Preface

This preface introduces the Tarmac Trace for Fast Models User Guide.

It contains the following:
• About this book on page 6.
About this book

This manual describes the use of the Fast Models Tarmac Trace plug-in from ARM, and the format of the trace files it generates.

Using this book

This book is organized into the following chapters:

**Chapter 1 Introduction**
This chapter introduces the document.

**Chapter 2 Tarmac Trace Plug-in**
This chapter describes how to set up the environment to use the Tarmac Trace plug-in, and how to start a simulation. It also describes the parameters that control the type of events to trace.

**Chapter 3 Tarmac Trace File Format**
This chapter describes the Tarmac Trace for Fast Models file format.

**Appendix A Architecture Message Plug-in**
This appendix describes the Architecture Message plug-in.

Glossary

The ARM Glossary is a list of terms used in ARM documentation, together with definitions for those terms. The ARM Glossary does not contain terms that are industry standard unless the ARM meaning differs from the generally accepted meaning.

See the ARM Glossary for more information.

Typographic conventions

*italic*
Introduces special terminology, denotes cross-references, and citations.

*bold*
Highlights interface elements, such as menu names. Denotes signal names. Also used for terms in descriptive lists, where appropriate.

*monospace*
Denotes text that you can enter at the keyboard, such as commands, file and program names, and source code.

*monospace*<br>
Denotes a permitted abbreviation for a command or option. You can enter the underlined text instead of the full command or option name.

*monospace italic*
Denotes arguments to monospace text where the argument is to be replaced by a specific value.

*monospace bold*
Denotes language keywords when used outside example code.

<and>
Encloses replaceable terms for assembler syntax where they appear in code or code fragments. For example:

```
MRC p15, 0, <Rd>, <CRn>, <CRm>, <Opcode_2>
```

SMALL CAPITALS
Used in body text for a few terms that have specific technical meanings, that are defined in the ARM glossary. For example, IMPLEMENTATION DEFINED, IMPLEMENTATION SPECIFIC, UNKNOWN, and UNPREDICTABLE.

Feedback
Feedback on this product

If you have any comments or suggestions about this product, contact your supplier and give:

• The product name.
• The product revision or version.
• An explanation with as much information as you can provide. Include symptoms and diagnostic procedures if appropriate.

Feedback on content

If you have comments on content then send an e-mail to errata@arm.com. Give:

• The title Tarmac Trace for Fast Models User Guide.
• The number ARM DUI0845H.
• If applicable, the page number(s) to which your comments refer.
• A concise explanation of your comments.

ARM also welcomes general suggestions for additions and improvements.

Note

ARM tests the PDF only in Adobe Acrobat and Acrobat Reader, and cannot guarantee the quality of the represented document when used with any other PDF reader.

Other information

• ARM Information Center.
• ARM Technical Support Knowledge Articles.
• Support and Maintenance.
• ARM Glossary.
Chapter 1
Introduction

This chapter introduces the document.
It contains the following sections:
• 1.1 About Tarmac Trace on page 1-9.
1.1 About Tarmac Trace

Tarmac is a textual trace output.

Fast Models supports the generation of traces that consistently track the execution and related activities in the model, particularly those that affect the state of the modeled IP. Generated virtual platforms provide trace support by using plug-ins in the form of DLLs and shared objects on Windows and Linux, respectively. Using the plug-in, trace information is written to a file in textual form in the format described in this document.

ARM provides a plug-in to produce a textual trace output (Tarmac). You can use other plug-ins, using the Model Trace Interface (MTI), instead, or at the same time. You can connect various plug-ins to this interface in the form of a shared object loaded at simulation start-up.

This document describes:
• How to enable and disable Tarmac Trace.
• How to control Tarmac Trace.
• File formats and how to analyze the output.

Related references

Chapter 3 Tarmac Trace File Format on page 3-15.
Chapter 2
Tarmac Trace Plug-in

This chapter describes how to set up the environment to use the Tarmac Trace plug-in, and how to start a simulation. It also describes the parameters that control the type of events to trace.

It contains the following sections:
• 2.1 Getting started on page 2-11.
• 2.2 Starting the simulation on page 2-12.
• 2.3 Tarmac Trace parameters on page 2-14.
2.1 Getting started

This section provides information on specifying the location of the trace plug-ins.

This section contains the following subsections:
• 2.1.1 Pointing to the position of the Tarmac Trace plug-in on page 2-11.

2.1.1 Pointing to the position of the Tarmac Trace plug-in

To provide the plug-in to the simulation, use a tool-specific method if possible.

When launching a model with an application that understands Model Trace Interface (MTI), use the tool-specific method of providing the plug-in to the simulation. Examples of such applications are Model Debugger, Model Shell, and SystemC (with Multiple Instantiation (MI) and command line parsed).

When specifying the plug-in to the launching tool is not possible, specify the trace plug-in by setting the environment variable `FM_TRACE_PLUGINS`.

This variable must point to the full path of the Tarmac Trace plug-in. On Linux, for `sh` users this path might be, for example:

```bash
export FM_TRACE_PLUGINS /home/<user>/<installation_path>/plugins/<platform>/TarmacTrace.so
```

On Windows, the full path might resemble this example: `C:\Program Files (x86)\ARM\FastModelsPortfolio\plugins\Win64_VC20\XX\Release`.

To use multiple plug-ins at the same time, separate them by ‘;’. You can also load the same plug-in multiple times. You can give a name for the plug-in instance by prefixing `instancename=` to the plug-in path or paths.
2.2 Starting the simulation

Tarmac Trace tracks a simulation with or without a debugger.

This section contains the following subsections:

- 2.2.1 Running the simulation with Model Debugger on page 2-12.
- 2.2.2 Running the simulation without a debugger on page 2-12.

2.2.1 Running the simulation with Model Debugger

How to run a simulation in Model Debugger.

Procedure

1. Specify the Tarmac Trace plug-in to load on simulation.
2. In Model Debugger, select File > Load Model....
3. Set the file path to the simulation library.
4. Set the model parameters in the Configure Model Parameters dialog box.

![Configure Model Parameters](image)

You might set, for example, the trace end count value and the name and location of the trace output file.

5. Load the application file.

Related tasks

2.1.1 Pointing to the position of the Tarmac Trace plug-in on page 2-11.

Related information

2.2.2 Running the simulation without a debugger

Start the simulation library using Model Shell. This tool permits the running of simulation targets like the ARM® Cortex®-A15 VE platform.

The corresponding executable `model_shell` is located in the `bin` directory of the installation. It provides several options to set parameters and load application files. The most convenient way to set parameters is to use a configuration file.

To generate this configuration file, start `model_shell` with the `--list-params` option and the simulation library. For Linux this is:

```bash
model_shell --list-params <path_to_simulation_library> > params.config
```

The configuration file for the parameters can have any arbitrary name and can be edited using a normal text editor to set the parameter values.
For Linux and Windows, the simulation library might be started using the parameter configuration file with the following command:

```
model_shell <path_to_simulation_library> -f params.config -a <application_file.axf>
```

The `--help` option lists all available options for `model_shell`.

Note: Use the `-C`, `--parameter PARNAME=VALUE` option to set individual parameters on the `model_shell` command line. This permits priority over parameters specified in a parameter file.
2.3 Tarmac Trace parameters

Configure the Tarmac Trace plug-in with these parameters.

The plug-in prefixes parameters with the path `TRACE.instance-name`, where `instance-name` is `TarmacTrace`, which is overridable.

Table 2-1 Parameter descriptions

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Type</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>end-instruction-count</code></td>
<td>int</td>
<td>0x0</td>
<td>Set the instruction count where tracing ends. 0x0 sets to trace until the end of the simulation.</td>
</tr>
<tr>
<td><code>loadstore-display-width</code></td>
<td>int</td>
<td>0x4</td>
<td>Memory transactions can in the case of LDM/STM involve up to 64 bytes. For easier readability you can break these up into multiple memory access records with a smaller size of bytes. 0 sets not to break up any transaction. 4 sets to break up transactions into words.</td>
</tr>
<tr>
<td><code>quantum-size</code></td>
<td>int</td>
<td>0x100</td>
<td>Set the default quantum size for tracing. The component <code>CORE_INFO.QUANTUM_SIZE</code> trace source field overrides this.</td>
</tr>
<tr>
<td><code>trace_branches</code></td>
<td>bool</td>
<td>false</td>
<td>Trace all nonsequential changes of the program flow. The information traced is sufficient to completely reconstruct program flow, and the tracing is fairly efficient.</td>
</tr>
<tr>
<td><code>trace_bus_accesses</code></td>
<td>bool</td>
<td>false</td>
<td>Trace all bus accesses. This forces all direct memory accesses to turn into full transactions, which slows down the simulation.</td>
</tr>
<tr>
<td><code>trace_core_registers</code></td>
<td>bool</td>
<td>true</td>
<td>If true, trace core registers (R0-R14, CPSR and SPSR). This produces a lot of data and can slow down simulation.</td>
</tr>
<tr>
<td><code>trace_cp15</code></td>
<td>bool</td>
<td>true</td>
<td>Determines whether to trace writes to CP15 registers.</td>
</tr>
<tr>
<td><code>trace_events</code></td>
<td>bool</td>
<td>true</td>
<td>Determines whether to trace exceptions and mode changes (for processors implementing modes).</td>
</tr>
<tr>
<td><code>trace-file</code></td>
<td>string</td>
<td>&quot;&quot;</td>
<td>Name of the trace output file. If empty, the trace output goes to stdout. If STDERR the trace output goes to stderr.</td>
</tr>
<tr>
<td><code>trace-file-per-comp</code></td>
<td>bool</td>
<td>false</td>
<td>Create a separate trace file for each component traced, adding the component name to the trace file name. At present the only components that support trace are processors, so this option is only relevant when there are multiple processors.</td>
</tr>
<tr>
<td><code>trace-inst-stem</code></td>
<td>string</td>
<td>&quot;&quot;</td>
<td>If set to a component path, trace only a subtree of components. In the simplest case of setting the component path of a single processor, then trace only this processor.</td>
</tr>
<tr>
<td><code>start-instruction-count</code></td>
<td>int</td>
<td>0x0</td>
<td>Set the instruction count where tracing starts. 0x0 sets to start from the beginning.</td>
</tr>
<tr>
<td><code>trace_instructions</code></td>
<td>bool</td>
<td>true</td>
<td>Determines whether to trace instructions.</td>
</tr>
<tr>
<td><code>trace_loads_stores</code></td>
<td>bool</td>
<td>true</td>
<td>Determines whether to trace load/stores. This is cheaper performance-wise than bus tracing.</td>
</tr>
<tr>
<td><code>trace_vfp</code></td>
<td>bool</td>
<td>true</td>
<td>Determines whether to trace VFP and NEON™ registers (including FPSCR and FPEXC).</td>
</tr>
</tbody>
</table>

Related tasks

2.2 Starting the simulation on page 2-12.
Chapter 3
Tarmac Trace File Format

This chapter describes the Tarmac Trace for Fast Models file format.

It contains the following sections:

• 3.1 Instruction trace on page 3-16.
• 3.2 Program flow trace on page 3-17.
• 3.3 Register trace on page 3-18.
• 3.4 Event trace on page 3-19.
• 3.5 Processor memory access trace on page 3-20.
• 3.6 Memory bus trace on page 3-21.
• 3.7 Example of the Fast Models Tarmac Trace file format on page 3-23.
3.1 Instruction trace

If enabled, this trace source generates one record for every instruction started.

The records (lines) of the instruction trace have this command syntax:

\(<time> \ <scale> \ <cpu> \ [IT|IS] \ (<inst_id>) \ <addr> \ <opcode> \ [A|T|X] \ <mode> \ <security>: \ <disasm>\)

- \(<time>\)
  Timestamp (decimal value).

- \(<scale>\)
  Unit for \(<time>\). \(\text{clk}\) indicates the timestamp is not related to real time, but an increasing count.

- \(<cpu>\)
  Processor that gave the instruction.

- \([IT|IS]\)
  \(\text{IT}\)
  Instruction passed the condition code (taken).
  \(\text{IS}\)
  Instruction failed the condition code (skipped).

- \(<inst_id>\)
  Tick count of this processor. This is equivalent to the number of instructions executed, except for certain instructions like \(\text{WFI/WFE}\) (decimal value).

- \(<addr>\)
  Fetch source address for this instruction, in hexadecimal format (virtual address).

- \(<opcode>\)
  16-bit/32-bit hexadecimal opcode of the instruction.

- \([A|T|X]\)
  Instruction set:
  \(A\)
  A32.
  \(T\)
  T32.
  \(X\)
  T32EE.

- \(<mode>\)
  Processor execution mode (\(\text{svc, irq, fiq, usr, mon, sys, abt, und}\)).

- \(<security>\)
  Processor security state (\(s\) or \(ns\)).

- \(<disasm>\)
  Disassembly of the instruction.
3.2 Program flow trace

If enabled, every executed branch instruction triggers this trace source. This is a more efficient way to reconstruct the program flow than by tracing every instruction.

Command syntax:

```
<time> <scale> [FD|FI|FR] (<inst_id>) <addr> <targ_addr> [A|T|X]
```

- `<time>`: Timestamp (decimal value).
- `<scale>`: Unit for `<time>`. This gives consistency with device-specific Tarmac Trace formats.
- `[FD|FI|FR]`: Program flow change by:
  - FD: A direct branch.
  - FI: An indirect branch.
  - FR: A return from exception.
- `<inst_id>`: Tick count of this processor. This is equivalent to the number of instructions executed, except for certain instructions like WFI/WFE (decimal value).
- `<addr>`: Fetch source address for this instruction, in hexadecimal format (virtual address).
- `<targ_addr>`: Address (virtual) at which the execution continues.
- `[A|T|X]`: Instruction set after the branch:
  - A: A32.
  - T: T32.
  - X: T32EE.
3.3 Register trace

If enabled, this source traces all writes to the processor registers.

This trace source includes writes to core registers R0 to R14, CPSR and SPSR, VFP registers such as S0 to S31, D0 to D31, FPSCR, FPEXC, and writes to CP14 and CP15 registers. Banked registers are traced separately using the mode as a suffix to the register name, for example r13 (current register R13) and r13_mon (banked register R13).

Command syntax:

```
<time> <scale> R <register> <value>
```

- `<time>`: Timestamp (decimal value).
- `<scale>`: Unit for `<time>`. This gives consistency with device-specific Tarmac Trace formats.
- `<register>`: Register name in lowercase letters. Banked core registers can have a mode appended with a single underscore. Banked CP14/CP15 registers have `_s` or `_ns` appended to indicate access of either the secure or non-secure banked register.
- `<value>`: Hexadecimal value written to the register (64 bits maximum).
3.4 Event trace

If enabled, this source traces exceptions and interrupts occurring.

Command syntax:

<time> <scale> E <value> <number> <desc>

<time>
Timestamp (decimal value).

*scale*
Unit for <time>. This gives consistency with device-specific Tarmac Trace formats.

<value>
Hexadecimal representation of a value associated with the event.

<number>
Event number.

<desc>
Event name.

<table>
<thead>
<tr>
<th>Number</th>
<th>Event description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>00000001</td>
<td>CoreEvent_Reset</td>
<td>-</td>
</tr>
<tr>
<td>00000002</td>
<td>CoreEvent_UndefinedInstr</td>
<td>-</td>
</tr>
<tr>
<td>00000003</td>
<td>CoreEvent_SWI</td>
<td>SWI number</td>
</tr>
<tr>
<td>00000004</td>
<td>CoreEvent_PrefetchAbort</td>
<td>-</td>
</tr>
<tr>
<td>00000005</td>
<td>CoreEvent_DataAbort</td>
<td>-</td>
</tr>
<tr>
<td>00000007</td>
<td>CoreEvent_IRQ</td>
<td>-</td>
</tr>
<tr>
<td>00000008</td>
<td>CoreEvent_FIQ</td>
<td>-</td>
</tr>
<tr>
<td>0000000E</td>
<td>CoreEvent_ImpDataAbort</td>
<td>-</td>
</tr>
<tr>
<td>00000019</td>
<td>CoreEvent_ModeChange</td>
<td>New mode</td>
</tr>
</tbody>
</table>
3.5 Processor memory access trace

If enabled, this source traces processor data accesses.

Command syntax:

<time> <scale> M<rw><sz><attrib> <addr> <data>

<time>
    Timestamp (decimal value).

<scale>
    Unit for <time>. This gives consistency with device-specific Tarmac Trace formats.

<rw>
    R
    Read access.
    W
    Write access.

(sz)
    Size of the data transfer in bytes (1, 2, 4, 8).

<attrib>
    Optional access attribute:
    X
    Exclusive access.
    T
    Translated (unprivileged) access.
    L
    Locked access (SWP, SWPB instructions).

<addr>
    Virtual address used to access memory in hexadecimal format.

<data>
    Hexadecimal value of data transferred. The data padding is according to the size of the transfer.
3.6 **Memory bus trace**

If enabled, this source traces transactions initiated through the memory bus master port of the processor. These accesses use physical addresses.

Command syntax:

```
<time> <scale> B<rw><sz><fd><lk><p><s> l<wrcbs> O<wrcbs> <master_id> <addr> <data>
```

- `<time>`: Timestamp (decimal value).
- `<scale>`: Unit for `<time>`. This gives consistency with device-specific Tarmac Trace formats.
- `<rw>`: R Read access.
  W Write access.
- `<sz>`: Size of the data transfer in bytes.
- `<fd>`: I Opcode fetch.
  D Data load/store or an MMU access.
- `<lk>`: L Locked access.
  X Exclusive access.
  _, underscore Normal access.
- `<p>`: P Privileged access.
  _, underscore Normal access.
- `<s>`: S Secure access.
  N Non-secure access.
- `<wrcbs>`: Inner cache attributes. See `<wrcbs>`.
- `<wrcbs>`: Outer cache attributes:
  W Allocate on write.
  _, underscore No allocate on write.
<r>
R
Allocate on read.
_, underscore
No allocate on read.
</r>

<c>
C
Cacheable access.
_, underscore
Non-cacheable access.
</c>

<b>
B
Bufferable access.
_, underscore
Non-bufferable access.
</b>

<s>
S
Shareability access.
_, underscore
Non-shareability access.
</s>

<master_id>
Master ID of the transaction.
</master_id>

<addr>
Physical address used to access memory in hexadecimal format.
</addr>

<data>
Hexadecimal value of data transferred. The data padding is according to the size of the transfer. Byte ordering is from lowest to highest byte. This means that for accesses in little endian mode, the data occurs mirrored compared to the register/memory access records.
### 3.7 Example of the Fast Models Tarmac Trace file format

The Tarmac Trace plug-in produced this trace file, which shows instruction, register, event, and processor memory access traces.
