 1 but appears in pass 2 of the assembler.

The following example shows when a line is not seen in pass 1:

```assembly
AREA x, CODE
  [ :DEF: foo
    num EQU 42 ; Assembler does not see this line during pass 1 because
    ; foo is not defined at this point during pass 1
  ]
  foo DCD num
END
```

A1905U: Pre-processor step failed for '<filename>'
A1906W: Unfinished IT block
A1907W: Test for this symbol has been seen and may cause failure in the second pass. This diagnostic is suppressed by default. Enable it to identify situations that might result in errors A1903E, A1908E, or A1909E.
A1908E: Label '<name>' value inconsistent: in pass 1 it was <val1>; in pass 2 it was <val2>

The following example generates this error because in pass 1 the value of x is 0x0004+r9, and in pass 2 the value of x is 0x0000+r0:

```assembly
map 0, r0
  if :not: :def: sym
    map 0, r9
    field 4
  endif
  x   field 4
sym LDR r0, x
```

---

This occurs if an instruction or directive does not appear in pass 1 but appears in pass 2 of the assembler.

The following example shows when a line is not seen in pass 1:

```assembly
AREA x, CODE
  [ :DEF: foo
    num EQU 42 ; Assembler does not see this line during pass 1 because
    ; foo is not defined at this point during pass 1
  ]
  foo DCD num
END
```

A1905U: Pre-processor step failed for '<filename>'
A1906W: Unfinished IT block
A1907W: Test for this symbol has been seen and may cause failure in the second pass. This diagnostic is suppressed by default. Enable it to identify situations that might result in errors A1903E, A1908E, or A1909E.
A1908E: Label '<name>' value inconsistent: in pass 1 it was <val1>; in pass 2 it was <val2>

The following example generates this error because in pass 1 the value of x is 0x0004+r9, and in pass 2 the value of x is 0x0000+r0:
A1909E: Line not seen in second pass; cannot be assembled
This occurs if an instruction or directive appears in pass 1 but does not appear in pass 2 of the assembler.

The following example shows when a line is not seen in pass 2:

```
AREA x, CODE
[ :LNOT :DEF: foo
  MOV r1, r2 ; Assembler does not see this line during pass 2 because
  ; foo is already defined
]
foo MOV r3, r4
END
```

A1911E: Immediate 0x<val> out of range for this operation. Immediate value must be 0
A1912E: In this instruction, register <field> must not be PC when flag-setting is specified
A1913E: Specified operand type not allowed in this position
A1914E: Expected expression
A1915E: Relocation is not recommended on this instruction or directive
A1916E: Unknown built-in variable '<name>'
A1917E: Expected vector register expression
A1921E: Expected 8-bit byte register expression
A1922E: Expected 16-bit halfword register expression
A1923E: Expected list of vector registers
A1925E: Coprocessor number must be 14 or 15 on this architecture
A1927E: Expected core register, 64-bit extension register or vector register
A1931W: This instruction inside IT block is deprecated
A1932E: Register type not allowed on this architecture
A1933E: Option '<opt>' not supported on target architecture
A1934E: Shift by <shift> not allowed. Permitted values are <allowed>
A1936E: Literal pool too distant, use LTORG to assemble it within <distance>
A1937E: Conversions to fixed point only support rounding mode Z
A1938E: Coprocessor number must be 14 on this architecture
A1939W: This mnemonic is deprecated
A1940E: Execute only is not compatible with <option>
A1941E: Unable to align to a non-multiple of <nopsize> using NOP instructions
A1942E: Data declarations are not permitted in execute-only sections
A1943E: INCBIN cannot be used in execute-only sections
A1944E: Literal pool entries cannot be generated in execute-only sections
A1992E: MOVT of external symbol must follow corresponding MOVW instruction
A1993E: This operator requires a relocation that is not supported in <objfmt>
A1994E: This directive is not supported in <objfmt>
A1995E: Weak definitions are not supported in <objfmt>
A1996E: TYPE must only be used after WEAK on IMPORT
A1997E: Expected alias for weak extern symbol
A1998E: Comdat Associated area must have Comdat Associative selection type
A1999E: Comdat Associated area cannot be another Comdat Associated area
Chapter 4
Linker Errors and Warnings

Describes the error and warning messages for the linker, armlink.

It contains the following sections:

- 4.1 Suppressing armlink error and warning messages on page 4-130.
- 4.2 List of the armlink error and warning messages on page 4-131.
4.1 Suppressing armlink error and warning messages

You can use command-line options to suppress or downgrade some of the diagnostic messages that the linker produces.

All linker warnings are suppressible with --diag_suppress, in the same way as compiler warnings. For example:

```
--diag_suppress 6306
```

Some errors such as L6220E, L6238E and L6784E can be downgraded to a warning by using:

```
--diag_warning
```
4.2 List of the armlink error and warning messages

A list of the error and warning messages that armlink produces.

Note
License-related error messages can be found in the
2.1 List of the licensing error and warning messages
on page 2-97 section.

L6000U: Out of memory.
This error is reported by RVCT v4.0 and earlier. For more details on why you might see this
error and possible solutions, see the description for error L6815U.
L6001U: Could not read from file <filename>.
L6002U: Could not open file <filename>: <reason>
This indicates that the linker was unable to open a file specified on the linker command line.
This can indicate a problem accessing the file or a fault with the command line. Some common
examples of this message are:

• L6002U: Could not open file /armlib/{libname}: No such file or directory
  Either specify the library path with --libpath or set the ARMCC5LIB environment variable to
  install_directory\lib.

Note
In ARM Compiler v5.0 and later, armlink does not require the ARMCC5LIB environment
variable to be set.

• Error: armlink : L6002: Could not open file errors=ver.txt
  This is caused by a missing double-dash (--) in front of errors=ver.txt. If you do not
  prefix options with -- or -, the linker treats them as input files and fails the link step because
  it is unable to load all the specified files.

See the following in the armlink User Guide:

--libpath=pathlist.

See the following in the Getting Started Guide:

Toolchain environment variables.

L6003U: Could not write to file <filename>.
An file I/O error occurred while reading, opening, or writing to the specified file.
L6004U: Incomplete library member list <list> for <library>.
This can occur if there is whitespace in the list of library objects.

The following example fails with Fatal error: L6004U: Missing library member in
member list for x.lib:

armlink x.lib(foo.o, bar.o)

The following example succeeds:

armlink x.lib(foo.o,bar.o)

Another less common cause is a corrupt library, or possibly a library in an unsupported format.
L6005U: Extra characters on end of member list for <library>.
L6006U: Overalignment value not specified with OVERALIGN attribute for execution region <regionname>.

See the following in the armlink User Guide:
• Syntax of an input section description.
• Overalignment of execution regions and input sections.

L6007U: Could not recognize the format of file <filename>.
The linker can recognize object files in ELF format and library files in AR format. The specified file is either corrupt, or is in a file format that the linker cannot recognize.

L6008U: Could not recognize the format of member <mem> from <lib>.
The linker can recognize library member objects in the ELF file format. The specified library member is either corrupt, or is in a file format that the linker cannot recognize.

The endianness of the specified file or object did not match the endianness of the other input files. The linker can handle input of either big endian or little endian objects in a single link step, but not a mixed input of some big and some little endian objects.

L6010U: Could not reopen stderr to file <filename>: <reason>
An file I/O error occurred while reading, opening, or writing to the specified file.

L6011U: Invalid integer constant : <number>.
Specifying an illegal integer constant causes this. An integer can be entered in hexadecimal format by prefixing &0x, or 0X.

L6015U: Could not find any input files to link.
The linker must be provided with at least one object file to link.

For example, if you try to link with:

```
armlink lib.a -o foo.axf
```

the linker reports this error.

You must instead use, for example:

```
armlink foo_1.o foo_2.o lib.a -o foo.axf
```

L6016U: Symbol table missing/corrupt in object/library <object>.
This can occur when linking with libraries built with the GNU tools. This is because GNU ar can generate incompatible information.

The workaround is to replace ar with armar and use the same command-line arguments.
Alternatively, the error is recoverable by using armar -s to rebuild the symbol table.

L6017U: Library <library> symbol table contains an invalid entry, no member at offset 0x<offset>.
The library might be corrupted. Try rebuilding it.

L6018U: <filename> is not a valid ELF file.
L6019U: <filename> is not a valid 64 bit ELF file.
L6020U: <filename> is not a valid 32 bit ELF file.
L6022U: Object <objname> has multiple <table>.
The object file is faulty or corrupted. This might indicate a compiler fault. Contact your supplier.

L6024U: Library <library> contains an invalid member name.
The file specified is not a valid library file, is faulty or corrupted. Try rebuilding it.

L6025U: Cannot extract members from a non-library file <library>.
The file specified is not a valid library file, is faulty or corrupted. Try rebuilding it.

L6026U: ELF file <filename> has neither little or big endian encoding
The ELF file is invalid. Try rebuilding it.

L6027U: Relocation #<rel_class>:<rel_number> in <objname>({secname}) has invalid/unknown type.
This might indicate a compiler fault. Contact your supplier.
L028U: Relocation #<rel_class>:<rel_number> in <objname>(<secname>) has invalid offset.
This might indicate a compiler fault. Contact your supplier.

L029U: Relocation #<rel_class>:<rel_number> in <objname>(<secname>) is wrt invalid/missing symbol.
The relocation is with respect to a symbol that is either:
• invalid or missing from the object symbol table
• a symbol that is not suited to be used by a relocation.
This might indicate a compiler fault. Contact your supplier.

L030U: Overalignment <overalignment> for region <regname> must be at least 4 and a power of 2
See the following in the armlink User Guide:
• Execution region attributes.
• Syntax of an input section description.
• Overalignment of execution regions and input sections.

L031U: Could not open scatter description file <filename>: <reason>
An I/O error occurred while trying to open the specified file. This could be because of an invalid filename.

L032U: Invalid <text> <value> (maximum <max_value>) found in <object>

L033U: Symbol <symbolname> in <objname> is defined relative to an invalid section.

L034U: Symbol <symbolname> in <objname> has invalid value.
This is most often caused by a section-relative symbol having a value that exceeds the section boundaries.

L035U: Relocation #<rel_class>:<rel_number> in ZI Section <objname>(<secname>) has invalid type.
ZI Sections cannot have relocations other than of type R_ARM_NONE.

L036U: Could not close file <filename>: <reason>
An I/O error occurred while closing the specified file.

L037U: '<arg>' is not a valid argument for option '<option>'.
The argument is not valid for this option. This could be because of a spelling error, or because of the use of an unsupported abbreviation of an argument.

L038U: Could not create a temporary file to write updated SYMDEFS.
An I/O error occurred while creating the temporary file required for storing the SYMDEFS output.

L039W: Relocation from #<rel_class>:<rel_number> in <objname>(<secname>) with respect to <symname>. Skipping creation of R-type relocation. No corresponding R-type relocation exists for type <rel_type>.
--reloc is used with objects containing relocations that do not have a corresponding R-type relocation.

L041U: An internal error has occurred (<clue>).
Contact your supplier.

L042U: Relocation #<rel_class>:<rel_number> in <objname>(<secname>) is wrt a mapping symbol(#<idx>, Last Map Symbol = #<last>).
Relocations with respect to mapping symbols are not permitted. This might indicate a compiler fault. Contact your supplier.

L043U: Relocation #<rel_class>:<rel_number> in <objname>(<secname>) is with respect to an out of range symbol(#<val>, Range = 1-<max>).
Relocations can only be made wrt symbols in the range (1-n), where n is the number of symbols.

L047U: The size of this image (<actual_size> bytes) exceeds the maximum allowed for this version of the linker.

L048U: The linker is unable to continue the link step (<id>). This version of the linker will not create this image.

L049U: The linker is unable to continue the link step (<id>). This version of the linker will not link with one or more given libraries.
L6050U: The code size of this image (<actual_size> bytes) exceeds the maximum allowed for this version of the linker.

L6058E: Syntax error parsing linker script <script> at line <lineno> : <token>
   The link ld script has a syntax error at the line number.

See the following in the armlink User Guide:

GNU ld script support in armlink.

L6064E: ELF Executable file <filename> given as input on command line
   This might be because you specified an object file as output from from the compiler without specifying the -c compiler option. For example:
   armcc file.c -o file.o
   armlink file.o -o file.axf

See the following in the armcc User Guide:
   -c.

L6065E: Load region <name> (size <size>) is larger than maximum writable contiguous block size of 0x80000000.
   The linker attempted to write a segment larger than 2GB. The size of a segment is limited to 2GB.

L6175E: EMPTY region <regname> cannot have any section selectors.

L6176E: A negative max_size cannot be used for region <regname> without the EMPTY attribute.
   Only regions with the EMPTY attribute are permitted to have a negative max_size.

L6177E: A negative max_size cannot be used for region <regname> which uses the +offset form of base address.
   Regions using the +offset form of base address are not permitted to have a negative max-size.

L6188E: Special section <sec1> multiply defined by <obj1> and <obj2>.
   A special section is one that can only be used once, such as "Veneer$$Code".

L6195E: Cannot specify both '<attr1>' and '<attr2>' for region <regname>
   See the following in the armlink User Guide:
   • Load region attributes.
   • Execution region attributes.
   • Inheritance rules for load region address attributes.
   • Inheritance rules for execution region address attributes.
   • Inheritance rules for the RELOC address attribute.
L6200E: Symbol <symbolname> multiply defined by <object1> and <object2>.
A common example of this:

Symbol __stdout multiply defined (by retarget.o and stdio.o).

This means that there are two conflicting definitions of __stdout present in retarget.o and stdio.o. The one in retarget.o is your own definition. The one in stdio.o is the default implementation, which was probably linked-in inadvertently.

stdio.o contains a number of symbol definitions and implementations of file functions like fopen, fclose, and fprintf.

stdio.o is being linked-in because it satisfies some unresolved references.
To identify why stdio.o is being linked-in, you must use the --verbose link option switch. For example:

```
armlink [...] --verbose --list err.txt
```

Then study err.txt to see exactly what the linker is linking in, from where, and why.

You might have to either:
- eliminate the calls like fopen, fclose, and fprintf
- re-implement the _sys_xxxx family of functions.

See the following in the ARM C and C++ Libraries and Floating-Point Support User Guide:
* Tailoring input/output functions in the C and C++ libraries.*

L6201E: Object <objname> contains multiple entry sections.
The input object specifies more than one entry point. Use the --entry command-line option to select the entry point to use.

See the following in the armlink User Guide:

```
--entry=location
```

L6202E: <objname>(<secname>) cannot be assigned to non-root region '<regionname>'
A root region is a region that has an execution address the same as its load address. The region does not therefore require moving or copying by the scatter-load initialization code. Certain sections must be placed in a root region in the image, including:
- __main.o.
- The linker-generated table (Region$$Table).
- Scatter-loading (__scatter*.o) objects from the library.
- Decompressor (__dc*.o) objects from the library.

If a required section is not placed in a root region, the linker reports, for example:

```
anon$$obj.o(Region$$Table) cannot be assigned to a non-root region 'RAM'.
```

You can use InRoot$$Sections to include all required sections in a root region:

```
ROM_LOAD 0x0000 0x4000
{ ROM_EXEC 0x0000 0x4000 ; root region
  { vectors.o (Vect, +FIRST) ; Vector table
    * (InRoot$$Sections) ; All library sections
      ; that must be in a root region
    ; for example, __main.o, __scatter*.o, dc*.o and + Region$$Table
  }
  RAM 0x10000 0x8000
  { * (+RO, +RW, +ZI) ; all other sections
  }
}
```
L6203E: Entry point (<address>) lies within non-root region <regionname>.
The image entry point must correspond to a valid instruction in a root-region of the image.

L6204E: Entry point (<address>) does not point to an instruction.
The image entry point you specified with the --entry command-line option must correspond to a valid instruction in the root-region of the image.

See the following in the armlink User Guide:

--entry=location.

L6205E: Entry point (<address>) must be word aligned for ARM instructions.
This message is displayed because the image entry point you specified with the --entry command-line option is not word-aligned. For example, you specified --entry=0x8001 instead of --entry=0x8000.

See the following in the armlink User Guide:

--entry=location.

L6206E: Entry point (<address>) lies outside the image.
The image entry point you specified with the --entry command-line option is outside the image. For example, you might have specified an entry address of 0x80000 instead of 0x8000, as follows:

```
armlink --entry=0x80000 test.o -o test.axf
```

See the following in the armlink User Guide:

--entry=location.

L6208E: Invalid argument for --entry command: '<arg>'
See the following in the armlink User Guide:

--entry=location.

L6209E: Invalid offset constant specified for --entry (<arg>)
See the following in the armlink User Guide:

--entry=location.

L6210E: Image cannot have multiple entry points. (<address1>,<address2>)
One or more input objects specifies more than one entry point for the image. Use the --entry command-line option to select the entry point to use.

See the following in the armlink User Guide:

--entry=location.

L6211E: Ambiguous section selection. Object <objname> contains more than one section.
This can occur when using the linker option --keep on an assembler object that contains more than one AREA. The linker must know which AREA you want to keep.
To solve this, use more than one --keep option to specify the names of the AREAs to keep, such as:

```
--keep boot.o(vectors) --keep boot.o(resethandler) ...
```

Note

Using assembler files with more than one AREA might give other problems elsewhere, so this is best avoided.

L6213E: Multiple First section <object2>(<section2>) not allowed.
<object1>(<section1>) already exists.
Only one FIRST section is permitted.
L6214E: Multiple Last section `<object2>`(<section2>) not allowed.
`<object1>`(<section1>) already exists.
    Only one LAST section is permitted.
L6215E: Ambiguous symbol selection for --First/--Last. Symbol `<symbol>` has more than one definition.
    See the following in the `armlink` User Guide:
    • `--first=section_id`.
    • `--last=section_id`. 
L6216E: Cannot use base/limit symbols for non-contiguous section <secname>

The exception handling index tables generated by the compiler are given the section name .ARM.exidx. For more information, see Exception Handling ABI for the ARM Architecture.

At link time these tables must be placed in the same execution region and be contiguous. If you explicitly place these sections non-contiguously using specific selector patterns in your scatter file, then this error message is likely to occur. For example:

```c
LOAD_ROM 0x00000000
{ 
  ER1 0x00000000 
  { 
    file1.o (+RO) ; from a C++ source
    * (+RO) 
  } 
  ER2 0x01000000 
  { 
    file2.o (+RO) ; from a C++ source
  } 
  ER3 +0 
  { 
    * (+RW, +ZI) 
  } 
}
```

This might produce the following error if exception handling index tables are in both file1.o and file2.o, because the linker cannot place them in separate regions:

```none
Error: L6216E: Cannot use base/limit symbols for non-contiguous section .ARM.exidx
```

Also, the .init_array sections must be placed contiguously within the same region for their base and limit symbols to be accessible.

The correct code is:

```c
LOAD_ROM 0x00000000
{ 
  ER1 0x00000000 
  { 
    file1.o (+RO) ; from a C++ source 
    * (.ARM.exidx) ; Section .ARM.exidx must be placed explicitly, otherwise it is shared between two regions and the linker is unable to decide where to place it. 
    *(.init_array) ; Section .init_array must be placed explicitly, otherwise it is shared between two regions and the linker is unable to decide where to place it. 
    * (+RO)
  } 
  ER2 0x01000000 
  { 
    file2.o (+RO) ; from a C++ source 
  } 
  ER3 +0 
  { 
    * (+RW, +ZI)
  } 
}
```

In this example, the base and limit symbols are contained in .init_array in a single region.

See the following in the ARM C and C++ Libraries and Floating-Point Support User Guide: C++ initialization, construction and destruction.

L6217E: Relocation #<rel_class>:<rel_number> in <objname>(<secname>) with respect to <symbol>. R_ARM_SBREL32 relocation to imported symbol
L6218E: Undefined symbol <symbol> (referred from <objname>).  
Some common examples of this are:

- User Error. There is a reference to an undefined or incorrectly defined symbol.
- Undefined symbol __ARM_switch8 or __ARM_ll_<xxxx> functions  

The helper functions are automatically generated into the object file by the compiler.

Note

An undefined reference error can, however, still be generated if linking objects from legacy projects where the helper functions are in the h_xxx libraries (h indicates that these are compiler helper libraries, rather than standard C library code).

Re-compile the object or ensure that these libraries can be found by the linker.

• When attempting to refer to a function or entity in C from a function or entity in C++. This is caused by C++ name mangling, and can be avoided by marking C functions extern "C".

• Undefined symbol thunk{v:0,-44} to Foo_i::~Foo_i() (referred from Bar_i.o)  

The symbol thunk{v:0,-44} to Foo_i::~Foo_i() is a wrapper function round the regular Foo_i::~Foo_i(). Foo_i is a derived class of some other base class, therefore:

— it has a base-class vtable for when it is referred to by a pointer to that base class
— the base-class vtable has an entry for the thunk
— the destructor thunk is output when the actual (derived class) destructor is output.

Therefore, to avoid the error, ensure this destructor is defined.

• Undefined symbol main (referred from kernel.o)  

The linker is reporting that your application does not include a main() function.

See the following in the Migration and Compatibility Guide:

C and C++ library changes between RVCT v2.2 and RVCT v3.0.

L6219E: <type> section <object1>({<section1>}) attributes {<attributes>} incompatible with neighboring section <object2>({<section2>}).  
This error occurs when the default ordering rules used by the linker (RO followed by RW followed by ZI) are violated. This typically happens when one uses +FIRST or +LAST, for example in a scatter file, attempting to force RW before RO.

L6220E: <type> region <regionname> size (<size> bytes) exceeds limit (<limit> bytes).

Example:

Execution region ROM_EXEC size (4208184 bytes) exceeds limit (4194304 bytes).

This can occur where a region has been given an (optional) maximum length in the scatter file, but the size of the code and data being placed in that region has exceeded the limit. This error is suppressible with -diag_suppress 6220.

For example, this might occur when using _ANYnum selectors with the ALIGN directive in a scatter file to force the linker to insert padding. You might be able to fix this using the --any_contingency option.

See the following in the armlink User Guide:

- Placement of unassigned sections with the _ANY module selector.
- --any_contingency.
- --diag_suppress=tag[,tag,...].
L6221E: <type1> region <regionname1> with <addrtype1> range [base1, limit1) overlaps with <type2> region <regionname2> with <addrtype2> range [base2, limit2).

This error can occur even though information in the scatter-loading description file and map information generated by the linker indicate that the execution regions do not overlap.

In RVCT v4.0 and earlier, the linker did not provide as much information, making the message harder to understand:

Warning L6221E: <type1> region <regionname1> overlaps with <type1> region <regionname2>

Example test.s file:

```
AREA area1, CODE
BX lr

AREA area2, READWRITE, NOINIT
SPACE 10

AREA area3, READWRITE
DCD 10
END
```

Example scatter.txt file:

```
LR1 0x8000
{
  ER1 +0
  { *(+ro) }
  ER2 +0
  { *(+zi) }
  ER3 +0
  { *(+rw) }
}
```

Built with:

```
armasm test.s
armlink -o test.axf --scatter scatter.txt test.o
```

Generates:

```
Warning: L6221E: Execution region ER2 with Execution range [0x00008004,0x00008010) overlaps with Execution region ER3 with Load range [0x00008004,0x00008008).
```

The linker might emit warning message L6221E when an execution region base address overlaps with the load address of another region. This could be due to an incorrect scatter file. The memory map of the image has a load view and an execution view, described by the scatter-loading file. A non-ZI section must have a unique load address and in most cases must have a unique execution address. From RVCT v3.1 onwards, the linker no longer assigns space to ZI execution regions. Therefore this warning might be because a load region LR2 with a relative base address immediately follows a ZI execution region in a load region LR1.

Because the overlapping part might not have real code or data inside, the warning might be harmless.

From RVCT v4.0 build 821 onwards, you can use the following linker options to find out the addresses of each region, and any regions that overlap with a load region:

```
--load_addr_map_info --map --list=map.txt
```

You can do one of the following:
• Ignore the warning, only if after analysis it is possible to determine that the execution region is not going to corrupt the load region that has not yet been copied to its execution region address. Also, debug the application to confirm that it initializes and executes correctly.
• Adjust the base addresses of the execution regions.
• Use the FIXED scatter-loading attribute to make the load regions and execution regions have the same base addresses.

See the following in the armlink User Guide:
• Scatter files containing relative base address load regions and a ZI execution region.
• Execution region attributes.
• Root execution regions and the FIXED attribute.

L6222E: Partial object cannot have multiple ENTRY sections, <e_oname>(<e_sname>) and <oname>(<sname>).
Where objects are being linked together into a partially-linked object, only one of the sections in the objects can have an entry point.

Note
It is not possible in this case to use the linker option --entry to select one of the entry points.

L6223E: Ambiguous selectors found for <objname>(<secname>) from Exec regions <region1> and <region2>.
This occurs if the scatter file specifies <objname>(<secname>) to be placed in more than one execution region. This can occur accidentally when using wildcards (*). The solution is to make the selections more specific in the scatter file.

L6224E: Could not place <objname>(<secname>) in any Execution region.
This occurs if the linker cannot match an input section to any of the selectors in your scatter file. You must correct your scatter file by adding an appropriate selector.

See the following in the armlink User Guide:
Section placement with the linker.

L6225E: Number <str...> is too long.
L6226E: Missing base address for region <regname>.
L6227E: Using --reloc with --rw-base without --split is not allowed.
See the following in the armlink User Guide:
• --reloc.
• --rw_base=address.
• --split.

L6228E: Expected '<str1>', found '<str2>'.
L6229E: Scatter description <file> is empty.
L6230E: Multiple execution regions (<region1>,<region2>) cannot select <secname>.
L6231E: Missing module selector.
L6232E: Missing section selector.
L6233E: Unknown section selector '+<selector>'.
L6234E: <ss> must follow a single selector.
For example, in a scatter file:

```plaintext
* (+FIRST, +RO)
```

+FIRST means place this (single) section first. Selectors that can match multiple sections (for example, +RO or +ENTRY) are not permitted to be used with +FIRST (or +LAST). If used together, the error message is generated.
L6235E: More than one section matches selector - cannot all be FIRST/LAST.
See the following in the armlink User Guide:
- Section placement with the FIRST and LAST attributes.
- Syntax of an input section description.

L6236E: No section matches selector - no section to be FIRST/LAST.
The scatter file specifies a section to be +FIRST or +LAST, but that section does not exist, or has been removed by the linker because it believes it to be unused. Use the linker option --info unused to reveal which objects are removed from your project. Example:

```plaintext
ROM_LOAD 0x00000000 0x4000
{
  ROM_EXEC 0x00000000
  {
    vectors.o (Vect, +First) << error here
    * (+RO)
  }
  RAM_EXEC 0x40000000
  {
    * (+RW, +ZI)
  }
}
```

Some possible solutions are:
- Ensure vectors.o is specified on the linker command line.
- Link with --keep vectors.o to force the linker not to remove this, or switch off this optimization entirely, with --no_remove. ARM does not recommend this.
- ARM recommends that you add the ENTRY directive to vectors.s, to tell the linker that it is a possible entry point for your application. For example:

```plaintext
AREA Vect, CODE
ENTRY ; define this as an entry point
Vector_table
...
```

Then link with --entry Vector_table to define the real start of your code.

See the following in the armlink User Guide:
- Section placement with the FIRST and LAST attributes.
- --entry=location.
- --info=topic[,topic,...].
- --keep=section_id.
- --remove, --no_remove.
- Syntax of an input section description.

See the following in the armasm User Guide:

ENTRY.

L6237E: <objname>(<secname>) contains relocation(s) to unaligned data.
L6238E: <objname>(<secname>) contains invalid call from '<attr1>' function to '<attr2>' function <sym>.  
This linker error is given where a stack alignment conflict is detected in object code. The ABI for the ARM Architecture suggests that code maintains eight-byte stack alignment at its interfaces. This permits efficient use of LDRD and STRD instructions (in ARM architecture 5TE and later) to access eight-byte aligned double and long long data types.

Symbols such as ~PRES8 and REQ8 are Build Attributes of the objects:

• PRES8 means the object preserves eight-byte alignment of the stack
• ~PRES8 means the object does not preserve eight-byte alignment of the stack (~ meaning NOT)
• REQ8 means the object requires eight-byte alignment of the stack.

This link error typically occurs in two cases:

• Where assembler code (that does not preserve eight-byte stack alignment) calls compiled C/C++ code (that requires eight-byte stack alignment).
• Where attempting to link legacy objects that were compiled with older tools with objects compiled with recent tools. Legacy objects that do not have these attributes are treated as ~PRES8, even if they do actually happen to preserve eight-byte alignment.

For example:

Error: L6238E: foo.o(.text) contains invalid call from '~PRES8' function to 'REQ8' function foobar

This means that there is a function in the object foo.o (in the section named .text) that does not preserve eight-byte stack alignment, but which is trying to call function foobar that requires eight-byte stack alignment.

A similar warning that might be encountered is:

Warning: L6306W: '~PRES8' section foo.o(.text) should not use the address of 'REQ8' function foobar

where the address of an external symbol is being referred to.

There are two possible solutions to work around this issue:

• Rebuild all your objects/libraries.
  
  If you have any assembler files, you must check that all instructions preserve eight-byte stack alignment, and if necessary, correct them.
  
  For example, change:

  STMFD sp!, {r0-r3, lr} ; push an odd number of registers

  to

  STMFD sp!, {r0-r3, r12, lr} ; push even number of registers

  The assembler automatically marks the object with the PRES8 attribute if all instructions preserve eight-byte stack alignment, so it is no longer necessary to add the PRESERVE8 directive to the top of each assembler file.
  
  • If you have any legacy objects/libraries that cannot be rebuilt, either because you do not have the source code, or because the old objects must not be rebuilt (for example, for qualification/certification reasons), then you must inspect the legacy objects to check whether they preserve eight-byte alignment or not.

  Use fromelf -c to disassemble the object code. C/C++ code compiled with ADS 1.1 or later normally preserves eight-byte alignment, but assembled code does not.

If your objects do indeed preserve eight-byte alignment, then the linker error L6238E can be suppressed with the use of --diag_suppress 6238 on the linker command line.
By using this, you are effectively guaranteeing that these objects are PES8.

The linker warning L6306W is suppressible with --diag_suppress 6306.

See the following FAQ:

8 Byte Stack Alignment.

L6239E: Cannot call non-interworking <t2> symbol '<sym>' in <obj2> from <t1> code in <obj1>({sec1})

Example:

```
Cannot call non-interworking ARM symbol 'ArmFunc' in object foo.o from THUMB code in bar.o(.text)
```

This problem can be caused by foo.c not being compiled with the option --apcs /interwork, to enable ARM code to call Thumb code (and Thumb to ARM) by linker-generated interworking veneers.

L6241E: <objname>({secname}) cannot use the address of '<attr1>' function <sym> as the image contains '<attr2>' functions.

When linking with --strict, the linker reports conditions that might fail as errors, for example:

```
Error: L6241E: foo.o(.text) cannot use the address of '~IW' function main as the image contains 'IW' functions.
```

IW means interworking, and ~IW means non-interworking.

L6242E: Cannot link object <objname> as its attributes are incompatible with the image attributes.

Each object file generated by the compilation tools includes a set of attributes that indicates the options that it was built with. The linker checks the attributes of each object file it processes. If it finds attributes that are incompatible with those of object files it has loaded previously, it generates this error.

There are two common reasons for this error:

- Object files compiled with incompatible options. For example:
  - attempting to link one file compiled for Cortex-A processors, with another file compiled for Cortex-M processors.
  - attempting to link files that have incompatible FPU options.
- Linking objects that have been compiled with an older toolchain that uses an incompatible ABI. See Are legacy objects and libraries compatible with my project? for more information.

L6243E: Selector only matches removed unused sections - no section to be FIRST/LAST.

All sections matching this selector have been removed from the image because they were unused. For more information, use --info unused.

L6244E: <type> region <regionname> address (<addr>) not aligned on a <align> byte boundary.

L6245E: Failed to create requested ZI section '{name}'.

L6248E: `<objname>` in `<attr1>` region '<r1>' cannot have `<rtype>` relocation to `<symname>` in `<attr2>` region '<r2>'.

This error can occur when you are trying to build position-independent (PI) code. Consider, for example the following code:

```c
#include <stdio.h>
char *str = "test";
int main(void)
{
    printf ("%s",str);
}
```

When you compile and link this using:

```bash
armcc -c --apcs /ropi/rwpi pi.c
armlink --ropi --rwpi pi.o
```

the linker reports the following error message:

```
Error: L6248E: pi.o(.data) in PI region 'ER_RW' cannot have address type relocation to .conststring in PI region 'ER_RO'.
```

This is because the compiler generates a global pointer `str` that must be initialized to the address of the string in the .conststring section. However, absolute addresses cannot be used in a PI system, so the link step fails.

To resolve this, you must re-write the code to avoid the explicit pointer. You can do this using either of the following methods:

- Use a global array instead of a global pointer, for example:

```c
#include <stdio.h>
const char str[] = "test";
int main(void)
{
    printf ("%s",str);
}
```

- Use a local pointer instead of a global pointer, for example:

```c
#include <stdio.h>
int main(void)
{
    char *str = "test";
    printf ("%s",str);
}
```

**Note**

If you are using an array of pointers, such as:

```c
char * list[] = {"zero", "one", "two"};
```

the linker reports a separate error for each element in the array. In this case, ARM recommends you declare a two dimensional array for the list, with the first dimension as the number of elements in the array, and the second dimension as the maximum size of an element in the array, for example:

```c
char list[3][5] = {"zero", "one", "two"};
```

You must change the `printf()` statement to, for example:

```c
printf("%s", list[1]);
```

See compiler error number 1359.
L6253E: Invalid SYMDEF address: <number>.
L6254E: Invalid SYMDEF type: <type>.
   The content of the symdefs file is invalid.
   See the following in the armlink User Guide:
   Symdefs file format.

L6255E: Could not delete file <filename>: <reason>
   An I/O error occurred while trying to delete the specified file. The file was either read-only, or
   was not found.
L6257E: <object>(<secname>) cannot be assigned to overlaid Execution region 'ername'.
   This message indicates a problem with the scatter file.
   See the following in the armlink User Guide:
   Scatter file syntax.

L6258E: Entry point <address> lies in an overlaid Execution region.
   This message indicates a problem with the scatter file.
   See the following in the armlink User Guide:
   Scatter file syntax.

L6259E: Reserved Word '<name>' cannot be used as a <type> region name.
   <name> is a reserved word, so choose a different name for your region.
L6260E: Multiple load regions with the same name (<regionname>) are not allowed.
   This message indicates a problem with the scatter file.
   See the following in the armlink User Guide:
   Scatter file syntax.

L6261E: Multiple execution regions with the same name (<regionname>) are not allowed.
   This message indicates a problem with the scatter file.
   See the following in the armlink User Guide:
   Scatter file syntax.

L6263E: <addr> address of <regionname> cannot be addressed from <pi_or_abs> Region Table in <regtabregionname>
   The Region Table contains information used by the C-library initialization code to copy,
   decompress, or create ZI. This error message is given when the scatter file specifies an image
   structure that cannot be described by the Region Table.
   The error message is most common when PI and non-PI load regions are mixed in the same
   image.

L6265E: Non-PI Section <obj>(<sec>) cannot be assigned to non-PI Exec region <er>.
   This might be caused by explicitly specifying the wrong ARM library on the linker command-line. Either:
   • remove the explicit specification of the ARM library
   • replace the library, for example, c_t.1, with the correct library.

L6266E: RWPI Section <obj>(<sec>) cannot be assigned to non-PI Exec region <er>.
   A file compiled with --apcs=/rwpi is placed in an execution region that does not have the PI
   attribute.

L6271E: Two or more mutually exclusive attributes specified for Load region <regname>
   This message indicates a problem with the scatter file.

L6272E: Two or more mutually exclusive attributes specified for Execution region <regname>
   This message indicates a problem with the scatter file.
L6273E: Section <objname>(<secname>) has mutually exclusive attributes (READONLY and ZI)
This message indicates a problem with the object file.

L6275E: COMMON section <obj1>(<sec1>) does not define <sym> (defined in <obj2>(<sec2>))
Given a set of COMMON sections with the same name, the linker selects one of them to be added to the image and discards all others. The selected COMMON section must define all the symbols defined by any rejected COMMON section, otherwise a symbol that was defined by a rejected section would become undefined again. The linker generates an error if the selected copy does not define a symbol that a rejected copy does. This error is normally caused by a compiler fault. Contact your supplier.

L6276E: Address <addr> marked both as <s1>(from <sp1>(<obj1>) via <src1>) and <s2>(from <sp2>(<obj2>) via <src2>)
The image cannot contain contradictory mapping symbols for a given address, because the contents of each word in the image are uniquely typed as ARM ($a) or THUMB ($t) code, DATA ($d), or NUMBER. It is not possible for a word to be both ARM code and DATA. This might indicate a compiler fault. Contact your supplier.

L6277E: Unknown command '<cmd>'

L6278E: Missing expected <str>

L6279E: Ambiguous selectors found for <sym> ('<sel1>' and '<sel2>')

L6280E: Cannot rename <sym> using the given patterns.
See the following in the armlink User Guide:

RENAME steering file command.

L6281E: Cannot rename both <sym1> and <sym2> to <newname>.
See the following in the armlink User Guide:

RENAME steering file command.

L6282E: Cannot rename <sym> to <newname> as a global symbol of that name exists (defined) in <obj>.
See the following in the armlink User Guide:

RENAME steering file command.

L6283E: Object <objname> contains illegal local reference to symbol <symbolname>.
An object cannot contain a reference to a local symbol, because local symbols are always defined within the object itself.

L6285E: Non-relocatable Load region <lr_name> contains R-Type dynamic relocations.
First R-Type dynamic relocation found in <object>(<secname>) at offset 0x<offset>.
This error occurs where there is a PI reference between two separate segments, if the two segments can be moved apart at runtime. When the linker sees that the two sections can be moved apart at runtime it generates a relocation (an R-Type relocation) that can be resolved if the sections are moved from their statically linked address. However the linker faults this relocation (giving error L6285E) because PI regions must not have relocations with respect to other sections as this invalidates the criteria for being position independent.
L6286E: Relocation <rel_class>:<rel_number> in <objname>(<secname>) with respect to {symname|%s}. Value(<val>) out of range(<range>) for (<rtype>)

This error typically occurs in the following situations:

- In handwritten assembly code, where there are not enough bits within the instruction opcode to hold the offset to a symbol.
  For example, the offset range is ±4095 for an ARM state LDR or STR instruction.
- When the linker is having difficulty placing veneers around a large code section in your image.
  When the linker places a veneer near a very large section it must decide whether to place the veneer before or after the section. When the linker has placed the veneer it might have to place more veneers, which could be placed between the original veneer and its target. This would increase the distance between the veneer and its target.

The linker automatically allows for modest increases in distances between veneers and their targets. However, a large number of veneers placed between the original veneer and its target might result in the target moving out of range. If this occurs, the linker generates message L6286E.

To work around this, you can move large code sections away from areas where the linker is placing many veneers. This can be done either by placing large sections in their own regions or by placing them first in the region they are located in using the +FIRST directive in the scatter-loading description file.

For example:

```
LOAD 0x0A000000 0x1000000
{    
    ROM1 +0x0
    {            
        *(+RO) 
    } 
}
```

This can be changed to:

```
LOAD 0x0A000000 0x1000000
{    
    ROM1 +0x0
    {            
        *(+RO) 
    } 
    ROM1A +0x0
    {            
        large.o (+RO) 
    } 
}
```

- When .ARM.exidx exception-handling index tables are placed in different execution regions, or too far from exception handling code.

The .ARM.exidx exception-handling index tables must be located in a single execution region. Also, the distance from these tables to the C++ code that uses C++ exception handling must be within the range -0x40000000 to 0x3fffffff. Otherwise, the linker reports the following error:

L6286: Value(0x9ff38980) out of range(-0x9ff38980) out of range(-0x40000000 - 0x3fffffff) for relocation #0 (R_ARM_PREL31), wrt symbol xxx in XXXX.o(.ARM.exidx)

This behavior is specified in the Exception Handling ABI for the ARM Architecture (EHABI). The EHABI states that the R_ARM_PREL31 relocation, which .ARM.exidx uses, does not use the highest bit (bit 31) for calculating the relocation.

The most likely cause of this is that C++ code that must access the .ARM.exidx sections, has been split and placed into separate execution regions, outside of the valid range (-0x40000000 to 0x3fffffff).
To resolve this error, if you have memory between the separated execution regions, place the `.ARM.exidx` section there with the selector *(.ARM.exidx)*. For example:

```plaintext
LOAD_ROM 0x00000000
{
  ER1 0x00000000 ; The distance from ER2 to ER1 is out of
  file1.o (+RO) ; From a C++ source.
  * (+RO)
}
ERx 0x30000000
{ *(.ARM.exidx) ; ARM.exidx to ER1 and ER2 both in range.
}
ER2 0x60000000
{ file2.o (+RO) ; From a C++ source.
}
ER3 +0
{ *(+RW, +ZI)
}

Otherwise, try placing the code into an execution region close enough to the tables (within the range of -0x40000000 to 0x3fffffff).

In other cases, make sure you have the latest patch installed from Downloads.

For more information, see the following:

*What does "Error: L6286E: Value out of range for relocation" mean?*

*Exception Handling ABI for the ARM Architecture.*

L6287E: Illegal alignment constraint (<align>) specified for <objname>(<secname>).
An illegal alignment was specified for an ELF object.
L6291E: Cannot assign Fixed Execution Region <ername> Load Address:<addr>. Load Address must be greater than or equal to next available Load Address:<load_addr>.
See the following in the *armlink User Guide*:

*Execution region attributes.*

L6292E: Ignoring unknown attribute '<attr>' specified for region <regname>.
This error message is specific to execution regions with the FIXED attribute. FIXED means make the load address the same as the execution address. The linker can only do this if the execution address is greater than or equal to the next available load address within the load region.
See the following in the *armlink User Guide*:

* Root execution regions and the FIXED attribute.*
* Execution region attributes.*

L6294E: <type> region <regionname> spans beyond 32 bit address space (base <base>, size <size> bytes).
This error message relates to a problem with the scatter file.
L6295E: Relocation #<rel_class>:<rel_number> in <objname>(<secname>) with respect to <symname> SBREL relocation requires image to be RWPI
L6296E: Definition of special symbol <sym1> is illegal as symbol <sym2> is absolute.
See L6188E.
L6300W: Common section <object1>(<section1>) is larger than its definition <object2>(<section2>).
This might indicate a compiler fault. Contact your supplier.
L6301W: Could not find file <filename>: <reason>
The specified file was not found in the default directories.
L6302W: Ignoring multiple SHLNAME entry.
There can be only one SHLNAME entry in an edit file. Only the first such entry is accepted by the linker. All subsequent SHLNAME entries are ignored.
L6304W: Duplicate input file <filename> ignored.
The specified filename occurred more than once in the list of input files.

L6305W: Image does not have an entry point. (Not specified or not set due to multiple choices.)
The entry point for the ELF image was either not specified, or was not set because there was more than one section with an entry point linked-in. You must use linker option --entry to specify the single, unique entry, for example:

```
--entry 0x0
```
or
```
--entry <label>
```
The label form is typical for an embedded system.

L6306W: '<attr1>' section <objname>(<secname>) should not use the address of '<attr2>' function <sym>.
See L6238E.

L6307W: Relocation #<rel_class>:<rel_num> in <objname>(<secname>) with respect to <sym>. Branch to unaligned destination.

L6308W: Could not find any object matching <membername> in library <libraryname>.
The name of an object in a library is specified on the link-line, but the library does not contain an object with that name.

L6309W: Library <libraryname> does not contain any members.
A library is specified on the linker command-line, but the library does not contain any members.

L6310W: Unable to find ARM libraries.
This is most often caused by incorrect arguments to --libpath or an invalid value for the environment variable ARMCC5LIB, if defined.

Set the correct path with either the --libpath linker option or the ARMCC5LIB environment variable. The default path for a Windows installation is:

```
install_directory\lib
```
Ensure this path does not include any of the following:

- \armlib
- \cpplib
- any trailing slashes (\) at the end. These are added by the linker automatically.

Use --verbose or --info libraries to display where the linker is attempting to locate the libraries.

See the following in the armlink User Guide:

- `--info=topic[,topic,...].`
- `--libpath=pathlist.`
- `--verbose.`

See the following in the Getting Started Guide:

- `Toolchain environment variables.`

L6311W: Undefined symbol <symbol> (referred from <objname>).
See L6218E.

L6312W: Empty <type> region description for region <region>
L6313W: Using <oldname> as an section selector is obsolete. Please use <newname> instead.

For example, use of IWV$$Code within the scatter file is obsolete. Replace IWV$$Code with Veneer$$Code.
L6314W: No section matches pattern <module>(<section>).

For example:

No section matches pattern foo.*o(ZI).

This can be caused by any of the following:

- The file foo.o is mentioned in your scatter file, but it is not listed on the linker command line. To resolve this, add foo.o to the link line.
- You are trying to place the ZI data of foo.o using a scatter file, but foo.o does not contain any ZI data. To resolve this, remove the +ZI attribute from the foo.o line in your scatter file.
- You have used __attribute__((at(address))) in your source code to place code and data at a specific address. You have also specified *(.ARM.__AT_address) in a scatter file, but you have not specified the address as eight hexadecimal digits. For example, if you specify __attribute__((at(0x1000))) in your source code, then you must specify the section name as *(.ARM.__AT_0x00010000) in the scatter file.

See the following in the armlink User Guide:

- Methods of placing functions and data at specific addresses.
- Placement of sections at a specific address with __at.

L6315W: Ignoring multiple Build Attribute symbols in Object <objname>.

An object can contain at most one absolute BuildAttribute$$... symbol. Only the first such symbol from the object symbol table is accepted by the linker. All subsequent ones are ignored.

L6316W: Ignoring multiple Build Attribute symbols in Object <objname> for section <sec_no>.

An object can contain at most one BuildAttribute$$... symbol applicable to a given section. Only the first such symbol from the object symbol table is accepted by the linker. All subsequent ones are ignored.

L6317W: <objname>(<secname>) should not use the address of '<attr1>' function <sym> as the image contains '<attr2>' functions.

L6318W: <objname>(<secname>) contains branch to a non-code symbol <sym>.

This warning means that in the (usually assembler) file, there is a branch to a non-code symbol (in another AREA) in the same file. This is most likely a branch to a label or address where there is data, not code.

For example:

```
AREA foo, CODE
B bar
AREA bar, DATA
DCD 0
END
```

This results in the message:

init.o(foo) contains branch to a non-code symbol bar.

If the destination has no name:

```
BL 0x200 ; Branch with link to 0x200 bytes ahead of PC
```

the following message is displayed:

```
bootsys.o(BOOTSYS_IVT) contains branch to a non-code symbol <Anonymous Symbol>.
```

This warning can also appear when linking objects generated by GCC. GCC uses linker relocations for references internal to each object. The targets of these relocations might not have appropriate mapping symbols that permit the linker to determine whether the target is code or data, so a warning is generated. By contrast, armcc resolves all such references at compile-time.
L6319W: Ignoring <cmd> command. Cannot find section <objname>(<secname>).
For example, when building a Linux application, you might have:
--keep *(.init_array)
on the linker command-line in your makefile, but this section might not be present when
building with no C++, in which case this warning is reported:
Ignoring --keep command. Cannot find section *(.init_array)
You can often ignore this warning, or suppress it with --diag_suppress 6319.

L6320W: Ignoring <cmd> command. Cannot find argument '<argname>'.

L6323W: Relocation #<rel_class>:<rel_number> in <objname>(<secname>) with respect to
<sym>. Multiple variants exist. Using the <type> variant to resolve ambiguity
L6324W: Ignoring <attr> attribute specified for Load region <regname>.
This attribute is applicable to execution regions only. If specified for a Load region, the linker
ignores it.

L6325W: Ignoring <attr> attribute for region <regname> which uses the +offset form of
base address.
This attribute is not applicable to regions using the +offset form of base address. If specified
for a region, which uses the +offset form, the linker ignores it.

A region that uses the +offset form of base address inherits the PI, RELOC, or OVERLAY
attributes from either:
• the previous region in the description
• the parent load region if it is the first execution region in the load region.

See the following in the armlink User Guide:
• Inheritance rules for load region address attributes.
• Inheritance rules for execution region address attributes.
• Inheritance rules for the RELOC address attribute.

L6326W: Ignoring ZEROPAD attribute for non-root execution region <ername>.
ZEROPAD only applies to root execution regions. A root region is a region whose execution
address is the same as its load address, and so does not require moving or copying at run-time.

See the following in the armlink User Guide:
Execution region attributes.

L6329W: Pattern <module>(<section>) only matches removed unused sections.
All sections matching this pattern have been removed from the image because they were
unused. For more information, use --info unused.
See the following in the armlink User Guide:
• Elimination of unused sections.
• --info=topic[,topic,...].

L6330W: Undefined symbol <symbol> (referred from <objname>). Unused section has been
removed.
This means that an unused section has had its base and limit symbols referenced. For more
information, use --info unused.
For example, when using a scatter file to place code and data with RVCT 2.1 or later, the linker
reports this error if the scatter file includes the linker-generated table ZISection$$Table. In
RVCT 2.1, a new region tables format was introduced which no longer contains ZISection$ $Table.

See the following in the armlink User Guide:
• Elimination of unused sections.
• --info=topic[,topic,...].
L6331W: No eligible global symbol matches pattern <pat>.
L6332W: Undefined symbol <sym1> (referred from <obj1>). Resolved to symbol <sym2>.
L6334W: Overalignment <overalignment> for region <regname> cannot be negative.
   See the following in the armlink User Guide:
   Overalignment of execution regions and input sections.

L6335W: ARM interworking code in <objname>(<secname>) may contain invalid tailcalls to ARM non-interworking code.
   The compiler is able to perform tailcall optimization for improved code size and performance.
   However, there is a problematic sequence for ARMv4T code in which a Thumb interworking (IW) function calls (by a veneer) an ARM IW function, which tailcalls an ARM non-interworking (~IW) function. The return from the ARM non-IW function can pop the return address off the stack into the PC instead of using the correct BX instruction. The linker can detect this situation and report this warning.
   Thumb IW tailcalls to Thumb non-IW do not occur because Thumb tailcalls with B are so short ranged that they can only be generated to functions in the same ELF section which must also be Thumb.
   The warning is pessimistic in that an object might contain invalid tailcalls, but the linker cannot be sure because it only looks at the attributes of the objects, not at the contents of their sections.
   To avoid the warning, either recompile your entire code base, including any user libraries, with --apcs /interwork, or manually inspect the ARM IW function to check for tailcalls (that is, where function calls are made using an ordinary branch B instruction), to check whether this is a real problem. This warning can be suppressed with --diag_suppress L6335W.

L6337W: Common code sections <o1>(<s1>) and <o2>(<s2>) have incompatible floating-point linkage
L6339W: Ignoring RELOC attribute for execution region <er_name>.
   Execution regions cannot explicitly be given the RELOC attribute. They can only gain this attribute by inheriting it from the parent load region or the previous execution region if using the +offset form of addressing.
   See the following in the armlink User Guide:
   Execution region attributes.

L6340W: options first and last are ignored for link type of <linktype>
   The --first and --last options are meaningless when creating a partially-linked object.
L6366E: <object> attributes<attr> are not compatible with the provided cpu and fpu attributes<cli> <diff>
L6367E: <object>(<section>) attributes<attr> are not compatible with the provided cpu and fpu attributes<cli> <diff>
L6368E: <symbol> defined in <object>(<section>) attributes<attr> are not compatible with the provided cpu and fpu attributes<cli> <diff>
L6369E: <symbol> defined in <object>(ABSOLUTE) are not compatible with the provided cpu and fpu Attributes<cli> <diff>
L6370E: cpu <cpu> is not compatible with fpu <fpu>
   See the following in the armlink User Guide:
   • --cpu=name.
   • --fpu=name.

L6371E: Adding attributes from cpu and fpu: <attrs>
L6372E: Image needs at least one load region.
L6373E: libattrs.map file not found in System Library directory <dir>. Library selection may be impaired.
L6384E: No Load Execution Region of name <region> seen yet at line <line>.
   This might be because you have used the current base address in a limit calculation in a scatter file. For example:

```
ER_foo 0 ImageBase(ER_foo)
```

L6385W: Addition overflow on line <line>
L6386E: Exec Region Expressions can only be used in base address calculations on line <line>
L6387E: Load Region Expressions can only be used in ScatterAssert expressions on line <line>
   See the following in the armlink User Guide:
   ScatterAssert function and load address related functions.
L6388E: ScatterAssert expression <expr> failed on line <line>
   See the following in the armlink User Guide:
   ScatterAssert function and load address related functions.
L6389E: Load Region <name> on line <line> not yet complete, cannot use operations that depend on length of region
L6390E: Conditional operator (expr) ? (expr) : (expr) on line <line> has no : (expr).
   See the following in the armlink User Guide:
   • About Expression evaluation in scatter files.
   • Expression rules in scatter files.
L6404W: FILL value preferred to combination of EMPTY, ZEROPAD and PADVALUE for Execution Region <name>.
   See the following in the armlink User Guide:
   Execution region attributes.
L6405W: No .ANY selector matches Section <name>(<objname>).
   See the following in the armlink User Guide:
   Placement of unassigned sections with the .ANY module selector.
L6406W: No space in execution regions with .ANY selector matching Section <name>(<objname>).
   This occurs if there is not sufficient space in the scatter file regions containing .ANY to place the section listed. You must modify your scatter file to ensure there is sufficient space for the section.
   See the following in the armlink User Guide:
   Placement of unassigned sections with the .ANY module selector.
L6407W: Sections of aggregate size 0x<size> bytes could not fit into .ANY selector(s).

This warning identifies the total amount of image data that cannot be placed in any .ANY selectors.

For example, .ANY(+ZI) is placed in an execution region that is too small for the amount of ZI data:

```
ROM_LOAD 0x8000
{
  ROM_EXEC 0x8000
  {
    .ANY(+RO,+RW)
  }
  RAM +0 0x{...} << region max length is too small
  {
    .ANY(+ZI)
  }
}
```

See the following in the armlink User Guide:

Placement of unassigned sections with the .ANY module selector.

L6408W: Output is --fpic yet section <sec> from <obj> has no FPIC attribute.
L6409W: Output is --fpic yet object <obj> has no FPIC attribute.
L6410W: Symbol <sym> with non STV_DEFAULT visibility <vis> should be resolved statically, cannot use definition in <lib>.
L6411W: No compatible library exists with a definition of startup symbol <name>.
L6412W: Disabling merging for section <sec> from object <obj>, non R_ARM_ABS32 relocation from section <srcsec> from object <srcobj>
L6413W: Disabling merging for section <sec> from object <obj>, Section contains misaligned string(s).
L6414E: --ropi used without --rwpi or --rw-base.

See the following in the armlink User Guide:

- --ropi.
- --rw_base=address.
- --rwpi.

L6415E: Could not find a unique set of libraries compatible with this image. Suggest using the --cpu option to select a specific library.

See the following in the armlink User Guide:

--cpu=name.

L6416E: Relocation <type> at <relclass>:<idx> <objname>(<secname>) cannot be veneered as it has an offset offset from its target.
L6417W: Relocation #<rel_class>:<rel_number> in <objname>(<secname>) is with respect to a reserved tagging symbol(#<idx>).
L6418W: Tagging symbol <symname> defined in <objname>(<secname>) is not recognized.
L6419W: Undefined symbol <symbol> (referred from <objname>) imported.
L6420E: Ignoring <oepname>(<secname>:<secnum>) as it is not of a recognized type.
L6422U: PLT generation requires an architecture with ARM instruction support.

For the linker to generate a Procedure Linkage Table (PLT), you must be using a target that supports the ARM instruction set. For example, the linker cannot generate a PLT for a Cortex-M3 target.

L6423E: Within the same collection, section <secname> cannot have different sort attributes.
L6424E: Within the same collection, section <secname1> and section <secname2> cannot be separated into different execution regions.
L6425E: Within the same collection, section <secname> cannot have their section names with different length.
4.2 List of the armlink error and warning messages

L6426E: Within the same collection, section <secname> cannot have its name duplicated.
L6427E: Cannot rename <sym> to <newname> as it has already been renamed to <name>.
L6429U: Attempt to set maximum number of open files to <val> failed with error code <error>.
    An attempt to increase the number of file handles armlink can keep open at any one time has failed.
L6431W: Ignoring incompatible enum size attribute on Symbol <symbol> defined in <object>(<section>).
L6432W: Ignoring incompatible enum size attribute on Object <object>(<section>).
L6433W: Ignoring incompatible enum size attribute on object <object>.
L6435W: Ignoring incompatible wchar_t size attribute on Symbol <symbol> defined in <object>(<section>).
L6436W: Ignoring incompatible wchar_t size attribute on Section <object>(<section>).
L6437W: Relocation #<rel_class>:<idx> in <objname>(<secname>) with respect to <armsym>. Branch relocation to untyped symol in object <armobjname>, target state unknown.
L6438E: __AT section <objname>(<secname>) address <address> must be at least 4 byte aligned.
L6439W: Multiply defined Global Symbol <sym> defined in <objname>(<secname>) rejected in favour of Symbol defined in <selobj>(<selsec>).
L6440E: Unexpected failure in link-time code generation
L6441U: System call to get maximum number of open files failed <error>.
L6442U: Linker requires a minimum of <min> open files, current system limit is <max> files.
L6443W: Data Compression for region <region> turned off. Region contains reference to symbol <symname> which depends on a compressed address.
    The linker requires the contents of a region to be fixed before it can be compressed and cannot modify it after it has been compressed. Therefore a compressible region cannot refer to a memory location that depends on the compression process.
L6444I: symbol visibility : <symname> set to <visibility>.
L6445I: symbol visibility : <symname> merged to <set_vis> from existing <old_vis> and new <new_vis>.
L6447E: SHT_PREINIT_ARRAY sections are not permitted in shared objects.
L6448W: While processing <filename>: <message>
L6449E: While processing <filename>: <message>
L6450U: Cannot find library <libname>.
L6451E: <object> built permitting Thumb is forbidden in an ARM-only link.
L6452E: <object>(<section>) built permitting Thumb is forbidden in an ARM-only link.
L6453E: <symbol> defined in <object>(<section>) built permitting Thumb is forbidden in an ARM-only link.
L6454E: <symbol> defined in <object>(ABSOLUTE) built permitting Thumb is forbidden in an ARM-only link.
L6455E: Symbol <symbolname> has deprecated ARM/Thumb Synonym definitions (by <object1> and <object2>).
L6459U: Could not create temporary file.
L6462E: Reference to <sym> from a shared library only matches a definition with Hidden or Protected Visibility in Object <obj>.
L6463U: Input Objects contain <archtype> instructions but could not find valid target for <archtype> architecture based on object attributes. Suggest using --cpu option to select a specific cpu.
    See the following in the armlink User Guide:
    --cpu=name.
L6464E: Only one of --dynamic_debug, --emit-relocs and --emit-debug-overlay-relocs can be selected.
   See the following in the armlink User Guide:
     • --dynamic_debug.
     • --emit_debug_overlay_relocs.
     • --emit_relocs.

L6467W: Library reports remark: <msg>

L6468U: Only --pltgot=direct or --pltgot=none supported for --base_platform with multiple Load Regions containing code.
   See the following in the armlink User Guide:
     • --base_platform.
     • --pltgot=type.

L6469E: --base_platform does not support RELOC Load Regions containing non RELOC Execution Regions. Please use +0 for the Base Address of Execution Region <ername> in Load Region <lrname>.
   See the following in the armlink User Guide:
     • --base_platform.
     • Inheritance rules for the RELOC address attribute.

L6470E: PLT section <secname> cannot be moved outside Load Region <lrname>.

L6471E: Branch Relocation <rel_class>:<idx> in section <secname> from object <objname> refers to ARM Absolute <armsym> symbol from object <armobjname>, Suppress error to treat as a Thumb address.

L6475W: IMPORT/EXPORT commands ignored when --override_visibility is not specified
   The symbol you are trying to export, either with an EXPORT command in a steering file or with the --undefined_and_export command-line option, is not exported because of low visibility.
   See the following in the armlink User Guide:
     • --override_visibility.
     • --undefined_and_export=symbol.
     • EXPORT.

L6616E: Cannot increase size of RegionTable <sec_name> from <obj_name>

L6617E: Cannot increase size of ZISectionTable <sec_name> from <obj_name>

L6629E: Unmatched parentheses expecting ) but found <character> at position <col> on line <line>
   This message indicates a parsing error in the scatter file.

L6630E: Invalid token start expected number or ( but found <character> at position <col> on line <line>
   This message indicates a parsing error in the scatter file.

L6631E: Division by zero on line <line>
   This message indicates an expression evaluation error in the scatter file.

L6632W: Subtraction underflow on line <line>
   This message indicates an expression evaluation error in the scatter file.

L6634E: Pre-processor command in '<filename>' too long, maximum length of <max_size>
   This message indicates a problem with pre-processing the scatter file.

L6635E: Could not open intermediate file '<filename>' produced by pre-processor: <reason>
   This message indicates a problem with pre-processing the scatter file.

L6636E: Pre-processor step failed for '<filename>'
   This message indicates a problem with pre-processing the scatter file.

L6637W: No input objects specified. At least one input object or library(object) must be specified.
   At least one input object or library(object) must be specified.

L6638U: Object <objname> has a link order dependency cycle, check sections with SHF_LINK_ORDER
L6640E: PDTTable section not least static data address, least static data section is <secname>

Systems that implement shared libraries with RWPI use a process data table (PDT). It is created at static link time by the linker and must be placed first in the data area of the image.

This message indicates that the scatter file does not permit placing the PDT first in the data area of the image.

To avoid the message, adjust your scatter file so that the PDT is placed correctly. This message can also be triggered if you accidentally build object files with --apcs=/rwpi.

L6642W: Unused virtual function elimination might not work correctly, because <obj_name> has not been compiled with --vfe

L6643E: The virtual function elimination information in section <sectionname> refers to the wrong section.

This message might indicate a compiler fault. Contact your supplier.

L6644E: Unexpectedly reached the end of the buffer when reading the virtual function elimination information in section <oepname>(<sectionname>).

This message might indicate a compiler fault. Contact your supplier.

L6645E: The virtual function elimination information in section <oepname>(<sectionname>) is incorrect: there should be a relocation at offset <offset>.

This message might indicate a compiler fault. Contact your supplier.

L6646W: The virtual function elimination information in section <oepname>(<sectionname>) contains garbage from offset <offset> onwards.

This message might indicate a compiler fault. Contact your supplier.

L6647E: The virtual function elimination information for <vcall_objectname>(<vcall_sectionname>) incorrectly indicates that section <curr_sectionname>(object <curr_objectname>), offset <offset> is a relocation (to a virtual function or RTTI), but there is no relocation at that offset.

This message might indicate a compiler fault. Contact your supplier.

L6649E: EMPTY region <regname> must have a maximum size.

See the following in the armlink User Guide:

Execution region attributes.

L6650E: Object <objname> Group section <sectionidx> contains invalid symbol index <symidx>.

L6651E: Section <secname> from object <objname> has SHF_GROUP flag but is not member of any group.

L6652E: Cannot reverse Byte Order of Data Sections, input objects are <inputendian> requested data byte order is <dataendian>.

L6654E: Rejected Local symbol <symname> referred to from a non group member <objname>(<nongrpname>)

This message might indicate a compiler fault. Contact your supplier.

L6656E: Internal error: the vfe section list contains a non-vfe section called <oepname>(<secname>).

This message might indicate a compiler fault. Contact your supplier.

L6664W: Relocation #<rel_class>:<rel_number> in <objname>(<secname>) is with respect to a symbol(#<idx> before last Map Symbol #<last>).
L6665W: Neither Lib$$Request$$armlib Lib$$Request$$cpplib defined, not searching ARM libraries.

The following code produces this warning:

```assembly
AREA Block, CODE, READONLY
EXPORT func1
IMPORT ||Lib$$Request$$armlib||
IMPORT printf
func1
LDR r0,=string
BL printf
BX lr
AREA BlockData, DATA
string DCB "mystring"
END
```

The linker has not been told to look in the libraries and so cannot find the symbol `printf`.

This also causes the following error:

L6218E: Undefined symbol printf (referred from L6665W.o).

If you do not want the libraries, then ignore this message. Otherwise, to fix both the error and the warning uncomment the line:

```assembly
IMPORT ||Lib$$Request$$armlib||
```

L6679W: Data in output ELF section #<sec> '<secname>' was not suitable for compression (<data_size> bytes to <compressed_size> bytes).
L6682E: Merge Section <oepname>(<spname>) is a code section
L6683E: Merge Section <oepname>(<spname>) has an element size of zero
L6684E: Section <spname> from object <oepname> has SHF_STRINGS flag but not SHF_MERGE flag
L6685E: Section <spname> from object <oepname> has a branch reloc <rel_idx> to a SHF_MERGE section
L6688U: Relocation #<rel_class>:<rel_idx> in <oepname>(<spname>) references a negative element
L6689U: Relocation #<rel_class>:<rel_idx> in <oepname>(<spname>). Destination is in the middle of a multibyte character
L6690U: Merge Section <spname> from object <oepname> has no symbols
L6703W: Section <er> implicitly marked as non-compressible.
L6707E: Padding value not specified with PADVALUE attribute for execution region <regionname>.

See the following in the armlink User Guide:

**Execution region attributes.**

L6708E: Could not process debug frame from <secname> from object <oepname>.
L6709E: Could not associate fde from <secname> from object <oepname>.
L6713W: Function at offset <offset> in <oepname>(<secname>) has no symbol.
L6714W: Exception index table section .ARM.exidx from object <oepname> has no data.
L6720U: Exception table <spname> from object <oepname> present in image, --noexceptions specified.

See the following in the armlink User Guide:

--exceptions, --no_exceptions.

L6721E: Section #<secnum> '<secname>' in <oepname> is not recognized and cannot be processed generically.
L6725W: Unused virtual function elimination might not work correctly, because there are dynamic relocations.
L6728U: Link order dependency on invalid section number <to> from section number <from>.
L6730W: Relocation #<rel_class>:<index> in <objname>(<secname>) with respect to <name>. Symbol has ABI type <type>, legacy type <legacy_type>.
This warning relates to a change in linker behavior between RVCT 2.0 and 2.1.

Note
The following example produces a warning message only when --strict_relocations is used, or when the input objects are from RVCT 2.0 or earlier.

Example:

```
AREA foo, CODE, READONLY
CODE32
ENTRY
KEEP
func proc
  NOP
ENDP
DCD foo
END
```

In RVCT 2.0 and earlier, the linker determines whether interworking is needed based on the content, which in this example is ARM code. In RVCT 2.1 and later, the linker follows the ABI, which defines that it is the type of the symbol, in this example STT_SECTION (which is interpreted as data), that determines whether interworking is applied.

The simplest solution is to move the data into a separate data area in the assembly source file. Alternatively, you can use --diag_suppress 6730 to suppress this warning.

L6731W: Unused virtual function elimination might not work correctly, because the section referred to from <secname> does not exist.
L6733W: <objname>(<secname>) contains offset relocation from <lr1name> to <lr2name>, load regions must be rigidly relative.
L6738E: Relocation #<rel_class>:<relnum> in <oepname>(<secname>) with respect to <wrtsym> is a GOT-relative relocation, but _GLOBAL_OFFSET_TABLE_ is undefined.
  Some GNU produced images can refer to the symbol named _GLOBAL_OFFSET_TABLE_. If there are no GOT Slot generating relocations and the linker is unable to pick a suitable address for the GOT base the linker issues this error message.
L6739E: Version '<vername>' has a dependency to undefined version '<depname>'.
L6740W: Symbol '<symname>' versioned '<vername>' defined in '<symverscr>' but not found in any input object.
L6741E: Versioned symbol binding should be 'local:' or 'global:'.
L6742E: Symbol '<symname>' defined by '<oepname>'. Cannot not match to default version symbol '<defversym>'
L6743E: Relocation #<rel_class>:<index> in <oepname>(<spname>) with respect to <symname> that has an alternate def. Internal consistency check failed
L6744E: Relocation #<rel_class>:<index> <oepname>(<spname>) with respect to undefined symbol <symname>. Internal consistency check:
L6745E: Target CPU <cpuname> does not Support ARM, <objname>(<secname>) contains ARM code
L6747W: Raising target architecture from <oldversion> to <newversion>.
  If the linker detects objects that specify the obsolete ARMv3, it upgrades these to ARMv4 to be usable with ARM libraries.
L6748U: Missing dynamic array, symbol table or string table in file <oepname>.
L6751E: No such sorting algorithm <str> available.
L6753E: CallTree sorting needs Entry Point to lie within a CallTree Sort ER.
L6751E: Removing symbol <symname>.
L6762E: Cannot build '<type>' PLT entries when building a <imgtype>.
L6763W: '<optname>' cannot be used when building a shared object or DLL. Switching it off
L6764E: Cannot create a PLT entry for target architecture 4T that calls Thumb symbol <symname>.

L6765W: Shared object entry points must be ARM-state when linking architecture 4T objects.

This can occur when linking with GNU C libraries. The GNU startup code `crt1.o` does not have any build attributes for the entry point, so the linker cannot determine which execution state (ARM or Thumb) the code runs in. Because the GNU C library startup code is ARM code, you can safely ignore this warning, or you can suppress it by using `--diag_suppress 6765`.

L6766W: PLT entries for architecture 4T do not support incremental linking.

L6769W: Relocation #<rel_class>:<relocnum> in <oepname>(<secname>) with respect to <wrtsym>. No GOTSLOT exists for symbol.

L6770E: The size and content of the dynamic array changed too late to be fixed.

L6771W: <oepname>(<secname>) contains one or more address-type relocations in RO data. Making section RW to be dynamically relocated at run-time.

L6772W: `IMPORT <symname>` command ignored when building `--sysv`.

See the following in the `armlink User Guide`:

- `--sysv`
- `IMPORT steering file command`.

L6774W: <objname>(<secname>) has debug frame entries of a bad length.

L6775W: <objname>(<secname>) has FDEs which use CIEs which are not in this section.

L6776W: The debug frame in <objname>(<secname>) does not describe an executable section.

L6777W: The debug frame in <objname>(<secname>) has <actual> relocations (expected <expected>.)

L6778W: The debug frame in <objname>(<secname>) uses 64-bit DWARF.

L6781E: Value(<val>) visibility removed from symbol '<symname>' through <impexp>.

L6781E: Value(<val>) visibility removed from symbol '<symname>' through <impexp>.

L6782W: Relocation #<rel_class>:<relnum> '<rtype>' in <oepname> may not access data correctly alongside <pltgot_type> PLT entries.

L6783E: Mapping symbol #<symnum> '<msym>' in <oepname>(<secnum>:<secname>) defined at the end of, or beyond, the section size (symbol offset=0x<moffset>, section size=0x<secsize>)

This indicates that the address for a section points to a location at the end of or outside of the ELF section. This can be caused by an empty inlined data section and indicates there might be a problem with the object file. You can use `--diag_warning 6783` to suppress this error.

L6784E: Symbol #<symnum> '<symname>' in <oepname>(<secnum>:<secname>) with value <value> has size 0x<size> that extends to outside the section.

The linker encountered a symbol with a size that extends outside of its containing section. This message is only a warning by default in the RVCT 2.2 build 503 and later toolchains. Use `--diag_warning 6784` to suppress this error.

L6785U: Symbol '<symname>' marked for import from '<libname>' already defined by '<oepname>'

L6786W: Mapping symbol #<symnum> '<msym>' in <oepname>(<secnum>:<secname>) defined at unaligned offset=0x<moffset>

L6787U: Region table handler '<handlername>' needed by entry for <regionname> was not found.
L6788E: Scatter-loading of execution region <er1name> to [(<base1>,<limit1>)) will cause the contents of execution region <er2name> at [<base2>,<limit2>) to be corrupted at run-time.

This occurs when scatter-loading takes place and an execution region is put in a position where it partially or wholly overwrites another execution region (which can be itself or another region).

For example, the following code generates this error:

```
LOAD_ROM 0x0000 0x4000
{
  EXEC1 0x4000 0x4000
  *(+RW,+ZI)
  EXEC2 0x0000 0x4000
  *(+RO)
}
```

and reports:

```
Error: L6788E: Scatter-loading of execution region EXEC2 will cause the contents of execution region EXEC2 to be corrupted at run-time.
```

This code does not generate the error:

```
LOAD_ROM 0x0000 0x4000
{
  EXEC1 0x0000 0x4000
  *(+RO)
  EXEC2 0x4000 0x4000
  *(+RW,+ZI)
}
```

See the following in the `armlink User Guide`:

*Information about scatter files.*
L6800W: Cannot convert generic model personality routine at 0x<offset> <oepname>(<secname>).
A personality routine unwinds the exception handling stack. If the linker detects old-format exception tables then it automatically converts them to the new format. This message indicates a fault in the compiler. Contact your supplier.

L6801E: <objname>(<secname>) containing <secarmthumb> code cannot use the address of 'IW (The user intended not all code should interwork)' function <sym>. The linker can diagnose where a non-interworking (~IW) function has its address taken by code in the other state. This error is disabled by default, but can be enabled by linking with --strict. The error can be downgraded to a warning with --diag_warning 6801 and subsequently suppressed completely if required with --diag_suppress 6801.

Where code, for example, in a.c uses the address of a non-interworking function in t.c:

```
armcc -c a.c
armcc --thumb -c t.c
armlink t.o a.o --strict
```

reports:
```
Error: L6801E: a.o(.text) containing ARM code cannot use the address of 'IW Thumb function foo.
```

L6802E: Relocation #<rel_class>:<idx> in <objname>(<secname>) with respect to <armsym>. Thumb Branch to non-Thumb symbol in <armobjname>(<armsecname>).
L6803W: Relocation #<rel_class>:<idx> in <objname>(<secname>) with respect to <armsym>. Thumb Branch is unlikely to reach target in <armobjname>(<armsym>).
L6804W: Legacy use of symbol type STT_TFUNC detected
L6805E: Relocation #<rel_class>:<idx> in <objname>(<secname>) with respect to <armsym>. Branch to untyped Absolute symbol in <armobjname>, target state unknown.
L6806W: Relocation #<rel_class>:<idx> in <objname>(<secname>) with respect to <othersym>. Branch to untyped symbol in <otherobjname>(<othersecname>), ABI requires external code symbols to be of type STTFUNC.
L6807E: Relocation #<rel_class>:<idx> in <objname>(<secname>) with respect to <othersym>. Branch to untyped symbol in same section. State change is required.
L6808W: Relocation #<rel_class>:<idx> in <objname>(<secname>) is of deprecated type <rtype>, please see ARMELF for ABI compliant alternative.
L6809E: Relocation #<rel_class>:<idx> in <objname>(<secname>) is of obsolete type <rtype>

Relocation errors and warnings are most likely to occur if you are linking object files built with previous versions of the ARM tools.

To show relocation errors and warnings, use the --strict_relocations switch. This option enables you to ensure ABI compliance of objects. It is off by default, and deprecated and obsolete relocations are handled silently by the linker.

See the following in the armlink User Guide:

```
--strict_relocations, --no_strict_relocations.
```

L6812U: Unknown symbol action type, please contact your supplier.
L6813U: Could not find Symbol <symname> to rename to <newname>.
See the following in the armlink User Guide:

```
RENAME steering file command.
```
This error is reported by ARM Compiler v4.1 and later. It provides information about the amount of memory available and the amount of memory required to perform the link step.

This error occurs because the linker does not have enough memory to link your target object. This is not common, but might be triggered for a number of reasons, such as:

- Linking very large objects or libraries together.
- Generating a large amount of debug information.
- Having very large regions defined in your scatter file.

In these cases, your workstation might run out of virtual memory.

This issue might also occur if you use the FIXED scatter-loading attribute. The FIXED attribute forces an execution region to become a root region in ROM at a fixed address. The linker might have to add padding bytes between the end of the previous execution region and the FIXED region, to generate the ROM image. The linker might run out of memory if large amounts of padding are added when the address of the FIXED region is far away from the end of the execution region. The link step might succeed if the gap is reduced.

See the following in the armlink User Guide:

- Execution region attributes.
- Root execution regions and the FIXED attribute.

While the linker can generate images of almost any size, it requires a larger amount of memory to run and finish the link. Try the following solutions to improve link-time performance, to avoid the Out of memory error:

1. Shut down all non-essential applications and processes when you are linking.

   For example, if you are running under Eclipse, try running your linker from the command-line, or exiting and restarting Eclipse between builds.

2. Use the 64-bit version of the linker.

   If you are using a 64-bit operating system, it is possible to make use of a 64-bit version of armlink.

   See the following in the Getting Started Guide:

   Changing to the 64-bit linker.

3. Use the --no_debug linker option.

   This command tells the linker to create the object without including any debug information.

   See the following in the armlink User Guide:

   --debug, --no_debug.

   ______ Note ______

   It is not possible to perform source level debugging if you use this option.

   _______________________________

4. Reduce debug information.

   If you do not want to use the --no_debug option, there are other methods you can use to try to reduce debug information.

   See the following in the armcc User Guide:

   Methods of reducing debug information in objects and libraries.

   You can also use the fromelf utility to strip debug information from objects and libraries that you do not have to debug.

   See the following in the fromelf User Guide:

   --strip=option[,option,...].
5. Use partial linking.
   
   You can use partial linking to split the link stage over a few smaller operations. Doing this also stops duplication of the object files in memory in the final link.
   
   See the following in the *armlink User Guide*:
   
   --partial.

6. Increase memory support on Windows operating systems.
   
   On some Windows operating systems it is possible to increase the virtual address space from 2GB (the default) to 3GB.
   
   For more information, see the following Microsoft article:
   
   *Memory Support and Windows Operating Systems*.

7. Use the --no_eager_load_debug linker option.
   
   This option is available in RVCT 4.0 build 697 and later. It causes the linker to remove debug section data from memory after object loading. This lowers the peak memory usage of the linker at the expense of some linker performance, because much of the debug data has to be loaded again when the final image is written.
   
   See the following in the *armlink User Guide*:
   
   --eager_load_debug, --no_eager_load_debug.

If you are still experiencing the same problem, raise a support case.

L6828E: Relocation #<rel_class>:<idx> in <objname>(<secname>) with respect to <symname>, Branch source address <srcaddr> cannot reach next available pool at [<pool_base>,<pool_limit>). Please use the --veneer_pool_size option to increase the contingency.
   
   The --veneer_inject_type=pool veneer generation model requires branches to veneers in the pool to be able to reach the pool limit, which is the highest possible address a veneer can use. If a branch is later found that cannot reach the pool limit, and armlink is able to fit all the veneers in the pool into the lower pool limit, then armlink reduces the pool limit to accommodate the branch. Error message L6828 is issued only if armlink is unable to lower the pool limit.
   
   See the following in the *armlink User Guide*:
   
   --veneer_inject_type=type.

L6898E: Relocation #<rel_class>:<idx> in <objname>(<secname>) with respect to <armsym>. ARM branch to non-ARM/Thumb symbol in <armobjname>(<armsecname>).

L6899E: Existing SYMDEFS file '<filename>' is read-only.

L6900E: Expected parentheses to specify priority between AND and OR operators.

L6901E: Expected symbol name.

L6902E: Expected a string.

L6903E: Cannot execute '<text>' in '<clause>' clause of script.

L6904E: Destination symbol of rename operation clashes with another rename.

L6905E: Source symbol of rename operation clashes with another rename.

L6906E: (This is the rename operation which it clashes with.)

L6907E: Expected an expression.

L6910E: Expected a phase name.

L6912W: Symbol <symname> defined at index <idx> in <oepname>(<secname>), has ABI symbol type <symtype> which is inconsistent with mapping symbol type <maptype>.

L6913E: Expected execution region name.

L6914W: option <spurious> ignored when using --<memoption>.
L6915E: Library reports error: <msg>
The message is typically one of the following:

- Error: L6915E: Library reports error: scatter-load file declares no heap or stack regions and __user_initial_stackheap is not defined.

or

- Error: L6915E: Library reports error: The semihosting __user_initial_stackheap cannot reliably set up a usable heap region if scatter loading is in use

It is most likely that you have not re-implemented __user_setup_stackheap() or you have not defined ARM_LIB_STACK or ARM_LIB_HEAP regions in the respective scatter file.

Note

__user_setup_stackheap() supersedes the deprecated function __user_initial_stackheap().

See the following in the Software Development Guide:

Placing the stack and heap.

See the following in the ARM C and C++ Libraries and Floating-Point Support User Guide:
- __user_setup_stackheap().
- Legacy function __user_initial_stackheap().

See the following in the armlink User Guide:

Reserving an empty region.

- Error: L6915E: Library reports error: __use_no_semihosting was requested but <function> was referenced.

Where <function> represents __user_initial_stackheap, __sys_exit, __sys_open, __sys_tmpnam, ttywrch, system, remove, rename, __sys_command_string, time, or clock.

This error can appear when retargeting semihosting-using functions, to avoid any SVC or BKPT instructions being linked-in from the C libraries.

Ensure that no semihosting-using functions are linked in from the C library by using:

```
#pragma import (__use_no_semihosting)
```

See the following in the ARM C and C++ Libraries and Floating-Point Support User Guide:

Using the libraries in a nonsemihosting environment.

If there are still semihosting-using functions being linked in, the linker reports this error.

To resolve this, you must provide your own implementations of these C library functions.

The emb_sw_dev directory contains examples of how to re-implement some of the more common semihosting-using functions. See the file retarget.c.

See the following for more information on semihosting-using C library functions:

Note

The linker does not report any semihosting-using functions such as, for example, __semihost(), in your own application code.

To identify which semihosting-using functions are still being linked-in from the C libraries:

1. Link with armlink --verbose --list err.txt
2. Search err.txt for occurrences of __I$use$semihosting
For example:

```c
... Loading member sys_exit.o from c_2.1.
reference: __I$use$semihosting
definition: __sys_exit
...```

This shows that the semihosting-using function __sys_exit is linked-in from the C library. To prevent this, you must provide your own implementation of this function.

- Error: L6915E: Library reports error: __use_no_heap was requested, but <reason> was referenced
  If <reason> represents malloc, free, __heapstats, or __heapvalid, the use of __use_no_heap conflicts with these functions.

- Error: L6915E: Library reports error: __use_no_heap_region was requested, but <reason> was referenced
  If <reason> represents malloc, free, __heapstats, __heapvalid, or __argv_alloc, the use of __use_no_heap_region conflicts with these functions.

L6916E: Relocation #<rel_class>:<idx> in <oepname>(<spname>). R_ARM_CALL for conditional BL instruction.
L6917E: Relocation #<rel_class>:<idx> in <oepname>(<spname>). R_ARM_JUMP24 for BLX instruction.
L6918W: Execution region <ername> placed at 0x<eraddr> needs padding to ensure alignment <salign> of <oepname>(<spname>).
L6922E: Section <objname>(<secname>) has mutually exclusive attributes (READONLY and TLS)
L6923E: Relocation #<rel_class>:<idx> in <oepname>(<spname>) with respect to <symname>. TLS relocation <type> to non-TLS symbol in <symobjname>(<symsecname>).
L6924E: Relocation #<rel_class>:<idx> in <oepname>(<spname>) with respect to <symname>. Non-TLS relocation <type> to STT_TLS symbol in <symobjname>(<symsecname>).
L6925E: Ignoring <token> attribute for region <region>. MemAccess support has been removed.
L6926E: Relocation #<rel_class>:<idx> in <oepname>(<spname>) has incorrect relocation type <rtype> for instruction encoding 0x<bl>.
L6927E: Relocation #<rel_class>:<idx> in <oepname>(<spname>) has incorrect relocation type <rtype> for instruction encoding 0x<bl1><bl2>.
L6932W: Library reports warning: <msg>

See the following in the Migration and Compatibility Guide:

Linker changes between RVCT v3.1 and RVCT v4.0.
L6971E: <objname>(<secname>) type <type> incompatible with <prevobj>(<prevname>) type <prevtype> in er <ername>. You might see this message when placing _at sections with a scatter file. For example, the following code in main.c and the related scatter file gives this error:

```c
int variable __attribute__((at(0x200000)));
```

The variable has the type ZI, and the linker attempts to place it at address 0x200000. However, this address is reserved for RW sections by the scatter file. This produces the error:

```
Error: L6971E: stdio_streams.o(.data) type RW incompatible with main.o(.ARM.__AT_0x00200000) type ZI in er RAM.
```

To fix this, change the address in your source code, for example:

```c
int variable __attribute__((at(0x210000)));
```

See the following in the armlink User Guide:

- Methods of placing functions and data at specific addresses.
- Placement of sections at a specific address with __at.

L6972E: <objname>(<secname>) with required base 0x<required> has been assigned base address 0x<actual>.

L6973E: Error placing AT section at address 0x<addr> in overlay ER <ername>. For example, you attempted to use __attribute__((at(address))) to place a section when building a DLL or application with an overlay region. __attribute__((at(address))) requires that you specify a fixed location in a scatter file with .ARM.__at_address. In this case, you must also specify the --no_autoat linker option.

See the following in the armlink User Guide:

- Placement of sections at a specific address with __at.
- --autoat, --no_autoat.

L6974E: AT section <name> does not have a base address. See the following in the armlink User Guide:

```
Placement of sections at a specific address with __at.
```

L6975E: <objname>(<secname>) cannot have a required base and SHF_MERGE.

L6976E: <objname>(<secname>) cannot have a required base and SHF_LINK_ORDER.

L6977E: <objname>(<secname>) cannot be part of a contiguous block of sections.

L6978W: <objname>(<secname>) has a user defined section type and a required base address.

L6979E: <objname>(<secname>) with required base address cannot be placed in Position Independent ER <ername>.

L6980W: FIRST and LAST ignored for <objname>(<secname>) with required base address. See the following in the armlink User Guide:

```
Section placement with the FIRST and LAST attributes.
```
L6981E: __AT incompatible with BPABI and SystemV Image types

See the following in the *armlink User Guide*:

Restrictions on placing __at sections.

L6982E: AT section `<objname>(<spname>)` with base `<base>` limit `<limit>` overlaps address range with AT section `<obj2name>(<sp2name>)` with base `<base2>` limit `<limit2>`.

See the following in the *armlink User Guide*:

Placement of sections at a specific address with __at.

L6983E: AT section `<objname>(<spname>)` with required base address `<base>` out of range for ER `<ername>` with base `<erbase>` and limit `<erlimit>`.

This can occur if you specify __attribute__((at(address))) in your code, .ARM.__at_address in your scatter file, and --no_autoat option on the linker command line. In this case, the address part of .ARM.__at_address must be specified as eight hexadecimal digits. For example:

```c
int x1 __attribute__((at(0x4000))); // defined in function.c

scatter file
LR1 0x0
{ ...
  function.o(.ARM.__at_0x00004000)
  ...
}
```

See the following in the *armlink User Guide*:
- Placement of sections at a specific address with __at.
- --autoat, --no_autoat.

L6984E: AT section `<objname>(<spname>)` has required base address `<base>` which is not aligned to section alignment `<alignment>`.

See the following in the *armlink User Guide*:

Placement of sections at a specific address with __at.

L6985E: Unable to automatically place AT section `<objname>(<spname>)` with required base address `<base>`.

Please manually place in the scatter file using the --no_autoat option.

See the following in the *armlink User Guide*:
- Placement of sections at a specific address with __at.
- --autoat, --no_autoat.
Chapter 5
ELF Image Converter Errors and Warnings

Describes the error and warning messages for the ELF image converter, fromelf.

It contains the following sections:

- 5.1 List of the fromelf error and warning messages on page 5-171.
5.1 List of the fromelf error and warning messages

Lists the error and warning messages that fromelf produces.

--- Note ---

License-related error messages can be found in the 2.1 List of the licensing error and warning messages on page 2-97 section.

Q0105E: Load region #<segindex> extends beyond top of address space.
Q0106E: Out of Memory.
Q0107E: Failed writing output file '<filename>': <reason>
Q0108E: Could not create output file '<filename>': <reason>
Q0119E: No output file specified.
Q0120E: No input file specified.
Q0122E: Could not open file '<filename>': <reason>

If <reason> is Invalid argument, this might be because you have invalid characters on the command line.

For example, on Windows you might have used the escape character \ when specifying a filter with an archive file:

```
fromelf --elf --strip=all t.a\(test*.o\) -o filtered/
```

On Windows, use:

```
fromelf --elf --strip=all t.a(test*.o) -o filtered/
```

See the following in the fromelf User Guide:

```
input_file.
```

Q0128E: File i/o failure.

This error can occur if you specify a directory for the --output command-line option, but you did not terminate the directory with a path separator. For example, --output=my_elf_files/.

See the following in the fromelf User Guide:

```
--output=destination.
```

Q0129E: Not a 32 bit ELF file.
Q0130E: Not a 64 bit ELF file.
Q0131E: Invalid ELF identification number found.

This error is given if you attempt to use fromelf on a file which is not in ELF format, or which is corrupted. Object (.o) files and executable (.axf) files are in ELF format.

Q0132E: Invalid ELF section index found <idx>.
Q0133E: Invalid ELF segment index found <idx>.
Q0134E: Invalid ELF string table index found <idx>.
Q0135E: Invalid ELF section entry size found.
Q0136E: ELF Header contains invalid file type.
Q0137E: ELF Header contains invalid machine name.
Q0138E: ELF Header contains invalid version number.

See Q0131E.
Q0147E: Failed to create Directory <dir>: <reason>
If <reason> is File exists, this might be because you have specified a directory that has the same name as a file that already exists. For example, if a file called filtered already exists, then the following command produces this error:

```bash
fromelf --elf --strip=all t.a(test*.o) -o filtered/
```

The path separator character / informs fromelf that filtered is a directory.

See the following in the fromelf User Guide:

```
--output=destination.
```

Q0171E: Invalid st_name index into string table <idx>.
See Q0131E.

Q0172E: Invalid index into symbol table <idx>.
See Q0131E.

Q0186E: This option requires debugging information to be present
The --fieldoffsets option requires the image to be built with dwarf debug tables.

Q0425W: Incorrectly formed virtual function elimination header in file
This might indicate a compiler fault. Contact your supplier.

Q0426E: Error reading vtable information from file
This might indicate a compiler fault. Contact your supplier.

Q0427E: Error getting string for symbol in a vtable
This might indicate a compiler fault. Contact your supplier.

Q0433E: Diagnostic style <style> not recognised

Q0440E: No relocation sections for <secname>

Q0447W: Unknown Diagnostic number (<num>)

Q0448W: Read past the end of the compressed data while decompressing section '<secname>' #<secnum> in <file>
This might indicate an internal fault. Contact your supplier.

Q0449W: Write past the end of the uncompressed data buffer of size <bufsize> while decompressing section '<secname>' #<secnum> in <file>
This might indicate an internal fault. Contact your supplier.

Q0450W: Section '<secname>' #<secnum> in file <file> uses a mixture of legacy and current ABI relocation types.

Q0451W: Option '--strip symbols' used without '--strip debug' on an ELF file that has debug information.

Q0452W: Option '--strip filesymbols' used without '--strip debug' on an ELF file that has debug information.

Q0453W: Stripping path names from '<path1>' and '<path2>' produces a duplicate file name '<filename>'.

Q0454E: In ELF file: <details>
Chapter 6
Librarian Errors and Warnings

Describes the error and warning messages for the ARM librarian, armar.

It contains the following sections:

• 6.1 List of the armar error and warning messages on page 6-174.
6.1 List of the armar error and warning messages

Lists the error and warning messages that armar produces.

L6800U: Out of memory
L6825E: Reading archive '<archive>' : <reason>
L6826E: '<archive>' not in archive format
L6827E: '<archive>' : malformed symbol table
L6828E: '<archive>' : malformed string table
L6829E: '<archive>' : malformed archive (at offset <offset>)
L6830E: Writing archive '<archive>' : <reason>
L6831E: '<member>' not present in archive '<archive>'
L6832E: Archive '<archive>' not found : <reason>
L6833E: File '<filename>' does not exist
L6835E: Reading file '<filename>' : <reason>
L6836E: '<filename>' already exists, so will not be extracted
L6838E: No archive specified
L6839E: One of the actions -[<actions>] must be specified
L6840E: Only one action option may be specified
L6841E: Position '<position>' not found
L6842E: Filename '<filename>' too long for file system
L6843E: Writing file '<filename>' : <reason>
L6874W: Minor variants of archive member '<member>' include no base variant

Minor variants of the same function exist within a library. Find the two equivalent objects and remove one of them.

L6875W: Adding non-ELF object '<filename>' to archive '<name>'
Chapter 7
Other Errors and Warnings

Describes error and warning messages that might be displayed by any of the tools.

It contains the following sections:

• 7.1 Internal faults and other unexpected failures on page 7-176.
• 7.2 List of other error and warning messages on page 7-177.
7.1 Internal faults and other unexpected failures

Internal faults indicate that the tool has failed an internal consistency check or has encountered some unexpected input that it could not deal with. They might point to a potential issue in the tool itself.

For example:

| Internal fault: [0x87ecef:5051234] |

contains:

- The message description (Internal fault).
- A six hex digit fault code for the error that occurred (0x87ecef).
- In RVCT 2.2 and earlier this was a four digit code.
- The version number (505 is ARM Compiler 5.05).
- The build number (1234 in this example).

If you see an internal fault, contact your supplier.

To facilitate the investigation, try to send only the single source file or function that is causing the error, plus the command-line options used.

It might be necessary to preprocess the file (that is, to take account of files added with `#include`). To do this, pass the file through the preprocessor as follows:

```
armcc <options> -E sourcefile.c > PPsourcefile.c
```

where `<options>` are your normal compile switches, such as `-O2`, `-g`, `-I`, `-D`, but without `-c`.

Check that the error is still reproducible with the preprocessed file. For example, compile it with:

```
armcc <options> -c PPsourcefile.c
```

Then provide the `PPsourcefile.c` file and the `<options>` to your supplier.
7.2 List of other error and warning messages

A list of the error and warning messages that any of the tools in the ARM Compiler toolchain produce.

Note

When the message is displayed, the X prefixing the message number is replaced by an appropriate letter relating to the tool. For example, the code X3900U is displayed as L3900U by the linker when you have specified an unrecognized option.

X3900U: Unrecognized option '<option>'.

X3901U: Missing argument for option '<option>'.

X3902U: Recursive via file inclusion depth of <limit> reached in file '<file>'.

X3903U: Argument '<argument>' not permitted for option '<option>'.

X3904U: Could not open via file '<file>'.

X3905U: Error when reading from via file '<file>'.

X3906U: Malformed via file '<file>'.

X3907U: Via file '<file>' command too long for buffer.

X3908U: Overflow: '<string>' will not fit in an integer.

X3910W: Old syntax, please use '<hyphens><option><separator><parameter>'.

X3912W: Option '<option>' is deprecated.

X3913W: Could not close via file '<file>'.

X3915W: Argument '<argument>' to option '<option>' is deprecated

X3916U: Unexpected argument for option '<dashes><option>'

X3917U: Concatenated options cannot have arguments: -<option> <arg>

X9905E: cannot use --apcs=/hardfp without floating point hardware

X9906E: cannot use --apcs=/hardfp with fpu <fpu_option>

X9907E: unable to select no floating point support

X9908E: --fpmode=none overrides --fpu choice
Appendix A
Errors and Warnings Reference Guide Document
Revisions

Describes the technical changes that have been made to the Errors and Warnings Reference Guide.

It contains the following sections:

### A.1 Revisions for Errors and Warnings Reference Guide

The following technical changes have been made to the Errors and Warnings Reference Guide.

#### Table A-1 Differences between issue J and issue K

<table>
<thead>
<tr>
<th>Change</th>
<th>Topics affected</th>
</tr>
</thead>
<tbody>
<tr>
<td>Changes to the compiler messages:</td>
<td></td>
</tr>
<tr>
<td>• Added error and warning messages 3082 to 3720 inclusive. These are new in ARM Compiler 5.05.</td>
<td>1.2 List of the armcc error and warning messages on page 1-12</td>
</tr>
<tr>
<td>• Moved the messages in the form C4XXX into the list of armcc error and warning messages.</td>
<td></td>
</tr>
<tr>
<td>• Mentioned that C4017W is suppressed by default.</td>
<td></td>
</tr>
<tr>
<td>Changes to the linker messages:</td>
<td></td>
</tr>
<tr>
<td>• Added more detail for L6221E.</td>
<td>4.2 List of the armlink error and warning messages on page 4-131</td>
</tr>
<tr>
<td>Changes to the assembler messages:</td>
<td></td>
</tr>
<tr>
<td>• Added all missing error and warning messages.</td>
<td>3.1 List of the armasm error and warning messages on page 3-101</td>
</tr>
<tr>
<td>• Added a description for A1871E.</td>
<td></td>
</tr>
</tbody>
</table>

#### Table A-2 Differences between issue I and issue J

<table>
<thead>
<tr>
<th>Change</th>
<th>Topics affected</th>
</tr>
</thead>
<tbody>
<tr>
<td>Changed references to environment variables from ARMCCnINC and ARMCCnLIB to ARMCC5INC and ARMCC5LIB.</td>
<td>• 1.2 List of the armcc error and warning messages on page 1-12</td>
</tr>
<tr>
<td>•</td>
<td>• 4.2 List of the armlink error and warning messages on page 4-131</td>
</tr>
</tbody>
</table>

#### Table A-3 Differences between Issue H and Issue I

<table>
<thead>
<tr>
<th>Change</th>
<th>Topics affected</th>
</tr>
</thead>
<tbody>
<tr>
<td>Changes to the compiler messages:</td>
<td></td>
</tr>
<tr>
<td>• Added more detail for 95, 1043, 1083, 1296, 1559.</td>
<td>1.2 List of the armcc error and warning messages on page 1-12</td>
</tr>
<tr>
<td>• Updated message ID numbers to reflect renumbering of C3nnn to C4nnn.</td>
<td></td>
</tr>
<tr>
<td>• Removed obsolete messages C3000E, C3015E, C3055U, and C3064E.</td>
<td></td>
</tr>
<tr>
<td>Changes to the linker messages:</td>
<td></td>
</tr>
<tr>
<td>• Added more detail for L6202E, L6330W.</td>
<td>4.2 List of the armlink error and warning messages on page 4-131</td>
</tr>
<tr>
<td>• Changed the article linked to from L6238E.</td>
<td></td>
</tr>
<tr>
<td>Changes to the assembler messages:</td>
<td></td>
</tr>
<tr>
<td>• Where appropriate, changed the term local label to numeric local label.</td>
<td>3.1 List of the armasm error and warning messages on page 3-101</td>
</tr>
<tr>
<td>• Improved the description of A1746W.</td>
<td></td>
</tr>
</tbody>
</table>
### Table A-4 Differences between Issue G and Issue H

<table>
<thead>
<tr>
<th>Change</th>
<th>Topics affected</th>
</tr>
</thead>
</table>
| Changes to the compiler messages:  
  • Added error and warning messages 2902 to 3040 inclusive, which are new in ARM Compiler 5.0.  
  • Added error and warning messages 3049 to 3081 inclusive, which are new in ARM Compiler 5.01.   | 1.2 List of the armcc error and warning messages on page 1-12 |
| Enhanced the description of the linker error message L6973E. | 4.2 List of the armlink error and warning messages on page 4-131 |

### Table A-5 Differences between Issue E and Issue F

<table>
<thead>
<tr>
<th>Change</th>
<th>Topics affected</th>
</tr>
</thead>
</table>
| Changes to the compiler messages:  
  • Changed the version number component of internal compiler errors from two to three digits.  
  • Removed messages 1113 and 2523 because they are no longer valid.  
  • Added the remarks 2813 and 2815. | 7.1 Internal faults and other unexpected failures on page 7-176   |
| Changes to the assembler messages:  
  • Corrected the E, W or U suffix in many error and warning message codes.  
  • Added more detail for A1322E, A1477E, A1745W, A1786W, A1788W and A1809W. | 3.1 List of the armasm error and warning messages on page 3-101 |
| Changes to the linker messages:  
  • Added cross references to the descriptions for L6218E and L6932W.  
  • Added more detail for L6242E and L6248E.  
  • Changed the ARMCCnnLIB and ARMCCnnINC environment variables to ARMCCnLIB and ARMCCnINC.  
  Where appropriate:  
  • Changed Thumb-1 to 16-bit Thumb.  
  • Changed Thumb-2 to 32-bit Thumb. | 4.2 List of the armlink error and warning messages on page 4-131 | Various topics |

### Table A-6 Differences between Issue D and Issue E

<table>
<thead>
<tr>
<th>Change</th>
<th>Topics affected</th>
</tr>
</thead>
</table>
| Changes to the compiler messages:  
  • Added more detail for error 1558. | 1.2 List of the armcc error and warning messages on page 1-12 |
| Changes to the assembler messages:  
  • Removed messages A1588E, A1589E, A1597E, A1613E, A1614E, and A1646W, because they are not reachable. | 3.1 List of the armasm error and warning messages on page 3-101 |
### Table A-7  Differences between Issue C and Issue D

<table>
<thead>
<tr>
<th>Change</th>
<th>Topics affected</th>
</tr>
</thead>
</table>
| Changes to the compiler messages:  
  • Added messages C3335E, C3336W, C3337E, and C3338W.  
  • Removed error C3053W, because --profile is deprecated.  
  • Added cross references to various messages. | 1.2 List of the armcc error and warning messages on page 1-12 |
| Changes to the assembler messages:  
  • Added messages A1903E, A1907W, A1908E, and A1909E.  
  • Added cross references to A1450W. | 3.1 List of the armasm error and warning messages on page 3-101 |
| Changes to the linker messages:  
  • Added L6064E.  
  • Corrected examples for L6216E.  
  • Added L6815U.  
  • Updated the description of L6002U.  
  • Updated the description of L6310W.  
  • Added cross references to various messages. | 4.2 List of the armlink error and warning messages on page 4-131 |
| Changes to the fromelf messages:  
  • Added cross references to various messages. | 5.1 List of the fromelf error and warning messages on page 5-171 |

### Table A-8  Differences between Issue B and Issue C

<table>
<thead>
<tr>
<th>Change</th>
<th>Topics affected</th>
</tr>
</thead>
</table>
| Changes to the linker messages:  
  • Added L6058E.  
  • Added L6828E. | 4.2 List of the armlink error and warning messages on page 4-131 |

### Table A-9  Differences between Issue A and Issue B

<table>
<thead>
<tr>
<th>Change</th>
<th>Topics affected</th>
</tr>
</thead>
</table>
| Changes to the compiler messages:  
  • Added more detail for 631 and 634. | 1.2 List of the armcc error and warning messages on page 1-12 |
| Changes to the assembler messages:  
  • Removed A1590E.  
  • Added more detail for A1746W. | 3.1 List of the armasm error and warning messages on page 3-101 |
| Changes to the linker messages:  
  • Added L6065E.  
  • Added more detail for L6220E, L6221E, L6384E, L6915E, and L6971E.  
  • Added cross-references for L6224E and L6469E. | 4.2 List of the armlink error and warning messages on page 4-131 |
| Changes to the fromelf messages:  
  • Added more detail for errors Q0122E, Q0128E, and Q0147E. | 5.1 List of the fromelf error and warning messages on page 5-171 |
